|    |                                                                               |
|----|-------------------------------------------------------------------------------|
| #  | The number of positional parameters in decimal.                               |
| -  | Flags supplied to the shell on invocation or by the <code>set</code> command. |
| ?  | The decimal value returned by the last synchronously executed command.        |
| \$ | The process number of this shell.                                             |
| !  | The process number of the last background command invoked.                    |

The following parameters are used by the shell. The parameters in this section are also referred to as environment variables.

|           |                                                                                                                                                                                         |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HOME      | The default argument (home directory) for the <code>cd</code> command, set to the user’s login directory by <code>login(1)</code> from the password file (see <code>passwd(4)</code> ). |
| PATH      | The search path for commands (see <code>Execution</code> section below).                                                                                                                |
| CDPATH    | The search path for the <code>cd</code> command.                                                                                                                                        |
| MAIL      | If this parameter is set to the name of a mail file <i>and</i> the <code>MAILPATH</code> parameter is not set, the shell informs the user of the arrival of mail in the specified file. |
| MAILCHECK | This parameter specifies how often (in seconds) the shell will check for the arrival of mail in the files specified by the <code>MAILPATH</code> or <code>MAIL</code> parameters. The   |

sh(1)

|          |                                                                                                                                                                                                                                                                                                        |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | default value is 600 seconds (10 minutes). If set to 0, the shell will check before each prompt.                                                                                                                                                                                                       |
| MAILPATH | A colon (:) separated list of file names. If this parameter is set, the shell informs the user of the arrival of mail in any of the specified files. Each file name can be followed by % and a message that will be printed when the modification time changes. The default message is, you have mail. |
| PS1      | Primary prompt string, by default "\$ ".                                                                                                                                                                                                                                                               |
| PS2      | Secondary prompt string, by default "> ".                                                                                                                                                                                                                                                              |
| IFS      | Internal field separators, normally space, tab, and newline (see Blank Interpretation section).                                                                                                                                                                                                        |
| SHACCT   | If this parameter is set to the name of a file writable by the user, the shell will write an accounting record in the file for each shell procedure executed.                                                                                                                                          |
| SHELL    | When the shell is invoked, it scans the environment (see Environment section below) for this name.                                                                                                                                                                                                     |

See `environ(5)` for descriptions of the following environment variables that affect the execution of `sh`: `LC_CTYPE` and `LC_MESSAGES`.

The shell gives default values to `PATH`, `PS1`, `PS2`, `MAILCHECK`, and `IFS`. `HOME` and `MAIL` are set by `login(1)`.

**Blank Interpretation**

After parameter and command substitution, the results of substitution are scanned for internal field separator characters (those found in `IFS`) and split into distinct arguments where such characters are found. Explicit null arguments (" " or ' ') are retained. Implicit null arguments (those resulting from *parameters* that have no values) are removed.

**Input/Output Redirection**

A command's input and output may be redirected using a special notation interpreted by the shell. The following may appear anywhere in a *simple-command* or may precede or follow a `command` and are *not* passed on as arguments to the invoked command. Note: Parameter and command substitution occurs before *word* or *digit* is used.

`<word`

Use file *word* as standard input (file descriptor 0).

|                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>&gt;word</i>        | Use file <i>word</i> as standard output (file descriptor 1). If the file does not exist, it is created; otherwise, it is truncated to zero length.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>&gt;&gt;word</i>    | Use file <i>word</i> as standard output. If the file exists, output is appended to it (by first seeking to the EOF); otherwise, the file is created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>&lt; &gt;word</i>   | Open file <i>word</i> for reading and writing as standard input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>&lt;&lt;[-]word</i> | <p>After parameter and command substitution is done on <i>word</i>, the shell input is read up to the first line that literally matches the resulting <i>word</i>, or to an EOF. If, however, <i>-</i> is appended to <i>&lt;&lt;</i>:</p> <ol style="list-style-type: none"> <li>1) leading tabs are stripped from <i>word</i> before the shell input is read (but after parameter and command substitution is done on <i>word</i>),</li> <li>2) leading tabs are stripped from the shell input as it is read and before each line is compared with <i>word</i>, and</li> <li>3) shell input is read up to the first line that literally matches the resulting <i>word</i>, or to an EOF.</li> </ol> <p>If any character of <i>word</i> is quoted (see Quoting section later), no additional processing is done to the shell input. If no characters of <i>word</i> are quoted:</p> <ol style="list-style-type: none"> <li>1) parameter and command substitution occurs,</li> <li>2) (escaped) <code>\newlines</code> are removed, and</li> <li>3) <code>\</code> must be used to quote the characters <code>\</code>, <code>\$</code>, and <code>`</code>.</li> </ol> <p>The resulting document becomes the standard input.</p> |

sh(1)

`<&digit` Use the file associated with file descriptor *digit* as standard input. Similarly for the standard output using `>&digit`.

`<&-` The standard input is closed. Similarly for the standard output using `>&-`.

If any of the above is preceded by a digit, the file descriptor which will be associated with the file is that specified by the digit (instead of the default 0 or 1). For example:

```
. . . 2>&1
```

associates file descriptor 2 with the file currently associated with file descriptor 1.

The order in which redirections are specified is significant. The shell evaluates redirections left-to-right. For example:

```
. . . 1>xxx 2>&1
```

first associates file descriptor 1 with file *xxx*. It associates file descriptor 2 with the file associated with file descriptor 1 (that is, *xxx*). If the order of redirections were reversed, file descriptor 2 would be associated with the terminal (assuming file descriptor 1 had been) and file descriptor 1 would be associated with file *xxx*.

Using the terminology introduced on the first page, under *Commands*, if a `command` is composed of several *simple commands*, redirection will be evaluated for the entire `command` before it is evaluated for each *simple command*. That is, the shell evaluates redirection for the entire *list*, then each *pipeline* within the *list*, then each `command` within each *pipeline*, then each *list* within each `command`.

If a `command` is followed by `&` the default standard input for the `command` is the empty file `/dev/null`. Otherwise, the environment for the execution of a `command` contains the file descriptors of the invoking shell as modified by input/output specifications.

### File Name Generation

Before a `command` is executed, each `command word` is scanned for the characters `*`, `?`, and `[`. If one of these characters appears the word is regarded as a *pattern*. The word is replaced with alphabetically sorted file names that match the pattern. If no file name is found that matches the pattern, the word is left unchanged. The character `.` at the start of a file name or immediately following a `/`, as well as the character `/` itself, must be matched explicitly.

`*` Matches any string, including the null string.

`?` Matches any single character.

`[...]` Matches any one of the enclosed characters. A pair of characters separated by `-` matches

sh(1)

any character lexically between the pair, inclusive. If the first character following the opening [ is a !, any character not enclosed is matched.

Note that all quoted characters (see below) must be matched explicitly in a filename.

**Quoting** The following characters have a special meaning to the shell and cause termination of a word unless quoted:

```
; & () | ^ < > newline space tab
```

A character may be *quoted* (that is, made to stand for itself) by preceding it with a backslash (\) or inserting it between a pair of quote marks ( ' ' or " "). During processing, the shell may quote certain characters to prevent them from taking on a special meaning. Backslashes used to quote a single character are removed from the word before the command is executed. The pair \newline is removed from a word before command and parameter substitution.

All characters enclosed between a pair of single quote marks ( ' ' ), except a single quote, are quoted by the shell. Backslash has no special meaning inside a pair of single quotes. A single quote may be quoted inside a pair of double quote marks (for example, " ' "), but a single quote can not be quoted inside a pair of single quotes.

Inside a pair of double quote marks ( " " ), parameter and command substitution occurs and the shell quotes the results to avoid blank interpretation and file name generation. If \$\* is within a pair of double quotes, the positional parameters are substituted and quoted, separated by quoted spaces (" \$1 \$2 . . ."); however, if @\$ is within a pair of double quotes, the positional parameters are substituted and quoted, separated by unquoted spaces (" \$1" "\$2" . . .). \ quotes the characters \, ', , and \$. The pair \newline is removed before parameter and command substitution. If a backslash precedes characters other than \, ', , \$, and newline, then the backslash itself is quoted by the shell.

**Prompting** When used interactively, the shell prompts with the value of PS1 before reading a command. If at any time a newline is typed and further input is needed to complete a command, the secondary prompt (that is, the value of PS2) is issued.

**Environment** The *environment* (see `environ(5)`) is a list of name-value pairs that is passed to an executed program in the same way as a normal argument list. The shell interacts with the environment in several ways. On invocation, the shell scans the environment and creates a parameter for each name found, giving it the corresponding value. If the user modifies the value of any of these parameters or creates new parameters, none of these affects the environment unless the `export` command is used to bind the shell's parameter to the environment (see also `set -a`). A parameter may be removed from the environment with the `unset` command. The environment seen by any executed command is thus composed of any unmodified name-value pairs originally inherited

sh(1)

by the shell, minus any pairs removed by `unset`, plus any modifications or additions, all of which must be noted in `export` commands.

The environment for any *simple-command* may be augmented by prefixing it with one or more assignments to parameters. Thus:

```
TERM=450 command
```

and

```
(export TERM; TERM=450; command)
```

are equivalent as far as the execution of `command` is concerned if `command` is not a Special Command. If `command` is a Special Command, then

```
TERM=450 command
```

will modify the `TERM` variable in the current shell.

If the `-k` flag is set, *all* keyword arguments are placed in the environment, even if they occur after the command name. The following example first prints `a=b c` and `c`:

```
echo a=b c
a=b c
set -k
echo a=b c
c
```

**Signals** The `INTERRUPT` and `QUIT` signals for an invoked command are ignored if the command is followed by `&`; otherwise signals have the values inherited by the shell from its parent, with the exception of signal 11 (but see also the `trap` command below).

**Execution** Each time a command is executed, the command substitution, parameter substitution, blank interpretation, input/output redirection, and filename generation listed above are carried out. If the command name matches the name of a defined function, the function is executed in the shell process (note how this differs from the execution of shell script files, which require a sub-shell for invocation). If the command name does not match the name of a defined function, but matches one of the *Special Commands* listed below, it is executed in the shell process.

The positional parameters \$1, \$2, . . . are set to the arguments of the function. If the command name matches neither a *Special Command* nor the name of a defined function, a new process is created and an attempt is made to execute the command via `exec(2)`.

The shell parameter `PATH` defines the search path for the directory containing the command. Alternative directory names are separated by a colon (:). The default path is `/usr/bin`. The current directory is specified by a null path name, which can appear immediately after the equal sign, between two colon delimiters anywhere in the path list, or at the end of the path list. If the command name contains a / the search path is not used. Otherwise, each directory in the path is searched for an executable file. If the file has execute permission but is not an `.out` file, it is assumed to be a file containing shell commands. A sub-shell is spawned to read it. A parenthesized command is also executed in a sub-shell.

The location in the search path where a command was found is remembered by the shell (to help avoid unnecessary *execs* later). If the command was found in a relative directory, its location must be re-determined whenever the current directory changes. The shell forgets all remembered locations whenever the `PATH` variable is changed or the `hash -r` command is executed (see below).

## Special Commands

Input/output redirection is now permitted for these commands. File descriptor 1 is the default output location. When Job Control is enabled, additional *Special Commands* are added to the shell's environment (see `Job Control` section below).

:

No effect; the command does nothing. A zero exit code is returned.

. *filename*

Read and execute commands from *filename* and return. The search path specified by `PATH` is used to find the directory containing *filename*.

`bg [%jobid . . .]`

When Job Control is enabled, the `bg` command is added to the user's environment to manipulate jobs. Resumes the execution of a stopped job in the background. If `%jobid` is omitted the current job is assumed. (See `Job Control` section below for more detail.)

`break [ n ]`

Exit from the enclosing `for` or `while` loop, if any. If *n* is specified, break *n* levels.

`cd [ argument ]`

Change the current directory to *argument*. The shell parameter `HOME` is the default *argument*. The shell parameter `CDPATH` defines the search path for the directory containing *argument*. Alternative directory names are separated by a colon (:). The default path is `<null>` (specifying the current directory). Note: The current directory is specified by a null path name, which can appear immediately after the equal sign or between the colon delimiters anywhere else in the path list. If *argument* begins with a / the search path is not used. Otherwise, each directory in the path is searched for *argument*.

sh(1)

`chdir [ dir ]`

`chdir` changes the shell's working directory to directory *dir*. If no argument is given, change to the home directory of the user. If *dir* is a relative pathname not found in the current directory, check for it in those directories listed in the `CDPATH` variable. If *dir* is the name of a shell variable whose value starts with a `/`, change to the directory named by that value.

`continue [ n ]`

Resume the next iteration of the enclosing `for` or `while` loop. If *n* is specified, resume at the *n*-th enclosing loop.

`echo [ arguments . . . ]`

The words in *arguments* are written to the shell's standard output, separated by space characters. See `echo(1)` for fuller usage and description.

`eval [ argument . . . ]`

The arguments are read as input to the shell and the resulting command(s) executed.

`exec [ argument . . . ]`

The command specified by the arguments is executed in place of this shell without creating a new process. Input/output arguments may appear and, if no other arguments are given, cause the shell input/output to be modified.

`exit [ n ]`

Causes the calling shell or shell script to exit with the exit status specified by *n*. If *n* is omitted the exit status is that of the last command executed (an EOF will also cause the shell to exit.)

`export [ name . . . ]`

The given *names* are marked for automatic export to the *environment* of subsequently executed commands. If no arguments are given, variable names that have been marked for export during the current shell's execution are listed. (Variable names exported from a parent shell are listed only if they have been exported again during the current shell's execution.) Function names are *not* exported.

`fg [%jobid . . . ]`

When Job Control is enabled, the `fg` command is added to the user's environment to manipulate jobs. Resumes the execution of a stopped job in the foreground, also moves an executing background job into the foreground. If *%jobid* is omitted the current job is assumed. (See `Job Control` section below for more detail.)

`getopts`

Use in shell scripts to support command syntax standards (see `intro(1)`); it parses positional parameters and checks for legal options. See `getoptcvt(1)` for usage and description.

`hash [ -r ] [ name . . . ]`

For each *name*, the location in the search path of the command specified by *name* is determined and remembered by the shell. The `-r` option causes the shell to forget

all remembered locations. If no arguments are given, information about remembered commands is presented. *Hits* is the number of times a command has been invoked by the shell process. *Cost* is a measure of the work required to locate a command in the search path. If a command is found in a "relative" directory in the search path, after changing to that directory, the stored location of that command is recalculated. Commands for which this will be done are indicated by an asterisk (\*) adjacent to the *hits* information. *Cost* will be incremented when the recalculation is done.

`jobs [-p | -l] [%jobid ...]`

`jobs -x command [arguments]`

Reports all jobs that are stopped or executing in the background. If *%jobid* is omitted, all jobs that are stopped or running in the background will be reported. (See Job Control section below for more detail.)

`kill [-sig] %job ...`

`kill -l`

Sends either the TERM (terminate) signal or the specified signal to the specified jobs or processes. Signals are either given by number or by names (as given in `signal(3HEAD)` stripped of the prefix "SIG" with the exception that SIGCHD is named CHLD). If the signal being sent is TERM (terminate) or HUP (hangup), then the job or process will be sent a CONT (continue) signal if it is stopped. The argument *job* can be the process id of a process that is not a member of one of the active jobs. See Job Control section below for a description of the format of *job*. In the second form, `kill -l`, the signal numbers and names are listed. (See `kill(1)`).

`login [argument ...]`

Equivalent to `'exec login argument. ...'` See `login(1)` for usage and description.

`newgrp [argument]`

Equivalent to `exec newgrp argument`. See `newgrp(1)` for usage and description.

`pwd`

Print the current working directory. See `pwd(1)` for usage and description.

`read name ...`

One line is read from the standard input and, using the internal field separator, IFS (normally space or tab), to delimit word boundaries, the first word is assigned to the first *name*, the second word to the second *name*, and so forth, with leftover words assigned to the last *name*. Lines can be continued using `\newline`. Characters other than `\newline` can be quoted by preceding them with a backslash. These backslashes are removed before words are assigned to *names*, and no interpretation is done on the character that follows the backslash. The return code is 0, unless an EOF is encountered.

`readonly [name ...]`

The given *names* are marked `readonly` and the values of these *names* may not be changed by subsequent assignment. If no arguments are given, a list of all `readonly` names is printed.

sh(1)

`return [ n ]`

Causes a function to exit with the return value specified by *n*. If *n* is omitted, the return status is that of the last command executed.

`set [ -aefhkntuvx [ argument . . . ] ]`

- a Mark variables which are modified or created for export.
- e Exit immediately if a command exits with a non-zero exit status.
- f Disable file name generation.
- h Locate and remember function commands as functions are defined (function commands are normally located when the function is executed).
- k All keyword arguments are placed in the environment for a command, not just those that precede the command name.
- n Read commands but do not execute them.
- t Exit after reading and executing one command.
- u Treat unset variables as an error when substituting.
- v Print shell input lines as they are read.
- x Print commands and their arguments as they are executed.
- Do not change any of the flags; useful in setting `$1` to `-`.

Using `+` rather than `-` causes these flags to be turned off. These flags can also be used upon invocation of the shell. The current set of flags may be found in `$-`. The remaining arguments are positional parameters and are assigned, in order, to `$1`, `$2`, . . . If no arguments are given the values of all names are printed.

`shift [ n ]`

The positional parameters from `$n+1` . . . are renamed `$1` . . . . If *n* is not given, it is assumed to be 1.

`stop pid . . .`

Halt execution of the process number *pid*. (see `ps(1)`).

`suspend`

Stops the execution of the current shell (but not if it is the login shell).

`test`

Evaluate conditional expressions. See `test(1)` for usage and description.

`times`

Print the accumulated user and system times for processes run from the shell.

`trap [ argument n [ n2 . . . ] ]`

The command *argument* is to be read and executed when the shell receives numeric or symbolic signal(s) (*n*). (Note: *argument* is scanned once when the trap is set and once when the trap is taken.) Trap commands are executed in order of signal

number or corresponding symbolic names. Any attempt to set a trap on a signal that was ignored on entry to the current shell is ineffective. An attempt to trap on signal 11 (memory fault) produces an error. If *argument* is absent all trap(s) *n* are reset to their original values. If *argument* is the null string this signal is ignored by the shell and by the commands it invokes. If *n* is 0 the command *argument* is executed on exit from the shell. The `trap` command with no arguments prints a list of commands associated with each signal number.

`type [ name ... ]`

For each *name*, indicate how it would be interpreted if used as a command name.

`ulimit [- ]&[HS] ]&a | cdfnstv] ]`

`ulimit [- ]&[HS] ]&c | d | f | n | s | t | v] ] limit`

`ulimit` prints or sets hard or soft resource limits. These limits are described in `getrlimit(2)`.

If `limit` is not present, `ulimit` prints the specified limits. Any number of limits may be printed at one time. The `-a` option prints all limits.

If `limit` is present, `ulimit` sets the specified limit to `limit`. The string `unlimited` requests the largest valid limit. Limits may be set for only one resource at a time. Any user may set a soft limit to any value below the hard limit. Any user may lower a hard limit. Only a super-user may raise a hard limit; see `su(1M)`.

The `-H` option specifies a hard limit. The `-S` option specifies a soft limit. If neither option is specified, `ulimit` will set both limits and print the soft limit.

The following options specify the resource whose limits are to be printed or set. If no option is specified, the file size limit is printed or set.

- `-c` maximum core file size (in 512-byte blocks)
- `-d` maximum size of data segment or heap (in kbytes)
- `-f` maximum file size (in 512-byte blocks)
- `-n` maximum file descriptor plus 1
- `-s` maximum size of stack segment (in kbytes)
- `-t` maximum CPU time (in seconds)
- `-v` maximum size of virtual memory (in kbytes)

Run the `sysdef(1M)` command to obtain the maximum possible limits for your system. The values reported are in hexadecimal, but can be translated into decimal numbers using the `bc(1)` utility. See `swap(1M)`.

Example of `ulimit`: to limit the size of a core file dump to 0 Megabytes, type the following:

```
ulimit -c 0
```

sh(1)

`umask [ nnn ]`

The user file-creation mask is set to *nnn* (see `umask(1)`). If *nnn* is omitted, the current value of the mask is printed.

`unset [ name . . . ]`

For each *name*, remove the corresponding variable or function value. The variables `PATH`, `PS1`, `PS2`, `MAILCHECK`, and `IFS` cannot be unset.

`wait [ n ]`

Wait for your background process whose process id is *n* and report its termination status. If *n* is omitted, all your shell's currently active background processes are waited for and the return code will be zero.

### Invocation

If the shell is invoked through `exec(2)` and the first character of argument zero is `-`, commands are initially read from `/etc/profile` and from `$HOME/.profile`, if such files exist. Thereafter, commands are read as described below, which is also the case when the shell is invoked as `/usr/bin/sh`. The flags below are interpreted by the shell on invocation only. Note: Unless the `-c` or `-s` flag is specified, the first argument is assumed to be the name of a file containing commands, and the remaining arguments are passed as positional parameters to that command file:

- `-c string` If the `-c` flag is present commands are read from *string*.
- `-i` If the `-i` flag is present or if the shell input and output are attached to a terminal, this shell is *interactive*. In this case `TERMINATE` is ignored (so that `kill 0` does not kill an interactive shell) and `INTERRUPT` is caught and ignored (so that `wait` is interruptible). In all cases, `QUIT` is ignored by the shell.
- `-p` If the `-p` flag is present, the shell will not set the effective user and group IDs to the real user and group IDs.
- `-r` If the `-r` flag is present the shell is a restricted shell (see `rsh(1M)`).
- `-s` If the `-s` flag is present or if no arguments remain, commands are read from the standard input. Any remaining arguments specify the positional parameters. Shell output (except for *Special Commands*) is written to file descriptor 2.

The remaining flags and arguments are described under the `set` command above.

### Job Control (jsh)

When the shell is invoked as `jsh`, Job Control is enabled in addition to all of the functionality described previously for `sh`. Typically Job Control is enabled for the interactive shell only. Non-interactive shells typically do not benefit from the added functionality of Job Control.

With Job Control enabled every command or pipeline the user enters at the terminal is called a *job*. All jobs exist in one of the following states: foreground, background or stopped. These terms are defined as follows: 1) a job in the foreground has read and write access to the controlling terminal; 2) a job in the background is denied read access and has conditional write access to the controlling terminal (see `stty(1)`); 3) a stopped job is a job that has been placed in a suspended state, usually as a result of a SIGTSTP signal (see `signal(3HEAD)`).

Every job that the shell starts is assigned a positive integer, called a *job number* which is tracked by the shell and will be used as an identifier to indicate a specific job. Additionally the shell keeps track of the *current* and *previous* jobs. The *current job* is the most recent job to be started or restarted. The *previous job* is the first non-current job.

The acceptable syntax for a Job Identifier is of the form:

`%jobid`

where, *jobid* may be specified in any of the following formats:

|                                  |                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%</code> or <code>+</code> | for the current job                                                                                                                                                                                                                                 |
| <code>-</code>                   | for the previous job                                                                                                                                                                                                                                |
| <code>?&lt;string&gt;</code>     | specify the job for which the command line uniquely contains <i>string</i> .                                                                                                                                                                        |
| <i>n</i>                         | for job number <i>n</i> , where <i>n</i> is a job number                                                                                                                                                                                            |
| <i>pref</i>                      | where <i>pref</i> is a unique prefix of the command name (for example, if the command <code>ls -l</code> name were running in the background, it could be referred to as <code>%ls</code> ); <i>pref</i> cannot contain blanks unless it is quoted. |

When Job Control is enabled, the following commands are added to the user's environment to manipulate jobs:

`bg [%jobid . . .]`

Resumes the execution of a stopped job in the background. If *%jobid* is omitted the current job is assumed.

`fg [%jobid . . .]`

Resumes the execution of a stopped job in the foreground, also moves an executing background job into the foreground. If *%jobid* is omitted the current job is assumed.

`jobs [-p | -l] [%jobid . . .]`

`jobs -x command [arguments]`

Reports all jobs that are stopped or executing in the background. If *%jobid* is omitted, all jobs that are stopped or running in the background will be reported.

The following options will modify/enhance the output of `jobs`:

`-l` Report the process group ID and working directory of the jobs.

sh(1)

- p Report only the process group ID of the jobs.
- x Replace any *jobid* found in *command* or *arguments* with the corresponding process group ID, and then execute *command* passing it *arguments*.

kill [ -signal ] %*jobid*

Builtin version of *kill* to provide the functionality of the *kill* command for processes identified with a *jobid*.

stop %*jobid* . . .

Stops the execution of a background job(s).

suspend

Stops the execution of the current shell (but not if it is the login shell).

wait [%*jobid* . . .]

*wait* builtin accepts a job identifier. If %*jobid* is omitted *wait* behaves as described above under *Special Commands*.

**Large File Behavior**

See *largefile(5)* for the description of the behavior of *sh* and *jsh* when encountering files greater than or equal to 2 Gbyte (  $2^{31}$  bytes).

**EXIT STATUS**

Errors detected by the shell, such as syntax errors, cause the shell to return a non-zero exit status. If the shell is being used non-interactively execution of the shell file is abandoned. Otherwise, the shell returns the exit status of the last command executed (see also the *exit* command above).

**jsh Only**

If the shell is invoked as *jsh* and an attempt is made to exit the shell while there are stopped jobs, the shell issues one warning:

There are stopped jobs.

This is the only message. If another exit attempt is made, and there are still stopped jobs they will be sent a *SIGHUP* signal from the kernel and the shell is exited.

**FILES**

\$HOME/.profile

/dev/null

/etc/profile

/tmp/sh\*

**ATTRIBUTES**

See *attributes(5)* for descriptions of the following attributes:

**/usr/bin/jsh**

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | Enabled         |

/usr/xpg4/bin/sh

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4        |
| CSI            | Enabled         |

**WARNINGS** The use of `setuid` shell scripts is *strongly* discouraged.

**NOTES** Words used for filenames in input/output redirection are not interpreted for filename generation (see File Name Generation section above). For example, `cat file1 >a*` will create a file named `a*`.

Because commands in pipelines are run as separate processes, variables set in a pipeline have no effect on the parent shell.

If you get the error message `cannot fork,too many processes`, try using the `wait(1)` command to clean up your background processes. If this doesn't help, the system process table is probably full or you have too many active foreground processes. (There is a limit to the number of process ids associated with your login, and to the number the system can keep track of.)

Only the last process in a pipeline can be waited for.

If a command is executed, and a command with the same name is installed in a directory in the search path before the directory where the original command was found, the shell will continue to `exec` the original command. Use the `hash` command to correct this situation.

The Bourne shell has a limitation on the effective UID for a process. If this UID is less than 100 (and not equal to the process' real UID), then the UID is reset to the process' real UID.

Because the shell implements both foreground and background jobs in the same process group, they all receive the same signals, which can lead to unexpected behavior. It is, therefore, recommended that other job control shells be used, especially in an interactive environment.

When the shell executes a shell script that attempts to execute a non-existent command interpreter, the shell returns an erroneous diagnostic message that the shell script file does not exist.

shell(1F)

**NAME** shell – run a command using shell

**SYNOPSIS** `shell command [command] ...`

**DESCRIPTION** The `shell` function concatenate its arguments, separating each by a space, and passes this string to the shell (`$SHELL` if set, otherwise `/usr/bin/sh`).

**EXAMPLES** **EXAMPLE 1** A sample output of `shell` command.

Since the Form and Menu Language does not directly support background processing, the `shell` function can be used instead.

```
`shell "build prog > /dev/null &"`
```

If you want the user to continue to be able to interact with the application while the background job is running, the output of an executable run by `shell` in the background must be redirected: to a file if you want to save the output, or to `/dev/null` if you don't want to save it (or if there is no output), otherwise your application may appear to be hung until the background job finishes processing.

`shell` can also be used to execute a command that has the same name as an FMLI built-in function.

**NOTES** The arguments to `shell` will be concatenate using spaces, which may or may not do what is expected. The variables set in local environments will not be expanded by the shell because "local" means "local to the current process."

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

**SEE ALSO** `sh(1)`, `attributes(5)`

**NAME** shell\_builtins – shell command interpreter built-in functions

**DESCRIPTION** The shell command interpreters `sh(1)`, `csh(1)`, and `ksh(1)` have special built-in functions which are interpreted by the shell as commands. Many of these built-in commands are implemented by more than one of the shells, and some are unique to a particular shell. These are:

| command  | built into   |
|----------|--------------|
| alias    | csh, ksh     |
| bg       | csh, ksh, sh |
| break    | csh, ksh, sh |

### Bourne Shell, sh, Special Commands

Input/output redirection is now permitted for these commands. File descriptor 1 is the default output location. When Job Control is enabled, additional *Special Commands* are added to the shell's environment.

Additional to these built-in reserved command words, sh also uses:

:                   No effect; the command does nothing. A zero exit code is returned.

.*filename*        Read and execute commands from *filename* and return. The search path specified by `PATH` is used to find the directory containing *filename*.

### C shell, cs

Built-in commands are executed within the C shell. If a built-in command occurs as any component of a pipeline except the last, it is executed in a subshell. Additional to these built-in reserved command words, cs also uses:

:                   Null command. This command is interpreted, but performs no action.

shell\_builtins(1)

**Korn Shell, ksh,  
Special Commands**

Input/Output redirection is permitted. Unless otherwise indicated, the output is written on file descriptor 1 and the exit status, when there is no syntax error, is zero.

Commands that are preceded by one or two \* (asterisks) are treated specially in the following ways:

1. Variable assignment lists preceding the command remain in effect when the command completes.
2. I/O redirections are processed after variable assignments.
3. Errors cause a script that contains them to abort.
4. Words, following a command preceded by \*\* that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the = sign and word splitting and file name generation are not performed.

Additional to these built-in reserved command words, ksh also uses:

- \* : [ *arg* ... ]      The command only expands parameters.
- \* .*file* [ *arg* ... ]      Read the complete *file* then execute the commands. The commands are executed in the current shell environment. The search path specified by `PATH` is used to find the directory containing *file*. If any arguments *arg* are given, they become the positional parameters. Otherwise the positional parameters are unchanged. The exit status is the exit status of the last command executed. the loop termination test.

intro(1), alias(1), break(1), case(1), cd(1), chmod(1), csh(1), echo(1), exec(1), exit(1), find(1), for(1), function(1), getoptcvt(1), getopts(1), glob(1), hash(1), history(1), if(1), jobs(1), kill(1), ksh(1), let(1), limit(1), login(1), logout(1), newgrp(1), nice(1), nohup(1), print(1), pwd(1), read(1), readonly(1), repeat(1), set(1), sh(1), shift(1), suspend(1), test(1B), time(1), times(1), trap(1), typeset(1), umask(1), wait(1), while(1), chdir(2), chmod(2), creat(2), umask(2), getopt(3C), profile(4), environ(5)

- NAME** shift – shell built-in function to traverse either a shell’s argument list or a list of field-separated words
- sh** **shift** [*n*]
- cs** **shift** [*variable*]
- ksh** \* **shift** [*n*]
- sh** The positional parameters from  $\$n+1 \dots$  are renamed  $\$1 \dots$ . If *n* is not given, it is assumed to be 1.
- cs** The components of *argv*, or *variable*, if supplied, are shifted to the left, discarding the first component. It is an error for the variable not to be set or to have a null value.
- ksh** The positional parameters from  $\$n+1 \ \$n+1 \ . \ . \ .$  are renamed  $\$1 \ . \ . \ .$ , default *n* is 1. The parameter *n* can be any arithmetic expression that evaluates to a non-negative number less than or equal to \$#.

On this man page, ksh(1) commands that are preceded by one or two \* (asterisks) are treated specially in the following ways:

1. Variable assignment lists preceding the command remain in effect when the command completes.
2. I/O redirections are processed after variable assignments.
3. Errors cause a script that contains them to abort.
4. Words, following a command preceded by \*\* that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the = sign and word splitting and file name generation are not performed.

| <b>SYNOPSIS</b>    | <code>/usr/ucb/shutdown [-fhknr] time [warning-message...]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                 |              |          |
| <b>DESCRIPTION</b> | <p>shutdown provides an automated procedure to notify users when the system is to be shut down. <code>time</code> specifies when shutdown will bring the system down; it may be the word <code>now</code> (indicating an immediate shutdown), or it may specify a future time in one of two formats: <code>+number</code> and <code>hour:minute</code>. The first form brings the system down in <code>number</code> minutes, and the second brings the system down at the time of day indicated in 24-hour notation.</p> <p>At intervals that get closer as the apocalypse approaches, warning messages are displayed at terminals of all logged-in users, and of users who have remote mounts on that machine.</p> <p>At shutdown time a message is written to the system log daemon, <code>syslogd(1M)</code>, containing the time of shutdown, the instigator of the shutdown, and the reason. Then a terminate signal is sent to <code>init</code>, which brings the system down to single-user mode.</p> |                |                 |              |          |
| <b>OPTIONS</b>     | <p>As an alternative to the above procedure, these options can be specified:</p> <ul style="list-style-type: none"><li>-f Arrange, in the manner of <code>fastboot(1B)</code>, that when the system is rebooted, the file systems will not be checked.</li><li>-h Execute <code>halt(1M)</code>.</li><li>-k Simulate shutdown of the system. Do not actually shut down the system.</li><li>-n Prevent the normal <code>sync(2)</code> before stopping.</li><li>-r Execute <code>reboot(1M)</code>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                 |              |          |
| <b>FILES</b>       | <code>/etc/rmtab</code> remote mounted file system table                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |          |

| <b>NAME</b>        | size – print section sizes in bytes of object files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <b>size</b> [-f] [-F] [-n] [-o] [-V] [-x] <i>filename...</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>The <code>size</code> command produces segment or section size information in bytes for each loaded section in ELF object files. <code>size</code> prints out the size of the text, data, and bss (uninitialized data) segments (or sections) and their total.</p> <p><code>size</code> processes ELF object files entered on the command line. If an archive file is input to the <code>size</code> command, the information for each object file in the archive is displayed.</p> <p>When calculating segment information, the <code>size</code> command prints out the total file size of the non-writable segments, the total file size of the writable segments, and the total memory size of the writable segments minus the total file size of the writable segments.</p> <p>If it cannot calculate segment information, <code>size</code> calculates section information. When calculating section information, it prints out the total size of sections that are allocatable, non-writable, and not NOBITS, the total size of the sections that are allocatable, writable, and not NOBITS, and the total size of the writable sections of type NOBITS. NOBITS sections do not actually take up space in the <i>filename</i>.</p> <p>If <code>size</code> cannot calculate either segment or section information, it prints an error message and stops processing the file.</p> |
| <b>OPTIONS</b>     | <p>-f        Print out the size of each allocatable section, the name of the section, and the total of the section sizes. If there is no section data, <code>size</code> prints out an error message and stops processing the file.</p> <p>-F        Print out the size of each loadable segment, the permission flags of the segment, then the total of the loadable segment sizes. If there is no segment data, <code>size</code> prints an error message and stops processing the file.</p> <p>-n        Print out non-loadable segment or non-allocatable section sizes. If segment data exists, <code>size</code> prints out the memory size of each loadable segment or file size of each non-loadable segment, the permission flags, and the total size of the segments. If there is no segment data, <code>size</code> prints out, for each allocatable and non-allocatable section, the memory size, the section name, and the total size of the sections. If there is no segment or section data, <code>size</code> prints an error message and stops processing.</p> <p>-o        Print numbers in octal, not decimal.</p> <p>-V        Print the version information for the <code>size</code> command on the standard error output.</p> <p>-x        Print numbers in hexadecimal; not decimal.</p>                                                                           |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Using the <code>size</code> Command</p> <p>The examples below are typical <code>size</code> output.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

size(1)

**EXAMPLE 1** Using the `size` Command (Continued)

```
example% size filename
2724 + 88 + 0 = 2812

example% size -f filename
26(.text) + 5(.init) + 5(.fini) = 36

example% size -F filename
2724(r-x) + 88(rwx) + 0(rwx) = 2812 (If statically linked)
```

**NOTES** Since the size of bss sections is not known until link-edit time, the `size` command will not give the true total size of pre-linked objects.

| <b>NAME</b>                  | sleep – suspend execution for an interval                                                                                                                                                                                                                                                                                                                  |                |                 |              |         |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| <b>SYNOPSIS</b>              | <b>sleep</b> <i>time</i>                                                                                                                                                                                                                                                                                                                                   |                |                 |              |         |
| <b>DESCRIPTION</b>           | The <code>sleep</code> utility will suspend execution for at least the integral number of seconds specified by the <code>time</code> operand.                                                                                                                                                                                                              |                |                 |              |         |
| <b>OPERANDS</b>              | The following operands are supported:<br><br><i>time</i> A non-negative decimal integer specifying the number of seconds for which to suspend execution.                                                                                                                                                                                                   |                |                 |              |         |
| <b>EXAMPLES</b>              | <b>EXAMPLE 1</b> Example of the <code>sleep</code> command.<br><br>To execute a command after a certain amount of time:<br><br><code>(sleep 105; command) &amp;</code><br>or to execute a command every so often:<br><br><pre>while true do     <i>command</i>     sleep 37 done</pre>                                                                     |                |                 |              |         |
| <b>ENVIRONMENT VARIABLES</b> | See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>sleep</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .                                                                                                                                        |                |                 |              |         |
| <b>EXIT STATUS</b>           | The following exit values are returned:<br><br>0            The execution was successfully suspended for at least <code>time</code> seconds, or a <code>SIGALRM</code> signal was received (see <b>NOTES</b> ).<br><br>>0          An error has occurred.                                                                                                  |                |                 |              |         |
| <b>ATTRIBUTES</b>            | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                               |                |                 |              |         |
|                              | <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">ATTRIBUTE TYPE</th> <th style="text-align: center;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWcsu</td> </tr> </tbody> </table>                                                                        | ATTRIBUTE TYPE | ATTRIBUTE VALUE | Availability | SUNWcsu |

| Availability                 | SUNWcsu                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |
| <b>SEE ALSO</b>              | <code>wait(1)</code> , <code>alarm(2)</code> , <code>sleep(3C)</code> , <code>wait(3UCB)</code> , <code>attributes(5)</code> , <code>environ(5)</code>                                                                                                                                                                                                     |                |                 |              |         |
| <b>NOTES</b>                 | If the <code>sleep</code> utility receives a <code>SIGALRM</code> signal, one of the following actions will be taken: <ul style="list-style-type: none"> <li>■ Terminate normally with a zero exit status.</li> <li>■ Effectively ignore the signal.</li> </ul> <p>The <code>sleep</code> utility will take the standard action for all other signals.</p> |                |                 |              |         |

## smart2cfg(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAME</b>        | smart2cfg – Compaq Smart-2 EISA/PCI and Smart-2SL PCI Array Controller ioctl utility                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>SYNOPSIS</b>    | <pre>smart2cfg -c [controller_num] smart2cfg -d [controller_num] smart2cfg -h smart2cfg -l logical_drive_num [controller_num] smart2cfg -p physical_drive_num bus_num [controller_num]</pre>                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>DESCRIPTION</b> | <p>smart2cfg issues controller-specific ioctls to the Compaq Smart-2 EISA/PCI and Smart-2SL PCI array controller using the smartii(7D) driver.</p> <p>smart2cfg provides information about the Smart-2 and Smart-2SL controllers installed on the system, the Logical and Physical drives as well as the details of the ReadWrite cache present on each controller. The utility is text based and is driven by command line arguments. smart2cfg and the smartii(7D) driver communicate using ioctls. smart2cfg also supports multiple commands.</p>                             |
| <b>OPTIONS</b>     | <pre>-c controller_num     Print cache details of the cache on controller controller_num.  -d controller_num     Print details of all the physical disks, all the logical drives, and the cache on controller controller_num.  -h     On-line help for the smart2cfg utility.  -l logical_drive_num controller_num     Print logical drive details of the drive logical_drive_num on controller controller_num.  -p physical_drive_num bus_num controller_num     Print physical drive details of the disk physical_drive_num on bus bus_num on controller controller_num.</pre> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Using smart2cfg</p> <p>Details of the physical disk with SCSI ID 0, on Bus 0, on controller 0:</p> <pre>smart2cfg -p 0 0 0</pre> <p>Logical drive details of logical drive 0 on controller 0:</p> <pre>smart2cfg -l 0 0</pre> <p>Cache details of controller 0:</p> <pre>smart2cfg -c 0</pre> <p>Information of all physical disks, logical drives, and cache on controller 0:</p>                                                                                                                                                                           |

**EXAMPLE 1** Using smart2cfg (Continued)

```
smart2cfg -d
```

Details of the disk with SCSI ID 0, on Bus 0, on controller 0, and logical drive details of logical drive 0 on controller 1:

```
smart2cfg -p 0 0 0 -1 0 1
```

**FILES**

```
/devices/eisa/smartii@<instance>, <ioaddr>:ioctlnode
/devices/pci@0, <bus_num>/pci1014, 22@<device_num>/pcie11, 4030@0:ioctlnode
/devices/pci@0, <bus_num>/pci1014, 22@<device_num>/pcie11, 4031@0:ioctlnode
```

**ATTRIBUTES**

attributes(5), smartii(7D)

**NOTES**

If the controller is not specified, the first controller is taken as default.

soelim(1)

**NAME** | soelim – resolve and eliminate .so requests from nroff or troff input

**SYNOPSIS** | **soelim** [*filename...*]

**DESCRIPTION** | soelim reads the specified files or the standard input and performs the textual inclusion implied by the nroff(1) directives of the form

.so *somefile*

when they appear at the beginning of input lines. This is useful since programs such as tbl(1) do not normally do this; it allows the placement of individual tables in separate files to be run as a part of a large document.

An argument consisting of '-' is taken to be a file name corresponding to the standard input.

Note: Inclusion can be suppressed by using ' ' instead of ' . ', that is,

' so /usr/share/lib/tmac/tmac.s

**EXAMPLES** | **EXAMPLE 1** A sample of the soelim command.

A sample usage of soelim would be

```
example% soelim exum?.n | tbl | nroff -ms | col | lpr
```

| <b>SYNOPSIS</b>                   | <code>/usr/dt/bin/solregis [-dc]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |            |                                                                              |      |       |            |         |                      |         |         |       |                            |               |     |   |                      |        |        |                                  |                          |     |        |                                                                              |                                   |              |        |      |                             |        |        |                              |                                 |     |        |                              |                           |              |        |                          |
| <b>DESCRIPTION</b>                | <p>The <code>solregis</code> command initiates the Solaris user registration procedure. This allows users to register with Sun Microsystems and receive information about Solaris. Normally, <code>solregis</code> is executed in conditional mode as a part of desktop login so that users are prompted at desktop start up time to register, unless they have already done so.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |            |                                                                              |      |       |            |         |                      |         |         |       |                            |               |     |   |                      |        |        |                                  |                          |     |        |                                                                              |                                   |              |        |      |                             |        |        |                              |                                 |     |        |                              |                           |              |        |                          |
| <b>OPTIONS</b>                    | <p>The following options are supported:</p> <p><code>-d</code>      Delay display of the initial screen until a window manager has asserted control of the X display.</p> <p><code>-c</code>      Conditional mode. If specified, <code>solregis</code> will exit without any dialog displayed if: (1) <code>\$HOME/.solregis/disable</code> exists, (2) <code>DISABLE=1</code> is specified in <code>/etc/default/solregis</code>, or (3) the user has already registered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |            |                                                                              |      |       |            |         |                      |         |         |       |                            |               |     |   |                      |        |        |                                  |                          |     |        |                                                                              |                                   |              |        |      |                             |        |        |                              |                                 |     |        |                              |                           |              |        |                          |
| <b>USAGE</b>                      | <p>The following resources can control the behavior and appearance of <code>solregis</code>:</p> <table border="1"> <thead> <tr> <th>Name</th> <th>Class</th> <th>Value Type</th> <th>Default</th> </tr> </thead> <tbody> <tr> <td><code>disable</code></td> <td>Disable</td> <td>Boolean</td> <td>False</td> </tr> <tr> <td><code>localeChoices</code></td> <td>LocaleChoices</td> <td>Int</td> <td>1</td> </tr> <tr> <td><code>action0</code></td> <td>Action</td> <td>String</td> <td><code>/usr/dt/bin/hotjava</code></td> </tr> <tr> <td><code>initialURL0</code></td> <td>URL</td> <td>String</td> <td><code>file:///usr/dt/app-config \</code><br/><code>/solregis/EReg.html</code></td> </tr> <tr> <td><code>localeChoice<i>n</i></code></td> <td>LocaleChoice</td> <td>String</td> <td>null</td> </tr> <tr> <td><code>action<i>n</i></code></td> <td>Action</td> <td>String</td> <td>null for <code>n&gt;0</code></td> </tr> <tr> <td><code>initialURL<i>n</i></code></td> <td>URL</td> <td>String</td> <td>null for <code>n&gt;0</code></td> </tr> <tr> <td><code>printContext</code></td> <td>PrintContext</td> <td>String</td> <td><code>thisorgunit</code></td> </tr> </tbody> </table> <p><code>disable</code>                      If TRUE, when executed in conditional mode <code>solregis</code> simply exits without displaying anything.</p> <p><code>localeChoices</code>              Specifies the number of <code>localeChoice<i>n</i></code>, <code>action<i>n</i></code> and <code>initialURL<i>n</i></code> sets. The first set is 0, so if <code>localeChoices</code> is 1, <code>localeChoice0</code>, <code>action0</code>, and <code>initialURL0</code> are the only active resources. If <code>localeChoices</code> is 1, none of the <code>localeChoice<i>n</i></code> strings are displayed, and <code>action0</code>, and so forth. are</p> |            |                                                                              | Name | Class | Value Type | Default | <code>disable</code> | Disable | Boolean | False | <code>localeChoices</code> | LocaleChoices | Int | 1 | <code>action0</code> | Action | String | <code>/usr/dt/bin/hotjava</code> | <code>initialURL0</code> | URL | String | <code>file:///usr/dt/app-config \</code><br><code>/solregis/EReg.html</code> | <code>localeChoice<i>n</i></code> | LocaleChoice | String | null | <code>action<i>n</i></code> | Action | String | null for <code>n&gt;0</code> | <code>initialURL<i>n</i></code> | URL | String | null for <code>n&gt;0</code> | <code>printContext</code> | PrintContext | String | <code>thisorgunit</code> |

|------------------------------|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              |                                                   | used. If <code>localeChoices</code> is greater than 1, each <code>localeChoice<i>n</i></code> string is made an element in an exclusive choice list and the index of the selected item controls which <code>action<i>n</i></code> and <code>initialURL<i>n</i></code> resources are applied.                                                                                      |
|                              | <code>localeChoice<i>n</i></code>                 | Specifies the string presented to the user for this choice.                                                                                                                                                                                                                                                                                                                       |
|                              | <code>action<i>n</i></code>                       | Specifies the file name of the command to be executed (normally expected to be a World Wide Web browser) when the user selects "Register Now", or the special string "print". If "print" is specified, the <code>initialURL<i>n</i></code> string must be a file name on the local system, naming a file which is to be printed after prompting the user for a print destination. |
|                              | <code>initialURL<i>n</i></code>                   | Specifies the argument to be passed to <code>action<i>n</i></code> for initial registration. This will normally be the Universal Resource Locator for the initial page to be displayed by the World Wide Web browser.                                                                                                                                                             |
|                              | <code>printContext</code>                         | XFN naming context under which the printers to display to the user if the special "print" action are named, in the service/printer context. For example, if the default <code>printContext</code> "thisorgunit" is used, the printers in <code>thisorgunit/service/printer</code> are displayed.                                                                                  |
| <b>ENVIRONMENT VARIABLES</b> |                                                   | See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>solregis</code> : <code>HOME</code> , <code>LANG</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .                                                                                                                                            |
| <b>EXIT STATUS</b>           |                                                   | The following exit values are returned:                                                                                                                                                                                                                                                                                                                                           |

| <b>DESCRIPTION</b>        | <p>The <code>sort</code> command sorts lines of all the named files together and writes the result on the standard output.</p> <p>Comparisons are based on one or more sort keys extracted from each line of input. By default, there is one sort key, the entire input line. Lines are ordered according to the collating sequence of the current locale.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>OPTIONS</b>            | The following options alter the default behavior:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>/usr/bin/sort</b>      | <p><code>-c</code> Checks that the single input file is ordered as specified by the arguments and the collating sequence of the current locale. The exit code is set and no output is produced unless the file is out of sort.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>/usr/xpg4/bin/sort</b> | <p><code>-c</code> Same as <code>/usr/bin/sort</code> except no output is produced under any circumstances.</p> <p><code>-m</code> Merges only. The input files are assumed to be already sorted.</p> <p><code>-u</code> Unique: suppresses all but one in each set of lines having equal keys. If used with the <code>-c</code> option, checks that there are no lines with duplicate keys in addition to checking that the input file is sorted.</p> <p><code>-o <i>output</i></code> Specifies the name of an output file to be used instead of the standard output. This file can be the same as one of the input files.</p> <p><code>-S <i>kmem</i></code> Specifies the maximum amount of swap-based memory used for sorting, in kilobytes (the default unit). <i>kmem</i> can also be specified directly as a number of bytes (b), kilobytes (k), megabytes (m), gigabytes (g), or terabytes (t); or as a percentage (%) of the installed physical memory.</p> <p><code>-T <i>directory</i></code> Specifies the <i>directory</i> in which to place temporary files.</p> <p><code>-y <i>kmem</i></code> (obsolete). This option was used to specify the amount of main memory initially used by <code>sort</code>. Its functionality is not appropriate for a virtual memory system; memory usage for <code>sort</code> is now specified using the <code>-S</code> option.</p> <p><code>-z <i>recsz</i></code> (obsolete). This option was used to prevent abnormal termination when lines longer than the system-dependent default buffer size are encountered. Because <code>sort</code> automatically allocates buffers large enough to hold the longest line, this option has no effect.</p> |

**Ordering Options**

The default sort order depends on the value of `LC_COLLATE`. If `LC_COLLATE` is set to `C`, sorting will be in ASCII order. If `LC_COLLATE` is set to `en_US`, sorting is case insensitive except when the two strings are otherwise equal and one has an uppercase letter earlier than the other. Other locales will have other sort orders.

The following options override the default ordering rules. When ordering options appear independent of any key field specifications, the requested field ordering rules are applied globally to all sort keys. When attached to a specific key (see *Sort Key Options*), the specified ordering options override all global ordering options for that key. In the obsolescent forms, if one or more of these options follows a *+pos1* option, it will affect only the key field specified by that preceding option.

- d       “Dictionary” order: only letters, digits, and blanks (spaces and tabs) are significant in comparisons.
- f       Folds lower-case letters into upper case.
- i       Ignores non-printable characters.
- M       Compares as months. The first three non-blank characters of the field are folded to upper case and compared. For example, in English the sorting order is "JAN" < "FEB" < . . . < "DEC". Invalid fields compare low to "JAN". The `-M` option implies the `-b` option (see below).
- n       Restricts the sort key to an initial numeric string, consisting of optional blank characters, optional minus sign, and zero or more digits with an optional radix character and thousands separators (as defined in the current locale), which will be sorted by arithmetic value. An empty digit string is treated as zero. Leading zeros and signs on zeros do not affect ordering.
- r       Reverses the sense of comparisons.

**Field Separator Options**

The treatment of field separators can be altered using the following options:

- b       Ignores leading blank characters when determining the starting and ending positions of a restricted sort key. If the `-b` option is specified before the first sort key option, it is applied to all sort key options. Otherwise, the `-b` option can be attached independently to each `-k field_start, field_end`, or *+pos1* or *-pos2* option-argument (see below).
- t *char*   Use *char* as the field separator character. *char* is not considered to be part of a field (although it can be included in a sort key). Each occurrence of *char* is significant (for example, `<char><char>` delimits an empty field). If `-t` is not specified, blank characters are used as default field separators; each maximal non-empty sequence of blank characters that follows a non-blank character is a field separator.

**Sort Key Options**

Sort keys can be specified using the options:

sort(1)

-k *keydef*

The *keydef* argument is a restricted sort key field definition. The format of this definition is:

-k *field\_start* [*type*] [, *field\_end* [*type*]] where:

*field\_start* and *field\_end*

define a key field restricted to a portion of the line.

*type*

is a modifier from the list of characters `bdfiMnr`. The `b` modifier behaves like the `-b` option, but applies only to the *field\_start* or *field\_end* to which it is attached and characters within a field are counted from the first non-blank character in the field. (This applies separately to *first\_character* and *last\_character*.) The other modifiers behave like the corresponding options, but apply only to the key field to which they are attached. They have this effect if specified with *field\_start*, *field\_end* or both. If any modifier is attached to a *field\_start* or to a *field\_end*, no option applies to either.

When there are multiple key fields, later keys are compared only after all earlier keys compare equal. Except when the `-u` option is specified, lines that otherwise compare equal are ordered as if none of the options `-d`, `-f`, `-i`, `-n` or `-k` were present (but with `-r` still in effect, if it was specified) and with all bytes in the lines significant to the comparison.

The notation:

-k *field\_start*[*type*][, *field\_end*[*type*]]

defines a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start* falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing *field\_end* means the last character of the line.

A field comprises a maximal sequence of non-separating characters and, in the absence of option `-t`, any preceding field separator.

The *field\_start* portion of the *keydef* option-argument has the form:

*field\_number*[.*first\_character*]

Fields and characters within fields are numbered starting with 1. *field\_number* and *first\_character*, interpreted as positive decimal

sort(1)

integers, specify the first character to be used as part of a sort key. If *.first\_character* is omitted, it refers to the first character of the field.

The *field\_end* portion of the *keydef* option-argument has the form:

*field\_number*[*.last\_character*]

The *field\_number* is as described above for *field\_start*. *last\_character*, interpreted as a non-negative decimal integer, specifies the last character to be used as part of the sort key. If *last\_character* evaluates to zero or *.last\_character* is omitted, it refers to the last character of the field specified by *field\_number*.

If the *-b* option or *b* type modifier is in effect, characters within a field are counted from the first non-blank character in the field. (This applies separately to *first\_character* and *last\_character*.)

[*+pos1* [*-pos2*]]

(obsolete). Provide functionality equivalent to the *-keydef* option.

*pos1* and *pos2* each have the form *m.n* optionally followed by one or more of the flags *bdfiMnr*. A starting position specified by *+m.n* is interpreted to mean the *n*+1st character in the *m*+1st field. A missing *.n* means *.0*, indicating the first character of the *m*+1st field. If the *b* flag is in effect *n* is counted from the first non-blank in the *m*+1st field; *+m.0b* refers to the first non-blank character in the *m*+1st field.

A last position specified by *-m.n* is interpreted to mean the *n*th character (including separators) after the last character of the *m*th field. A missing *.n* means *.0*, indicating the last character of the *m*th field. If the *b* flag is in effect *n* is counted from the last leading blank in the *m*+1st field; *-m.1b* refers to the first non-blank in the *m*+1st field.

The fully specified *+pos1 -pos2* form with type modifiers *T* and *U*:

*+w.xT -y.zU*

is equivalent to:

undefined (z==0 & U contains *b* & *-t* is present)

*-k w+1.x+1T,y.0U* (z==0 otherwise)

*-k w+1.x+1T,y+1.zU* (z > 0)

Implementations support at least nine occurrences of the sort keys (the *-k* option and obsolescent *+pos1* and *-pos2*) which are

sort(1)

significant in command line order. If no sort key is specified, a default sort key of the entire line is used.

**OPERANDS** The following operand is supported:

*file* A path name of a file to be sorted, merged or checked. If no *file* operands are specified, or if a *file* operand is `-`, the standard input will be used.

**USAGE** See `largefile(5)` for the description of the behavior of `sort` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

**EXAMPLES** In the following examples, first the preferred and then the obsolete way of specifying `sort` keys are given as an aid to understanding the relationship between the two forms.

**EXAMPLE 1** Sorting with the second field as a sort key

Either of the following commands sorts the contents of `infile` with the second field as the sort key:

```
example% sort -k 2,2 infile
example% sort +1 -2 infile
```

**EXAMPLE 2** Sorting in reverse order

Either of the following commands sorts, in reverse order, the contents of `infile1` and `infile2`, placing the output in `outfile` and using the second character of the second field as the sort key (assuming that the first character of the second field is the field separator):

```
example% sort -r -o outfile -k 2.2,2.2 infile1 infile2
example% sort -r -o outfile +1.1 -1.2 infile1 infile2
```

**EXAMPLE 3** Sorting using a specified character in one of the files

Either of the following commands sorts the contents of `infile1` and `infile2` using the second non-blank character of the second field as the sort key:

```
example% sort -k 2.2b,2.2b infile1 infile2
example% sort +1.1b -1.2b infile1 infile2
```

**EXAMPLE 4** Sorting by numeric user ID

Either of the following commands prints the `passwd(4)` file (user database) sorted by the numeric user ID (the third colon-separated field):

```
example% sort -t : -k 3,3n /etc/passwd
example% sort -t : +2 -3n /etc/passwd
```

**EXAMPLE 4** Sorting by numeric user ID (Continued)

**EXAMPLE 5** Printing sorted lines excluding lines that duplicate a field

Either of the following commands prints the lines of the already sorted file *infile*, suppressing all but one occurrence of lines having the same third field:

```
example% sort -um -k 3.1,3.0 infile
example% sort -um +2.0 -3.0 infile
```

**ENVIRONMENT VARIABLES**

See *environ(5)* for descriptions of the following environment variables that affect the execution of *sort*: *LC\_COLLATE*, *LC\_MESSAGES*, and *NLSPATH*.

- LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single- versus multi-byte characters in arguments and input files) and the behavior of character classification for the *-b*, *-d*, *-f*, *-i* and *-n* options.
- LC\_NUMERIC* Determine the locale for the definition of the radix character and thousands separator for the *-n* option.

**EXIT STATUS**

The following exit values are returned:

- 0 All input files were output successfully, or *-c* was specified and the input file was correctly sorted.
- 1 Under the *-c* option, the file was not ordered as specified, or if the *-c* and *-u* options were both specified, two input lines were found with equal keys.
- >1 An error occurred.

**FILES**

*/var/tmp/stm???* temporary files

**ATTRIBUTES**

See *attributes(5)* for descriptions of the following attributes:

*/usr/bin/sort*

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWesu         |
| CSI            | Enabled         |

*/usr/xpg4/bin/sort*

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4        |
| CSI            | Enabled         |

*comm(1)*, *join(1)*, *uniq(1)*, *passwd(4)*, *attributes(5)*, *environ(5)*, *largefile(5)*, *XPG4(5)*

sort(1)

**DIAGNOSTICS** Comments and exits with non-zero status for various trouble conditions (for example, when input lines are too long), and for disorders discovered under the `-c` option.

**NOTES** When the last line of an input file is missing a `new-line` character, `sort` appends one, prints a warning message, and continues.

`sort` does not guarantee preservation of relative line ordering on equal keys.

One can tune `sort` performance for a specific scenario using the `-S` option. However, one should note in particular that `sort` has greater knowledge of how to use a finite amount of memory for sorting than the virtual memory system. Thus, a `sort` invoked to request an extremely large amount of memory via the `-S` option will perform extremely poorly.

| <b>DESCRIPTION</b> | <p>sortbib sorts files of records containing <i>refer</i> key-letters by user-specified keys. Records may be separated by blank lines, or by ‘. [‘ and ‘.]’ delimiters, but the two styles may not be mixed together. This program reads through each <i>database</i> and pulls out key fields, which are sorted separately. The sorted key fields contain the file pointer, byte offset, and length of corresponding records. These records are delivered using disk seeks and reads, so <i>sortbib</i> may not be used in a pipeline to read standard input.</p> <p>The most common key-letters and their meanings are given below.</p> <table> <tr><td>%A</td><td>Author’s name</td></tr> <tr><td>%B</td><td>Book containing article referenced</td></tr> <tr><td>%C</td><td>City (place of publication)</td></tr> <tr><td>%D</td><td>Date of publication</td></tr> <tr><td>%E</td><td>Editor of book containing article referenced</td></tr> <tr><td>%F</td><td>Footnote number or label (supplied by <i>refer</i>)</td></tr> <tr><td>%G</td><td>Government order number</td></tr> <tr><td>%H</td><td>Header commentary, printed before reference</td></tr> <tr><td>%I</td><td>Issuer (publisher)</td></tr> <tr><td>%J</td><td>Journal containing article</td></tr> <tr><td>%K</td><td>Keywords to use in locating reference</td></tr> <tr><td>%L</td><td>Label field used by -k option of <i>refer</i></td></tr> <tr><td>%M</td><td>Bell Labs Memorandum (undefined)</td></tr> <tr><td>%N</td><td>Number within volume</td></tr> <tr><td>%O</td><td>Other commentary, printed at end of reference</td></tr> <tr><td>%P</td><td>Page number(s)</td></tr> <tr><td>%Q</td><td>Corporate or Foreign Author (unreversed)</td></tr> <tr><td>%R</td><td>Report, paper, or thesis (unpublished)</td></tr> <tr><td>%S</td><td>Series title</td></tr> <tr><td>%T</td><td>Title of article or book</td></tr> <tr><td>%V</td><td>Volume number</td></tr> <tr><td>%X</td><td>Abstract — used by <i>roffbib</i>, not by <i>refer</i></td></tr> <tr><td>%Y, Z</td><td>Ignored by <i>refer</i></td></tr> </table> | %A | Author’s name | %B | Book containing article referenced | %C | City (place of publication) | %D | Date of publication | %E | Editor of book containing article referenced | %F | Footnote number or label (supplied by <i>refer</i> ) | %G | Government order number | %H | Header commentary, printed before reference | %I | Issuer (publisher) | %J | Journal containing article | %K | Keywords to use in locating reference | %L | Label field used by -k option of <i>refer</i> | %M | Bell Labs Memorandum (undefined) | %N | Number within volume | %O | Other commentary, printed at end of reference | %P | Page number(s) | %Q | Corporate or Foreign Author (unreversed) | %R | Report, paper, or thesis (unpublished) | %S | Series title | %T | Title of article or book | %V | Volume number | %X | Abstract — used by <i>roffbib</i> , not by <i>refer</i> | %Y, Z | Ignored by <i>refer</i> |

## sortbib(1)

By default, `sortbib` alphabetizes by the first `%A` and the `%D` fields, which contain the senior author and date.

`sortbib` sorts on the last word on the `%A` line, which is assumed to be the author's last name. A word in the final position, such as 'jr.' or 'ed.', will be ignored if the name beforehand ends with a comma. Authors with two-word last names or unusual constructions can be sorted correctly by using the `nroff` convention '\0' in place of a blank. A `%Q` field is considered to be the same as `%A`, except sorting begins with the first, not the last, word. `sortbib` sorts on the last word of the `%D` line, usually the year. It also ignores leading articles (like 'A' or 'The') when sorting by titles in the `%T` or `%J` fields; it will ignore articles of any modern European language. If a sort-significant field is absent from a record, `sortbib` places that record before other records containing that field.

No more than 16 databases may be sorted together at one time. Records longer than 4096 characters will be truncated.

**OPTIONS**    `-sKEYS`    Specify new *KEYS*. For instance, `-sATD` will sort by author, title, and date, while `-sA+D` will sort by all authors, and date. Sort keys past the fourth are not meaningful.

**ATTRIBUTES**    See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWdoc         |

**SEE ALSO**    `addbib(1)`, `indxbib(1)`, `lookbib(1)`, `refer(1)`, `roffbib(1)`, `attributes(5)`

**BUGS**        Records with missing author fields should probably be sorted by title.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>NAME</b>        | sotruss – trace shared library procedure calls                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>SYNOPSIS</b>    | <code>/usr/bin/sotruss [-f] [-F <i>bindfromlist</i>] [-T <i>bindtolist</i>] [-o <i>outputfile</i>]<br/>executable [<i>executable arguments...</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | sotruss executes the specified command and produces a trace of the library calls that it performs. Each line of the trace output reports what bindings are occurring between dynamic objects as each procedure call is executed. sotruss traces all of the procedure calls that occur between dynamic objects via the <i>Procedure Linkage Table</i> , so only those procedure calls which are bound via the <i>Procedure Linkage Table</i> will be traced. See <i>Linker and Libraries Guide</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>OPTIONS</b>     | <p><code>-F <i>bindfromlist</i></code>            A colon-separated list of libraries that are to be traced. Only calls from these libraries will be traced. The default is to trace calls from the main executable only.</p> <p><code>-T <i>bindtolist</i></code>            A colon-separated list of libraries that are to be traced. Only calls to these libraries will be traced. The default is to trace all calls.</p> <p><code>-o <i>outputfile</i></code>            sotruss output will be directed to the <i>outputfile</i>. If this option is combined with the <code>-f</code> option then the <i>pid</i> of the executing program will be placed at the end of the filename. By default sotruss output is placed on <code>stderr</code>.</p> <p><code>-f</code>                            Follow all children created by <code>fork()</code> and print <code>truss</code> output on each child process. This option will also cause a <i>pid</i> to be output on each <code>truss</code> output line.</p> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> An example of sotruss.</p> <p>A simple example shows the tracing of a simple <code>ls</code> command:</p> <pre>% sotruss ls   more ls      -&gt;      libc.so.1:*atexit(0xef7d7d1c, 0x23c00, 0x0) ls      -&gt;      libc.so.1:*atexit(0x1392c, 0xef7d7d1c, 0xef621bb0) ls      -&gt;      libc.so.1:*setlocale(0x6, 0x1396c, 0xef621ba8) ls      -&gt;      libc.so.1:*textdomain(0x13970, 0x1396c, 0xef621ba8) ls      -&gt;      libc.so.1:*time(0x0, 0xef61f6fc, 0xef621ba8) ls      -&gt;      libc.so.1:*isatty(0x1, 0xef61f6fc, 0x0) ls      -&gt;      libc.so.1:*getopt(0x1, 0xfffff8fc, 0x13980) ls      -&gt;      libc.so.1:*malloc(0x100, 0x0, 0x0) ls      -&gt;      libc.so.1:*malloc(0x9000, 0x0, 0x0) ls      -&gt;      libc.so.1:*lstat64(0x23ee8, 0xfffff7a0, 0x0) . . . ls      -&gt;      libc.so.1:*printf(0x13a64, 0x26208, 0x23ef0) ls      -&gt;      libc.so.1:*printf(0x13a64, 0x26448, 0x23ef0) ls      -&gt;      libc.so.1:*exit(0x0, 0x24220, 0x2421c)</pre>        |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>DESCRIPTION</b>     | <p>The <code>spell</code> command collects words from the named <code>files</code> and looks them up in a spelling list. Words that neither occur among nor are derivable (by applying certain inflections, prefixes, or suffixes) from words in the spelling list are written to the standard output.</p> <p>If there are no <code>file</code> arguments, words to check are collected from the standard input. <code>spell</code> ignores most <code>troff(1)</code>, <code>tbl(1)</code>, and <code>eqn(1)</code> constructs. Copies of all output words are accumulated in the history file (<code>spellhist</code>), and a stop list filters out misspellings (for example, <code>their=thy-y+ier</code>) that would otherwise pass.</p> <p>By default, <code>spell</code> (like <code>deroff(1)</code>) follows chains of included files (<code>.so</code> and <code>.nx troff(1)</code> requests), unless the names of such included files begin with <code>/usr/lib</code>.</p> <p>The standard spelling list is based on many sources, and while more haphazard than an ordinary dictionary, is also more effective in respect to proper names and popular technical words. Coverage of the specialized vocabularies of biology, medicine and chemistry is light.</p> <p>Three programs help maintain and check the hash lists used by <code>spell</code>:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;"><code>hashmake</code></td> <td>Reads a list of words from the standard input and writes the corresponding nine-digit hash code on the standard output.</td> </tr> <tr> <td><code>spellin</code></td> <td>Reads <i>n</i> hash codes from the standard input and writes a compressed spelling list on the standard output.</td> </tr> <tr> <td><code>hashcheck</code></td> <td>Reads a compressed <i>spelling_list</i> and recreates the nine-digit hash codes for all the words in it. It writes these codes on the standard output.</td> </tr> </table> | <code>hashmake</code> | Reads a list of words from the standard input and writes the corresponding nine-digit hash code on the standard output.                                                                | <code>spellin</code> | Reads <i>n</i> hash codes from the standard input and writes a compressed spelling list on the standard output.                                                             | <code>hashcheck</code> | Reads a compressed <i>spelling_list</i> and recreates the nine-digit hash codes for all the words in it. It writes these codes on the standard output. |    |                                                                                                                           |
| <code>hashmake</code>  | Reads a list of words from the standard input and writes the corresponding nine-digit hash code on the standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                       |                                                                                                                                                                                        |                      |                                                                                                                                                                             |                        |                                                                                                                                                        |    |                                                                                                                           |
| <code>spellin</code>   | Reads <i>n</i> hash codes from the standard input and writes a compressed spelling list on the standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                       |                                                                                                                                                                                        |                      |                                                                                                                                                                             |                        |                                                                                                                                                        |    |                                                                                                                           |
| <code>hashcheck</code> | Reads a compressed <i>spelling_list</i> and recreates the nine-digit hash codes for all the words in it. It writes these codes on the standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                       |                                                                                                                                                                                        |                      |                                                                                                                                                                             |                        |                                                                                                                                                        |    |                                                                                                                           |

## spell(1)

**-x** Print every plausible stem, one per line, with = preceding each word.

**+local\_file** Specify a set of words that are correct spellings (in addition to spell's own spelling list) for each job. *local\_file* is the name of a user-provided file that contains a sorted list of words, one per line. Words found in *local\_file* are removed from spell's output. Use `sort(1)` to order *local\_file* in ASCII collating sequence. If this ordering is not followed, some entries in *local\_file* may be ignored.

**OPERANDS** The following operands are supported:

**file** A path name of a text file to check for spelling errors. If no files are named, words are collected from the standard input.

**ENVIRONMENT VARIABLES** See `environ(5)` for descriptions of the following environment variables that affect the execution of `spell`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**FILES** `D_SPELL=/usr/lib/spell/hlist [ab]`  
hashed spelling lists, American & British

`S_SPELL=/usr/lib/spell/hstop`  
hashed stop list

`H_SPELL=/var/adm/spellhist`  
history file

`/usr/share/lib/dict/words`  
master dictionary

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWesu         |

**NOTES** Misspelled words can be monitored by default by setting the `H_SPELL` variable in `/usr/bin/spell` to the name of a file that has permission mode 666.

`spell` works only on English words defined in the U.S. ASCII codeset.

Because copies of all output are accumulated in the `spellhist` file, `spellhist` may grow quite large and require purging.

spell(1)

**BUGS** The spelling list's coverage is uneven; new installations may wish to monitor the output for several months to gather local additions.

British spelling was done by an American.

spline(1)

**NAME** spline – interpolate smooth curve

**SYNOPSIS** **spline** [-aknpx] ...

**DESCRIPTION** spline takes pairs of numbers from the standard input as abscissas and ordinates of a function. It produces a similar set, which is approximately equally spaced and includes the input set, on the standard output. The cubic spline output (R. W. Hamming, *Numerical Methods for Scientists and Engineers*, 2nd ed., 349ff) has two continuous derivatives, and sufficiently many points to look smooth when plotted, for example by graph(1).

**OPTIONS**

- a Supply abscissas automatically (they are missing from the input); spacing is given by the next argument, or is assumed to be 1 if next argument is not a number.
- k The constant  $k$  used in the boundary value computation  
 $(2nd\ deriv.\ at\ end) = k*(2nd\ deriv.\ next\ to\ end)$   
is set by the next argument. By default  $k = 0$ .
- n Space output points so that approximately  $n$  intervals occur between the lower and upper  $x$  limits. (Default  $n = 100$ .)
- p Make output periodic, that is, match derivatives at ends. First and last input values should normally agree.
- x Next 1 (or 2) arguments are lower (and upper)  $x$  limits. Normally these limits are calculated from the data. Automatic abscissas start at lower limit (default 0).

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

**SEE ALSO** graph(1), attributes(5)  
R. W. Hamming, *Numerical Methods for Scientists and Engineers*, 2nd ed.

**DIAGNOSTICS** When data is not strictly monotonic in  $x$ , spline reproduces the input without interpolating extra points.

**BUGS** A limit of 1000 input points is enforced silently.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>NAME</b>                  | split – split a file into pieces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>              | <pre>split [-linecount   -l <i>linecount</i>] [-a <i>suffixlength</i>] [<i>file</i> [<i>name</i>]]</pre> <pre>split [-b <i>n</i>   <i>nk</i>   <i>nm</i>] [-a <i>suffixlength</i>] [<i>file</i> [<i>name</i>]]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b>           | The <code>split</code> utility reads <i>file</i> and writes it in <i>linecount</i> -line pieces into a set of output-files. The name of the first output-file is <i>name</i> with <i>aa</i> appended, and so on lexicographically, up to <i>zz</i> (a maximum of 676 files). The maximum length of <i>name</i> is 2 characters less than the maximum filename length allowed by the filesystem. See <code>statvfs(2)</code> . If no output name is given, <i>x</i> is used as the default (output-files will be called <i>xaa</i> , <i>xab</i> , and so forth).                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>OPTIONS</b>               | <p>The following options are supported:</p> <p><i>-linecount</i>   <i>-l linecount</i>      Number of lines in each piece. Defaults to 1000 lines.</p> <p><i>-a suffixlength</i>                    Uses <i>suffixlength</i> letters to form the suffix portion of the filenames of the split file. If <i>-a</i> is not specified, the default suffix length is 2. If the sum of the <i>name</i> operand and the <i>suffixlength</i> option-argument would create a filename exceeding <code>NAME_MAX</code> bytes, an error will result; <code>split</code> will exit with a diagnostic message and no files will be created.</p> <p><i>-b n</i>                                    Splits a file into pieces <i>n</i> bytes in size.</p> <p><i>-b nk</i>                                  Splits a file into pieces <i>n</i>*1024 bytes in size.</p> <p><i>-b nm</i>                                  Splits a file into pieces <i>n</i>*1 048 576 bytes in size.</p> |
| <b>OPERANDS</b>              | <p>The following operands are supported:</p> <p><i>file</i>                                    The path name of the ordinary file to be split. If no input file is given or <i>file</i> is <i>-</i>, the standard input will be used.</p> <p><i>name</i>                                    The prefix to be used for each of the files resulting from the <code>split</code> operation. If no <i>name</i> argument is given, <i>x</i> will be used as the prefix of the output files. The combined length of the basename of <i>prefix</i> and <i>suffixlength</i> cannot exceed <code>NAME_MAX</code> bytes; see <code>OPTIONS</code>.</p>                                                                                                                                                                                                                                                                                                                            |
| <b>USAGE</b>                 | See <code>largefile(5)</code> for the description of the behavior of <code>split</code> when encountering files greater than or equal to 2 Gbyte (2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ENVIRONMENT VARIABLES</b> | See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>split</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>EXIT STATUS</b>           | <p>The following exit values are returned:</p> <p>0                                        Successful completion.</p> <p>&gt;0                                      An error occurred.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>DESCRIPTION</b> | <p>The <i>srchtxt</i> utility is used to display all the text strings in message data bases, or to search for a text string in message data bases (see <i>mkmsgs(1)</i>). These data bases are files in the directory <code>/usr/lib/locale/locale/LC_MESSAGES</code> (see <i>setlocale(3C)</i>), unless a file name given with the <code>-m</code> option contains a <code>/</code>. The directory <i>locale</i> can be viewed as the name of the language in which the text strings are written. If the <code>-l</code> option is not specified, the files accessed will be determined by the value of the environment variable <code>LC_MESSAGES</code>. If <code>LC_MESSAGES</code> is not set, the files accessed will be determined by the value of the environment variable <code>LANG</code>. If <code>LANG</code> is not set, the files accessed will be in the directory <code>/usr/lib/locale//C/LC_MESSAGES</code>, which contains default strings.</p> <p>If no <i>text</i> argument is present, then all the text strings in the files accessed will be displayed.</p> <p>If the <code>-s</code> option is not specified, the displayed text is prefixed by message sequence numbers. The message sequence numbers are enclosed in angle brackets: <code>&lt;msgfile:msgnum&gt;</code>.</p> <p><i>msgfile</i>                    name of the file where the displayed text occurred</p> <p><i>msgnum</i>                    sequence number in <i>msgfile</i> where the displayed text occurred</p> <p>This display is in the format used by <i>gettext(1)</i> and <i>gettext(3C)</i>.</p> |
| <b>OPTIONS</b>     | <p><code>-s</code>                    Suppress printing of the message sequence numbers of the messages being displayed.</p> <p><code>-l locale</code>            Access files in the directory <code>/usr/lib/locale/locale/LC_MESSAGES</code>. If <code>-m msgfile</code> is also supplied, <code>LOCALE</code> is ignored for <i>msgfiles</i> containing a <code>/</code>.</p> <p><code>-m msgfile</code>           Access files specified by one or more <i>msgfiles</i>. If <i>msgfile</i> contains a <code>/</code> character, then <i>msgfile</i> is interpreted as a pathname; otherwise, it will be assumed to be in the directory determined as described above. To specify more than one <i>msgfile</i>, separate the file names using commas.</p> <p><i>text</i>                    Search for the text string specified by <i>text</i> and display each one that matches. <i>text</i> can take the form of a regular expression; see <i>regex(5)</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Using <i>srchtxt</i></p> <p>If message files have been installed in a locale named <i>french</i> by using <i>mkmsgs(1)</i>, then you could display the entire set of text strings in the <i>french</i> locale (<code>/usr/lib/locale/french/LC_MESSAGES/*</code>) by typing:</p> <pre>example% srchtxt -l french</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## srchtxt(1)

### EXAMPLE 1 Using srchtxt (Continued)

### EXAMPLE 2 Using srchtxt

If a set of error messages associated with the operating system have been installed in the file UX in the french locale (/usr/lib/locale/french/LC\_MESSAGE/UX), then, using the value of the LANG environment variable to determine the locale to be searched, you could search that file in that locale for all error messages dealing with files by typing:

```
example% setenv LANG=french; export LANG
example% srchtxt -m UX "[Ff]ichier"
```

If /usr/lib/locale/french/LC\_MESSAGES/UX contained the following strings:

```
Erreur E/S\n
Liste d'arguments trop longue\n
Fichier inexistant\n
Argument invalide\n
Trop de fichiers ouverts\n
Fichier trop long\n
Trop de liens\n
Argument hors du domaine\n
Identificateur supprim\n
Etreinte fatale\n
.\n
.\n
.
```

then the following strings would be displayed:

```
<UX:3>Fichier inexistant\n
<UX:5>Trop de fichiers ouverts\n
<UX:6>Fichier trop long\n
```

### EXAMPLE 3 Using srchtxt

If a set of error messages associated with the operating system have been installed in the file UX and a set of error messages associated with the INGRESS data base product have been installed in the file ingress, both in the german locale, then you could search for the pattern [Dd]atei in both the files UX and ingress in the german locale by typing:

```
example% srchtxt -l german -m UX,ingress "[Dd]atei"
```

## ENVIRONMENT VARIABLES

See environ(5) for a description of the LC\_CTYPE environment variable that affects the execution of srchtxt.

## FILES

/usr/lib/locale/C/LC\_MESSAGES/\*  
default files created by mkmsgs(1)

/usr/lib/locale/locale/LC\_MESSAGES/\*  
message files created by mkmsgs(1)

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWloc         |

**SEE ALSO** `exstr(1)`, `gettxt(1)`, `locale(1)`, `mkmsgs(1)`, `gettxt(3C)`, `setlocale(3C)`, `attributes(5)`, `environ(5)`, `locale(5)`, `regex(5)`

**DIAGNOSTICS** The error messages produced by `srchtxt` are intended to be self-explanatory. They indicate an error in the command line or errors encountered while searching for a particular locale and/or message file.

## strchg(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>DESCRIPTION</b> | <p>These commands are used to alter or query the configuration of the stream associated with the user's standard input. The <b>strchg</b> command pushes modules on and/or pops modules off the stream. The <b>strconf</b> command queries the configuration of the stream. Only the super-user or owner of a STREAMS device may alter the configuration of that stream.</p> <p>Invoked without any arguments, <b>strconf</b> prints a list of all the modules in the stream as well as the topmost driver. The list is printed with one name per line where the first name printed is the topmost module on the stream (if one exists) and the last item printed is the name of the driver.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>OPTIONS</b>     | <p>The following options apply to <b>strchg</b> and, -h, -f, and -p are mutually exclusive.</p> <p>-h <i>module1</i> [, <i>module2</i>. . . ]<br/>Mnemonic for <i>push</i>, pushes modules onto a stream. It takes as arguments the names of one or more pushable streams modules. These modules are pushed in order; that is, <i>module1</i> is pushed first, <i>module2</i> is pushed second, etc.</p> <p>-p<br/>Mnemonic for <i>pop</i>, pops modules off the stream. With the -p option alone, <b>strchg</b> pops the topmost module from the stream.</p> <p>-a <i>module</i><br/>Pop all the modules above the topmost driver off the stream. This option requires the -p option.</p> <p>-u <i>module</i><br/>All modules above, but not including <i>module</i> are popped off the stream. This option requires the -p option.</p> <p>-f <i>filename</i><br/>Specify a <i>filename</i> that contains a list of modules representing the desired configuration of the stream. Each module name must appear on a separate line where the first name represents the topmost module and the last name represents the module that should be closest to the driver. <b>strchg</b> will determine the current configuration of the stream and pop and push the necessary modules in order to end up with the desired configuration.</p> <p>The following options apply to <b>strconf</b> and, -m and -t are mutually exclusive.</p> <p>-m <i>module</i>            Determine if the named <i>module</i> is present on a stream. If it is, <b>strconf</b> prints the message <i>yes</i> and returns zero. If not,</p> |

`strconf` prints the message `no` and returns a non-zero value. The `-t` and `-m` options are mutually exclusive.

`-t module` Print only the topmost module (if one exists). The `-t` and `-m` options are mutually exclusive.

#### EXAMPLES **EXAMPLE 1** Using the `strchg` Command

The following command pushes the module `ldterm` on the stream associated with the user's standard input:

```
example% strchg -h ldterm
```

The following command pops the topmost module from the stream associated with `/dev/term/24`. The user must be the owner of this device or the super user.

```
example% strchg -p < /dev/term/24
```

If the file `fileconf` contains the following:

```
ttcompat
ldterm
ptem
```

then the command

```
example% strchg -f fileconf
```

will configure the user's standard input stream so that the module `ptem` is pushed over the driver, followed by `ldterm` and `ttcompat` closest to the stream head.

The `strconf` command with no arguments lists the modules and topmost driver on the stream; for a stream that has only the module `ldterm` pushed above the `zs` driver, it would produce the following output:

```
ldterm
zs
```

The following command asks if `ldterm` is on the stream:

```
example% strconf -m ldterm
```

and produces the following output while returning an exit status of 0:

```
yes
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `attributes(5)`, `streamio(7I)`

strchg(1)

**DIAGNOSTICS**

`strchg` returns zero on success. It prints an error message and returns non-zero status for various error conditions, including usage error, bad module name, too many modules to push, failure of an `ioctl` on the stream, or failure to open *filename* from the `-f` option.

`strconf` returns zero on success (for the `-m` or `-t` option, "success" means the named or topmost module is present). It returns a non-zero status if invoked with the `-m` or `-t` option and the module is not present. It prints an error message and returns non-zero status for various error conditions, including usage error or failure of an `ioctl` on the stream.

**NOTES**

If the user is neither the owner of the stream nor the super-user, the `strchg` command will fail. If the user does not have read permissions on the stream and is not the super user, the `strconf` command will fail.

If modules are pushed in the wrong order, one could end up with a stream that does not function as expected. For ttys, if the line discipline module is not pushed in the correct place, one could have a terminal that does not respond to any commands.

| <b>NAME</b>                  | strings – find printable strings in an object or binary file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                 |              |         |     |         |

| <b>SYNOPSIS</b>              | <b>strings</b> [-a   -] [-t <i>format</i>   -o] [-n <i>number</i>   -number] [ <i>file</i> ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |     |         |
| <b>DESCRIPTION</b>           | <p>The <code>strings</code> utility looks for ASCII strings in a binary file. A string is any sequence of 4 or more printing characters ending with a newline or a null character.</p> <p><code>strings</code> is useful for identifying random object files and many other things.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |         |     |         |
| <b>OPTIONS</b>               | <p>The following options are supported:</p> <p>-a   -                                Look everywhere in the file for strings. If this flag is omitted, <code>strings</code> only looks in the initialized data space of object files.</p> <p>-n <i>number</i>   -<i>number</i>                Use a <i>number</i> as the minimum string length rather than the default, which is 4.</p> <p>-o                                        Equivalent to -t d option.</p> <p>-t <i>format</i>                                Write each string preceded by its byte offset from the start of the file. The format is dependent on the single character used as the <i>format</i> option-argument:</p> <p style="margin-left: 40px;">d                                        The offset will be written in decimal.</p> <p style="margin-left: 40px;">o                                        The offset will be written in octal.</p> <p style="margin-left: 40px;">x                                        The offset will be written in hexadecimal.</p> |                |                 |              |         |     |         |
| <b>OPERANDS</b>              | <p>The following operand is supported:</p> <p><i>file</i>                                    A path name of a regular file to be used as input. If no <i>file</i> operand is specified, the <code>strings</code> utility will read from the standard input.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |     |         |
| <b>ENVIRONMENT VARIABLES</b> | See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>strings</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                 |              |         |     |         |

strings(1)

**NOTES**

The algorithm for identifying strings is extremely primitive.

For backwards compatibility, the options -a and - are interchangeable.

| <b>NAME</b>                  | strip – strip symbol table, debugging and line number information from an object file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>              | <code>/usr/ccs/bin/strip [-blrVx] file...</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>DESCRIPTION</b>           | <p>The <code>strip</code> command removes the symbol table, debugging information, and line number information from ELF object files. Once this stripping process has been done, no symbolic debugging access will be available for that file; therefore, this command is normally run only on production modules that have been debugged and tested.</p> <p>If <code>strip</code> is executed on a common archive file (see <code>ar(3HEAD)</code>) in addition to processing the members, <code>strip</code> will remove the archive symbol table. The archive symbol table must be restored by executing the <code>ar(1)</code> command with the <code>-s</code> option before the archive can be linked by the <code>ld(1)</code> command. <code>strip</code> will produce appropriate warning messages when this situation arises.</p> <p><code>strip</code> is used to reduce the file storage overhead taken by the object file.</p> |
| <b>OPTIONS</b>               | <p>The amount of information stripped from the ELF object file can be controlled by using any of the following options:</p> <ul style="list-style-type: none"> <li>-b        Same effect as the default behavior. This option is obsolete and will be removed in the next release.</li> <li>-l        Strip line number information only; do not strip the symbol table or debugging information.</li> <li>-r        Same effect as the default behavior. This option is obsolete and will be removed in the next release.</li> <li>-V        Print, on standard error, the version number of <code>strip</code>.</li> <li>-x        Do not strip the symbol table; debugging and line number information may be stripped.</li> </ul>                                                                                                                                                                                                       |
| <b>OPERANDS</b>              | <p>The following operand is supported:</p> <p><code>file</code>    A path name referring to an executable file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>NAME</b>          | stty – set the options for a terminal                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |
| <b>SYNOPSIS</b>      | <pre> /usr/bin/stty [-a] [-g] /usr/bin/stty [modes] /usr/xpg4/bin/stty [-a   -g] /usr/xpg4/bin/stty [modes] </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |
| <b>DESCRIPTION</b>   | <p>The <code>stty</code> command sets certain terminal I/O options for the device that is the current standard input; without arguments, it reports the settings of certain options.</p> <p>In this report, if a character is preceded by a caret (^), then the value of that option is the corresponding control character (for example, “^h” is CTRL-H; in this case, recall that CTRL-H is the same as the “back-space” key). The sequence “^” means that an option has a null value.</p> <p>See <code>termio(7I)</code> for detailed information about the modes listed from <code>Control Modes</code> through <code>Local Modes</code>. For detailed information about the modes listed under <code>Hardware Flow Control Modes</code> and <code>Clock Modes</code>, below, see <code>termiox(7I)</code>.</p> <p>Operands described in the <code>Combination Modes</code> section are implemented using options in the earlier sections. Note that many combinations of options make no sense, but no sanity checking is performed. Hardware flow control and clock modes options may not be supported by all hardware interfaces.</p> |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |
| <b>OPTIONS</b>       | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-a        Write to standard output all of the option settings for the terminal.</li> <li>-g        Report current settings in a form that can be used as an argument to another <code>stty</code> command. Emits <code>termios</code>-type output if the underlying driver supports it; otherwise, it emits <code>termio</code>-type output.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |
| <b>OPERANDS</b>      | The following <i>mode</i> operands are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |
| <b>Control Modes</b> | <table border="0" style="width: 100%;"> <tr> <td style="padding-right: 20px;">parenb(-parenb)</td> <td>Enable (disable) parity generation and detection.</td> </tr> <tr> <td>parext(-parext)</td> <td>Enable (disable) extended parity generation and detection for mark and space parity.</td> </tr> <tr> <td>parodd(-parodd)</td> <td>Select odd (even) parity, or mark (space) parity if parext is enabled.</td> </tr> <tr> <td>cs5 cs6 cs7 cs8</td> <td>Select character size (see <code>termio(7I)</code>).</td> </tr> <tr> <td>0</td> <td>Hang up line immediately.</td> </tr> <tr> <td>hupcl (-hupcl)</td> <td>Hang up (do not hang up) connection on last close.</td> </tr> <tr> <td>hup (-hup)</td> <td>Same as hupcl(-hupcl).</td> </tr> <tr> <td>cstopb (-cstopb)</td> <td>Use two (one) stop bits per character.</td> </tr> </table>                                                                                                                                                                                                                                                                                             | parenb(-parenb) | Enable (disable) parity generation and detection. | parext(-parext) | Enable (disable) extended parity generation and detection for mark and space parity. | parodd(-parodd) | Select odd (even) parity, or mark (space) parity if parext is enabled. | cs5 cs6 cs7 cs8 | Select character size (see <code>termio(7I)</code> ). | 0 | Hang up line immediately. | hupcl (-hupcl) | Hang up (do not hang up) connection on last close. | hup (-hup) | Same as hupcl(-hupcl). | cstopb (-cstopb) | Use two (one) stop bits per character. |
| parenb(-parenb)      | Enable (disable) parity generation and detection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |
| parext(-parext)      | Enable (disable) extended parity generation and detection for mark and space parity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                 |                                                   |                 |                                                                                      |                 |                                                                        |                 |                                                       |   |                           |                |                                                    |            |                        |                  |                                        |

## stty(1)

| Local Modes |                                 |                                                                                                                                                                                                                                                                                          |
|-------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <code>isig(-isig)</code>        | Enable (disable) the checking of characters against the special control characters INTR, QUIT, SWTCH, and SUSP.                                                                                                                                                                          |
|             | <code>icanon (-icanon)</code>   | Enable (disable) canonical input (ERASE and KILL processing). Does not set MIN or TIME.                                                                                                                                                                                                  |
|             | <code>xcase (-xcase)</code>     | Canonical (unprocessed) upper/lower-case presentation.                                                                                                                                                                                                                                   |
|             | <code>echo (-echo)</code>       | Echo back (do not echo back) every character typed.                                                                                                                                                                                                                                      |
|             | <code>echoe (-echoe)</code>     | Echo (do not echo) ERASE character as a backspace-space-backspace string. Note: This mode will erase the ERASEed character on many CRT terminals; however, it does not keep track of column position and, as a result, it may be confusing for escaped characters, tabs, and backspaces. |
|             | <code>echok(-echok)</code>      | Echo (do not echo) NL after KILL character.                                                                                                                                                                                                                                              |
|             | <code>lfkc (-lfkc)</code>       | The same as <code>echok(-echok)</code> ; obsolete.                                                                                                                                                                                                                                       |
|             | <code>echonl (-echonl)</code>   | Echo (do not echo) NL.                                                                                                                                                                                                                                                                   |
|             | <code>noflsh (-noflsh)</code>   | Disable (enable) flush after INTR, QUIT, or SUSP.                                                                                                                                                                                                                                        |
|             | <code>stwrap (-stwrap)</code>   | Disable (enable) truncation of lines longer than 79 characters on a synchronous line.                                                                                                                                                                                                    |
|             | <code>tostop (-tostop)</code>   | Send (do not send) SIGTTOU when background processes write to the terminal.                                                                                                                                                                                                              |
|             | <code>echoctl (-echoctl)</code> | Echo (do not echo) control characters as <i>^char</i> , delete as <i>^?</i> .                                                                                                                                                                                                            |
|             | <code>echoprt (-echoprt)</code> | Echo (do not echo) erase character as character is "erased".                                                                                                                                                                                                                             |
|             | <code>echoke (-echoke)</code>   | BS-SP-BS erase (do not BS-SP-BS erase) entire line on line kill.                                                                                                                                                                                                                         |
|             | <code>flusho (-flusho)</code>   | Output is (is not) being flushed.                                                                                                                                                                                                                                                        |
|             | <code>pendin (-pendin)</code>   | Retype (do not retype) pending input at next read or input character.                                                                                                                                                                                                                    |
|             | <code>iexten (-iexten)</code>   | Enable (disable) special control characters not currently controlled by <code>icanon</code> , <code>isig</code> , <code>ixon</code> , or <code>ixoff</code> : VEOLZ, VSWTCH, VREPRINT, VDISCARD, VDSUSP, VWERASE, and VLNEXT.                                                            |
|             | <code>stflush (-stflush)</code> | Enable (disable) flush on a synchronous line after every <code>write(2)</code> .                                                                                                                                                                                                         |

|                                    |                    |                                                                                                                                                         |
|------------------------------------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hardware Flow Control Modes</b> | stappl (-stappl)   | Use application mode (use line mode) on a synchronous line.                                                                                             |
|                                    | rtsxoff (-rtsxoff) | Enable (disable) RTS hardware flow control on input.                                                                                                    |
|                                    | ctsxon (-ctsxon)   | Enable (disable) CTS hardware flow control on output.                                                                                                   |
|                                    | dtrxoff (-dtrxoff) | Enable (disable) DTR hardware flow control on input.                                                                                                    |
|                                    | cdxon (-cdxon)     | Enable (disable) CD hardware flow control on output.                                                                                                    |
|                                    | isxoff (-isxoff)   | Enable (disable) isochronous hardware flow control on input.                                                                                            |
| <b>Clock Modes</b>                 | xcibrg             | Get transmit clock from internal baud rate generator.                                                                                                   |
|                                    | xctset             | Get the transmit clock from transmitter signal element timing (DCE source) lead, CCITT V.24 circuit 114, EIA-232-D pin 15.                              |
|                                    | xcrset             | Get transmit clock from receiver signal element timing (DCE source) lead, CCITT V.24 circuit 115, EIA-232-D pin 17.                                     |
|                                    | rcibrg             | Get receive clock from internal baud rate generator.                                                                                                    |
|                                    | rctset             | Get receive clock from transmitter signal element timing (DCE source) lead, CCITT V.24 circuit 114, EIA-232-D pin 15.                                   |
|                                    | rcrset             | Get receive clock from receiver signal element timing (DCE source) lead, CCITT V.24 circuit 115, EIA-232-D pin 17.                                      |
|                                    | tsetcoff           | Transmitter signal element timing clock not provided.                                                                                                   |
|                                    | tsetcrbrg          | Output receive baud rate generator on transmitter signal element timing (DTE source) lead, CCITT V.24 circuit 113, EIA-232-D pin 24.                    |
|                                    | tsetctbrg          | Output transmit baud rate generator on transmitter signal element timing (DTE source) lead, CCITT V.24 circuit 113, EIA-232-D pin 24.                   |
|                                    | tsetctset          | Output transmitter signal element timing (DCE source) on transmitter signal element timing (DTE source) lead, CCITT V.24 circuit 113, EIA-232-D pin 24. |
|                                    | tsetcrset          | Output receiver signal element timing (DCE source) on transmitter signal element timing (DTE source) lead, CCITT V.24 circuit 113, EIA-232-D pin 24.    |
|                                    | rsetcoff           | Receiver signal element timing clock not provided.                                                                                                      |
|                                    | rsetcrbrg          | Output receive baud rate generator on receiver signal element timing (DTE source) lead, CCITT V.24 circuit 128, no EIA-232-D pin.                       |

stty(1)

**Control Assignments**

- rsetctbrg      Output transmit baud rate generator on receiver signal element timing (DTE source) lead, CCITT V.24 circuit 128, no EIA-232-D pin.
- rsetctset      Output transmitter signal element timing (DCE source) on receiver signal element timing (DTE source) lead, CCITT V.24 circuit 128, no EIA-232-D pin.
- rsetcrset      Output receiver signal element timing (DCE source) on receiver signal element timing (DTE source) lead, CCITT V.24 circuit 128, no EIA-232-D pin.

*control-character c*      Set *control-character* to *c*, where:

*control-character*

is *ctab*, *discard*, *dsusp*, *eof*, *eol*, *eol2*, *erase*, *intr*, *kill*, *lnext*, *quit*, *reprint*, *start*, *stop*, *susp*, *swtch*, or *werase* (*ctab* is used with *-stappl*, see *termio(7I)*).

*c*

If *c* is a single character, the control character will be set to that character.

In the POSIX locale, if *c* is preceded by a caret (^) indicating an escape from the shell and is one of those listed in the ^*c* column of the following table, then its value used (in the Value column) is the corresponding control character (for example, “^d” is a CTRL-D). “^?” is interpreted as DEL and “^-” is interpreted as undefined.

| <i>^c</i> | Value | <i>^c</i> | Value | <i>^c</i> | Value |
|-----------|-------|-----------|-------|-----------|-------|
| a, A      | <SOH> | l, L      | <FF>  | w, W      | <ETB> |
| b, B      | <STX> | m, M      | <CR>  | x, X      | <CAN> |
| c, C      | <ETX> | n, N      | <SO>  | y, Y      | <EM>  |
| d, D      | <EOT> | o, O      | <SI>  | z, Z      | <SUB> |

| k, K           | <VT>  | v, V           | <SYN> |                |       |

|                           |                      |          |                                                                                                                                                |
|---------------------------|----------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Combination Modes</b>  | min <i>number</i>    |          |                                                                                                                                                |
|                           | time <i>number</i>   |          | Set the value of min or time to <i>number</i> . MIN and TIME are used in Non-Canonical mode input processing (-icanon).                        |
|                           | line <i>i</i>        |          | Set line discipline to <i>i</i> (0 < <i>i</i> < 127).                                                                                          |
|                           | saved settings       |          | Set the current terminal characteristics to the saved settings produced by the -g option.                                                      |
|                           | evenp or parity      |          | Enable parenb and cs7, or disable parodd.                                                                                                      |
|                           | oddp                 |          | Enable parenb, cs7, and parodd.                                                                                                                |
|                           | spacep               |          | Enable parenb, cs7, and parext.                                                                                                                |
|                           | markp                |          | Enable parenb, cs7, parodd, and parext.                                                                                                        |
|                           | -parity, or -evenp   |          | Disable parenb, and set cs8.                                                                                                                   |
|                           | -oddp                |          | Disable parenb and parodd, and set cs8.                                                                                                        |
|                           | -spacep              |          | Disable parenb and parext, and set cs8.                                                                                                        |
|                           | -markp               |          | Disable parenb, parodd, and parext, and set cs8.                                                                                               |
|                           | raw (-raw or cooked) |          | Enable (disable) raw input and output. Raw mode is equivalent to setting:<br><br>stty cs8 -icanon min 1 time 0 -isig -xcase \<br>-inpck -opost |
|                           | <b>/usr/bin/stty</b> | nl (-nl) |                                                                                                                                                |
| <b>/usr/xpg4/bin/stty</b> | nl (-nl)             |          | Set (unset) icrnl. In addition, -nl unsets inlcr, igncr, ocrnl, and onlret; -nl sets onlcr, and nl unsets onlcr.                               |
|                           | lcase (-lcase)       |          | Set (unset) xcase, iuclc, and olcuc.                                                                                                           |
|                           | LCASE (-LCASE)       |          | Same as lcase (-lcase).                                                                                                                        |
|                           | tabs (-tabs or tab3) |          | Preserve (expand to spaces) tabs when printing.                                                                                                |
|                           | ek                   |          | Reset ERASE and KILL characters back to normal # and @.                                                                                        |
|                           | sane                 |          | Resets all modes to some reasonable values.                                                                                                    |

stty(1)

*term* Set all modes suitable for the terminal type *term*, where *term* is one of *tty33*, *tty37*, *vt05*, *tn300*, *ti700*, or *tek*.

*async* Set normal asynchronous communications where clock settings are *xcibrg*, *rcibrg*, *tsetcoff* and *rsetcoff*.

**Window Size**

*rows n* Set window size to *n* rows.

*columns n* Set window size to *n* columns.

*cols n* Set window size to *n* columns. Note that *cols* is a shorthand alias for *columns*.

*ypixels n* Set vertical window size to *n* pixels.

*xpixels n* Set horizontal window size to *n* pixels.

**USAGE**

The *-g* flag is designed to facilitate the saving and restoring of terminal state from the shell level. For example, a program may:

```
saveterm="$ (stty -g)" # save terminal state
stty (new settings) # set new state
. . . # . . .
stty $saveterm # restore terminal state
```

Since the *-a* format is so loosely specified, scripts that save and restore terminal settings should use the *-g* option.

**ENVIRONMENT VARIABLES**

See *environ(5)* for descriptions of the following environment variables that affect the execution of *stty*: *LC\_CTYPE*, *LC\_MESSAGES*, and *NLSPATH*.

**EXIT STATUS**

The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES**

See *attributes(5)* for descriptions of the following attributes:

*/usr/bin/stty*

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

*/usr/xpg4/bin/stty*

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|

| <b>SYNOPSIS</b>         | <code>/usr/ucb/stty [-a] [-g] [-h] [modes]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b>      | <code>stty</code> sets certain terminal I/O options for the device that is the current standard output; without arguments, it reports the settings of certain options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>OPTIONS</b>          | <p>In this report, if a character is preceded by a caret (^), then the value of that option is the corresponding CTRL character (for example, “^h” is CTRL-H; in this case, recall that CTRL-H is the same as the “back-space” key.) The sequence “^ ’” means that an option has a null value.</p> <p>-a                    Report all of the option settings.</p> <p>-g                    Report current settings in a form that can be used as an argument to another <code>stty</code> command.</p> <p>-h                    Report all the option settings with the control characters in an easy to read column format.</p> <p>Options in the last group are implemented using options in the previous groups. Note: Many combinations of options make no sense, but no sanity checking is performed. Hardware flow control and clock modes options may not be supported by all hardware interfaces. The options are selected from the following:</p> |
| <b>Special Requests</b> | <p>all                    Reports the same option settings as <code>stty</code> without arguments, but with the control characters in column format.</p> <p>everything            Everything <code>stty</code> knows about is printed. Same as -h option.</p> <p>speed                 The terminal speed alone is reported on the standard output.</p> <p>size                   The terminal (window) sizes are printed on the standard output, first rows and then columns. This option is only appropriate if currently running a window system.</p> <p>                       size and speed always report on the settings of <code>/dev/tty</code>, and always report the settings to the standard output.</p>                                                                                                                                                                                                                                        |
| <b>Control Modes</b>    | <p>parenb (-parenb)<br/>  Enable (disable) parity generation and detection.</p> <p>parext (-parext)<br/>  Enable (disable) extended parity generation and detection for mark and space parity.</p> <p>parodd (-parodd)<br/>  Select odd (even) parity, or mark (space) parity if <code>parext</code> is enabled.</p> <p>cs5 cs6 cs7 cs8<br/>  Select character size (see <code>termio(7I)</code>).</p> <p>0<br/>  Hang up line immediately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                    | istrip (-istrip)                                                                                                                                                                                                                | Strip (do not strip) input characters to seven bits.                                                                                            |
|                    | inlcr (-inlcr)                                                                                                                                                                                                                  | Map (do not map) NL to CR on input.                                                                                                             |
|                    | igncr (-igncr)                                                                                                                                                                                                                  | Ignore (do not ignore) CR on input.                                                                                                             |
|                    | icrnl (-icrnl)                                                                                                                                                                                                                  | Map (do not map) CR to NL on input.                                                                                                             |

stty(1B)

|                     |                     |                                                                                                                   |
|---------------------|---------------------|-------------------------------------------------------------------------------------------------------------------|
|                     | iuclc (-iuclc)      | Map (do not map) upper-case alphabetic to lower case on input.                                                    |
|                     | ixon (-ixon)        | Enable (disable) START/STOP output control. Output is stopped by sending an STOP and started by sending an START. |
|                     | ixany (-ixany)      | Allow any character (only START) to restart output.                                                               |
|                     | decctlq (-decctlq)  | Same as -ixany.                                                                                                   |
|                     | ixoff (-ixoff)      | Request that the system send (not send) START/STOP characters when the input queue is nearly empty/full.          |
|                     | tandem (-tandem)    | Same as ixoff.                                                                                                    |
|                     | imaxbel (-imaxbel)  | Echo (do not echo) BEL when the input line is too long.                                                           |
|                     | iexten (-iexten)    | Enable (disable) extended (implementation-defined) functions for input data.                                      |
| <b>Output Modes</b> | opost (-opost)      | Post-process output (do not post-process output; ignore all other output modes).                                  |
|                     | olcuc (-olcuc)      | Map (do not map) lower-case alphabetic to upper case on output.                                                   |
|                     | onlcr (-onlcr)      | Map (do not map) NL to CR-NL on output.                                                                           |
|                     | ocrnl (-ocrnl)      | Map (do not map) CR to NL on output.                                                                              |
|                     | onocr (-onocr)      | Do not (do) output CRs at column zero.                                                                            |
|                     | onlret (-onlret)    | On the terminal NL performs (does not perform) the CR function.                                                   |
|                     | ofill (-ofill)      | Use fill characters (use timing) for delays.                                                                      |
|                     | ofdel (-ofdel)      | Fill characters are DELs (NULs).                                                                                  |
|                     | cr0 cr1 cr2 cr3     | Select style of delay for carriage returns (see <code>termio(7I)</code> ).                                        |
|                     | nl0 nl1             | Select style of delay for line-feeds (see <code>termio(7I)</code> ).                                              |
|                     | tab0 tab1 tab2 tab3 | Select style of delay for horizontal tabs (see <code>termio(7I)</code> ).                                         |
|                     | bs0 bs1             | Select style of delay for backspaces (see <code>termio(7I)</code> ).                                              |
|                     | ff0 ff1             | Select style of delay for form-feeds (see <code>termio(7I)</code> ).                                              |
|                     | vt0 vt1             | Select style of delay for vertical tabs (see <code>termio(7I)</code> ).                                           |
| <b>Local Modes</b>  | isig (-isig)        | Enable (disable) the checking of characters against the special control characters INTR, QUIT, and SWTCH.         |

|                      |                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| icanon (-icanon)     | Enable (disable) canonical input (ERASE and KILL processing). Does not set MIN or TIME.                                                                                                                                                                                                     |
| cbreak (-cbreak)     | Equivalent to -icanon min 1 time 0.                                                                                                                                                                                                                                                         |
| xcase (-xcase)       | Canonical (unprocessed) upper/lower-case presentation.                                                                                                                                                                                                                                      |
| echo (-echo)         | Echo back (do not echo back) every character typed.                                                                                                                                                                                                                                         |
| echoe (-echoe)       | Echo (do not echo) ERASE character as a backspace-space-backspace string. Note: This mode will erase the ERASEed character on many CRT terminals; however, it does <i>not</i> keep track of column position and, as a result, may be confusing on escaped characters, tabs, and backspaces. |
| crterase (-crterase) | Same as echoe.                                                                                                                                                                                                                                                                              |
| echok (-echok)       | Echo (do not echo) NL after KILL character.                                                                                                                                                                                                                                                 |
| lfkc (-lfkc)         | The same as echok (-echok); obsolete.                                                                                                                                                                                                                                                       |
| echonl (-echonl)     | Echo (do not echo) NL.                                                                                                                                                                                                                                                                      |
| noflsh (-noflsh)     | Disable (enable) flush after INTR, QUIT, or SWITCH.                                                                                                                                                                                                                                         |
| stwrap (-stwrap)     | Disable (enable) truncation of lines longer than 79 characters on a synchronous line. (Does not apply to the 3B2.)                                                                                                                                                                          |
| tostop (-tostop)     | Send (do not send) SIGTTOU for background processes.                                                                                                                                                                                                                                        |
| echoctl (-echoctl)   | Echo (do not echo) control characters as <i>^char</i> , delete as <i>^?</i>                                                                                                                                                                                                                 |
| ctlecho (-ctlecho)   | Same as echoctl.                                                                                                                                                                                                                                                                            |
| echoprt (-echoprt)   | Echo (do not echo) erase character as character is "erased".                                                                                                                                                                                                                                |
| prterase (-prterase) | Same as echoprt.                                                                                                                                                                                                                                                                            |
| echoke (-echoke)     | BS-SP-BS erase (do not BS-SP-BS erase) entire line on line kill.                                                                                                                                                                                                                            |
| crtkill (-crtkill)   | Same as echoke.                                                                                                                                                                                                                                                                             |
| flusho (-flusho)     | Output is (is not) being flushed.                                                                                                                                                                                                                                                           |
| pendin (-pendin)     | Retype (do not retype) pending input at next read or input character.                                                                                                                                                                                                                       |
| stflush (-stflush)   | Enable (disable) flush on a synchronous line after every write(2). (Does not apply to the 3B2.)                                                                                                                                                                                             |

stty(1B)

|                                    |                      |                                                                                                                                       |
|------------------------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------|
|                                    | stappl (-stappl)     | Use application mode (use line mode) on a synchronous line. (Does not apply to the 3B2.)                                              |
| <b>Hardware Flow Control Modes</b> | rtsxoff (-rtsxoff)   | Enable (disable) RTS hardware flow control on input.                                                                                  |
|                                    | ctsxon (-ctsxon)     | Enable (disable) CTS hardware flow control on output.                                                                                 |
|                                    | dterxoff (-dterxoff) | Enable (disable) DTER hardware flow control on input.                                                                                 |
|                                    | rlsdxon (-rlsdxon)   | Enable (disable) RLSD hardware flow control on output.                                                                                |
|                                    | isxoff (-isxoff)     | Enable (disable) isochronous hardware flow control on input.                                                                          |
| <b>Clock Modes</b>                 | xcibrg               | Get transmit clock from internal baud rate generator.                                                                                 |
|                                    | xctset               | Get the transmit clock from transmitter signal element timing (DCE source) lead, CCITT V.24 circuit 114, EIA-232-D pin 15.            |
|                                    | xcrset               | Get transmit clock from receiver signal element timing (DCE source) lead, CCITT V.24 circuit 115, EIA-232-D pin 17.                   |
|                                    | rcibrg               | Get receive clock from internal baud rate generator.                                                                                  |
|                                    | rctset               | Get receive clock from transmitter signal element timing (DCE source) lead, CCITT V.24 circuit 114, EIA-232-D pin 15.                 |
|                                    | rcrset               | Get receive clock from receiver signal element timing (DCE source) lead, CCITT V.24 circuit 115, EIA-232-D pin 17.                    |
|                                    | tsetcoff             | Transmitter signal element timing clock not provided.                                                                                 |
|                                    | tsetcrc              | Output receive clock on transmitter signal element timing (DTE source) lead, CCITT V.24 circuit 113, EIA-232-D pin 24, clock source.  |
|                                    | tsetcxc              | Output transmit clock on transmitter signal element timing (DTE source) lead, CCITT V.24 circuit 113, EIA-232-D pin 24, clock source. |
|                                    | rsetcoff             | Receiver signal element timing clock not provided.                                                                                    |
|                                    | rsetcrc              | Output receive clock on receiver signal element timing (DTE source) lead, CCITT V.24 circuit 128, no EIA-232-D pin, clock source.     |
|                                    | rsetcxc              | Output transmit clock on receiver signal element timing (DTE source) lead, CCITT V.24 circuit 128, no EIA-232-D pin, clock source.    |

|                            |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Control Assignments</b> | <i>control-character c</i> | Set <i>control-character</i> to <i>c</i> , where <i>control-character</i> is <i>intr</i> , <i>quit</i> , <i>erase</i> , <i>kill</i> , <i>eof</i> , <i>eol</i> , <i>eol2</i> , <i>swtch</i> , <i>start</i> , <i>stop</i> , <i>susp</i> , <i>dsusp</i> , <i>rprnt</i> , <i>flush</i> , <i>werase</i> , <i>lnext</i> , <i>min</i> , <i>ctab</i> , <i>time</i> , or <i>brk</i> ( <i>ctab</i> is used with <i>-stappl</i> ; <i>min</i> and <i>time</i> are used with <i>-icanon</i> ; see <i>termio(7I)</i> ). If <i>c</i> is preceded by an (escaped from the shell) caret (^), then the value used is the corresponding CTRL character (for example, “^d” is a CTRL-d); “^?” is interpreted as DEL and “^-” is interpreted as undefined. |
| <b>Combination Modes</b>   | line <i>i</i>              | Set line discipline to <i>i</i> ( $0 < i < 127$ ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                            | evenp or parity            | Enable parenb and cs7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                            | -evenp, or -parity         | Disable parenb, and set cs8.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>NAME</b>                  | sum – print checksum and block count for a file                                                                                                                                                                                                    |                |                 |              |         |     |         |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|-----|---------|
| <b>SYNOPSIS</b>              | <b>sum</b> [-r] [ <i>file</i> ...]                                                                                                                                                                                                                 |                |                 |              |         |     |         |
| <b>DESCRIPTION</b>           | The <code>sum</code> utility calculates and prints a 16-bit checksum for the named file and the number of 512-byte blocks in the file. It is typically used to look for bad spots, or to validate a file communicated over some transmission line. |                |                 |              |         |     |         |
| <b>OPTIONS</b>               | The following options are supported:<br>-r        Use an alternate (machine-dependent) algorithm in computing the checksum.                                                                                                                        |                |                 |              |         |     |         |
| <b>OPERANDS</b>              | The following operands are supported:<br><i>file</i> A path name of a file. If no files are named, the standard input is used.                                                                                                                     |                |                 |              |         |     |         |
| <b>USAGE</b>                 | See <code>largefile(5)</code> for the description of the behavior of <code>sum</code> when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                  |                |                 |              |         |     |         |
| <b>ENVIRONMENT VARIABLES</b> | See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>sum</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .                                  |                |                 |              |         |     |         |
| <b>EXIT STATUS</b>           | The following exit values are returned.<br>0        Successful completion.<br>>0       An error occurred.                                                                                                                                          |                |                 |              |         |     |         |
| <b>ATTRIBUTES</b>            | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                       |                |                 |              |         |     |         |
|                              | <table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWesu</td> </tr> <tr> <td>CSI</td> <td>enabled</td> </tr> </tbody> </table>                               | ATTRIBUTE TYPE | ATTRIBUTE VALUE | Availability | SUNWesu | CSI | enabled |
| ATTRIBUTE TYPE               | ATTRIBUTE VALUE                                                                                                                                                                                                                                    |                |                 |              |         |     |         |
| Availability                 | SUNWesu                                                                                                                                                                                                                                            |                |                 |              |         |     |         |
| CSI                          | enabled                                                                                                                                                                                                                                            |                |                 |              |         |     |         |
| <b>SEE ALSO</b>              | <code>cksum(1)</code> , <code>sum(1B)</code> , <code>wc(1)</code> , <code>attributes(5)</code> , <code>environ(5)</code> , <code>largefile(5)</code>                                                                                               |                |                 |              |         |     |         |
| <b>DIAGNOSTICS</b>           | “Read error” is indistinguishable from end of file on most devices; check the block count.                                                                                                                                                         |                |                 |              |         |     |         |
| <b>NOTES</b>                 | Portable applications should use <code>cksum(1)</code> .<br><code>sum</code> and <code>usr/ucb/sum</code> (see <code>sum(1B)</code> ) return different checksums.                                                                                  |                |                 |              |         |     |         |

sum(1B)

**NAME** | sum – calculate a checksum for a file

**SYNOPSIS** | */usr/ucb/sum file...*

**DESCRIPTION** | sum calculates and displays a 16-bit checksum for the named file and displays the size of the file in kilobytes. It is typically used to look for bad spots, or to validate a file communicated over some transmission line. The checksum is calculated by an algorithm which may yield different results on machines with 16-bit ints and machines with 32-bit ints, so it cannot always be used to validate that a file has been transferred between machines with different-sized ints.

**USAGE** | See `largefile(5)` for the description of the behavior of `sum` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWscpu        |

**SEE ALSO** | `sum(1)`, `wc(1)`, `attributes(5)`, `largefile(5)`

**DIAGNOSTICS** | Read error is indistinguishable from EOF on most devices; check the block count.

**NOTES** | `sum` and `/usr/bin/sum` (see `sum(1)`) return different checksums.

This utility is obsolete.

suspend(1)

**NAME** suspend – shell built-in function to halt the current shell

**sh** **suspend**

**csh** **suspend**

**ksh** **suspend**

**sh** Stops the execution of the current shell (but not if it is the login shell).

**csh** Stop the shell in its tracks, much as if it had been sent a stop signal with ^Z. This is most often used to stop shells started by su.

**ksh** Stops the execution of the current shell (but not if it is the login shell).

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `csh(1)`, `kill(1)`, `ksh(1)`, `sh(1)`, `su(1M)`, `attributes(5)`

symorder(1)

**NAME** symorder – rearrange a list of symbols

**SYNOPSIS** **symorder** [-s] *objectfile symbolfile*

**DESCRIPTION** *symorder* was used in SunOS 4.x specifically to cut down on the overhead of getting symbols from *vmunix*. This is no longer applicable as kernel symbol entries are dynamically obtained through */dev/ksyms*.

This script is provided as a convenience for software developers who need to maintain scripts that are portable across a variety of operating systems.

**EXIT STATUS** *symorder* has exit status 0.

**ATTRIBUTES** See *attributes(5)* for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWbtool       |

**SEE ALSO** *nlist(3ELF)*, *attributes(5)*, *ksyms(7D)*.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>NAME</b>        | sysV-make – maintain, update, and regenerate groups of programs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>SYNOPSIS</b>    | <code>/usr/lib/svr4.make [-f <i>makefile</i>] [-eiknpqrst] [<i>names</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b> | <p>This is the “vanilla” System V version of make. If the environment variable <code>USE_SVR4_MAKE</code> is set, then the command <code>make</code> will invoke this version of make. (See also the <code>ENVIRONMENT</code> section.)</p> <p><code>make</code> allows the programmer to maintain, update, and regenerate groups of computer programs. <code>make</code> executes commands in <i>makefile</i> to update one or more target <i>names</i> (<i>names</i> are typically programs). If the <code>-f</code> option is not present, then <code>makefile</code>, <code>Makefile</code>, and the Source Code Control System (SCCS) files <code>s.makefile</code> and <code>s.Makefile</code> are tried in order. If <i>makefile</i> is <code>'-'</code> the standard input is taken. More than one <code>-f <i>makefile</i></code> argument pair may appear.</p> <p><code>make</code> updates a target only if its dependents are newer than the target. All prerequisite files of a target are added recursively to the list of targets. Missing files are deemed to be outdated.</p> <p>The following list of four directives can be included in <i>makefile</i> to extend the options provided by <code>make</code>. They are used in <i>makefile</i> as if they were targets:</p> <p><code>.DEFAULT :</code> If a file must be made but there are no explicit commands or relevant built-in rules, the commands associated with the name <code>.DEFAULT</code> are used if it exists.</p> <p><code>.IGNORE :</code> Same effect as the <code>-i</code> option.</p> <p><code>.PRECIOUS :</code> Dependents of the <code>.PRECIOUS</code> entry will not be removed when quit or interrupt are hit.</p> <p><code>.SILENT :</code> Same effect as the <code>-s</code> option.</p> |
| <b>Options</b>     | <p>The options for <code>make</code> are listed below:</p> <p><code>-e</code> Environment variables override assignments within makefiles.</p> <p><code>-f <i>makefile</i></code> Description filename (<i>makefile</i> is assumed to be the name of a description file).</p> <p><code>-i</code> Ignore error codes returned by invoked commands.</p> <p><code>-k</code> Abandon work on the current entry if it fails, but continue on other branches that do not depend on that entry.</p> <p><code>-n</code> No execute mode. Print commands, but do not execute them. Even command lines beginning with an <code>'@'</code> are printed.</p> <p><code>-p</code> Print out the complete set of macro definitions and target descriptions.</p> <p><code>-q</code> Question. <code>make</code> returns a zero or non-zero status code depending on whether or not the target file has been updated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|    |                                                                                           |
|----|-------------------------------------------------------------------------------------------|
| -r | Do not use the built-in rules.                                                            |
| -s | Silent mode. Do not print command lines before executing.                                 |
| -t | Touch the target files (causing them to be updated) rather than issue the usual commands. |

**Creating the makefile**

The makefile invoked with the `-f` option is a carefully structured file of explicit instructions for updating and regenerating programs, and contains a sequence of entries that specify dependencies. The first line of an entry is a blank-separated, non-null list of targets, then a `' '`, then a (possibly null) list of prerequisite files or dependencies. Text following a `' '` and all following lines that begin with a tab are shell commands to be executed to update the target. The first non-empty line that does not begin with a tab or `'#'` begins a new dependency or macro definition. Shell commands may be continued across lines with a backslash-new-line (`\-NEWLINE`) sequence. Everything printed by `make` (except the initial TAB) is passed directly to the shell as is. Thus,

```
echo a\
b
```

will produce

```
ab
```

exactly the same as the shell would.

Number-sign (`#`) and `NEWLINE` surround comments including contained `'\-NEWLINE'` sequences.

The following makefile says that `pgm` depends on two files `a.o` and `b.o`, and that they in turn depend on their corresponding source files (`a.c` and `b.c`) and a common file `incl.h`:

```
pgm: a.o b.o
 cc a.o b.o -o pgm
a.o: incl.h a.c
 cc -c a.c
b.o: incl.h b.c
 cc -c b.c
```

Command lines are executed one at a time, each by its own shell. The `SHELL` environment variable can be used to specify which shell `make` should use to execute commands. The default is `/usr/bin/sh`. The first one or two characters in a command can be the following: `'@'`, `'-'`, `'@-'`, or `'-@'`. If `'@'` is present, printing of the command is suppressed. If `'-'` is present, `make` ignores an error. A line is printed when it is executed unless the `-s` option is present, or the entry `.SILENT:` is included in *makefile*, or unless the initial character sequence contains a `@`. The `-n` option specifies printing without execution; however, if the command line has the string `$(MAKE)` in

it, the line is always executed (see the discussion of the MAKEFLAGS macro in the make Environment sub-section below). The -t (touch) option updates the modified date of a file without executing any commands.

Commands returning non-zero status normally terminate make. If the -i option is present, if the entry .IGNORE: is included in *makefile*, or if the initial character sequence of the command contains '-', the error is ignored. If the -k option is present, work is abandoned on the current entry, but continues on other branches that do not depend on that entry.

Interrupt and quit cause the target to be deleted unless the target is a dependent of the directive .PRECIOUS.

#### make Environment

The environment is read by make. All variables are assumed to be macro definitions and are processed as such. The environment variables are processed before any makefile and after the internal rules; thus, macro assignments in a makefile override environment variables. The -e option causes the environment to override the macro assignments in a makefile. Suffixes and their associated rules in the makefile will override any identical suffixes in the built-in rules.

The MAKEFLAGS environment variable is processed by make as containing any legal input option (except -f and -p) defined for the command line. Further, upon invocation, make "invents" the variable if it is not in the environment, puts the current options into it, and passes it on to invocations of commands. Thus, MAKEFLAGS always contains the current input options. This feature proves very useful for "super-makes". In fact, as noted above, when the -n option is used, the command \$(MAKE) is executed anyway; hence, one can perform a make -n recursively on a whole software system to see what would have been executed. This result is possible because the -n is put in MAKEFLAGS and passed to further invocations of \$(MAKE). This usage is one way of debugging all of the makefiles for a software project without actually doing anything.

#### Include Files

If the string *include* appears as the first seven letters of a line in a *makefile*, and is followed by a blank or a tab, the rest of the line is assumed to be a filename and will be read by the current invocation, after substituting for any macros.

#### Macros

Entries of the form *string1* = *string2* are macro definitions. *string2* is defined as all characters up to a comment character or an unescaped NEWLINE. Subsequent appearances of \$(*string1*[ :*subst1*=[*subst2*]]) are replaced by *string2*. The parentheses are optional if a single-character macro name is used and there is no substitute sequence. The optional :*subst1*=*subst2* is a substitute sequence. If it is specified, all non-overlapping occurrences of *subst1* in the named macro are replaced by *subst2*. Strings (for the purposes of this type of substitution) are delimited by BLANKs, TABs, NEWLINE characters, and beginnings of lines. An example of the use of the substitute sequence is shown in the Libraries sub-section below.

#### Internal Macros

There are five internally maintained macros that are useful for writing rules for building targets.

## sysV-make(1)

- \$\*** The macro `$*` stands for the filename part of the current dependent with the suffix deleted. It is evaluated only for inference rules.
- \$@** The `$@` macro stands for the full target name of the current target. It is evaluated only for explicitly named dependencies.
- \$<** The `$<` macro is only evaluated for inference rules or the `.DEFAULT` rule. It is the module that is outdated with respect to the target (the “manufactured” dependent file name). Thus, in the `.c.o` rule, the `$<` macro would evaluate to the `.c` file. An example for making optimized `.o` files from `.c` files is:
- ```
.c.o:
    cc -c -O $*.c

or:

.c.o:
    cc -c -O $<
```
- \$?** The `$?` macro is evaluated when explicit rules from the makefile are evaluated. It is the list of prerequisites that are outdated with respect to the target, and essentially those modules that must be rebuilt.
- \$%** The `$%` macro is only evaluated when the target is an archive library member of the form `lib(file.o)`. In this case, `$@` evaluates to `lib` and `$%` evaluates to the library member, `file.o`.

Four of the five macros can have alternative forms. When an upper case D or F is appended to any of the four macros, the meaning is changed to “directory part” for D and “file part” for F. Thus, `$(@D)` refers to the directory part of the string `$@`. If there is no directory part, `./` is generated. The only macro excluded from this alternative form is `$?`.

Suffixes Certain names (for instance, those ending with `.o`) have inferable prerequisites such as `.c`, `.s`, etc. If no update commands for such a file appear in *makefile*, and if an inferable prerequisite exists, that prerequisite is compiled to make the target. In this case, *make* has inference rules that allow building files from other files by examining the suffixes and determining an appropriate inference rule to use. The current default inference rules are:

<code>.c</code>	<code>.c~</code>	<code>.f</code>	<code>.f~</code>	<code>.s</code>	<code>.s~</code>	<code>.sh</code>	<code>.sh~</code>	<code>.C</code>	<code>.C~</code>
<code>.c.a</code>	<code>.c.o</code>	<code>.c~.a</code>	<code>.c~.c</code>	<code>.c~.o</code>	<code>.f.a</code>	<code>.f.o</code>	<code>.f~.a</code>	<code>.f~.f</code>	<code>.f~.o</code>
<code>.h~.h</code>	<code>.l.c</code>	<code>.l.o</code>	<code>.l~.c</code>	<code>.l~.l</code>	<code>.l~.o</code>	<code>.s.a</code>	<code>.s.o</code>	<code>.s~.a</code>	<code>.s~.o</code>
<code>.s~.s</code>	<code>.sh~.sh</code>	<code>.y.c</code>	<code>.y.o</code>	<code>.y~.c</code>	<code>.y~.o</code>	<code>.y~.y</code>	<code>.C.a</code>	<code>.C.o</code>	<code>.C~.a</code>
<code>.C~.C</code>	<code>.C~.o</code>	<code>.L.C</code>	<code>.L.o</code>	<code>.L~.C</code>	<code>.L~.L</code>	<code>.L~.o</code>	<code>.Y.C</code>	<code>.Y.o</code>	<code>.Y~.C</code>

```
.Y~.o  .Y~Y
```

The internal rules for `make` are contained in the source file `make.rules` for the `make` program. These rules can be locally modified. To print out the rules compiled into the `make` on any machine in a form suitable for recompilation, the following command is used:

```
make -pf - 2>/dev/null </dev/null
```

A tilde in the above rules refers to an SCCS file (see `sccsfile(4)`). Thus, the rule `.c~.o` would transform an SCCS C source file into an object file (`.o`). Because the `s.` of the SCCS files is a prefix, it is incompatible with the `make` suffix point of view. Hence, the tilde is a way of changing any file reference into an SCCS file reference.

A rule with only one suffix (for example, `.c:`) is the definition of how to build `x` from `x.c`. In effect, the other suffix is null. This feature is useful for building targets from only one source file, for example, shell procedures and simple C programs.

Additional suffixes are given as the dependency list for `.SUFFIXES`. Order is significant: the first possible name for which both a file and a rule exist is inferred as a prerequisite. The default list is:

```
.SUFFIXES: .o .c .c~ .y .y~ .l .l~ .s .s~ .sh .sh~ .h .h~ .f .f~ .C
.C~ .Y .Y~ .L .L~
```

Here again, the above command for printing the internal rules will display the list of suffixes implemented on the current machine. Multiple suffix lists accumulate; `.SUFFIXES:` with no dependencies clears the list of suffixes.

Inference Rules

The first example can be done more briefly.

```
pgm: a.o b.o
      cc a.o b.o -o pgm
a.o b.o: incl.h
```

This abbreviation is possible because `make` has a set of internal rules for building files. The user may add rules to this list by simply putting them in the *makefile*.

Certain macros are used by the default inference rules to permit the inclusion of optional matter in any resulting commands. For example, `CFLAGS`, `LFLAGS`, and `YFLAGS` are used for compiler options to `cc(1B)`. Again, the previous method for examining the current rules is recommended.

The inference of prerequisites can be controlled. The rule to create a file with suffix `.o` from a file with suffix `.c` is specified as an entry with `.c.o:` as the target and no dependents. Shell commands associated with the target define the rule for making a `.o` file from a `.c` file. Any target that has no slashes in it and starts with a dot is identified as a rule and not a true target.

sysV-make(1)

Libraries | If a target or dependency name contains parentheses, it is assumed to be an archive library, the string within parentheses referring to a member within the library. Thus, `lib(file.o)` and `$(LIB) (file.o)` both refer to an archive library that contains `file.o`. (This example assumes the `LIB` macro has been previously defined.) The expression `$(LIB) (file1.o file2.o)` is not legal. Rules pertaining to archive libraries have the form `.XX.a` where the `XX` is the suffix from which the archive member is to be made. An unfortunate by-product of the current implementation requires the `XX` to be different from the suffix of the archive member. Thus, one cannot have `lib(file.o)` depend upon `file.o` explicitly. The most common use of the archive interface follows. Here, we assume the source files are all C type source:

```
lib:    lib(file1.o) lib(file2.o) lib(file3.o)
        @echo lib is now up-to-date
.c.a:
        $(CC) -c $(CFLAGS) $<
        $(AR) $(ARFLAGS) $@ $*.o
        rm -f $*.o
```

In fact, the `.c.a` rule listed above is built into `make` and is unnecessary in this example. A more interesting, but more limited example of an archive library maintenance construction follows:

```
lib:    lib(file1.o) lib(file2.o) lib(file3.o)
        $(CC) -c $(CFLAGS) $(?:.o=.c)
        $(AR) $(ARFLAGS) lib $?
        rm $?
        @echo lib is now up-to-date
.c.a:;
```

Here the substitution mode of the macro expansions is used. The `$?` list is defined to be the set of object filenames (inside `lib`) whose C source files are outdated. The substitution mode translates the `.o` to `.c`. (Unfortunately, one cannot as yet transform to `.c~`; however, this transformation may become possible in the future.) Also note the disabling of the `.c.a:` rule, which would have created each object file, one by one. This particular construct speeds up archive library maintenance considerably. This type of construct becomes very cumbersome if the archive library contains a mix of assembly programs and C programs.

ENVIRONMENT VARIABLES

USE_SVR4_MAKE | If this environment variable is set, then the `make` command will invoke this System V version of `make`. If this variable is not set, then the default version of `make(1S)` is invoked.

`USE_SVR4_MAKE` can be set as follows (Bourne shell):

```
$ USE_SVR4_MAKE=''' ; export USE_SVR4_MAKE
```

or (C shell):

```
% setenv USE_SVR4_MAKE
```

FILES [Mm]akefile
 s. [Mm]akefile
 default makefiles

/usr/bin/sh
 default shell for make

/usr/share/lib/make/make.rules
 default rules for make

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWspot

SEE ALSO cc(1B), cd(1), make(1S), sh(1), printf(3C), sccsfile(4), attributes(5)

NOTES Some commands return non-zero status inappropriately; use `-i` or the `'-'` command line prefix to overcome the difficulty.

Filename containing the characters `'='`, `':'`, and `'@'` will not work. Commands that are directly executed by the shell, notably `cd(1)`, are ineffectual across NEWLINES in `make`. The syntax `lib(file1.o file2.o file3.o)` is illegal. You cannot build `lib(file.o)` from `file.o`.

	-c2	1, 6, 10, 14, 49	COBOL compact format (columns 1-6 omitted). Using this code, the first typed character corresponds to card column 7, one space gets you to column 8, and a tab reaches column 12. Files using this tab setup should include a format specification as follows (see <code>fspec(4)</code>): <:t-c2 m6 s66 d:>
	-c3	1, 6, 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62, 67	COBOL compact format (columns 1-6 omitted), with more tabs than -c2. This is the recommended format for COBOL. The appropriate format specification is (see <code>fspec(4)</code>): <:t-c3 m6 s66 d:>
	-f	1, 7, 11, 15, 19, 23	FORTRAN
	-p	1, 5, 9, 13, 17, 21, 25, 29, 33, 37, 41, 45, 49, 53, 57, 61	PL/I
	-s	1, 10, 55	SNOBOL
	-u	1, 12, 20, 44	UNIVAC 1100 Assembler
<i>Repetitive</i>	-n		A <i>repetitive</i> specification requests tabs at columns $1+n$, $1+2*n$, etc., where n is a single-digit decimal number. Of particular importance is the value 8: this represents the UNIX system "standard" tab setting, and is the most likely tab setting to be found at a terminal. When -0 is used, the tab stops are cleared and no new ones are set.
<i>Arbitrary</i>			See OPERANDS.
<i>File</i>	-file		If the name of a <code>file</code> is given, <code>tabs</code> reads the first line of the file, searching for a format specification (see <code>fspec(4)</code>). If it finds one there, it sets the tab stops according to it, otherwise it sets them as -8. This type of specification may be used to make sure that a tabbed file is printed with correct tab settings, and would be used with the <code>pr</code> command: example% <code>tabs -file; pr file</code>
			Tab and margin setting is performed via the standard output.

tabs(1)

OPERANDS

The following operand is supported:

n1[,*n2*, . . .] The *arbitrary* format consists of tab-stop values separated by commas or spaces. The tab-stop values must be positive decimal integers in ascending order. Up to 40 numbers are allowed. If any number (except the first one) is preceded by a plus sign, it is taken as an increment to be added to the previous value. Thus, the formats 1,10,20,30, and 1,10,+10,+10 are considered identical.

EXAMPLES

EXAMPLE 1 Using the tabs Command

The following command is an example using *-code* (*canned* specification) to set tabs to the settings required by the IBM assembler: columns 1, 10, 16, 36, 72:

```
example% tabs -a
```

The next command is an example of using *-n* (*repetitive* specification), where *n* is 8, causes tabs to be set every eighth position: 1+(1*8), 1+(2*8), . . . which evaluate to columns 9, 17, . . . :

```
example% tabs -8
```

This command uses *n1,n2,. . .* (*arbitrary* specification) to set tabs at columns 1, 8, and 36:

```
example% tabs 1,8,36
```

The last command is an example of using *-file* (*file* specification) to indicate that tabs should be set according to the first line of `$HOME/fspec.list/att4425` (see `fspec(4)`).

```
example% tabs - $HOME/fspec.list/att4425
```

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `tabs`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

TERM Determine the terminal type. If this variable is unset or null, and if the `-T` option is not specified, terminal type `ansi+tabs` will be used.

EXIT STATUS

The following exit values are returned:

0 Successful completion.

>0 An error occurred.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu
CSI	enabled

tabs(1)

SEE ALSO expand(1), newform(1), pr(1), stty(1), tput(1), fspec(4), terminfo(4), attributes(5), environ(5), term(5)

NOTES There is no consistency among different terminals regarding ways of clearing tabs and setting the left margin.

tabs clears only 20 tabs (on terminals requiring a long sequence), but is willing to set 64.

The *tabspec* used with the tabs command is different from the one used with the newform command. For example, tabs -8 sets every eighth position; whereas newform -i-8 indicates that tabs are set every eighth position.

tail(1)

NAME	tail – deliver the last part of a file
SYNOPSIS	<pre>/usr/bin/tail [+ number [lbcrl]] [file] /usr/bin/tail [-lbcrl] [file] /usr/bin/tail [+ number [lbcfl]] [file] /usr/bin/tail [-lbcfl] [file] /usr/xpg4/bin/tail [-f -r] [-c number -n number] [file] /usr/xpg4/bin/tail [+ number [l b c] [fl]] [file] /usr/xpg4/bin/tail [+ number [l] [f r]] [file]</pre>
DESCRIPTION	<p>The <code>tail</code> utility copies the named file to the standard output beginning at a designated place. If no file is named, the standard input is used.</p> <p>Copying begins at a point in the file indicated by the <code>-cnumber</code>, <code>-nnumber</code>, or <code>+number</code> options (if <code>+number</code> is specified, begins at distance number from the beginning; if <code>-number</code> is specified, from the end of the input; if <code>number</code> is NULL, the value 10 is assumed). <code>number</code> is counted in units of lines or byte according to the <code>-c</code> or <code>-n</code> options, or lines, blocks, or bytes, according to the appended option <code>l</code>, <code>b</code>, or <code>c</code>. When no units are specified, counting is by lines.</p>
OPTIONS	<p>The following options are supported for both <code>/usr/bin/tail</code> and <code>/usr/xpg4/bin/tail</code>. The <code>-r</code> and <code>-f</code> options are mutually exclusive. If both are specified on the command line, the <code>-f</code> option will be ignored.</p> <ul style="list-style-type: none"><code>-b</code> Units of blocks.<code>-c</code> Units of bytes.<code>-f</code> Follow. If the input-file is not a pipe, the program will not terminate after the line of the input-file has been copied, but will enter an endless loop, wherein it sleeps for a second and then attempts to read and copy further records from the input-file. Thus it may be used to monitor the growth of a file that is being written by some other process.<code>-l</code> Units of lines.<code>-r</code> Reverse. Copies lines from the specified starting point in the file in reverse order. The default for <code>r</code> is to print the entire file in reverse order.
/usr/xpg4/bin/tail	<p>The following options are supported for <code>/usr/xpg4/bin/tail</code> only:</p> <ul style="list-style-type: none"><code>-c number</code> The <code>number</code> option-argument must be a decimal integer whose sign affects the location in the file, measured in bytes, to begin the copying:<ul style="list-style-type: none"><code>+</code> Copying starts relative to the beginning of the file.<code>-</code> Copying starts relative to the end of the file.

none Copying starts relative to the end of the file.

The origin for counting is 1; that is, `-c+1` represents the first byte of the file, `-c-1` the last.

`-n number` Equivalent to `-cnumber`, except the starting location in the file is measured in lines instead of bytes. The origin for counting is 1; that is, `-n+1` represents the first line of the file, `-n-1` the last.

OPERANDS The following operand is supported:

file A path name of an input file. If no `file` operands are specified, the standard input will be used.

USAGE See `largefile(5)` for the description of the behavior of `tail` when encountering files greater than or equal to 2 Gbyte (2^{31} bytes).

EXAMPLES **EXAMPLE 1** Using the `tail` Command

The following command will print the last ten lines of the file `fred`, followed by any lines that are appended to `fred` between the time `tail` is initiated and killed.

```
example% tail -f fred
```

The next command will print the last 15 bytes of the file `fred`, followed by any lines that are appended to `fred` between the time `tail` is initiated and killed:

```
example% tail -15cf fred
```

ENVIRONMENT VARIABLES See `environ(5)` for descriptions of the following environment variables that affect the execution of `tail`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

EXIT STATUS The following exit values are returned:

0 Successful completion.

>0 An error occurred.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

`/usr/bin/tail`

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu
CSI	Enabled

`/usr/xpg4/bin/tail`

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWxcu4
CSI	Enabled

tail(1)

SEE ALSO | cat(1), head(1), more(1), pg(1), dd(1M), attributes(5), environ(5),
largefile(5), XPG4(5)

NOTES | Piped tails relative to the end of the file are stored in a buffer, and thus are limited in
length. Various kinds of anomalous behavior may happen with character special files.

NAME	talk – talk to another user
SYNOPSIS	talk <i>address</i> [<i>terminal</i>]
DESCRIPTION	<p>The <code>talk</code> utility is a two-way, screen-oriented communication program.</p> <p>When first invoked, <code>talk</code> sends a message similar to:</p> <pre>Message from TalkDaemon@ her_machine at time... talk: connection requested by your_address talk: respond with: talk your_address</pre> <p>to the specified <i>address</i>. At this point, the recipient of the message can reply by typing:</p> <pre>talk your_address</pre> <p>Once communication is established, the two parties can type simultaneously, with their output displayed in separate regions of the screen. Characters are processed as follows:</p> <ul style="list-style-type: none"> ■ Typing the alert character will alert the recipient's terminal. ■ Typing CTRL-L will cause the sender's screen regions to be refreshed. ■ Typing the erase and kill characters will affect the sender's terminal in the manner described by the <code>termios(3C)</code> interface. ■ Typing the interrupt or end-of-file (EOF) characters will terminate the local <code>talk</code> utility. Once the <code>talk</code> session has been terminated on one side, the other side of the <code>talk</code> session will be notified that the <code>talk</code> session has been terminated and will be able to do nothing except exit. ■ Typing characters from <code>LC_CTYPE</code> classifications <code>print</code> or <code>space</code> will cause those characters to be sent to the recipient's terminal. ■ When and only when the <code>stty iexten</code> local mode is enabled, additional special control characters and multi-byte or single-byte characters are processed as printable characters if their wide character equivalents are printable. ■ Typing other non-printable characters will cause them to be written to the recipient's terminal as follows: control characters will appear as a caret (<code>^</code>) followed by the appropriate ASCII character, and characters with the high-order bit set will appear in "meta" notation. For example, <code>'\003'</code> is displayed as <code>'^C'</code> and <code>'\372'</code> as <code>'M-z'</code>. <p>Permission to be a recipient of a <code>talk</code> message can be denied or granted by use of the <code>msg(1)</code> utility. However, a user's privilege may further constrain the domain of accessibility of other users' terminals. Certain commands, such as <code>pr(1)</code>, disallow messages in order to prevent interference with their output. <code>talk</code> will fail when the user lacks the appropriate privileges to perform the requested action.</p> <p>Certain block-mode terminals do not have all the capabilities necessary to support the simultaneous exchange of messages required for <code>talk</code>. When this type of exchange cannot be supported on such terminals, the implementation may support an exchange</p>

talk(1)

with reduced levels of simultaneous interaction or it may report an error describing the terminal-related deficiency.

OPERANDS The following operands are supported:

address The recipient of the `talk` session. One form of *address* is the *username*, as returned by the `who(1)` utility. If you wish to talk to someone on your own machine, then *username* is just the person's login name. If you wish to talk to a user on another host, then *username* is one of the following forms:

host!user
host.user
host:user
user@host

although *user@host* is perhaps preferred.

terminal If the recipient is logged in more than once, *terminal* can be used to indicate the appropriate terminal name. If *terminal* is not specified, the `talk` message will be displayed on one or more accessible terminals in use by the recipient. The format of *terminal* will be the same as that returned by `who`.

ENVIRONMENT VARIABLES See `environ(5)` for descriptions of the following environment variables that affect the execution of `talk`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

TERM Determine the name of the invoker's terminal type. If this variable is unset or null, an unspecified terminal type will be used.

EXIT STATUS The following exit values are returned:

0 Successful completion.

>0 An error occurred, or `talk` was invoked on a terminal incapable of supporting it.

FILES

<code>/etc/hosts</code>	host name database
<code>/var/adm/utmp</code>	user and accounting information for <code>talk</code>

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO `mail(1)`, `mesg(1)`, `pr(1)`, `stty(1)`, `who(1)`, `write(1)`, `termios(3C)`, `attributes(5)`, `environ(5)`

talk(1)

NOTES | Typing CTRL-L redraws the screen, while the erase, kill, and word kill characters will work in `talk` as normal. To exit, type an interrupt character; `talk` then moves the cursor to the bottom of the screen and restores the terminal to its previous state.

tar(1)

NAME	tar – create tape archives and add or extract files
SYNOPSIS	<pre>tar c [bBeEfFhiklnopPqvwX [0-7]] [block] [tarfile] [exclude-file] {-I include-file -C directory file file...} tar r [bBeEfFhiklnqvw [0-7]] [block] {-I include-file -C directory file file...} tar t [BefFhiklnqvX [0-7]] [tarfile] [exclude-file] {-I include-file file...} tar u [bBeEfFhiklnqvw [0-7]] [block] [tarfile] file... tar x [BefFhiklmnopqvwX [0-7]] [tarfile] [exclude-file] [file...]</pre>
DESCRIPTION	<p>The tar command archives and extracts files to and from a single file called a <i>tarfile</i>. A <i>tarfile</i> is usually a magnetic tape, but it can be any file. tar's actions are controlled by the <i>key</i> argument. The <i>key</i> is a string of characters containing exactly one function letter (c, r, t, u, or x) and zero or more function modifiers (letters or digits), depending on the function letter used. The <i>key</i> string contains no SPACE characters. Function modifier arguments are listed on the command line in the same order as their corresponding function modifiers appear in the <i>key</i> string.</p> <p>The -I <i>include-file</i>, -C <i>directory file</i>, and <i>file</i> arguments specify which files or directories are to be archived or extracted. In all cases, appearance of a directory name refers to the files and (recursively) subdirectories of that directory. Arguments appearing within braces ({ }) indicate that one of the arguments must be specified.</p>
OPTIONS	<p>The following options are supported:</p> <p>-I <i>include-file</i> Opens <i>include-file</i> containing a list of files, one per line, and treats it as if each file appeared separately on the command line. Be careful of trailing white spaces. Also beware of leading white spaces, since, for each line in the included file, the entire line (apart from the newline) will be used to match against the initial string of files to include. In the case where excluded files (see X function modifier) are also specified, they take precedence over all included files. If a file is specified in both the <i>exclude-file</i> and the <i>include-file</i> (or on the command line), it will be excluded.</p> <p>-C <i>directory file</i> Performs a <i>chdir</i> (see <i>cd(1)</i>) operation on <i>directory</i> and performs the c (create) or r (replace) operation on <i>file</i>. Use short relative path names for <i>file</i>. If <i>file</i> is '.', archive all files in <i>directory</i>. This option enables archiving files from multiple directories not related by a close common parent.</p>
OPERANDS	<p>The following operands are supported:</p> <p><i>file</i> A path name of a regular file or directory to be archived (when the c, r or u functions are specified), extracted (x) or listed (t). When <i>file</i> is the path</p>

name of a directory, the action applies to all of the files and (recursively) subdirectories of that directory.

When a file is archived, and the `E` flag (see `Function Modifiers`) is not specified, the filename cannot exceed 256 characters. In addition, it must be possible to split the name between parent directory names so that the prefix is no longer than 155 characters and the name is no longer than 100 characters. If `E` is specified, a name of up to `PATH_MAX` characters may be specified.

For example, a file whose basename is longer than 100 characters could not be archived without using the `E` flag. A file whose directory portion is 200 characters and whose basename is 50 characters could be archived (without using `E`) if a slash appears in the directory name somewhere in character positions 151-156.

Function Letters

The function portion of the key is specified by one of the following letters:

- `c` Create. Writing begins at the beginning of the tarfile, instead of at the end.
- `r` Replace. The named `files` are written at the end of the tarfile. A file created with extended headers must be updated with extended headers (see `E` flag under `Function Modifiers`). A file created without extended headers cannot be modified with extended headers.
- `t` Table of Contents. The names of the specified files are listed each time they occur in the tarfile. If no `file` argument is given, the names of all files in the tarfile are listed. With the `v` function modifier, additional information for the specified files is displayed.
- `u` Update. The named `files` are written at the end of the tarfile if they are not already in the tarfile, or if they have been modified since last written to that tarfile. An update can be rather slow. A tarfile created on a 5.x system cannot be updated on a 4.x system. A file created with extended headers must be updated with extended headers (see `E` flag under `Function Modifiers`). A file created without extended headers cannot be modified with extended headers.
- `x` Extract or restore. The named `files` are extracted from the tarfile and written to the directory specified in the tarfile, relative to the current directory. Use the relative path names of files and directories to be extracted. If a named file matches a directory whose contents has been written to the tarfile, this directory is recursively extracted. The owner, modification time, and mode are restored (if possible); otherwise, to restore owner, you must be the super-user. Character-special and block-special devices (created by `mknod(1M)`) can only be extracted by the super-user. If no `file` argument is given, the entire content of the tarfile is extracted. If the tarfile contains several files with the same name, each file is written to the appropriate directory, overwriting the previous one. Filename

tar(1)

substitution wildcards cannot be used for extracting files from the archive; rather, use a command of the form:

```
tar xvf . . . /dev/rmt/0 `tar tf . . . /dev/rmt/0 | grep 'pattern'`
```

When extracting tapes created with the `r` or `u` functions, directory modification times may not be set correctly. These same functions cannot be used with many tape drives due to tape drive limitations such as the absence of backspace or append capabilities.

When using the `r`, `u`, or `x` functions or the `X` function modifier, the named files must match exactly the corresponding files in the *tarfile*. For example, to extract `./thisfile`, you must specify `./thisfile`, and not `thisfile`. The `t` function displays how each file was archived.

Function Modifiers

The characters below may be used in conjunction with the letter that selects the desired function.

b Blocking Factor. Use when reading or writing to raw magnetic archives (see `f` below). The *block* argument specifies the number of 512-byte tape blocks to be included in each read or write operation performed on the tarfile. The minimum is 1, the default is 20. The maximum value is a function of the amount of memory available and the blocking requirements of the specific tape device involved (see `mt io(7I)` for details.) The maximum cannot exceed `INT_MAX/512 (4194303)`.

When a tape archive is being read, its actual blocking factor will be automatically detected, provided that it is less than or equal to the nominal blocking factor (the value of the *block* argument, or the default value if the `b` modifier is not specified). If the actual blocking factor is greater than the nominal blocking factor, a read error will result. See Example 5 in `EXAMPLES`.

B Block. Force `tar` to perform multiple reads (if necessary) to read exactly enough bytes to fill a block. This function modifier enables `tar` to work across the Ethernet, since pipes and sockets return partial blocks even when more data is coming. When reading from standard input, `'-'`, this function modifier is selected by default to ensure that `tar` can recover from short reads.

e Error. Exit immediately with a positive exit status if any unexpected errors occur. The `SYSV3` environment variable overrides the default behavior. (See `ENVIRONMENT` section below.)

E Write a tarfile with extended headers. (Used with `c`, `r`, or `u` options; ignored with `t` or `x` options.) When a tarfile is written with extended headers, the modification time is maintained with a granularity of microseconds rather than seconds. In addition, filenames no longer than `PATH_MAX` characters that could not be archived without `E`, and file sizes greater than 8GB, are supported.

The E flag is required whenever the larger files and/or files with longer names, or whose UID/GID exceed 2097151, are to be archived, or if time granularity of microseconds is desired.

f File. Use the *tarfile* argument as the name of the tarfile. If *f* is specified, `/etc/default/tar` is not searched. If *f* is omitted, `tar` will use the device indicated by the `TAPE` environment variable, if set; otherwise, it will use the default values defined in `/etc/default/tar`. If the name of the tarfile is `'-'`, `tar` writes to the standard output or reads from the standard input, whichever is appropriate. `tar` can be used as the head or tail of a pipeline. `tar` can also be used to move hierarchies with the command:

```
example% cd fromdir; tar cf - . | (cd todir; tar xfbp -)
```

F With one *F* argument, `tar` excludes all directories named `SCCS` and `RCS` from the tarfile. With two arguments, `FF`, `tar` excludes all directories named `SCCS` and `RCS`, all files with `.o` as their suffix, and all files named `errs`, `core`, and `a.out`. The `SYSV3` environment variable overrides the default behavior. (See `ENVIRONMENT` section below.)

h Follow symbolic links as if they were normal files or directories. Normally, `tar` does not follow symbolic links.

i Ignore directory checksum errors.

k size Requires `tar` to use the *size* argument as the size of an archive in kilobytes. This is useful when the archive is intended for a fixed size device such as floppy disks. Large files are then split across volumes if they do not fit in the specified size.

l Link. Output error message if unable to resolve all links to the files being archived. If *l* is not specified, no error messages are printed.

m Modify. The modification time of the file is the time of extraction. This function modifier is valid only with the *x* function.

n The file being read is a non-tape device. Reading of the archive is faster since `tar` can randomly seek around the archive.

o Ownership. Assign to extracted files the user and group identifiers of the user running the program, rather than those on tarfile. This is the default behavior for users other than root. If the *o* function modifier is not set and the user is root, the extracted files will take on the group and user identifiers of the files on tarfile (see `chown(1)` for more information). The *o* function modifier is only valid with the *x* function.

p Restore the named files to their original modes, and ACLs if applicable, ignoring the present `umask(1)`. This is the default

tar(1)

	<p>behavior if invoked as super-user with the <code>x</code> function letter specified. If super-user, SETUID and sticky information are also extracted, and files are restored with their original owners and permissions, rather than owned by root. When this function modifier is used with the <code>c</code> function, ACLs are created in the tarfile along with other information. Errors will occur when a tarfile with ACLs is extracted by previous versions of <code>tar</code>.</p>
<code>P</code>	Suppress the addition of a trailing "/" on directory entries in the archive.
<code>q</code>	Stop after extracting the first occurrence of the named file. <code>tar</code> will normally continue reading the archive after finding an occurrence of a file.
<code>v</code>	Verbose. Output the name of each file preceded by the function letter. With the <code>t</code> function, <code>v</code> provides additional information about the tarfile entries. The listing is similar to the format produced by the <code>-l</code> option of the <code>ls(1)</code> command.
<code>w</code>	What. Output the action to be taken and the name of the file, then await the user's confirmation. If the response is affirmative, the action is performed; otherwise, the action is not performed. This function modifier cannot be used with the <code>t</code> function.
<code>X</code>	Exclude. Use the <i>exclude-file</i> argument as a file containing a list of relative path names for files (or directories) to be excluded from the tarfile when using the functions <code>c</code> , <code>x</code> , or <code>t</code> . Be careful of trailing white spaces. Also beware of leading white spaces, since, for each line in the excluded file, the entire line (apart from the newline) will be used to match against the initial string of files to exclude. Multiple <code>X</code> arguments may be used, with one <i>exclude-file</i> per argument. In the case where included files (see <code>-I include-file</code> option) are also specified, the excluded files take precedence over all included files. If a file is specified in both the <i>exclude-file</i> and the <i>include-file</i> (or on the command line), it will be excluded.
<code>[0-7]</code>	Select an alternative drive on which the tape is mounted. The default entries are specified in <code>/etc/default/tar</code> . If no digit or <code>f</code> function modifier is specified, the entry in <code>/etc/default/tar</code> with digit "0" is the default.
USAGE	<p>See <code>largefile(5)</code> for the description of the behavior of <code>tar</code> when encountering files greater than or equal to 2 Gbyte (2^{31} bytes).</p> <p>The automatic determination of the actual blocking factor may be fooled when reading from a pipe or a socket (see the <code>B</code> function modifier below).</p> <p>1/4" streaming tape has an inherent blocking factor of one 512-byte block. It can be read or written using any blocking factor.</p>

This function modifier works for archives on disk files and block special devices, among others, but is intended principally for tape devices.

For information on `tar` header format, see `archives(4)`.

EXAMPLES **EXAMPLE 1** Using the `tar` Command to Create an Archive of Your Home Directory

The following is an example using `tar` to create an archive of your home directory on a tape mounted on drive `/dev/rmt/0`:

```
example% cd
example% tar cvf /dev/rmt/0 .
messages from tar
```

The `c` function letter means create the archive; the `v` function modifier outputs messages explaining what `tar` is doing; the `f` function modifier indicates that the tarfile is being specified (`/dev/rmt/0` in this example). The dot (`.`) at the end of the command line indicates the current directory and is the argument of the `f` function modifier.

Display the table of contents of the tarfile with the following command:

```
example% tar tvf /dev/rmt/0
```

The output will be similar to the following for the POSIX locale:

```
rw-r--r-- 1677/40 2123 Nov 7 18:15 1985 ./test.c
. . .
example%
```

The columns have the following meanings:

- column 1 is the access permissions to `./test.c`
- column 2 is the *user-id/group-id* of `./test.c`
- column 3 is the size of `./test.c` in bytes
- column 4 is the modification date of `./test.c`. When the `LC_TIME` category is not set to the POSIX locale, a different format and date order field may be used.
- column 5 is the name of `./test.c`

To extract files from the archive:

```
example% tar xvf /dev/rmt/0
messages from tar
example%
```

If there are multiple archive files on a tape, each is separated from the following one by an EOF marker. To have `tar` read the first and second archives from a tape with multiple archives on it, the *non-rewinding* version of the tape device name must be used with the `f` function modifier, as follows:

```
example% tar xvfp /dev/rmt/0n read first archive from tape
messages from tar example% tar xvfp /dev/rmt/0n read second archive from tape
messages from tar example%
```

tar(1)

EXAMPLE 1 Using the tar Command to Create an Archive of Your Home Directory (Continued)

Note that in some earlier releases, the above scenario did not work correctly, and intervention with `mt(1)` between `tar` invocations was necessary. To emulate the old behavior, use the non-rewind device name containing the letter `b` for BSD behavior. See the Close Operations section of the `mtio(7I)` manual page.

EXAMPLE 2 Using Tar To Archive Files From /usr/include And From /etc To Default Tape Drive 0:

To archive files from `/usr/include` and from `/etc` to default tape drive 0:

```
example% tar c -C /usr include -C /etc .
```

The table of contents from the resulting tarfile would produce output like the following:

```
include/  
include/a.out.h  
and all the other files in /usr/include . . .  
./chown and all the other files in /etc
```

To extract all files in the `include` directory:

```
example% tar xv include  
x include/, 0 bytes, 0 tape blocksand all files under include . . .
```

EXAMPLE 3 Using tar to Transfer Files Across the Network

The following is an example using `tar` to transfer files across the network. First, here is how to archive files from the local machine (`example`) to a tape on a remote system (`host`):

```
example% tar cvfb - 20 files | rsh host dd of=/dev/rmt/0 obs=20b  
messages from tar  
example%
```

In the example above, we are *creating a tarfile* with the `c` key letter, asking for *verbose* output from `tar` with the `v` function modifier, specifying the name of the output *tarfile* using the `f` function modifier (the standard output is where the *tarfile* appears, as indicated by the `'-'` sign), and specifying the blocksize (20) with the `b` function modifier. If you want to change the blocksize, you must change the blocksize arguments both on the `tar` command *and* on the `dd` command.

EXAMPLE 4 Using Tar To Retrieve Files From A Tape On The Remote System Back To The Local System:

The following is an example that uses `tar` to retrieve files from a tape on the remote system back to the local system:

```
example% rsh -n host dd if=/dev/rmt/0 bs=20b | tar xvBfb - 20 files  
messages from tar  
example%
```

EXAMPLE 4 Using `tar` To Retrieve Files From A Tape On The Remote System Back To The Local System: (Continued)

In the example above, we are *extracting* from the *tarfile* with the `x` key letter, asking for *verbose output* from `tar` with the `v` function modifier, telling `tar` it is reading from a pipe with the `B` function modifier, specifying the name of the input *tarfile* using the `f` function modifier (the standard input is where the *tarfile* appears, as indicated by the `'-` sign), and specifying the blocksize (`20`) with the `b` function modifier.

EXAMPLE 5 Creating An Archive Of The Home Directory On `/dev/rmt/0` With A Blocking Factor Of `19`

The following example creates an archive of the home directory on `/dev/rmt/0` with an actual blocking factor of `19`:

```
example% tar cvfb /dev/rmt/0 19 $HOME
```

To recognize this archive's actual blocking factor without using the `b` function modifier:

```
example% tar tvf /dev/rmt/0
tar: blocksize = 19
. . .
```

To recognize this archive's actual blocking factor using a larger nominal blocking factor:

```
example% tar tvf /dev/rmt/0 30
tar: blocksize = 19
. . .
```

Attempt to recognize this archive's actual blocking factor using a nominal blocking factor that is too small:

```
example% tar tvf /dev/rmt/0 10
tar: tape read error
```

ENVIRONMENT VARIABLES

SYSV3 This variable is used to override the default behavior of `tar`, provide compatibility with INTERACTIVE UNIX Systems and SCO UNIX installation scripts, and should not be used in new scripts. (It is intended for compatibility purposes only.) When set, the following options behave differently:

- `-F filename` Uses *filename* to obtain a list of command line switches and files on which to operate.
- `-e` Prevents files from being split across volumes. If there is insufficient room on one volume, `tar` prompts for a new volume. If the file will not fit on the new volume, `tar` exits with an error.

See `environ(5)` for descriptions of the following environment variables that affect the execution of `tar`: `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, `TZ`, and `NLSPATH`.

tar(1)

EXIT STATUS The following exit values are returned:

0 Successful completion.
>0 An error occurred.

FILES /dev/rmt/ [0-7] [b] [n]
/dev/rmt/ [0-7] l [b] [n]
/dev/rmt/ [0-7] m [b] [n]
/dev/rmt/ [0-7] h [b] [n]
/dev/rmt/ [0-7] u [b] [n]
/dev/rmt/ [0-7] c [b] [n]
/etc/default/tar

Settings may look like this:

```
archive0=/dev/rmt/0
archive1=/dev/rmt/0n
archive2=/dev/rmt/1
archive3=/dev/rmt/1n
archive4=/dev/rmt/0
archive5=/dev/rmt/0n
archive6=/dev/rmt/1
archive7=/dev/rmt/1n
```

/tmp/tar*

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu
CSI	Enabled

SEE ALSO `ar(1)`, `basename(1)`, `cd(1)`, `chown(1)`, `cpio(1)`, `csh(1)`, `dirname(1)`, `ls(1)`, `mt(1)`, `pax(1)`, `setfacl(1)`, `umask(1)`, `mknod(1M)`, `vold(1M)`, `archives(4)`, `attributes(5)`, `environ(5)`, `largefile(5)`, `mtio(7I)`

DIAGNOSTICS Diagnostic messages are output for bad key characters and tape read/write errors, and for insufficient memory to hold the link tables.

NOTES There is no way to access the *n*-th occurrence of a file.

Tape errors are handled ungracefully.

When the Volume Management daemon is running, accesses to floppy devices through the conventional device names (for example, `/dev/rdiskette`) may not succeed. See `vold(1M)` for further details.

The `tar` archive format allows UIDs and GIDs up to 2097151 to be stored in the archive header. Files with UIDs and GIDs greater than this value will be archived with the UID and GID of 60001.

If an archive is created that contains files whose names were created by processes running in multiple locales, a single locale that uses a full 8-bit codeset (for example, the `en_US` locale) should be used both to create the archive and to extract files from the archive.

tbl(1)

NAME tbl – format tables for nroff or troff

SYNOPSIS **tbl** [-me] [-mm] [-ms] [*filename*]...

DESCRIPTION tbl is a preprocessor for formatting tables for nroff(1) or troff(1). The input *filenames* are copied to the standard output, except that lines between .TS and .TE command lines are assumed to describe tables and are reformatted.

If no arguments are given, tbl reads the standard input, so tbl may be used as a filter. When tbl is used with eqn(1) or neqn, the tbl command should be first, to minimize the volume of data passed through pipes.

OPTIONS

- me Copy the -me macro package to the front of the output file.
- mm Copy the -mm macro package to the front of the output file.
- ms Copy the -ms macro package to the front of the output file.

EXAMPLES **EXAMPLE 1** Using tbl

As an example, letting '@' (at-sign) represent a TAB, which should be typed as an actual TAB character in the input file

```
.TS
c s s
c c s
c c c
l n n.
Household Population
Town@Households
@Number@Size
Bedminster@789@3.26
Bernards Twp.@3087@3.74
Bernardsville@2018@3.30
Bound Brook@3425@3.04
Branchburg@1644@3.49
.TE
```

yields

Town	Household Population		Size
	Number	Households	
Bedminster	789	3.26	
Bernards Twp.	3087	3.74	
Bernardsville	2018	3.30	
Bound Brook	3425	3.04	
Branchburg	1644	3.49

tcopy(1)

NAME | tcopy – copy a magnetic tape

SYNOPSIS | **tcopy** *source* [*destination*]

DESCRIPTION | tcopy copies the magnetic tape mounted on the tape drive specified by the *source* argument. The only assumption made about the contents of a tape is that there are two tape marks at the end.

When only a source drive is specified, tcopy scans the tape, and displays information about the sizes of records and tape files. If a destination is specified, tcopy makes a copies the source tape onto the *destination* tape, with blocking preserved. As it copies, tcopy produces the same output as it does when only scanning a tape.

ATTRIBUTES | See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWesu

SEE ALSO | mt(1), ioctl(2), attributes(5)

NOTES | tcopy will only run on systems supporting an associated set of ioctl(2) requests.

NAME	tee – replicate the standard output						
SYNOPSIS	tee [-ai] [<i>file...</i>]						
DESCRIPTION	The <code>tee</code> utility will copy standard input to standard output, making a copy in zero or more files. <code>tee</code> will not buffer its output. The options determine if the specified files are overwritten or appended to.						
OPTIONS	The following options are supported. -a Append the output to the files rather than overwriting them. -i Ignore interrupts.						
OPERANDS	The following operands are supported: <i>file</i> A path name of an output file. Processing of at least 13 <i>file</i> operands will be supported.						
USAGE	See <code>largefile(5)</code> for the description of the behavior of <code>tee</code> when encountering files greater than or equal to 2 Gbyte (2^{31} bytes).						
ENVIRONMENT VARIABLES	See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>tee</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .						
EXIT STATUS	The following exit values are returned: 0 The standard input was successfully copied to all output files. >0 The number of files that could not be opened or whose status could not be obtained.						
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:						
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWcsu</td> </tr> <tr> <td>CSI</td> <td>Enabled</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWcsu	CSI	Enabled

telnet(1)

NAME	telnet – user interface to a remote system using the TELNET protocol
SYNOPSIS	telnet [-8ELcdr] [-e <i>escape_char</i>] [-l <i>user</i>] [-n <i>file</i>] [[[!] @hop1 [@hop2...] @] <i>host</i> [<i>port</i>]
DESCRIPTION	<p>telnet communicates with another host using the TELNET protocol. If telnet is invoked without arguments, it enters command mode, indicated by its prompt, telnet>. In this mode, it accepts and executes its associated commands. See USAGE, telnet Commands, below. If it is invoked with arguments, it performs an open command with those arguments.</p> <p>If for example a <i>host</i> is specified as @hop1@hop2@host, the connection goes through hosts hop1 and hop2, using loose source routing to end at host. If a leading ! is used, the connection follows strict source routing. Note that when telnet uses IPv6, it can only use loose source routing, and the connection ignores the !.</p> <p>Once a connection has been opened, telnet enters input mode. In this mode, text typed is sent to the remote host. The input mode entered will be either "line mode", "character at a time", or "old line by line", depending upon what the remote system supports.</p> <p>In "line mode", character processing is done on the local system, under the control of the remote system. When input editing or character echoing is to be disabled, the remote system will relay that information. The remote system will also relay changes to any special characters that happen on the remote system, so that they can take effect on the local system.</p> <p>In "character at a time" mode, most text typed is immediately sent to the remote host for processing.</p> <p>In "old line by line" mode, all text is echoed locally, and (normally) only completed lines are sent to the remote host. The "local echo character" (initially ^E) may be used to turn off and on the local echo. (Use this mostly to enter passwords without the password being echoed.)</p> <p>If the "line mode" option is enabled, or if the localchars toggle is TRUE (the default in "old line by line" mode), the user's quit, intr, and flush characters are trapped locally, and sent as TELNET protocol sequences to the remote side. If "line mode" has ever been enabled, then the user's susp and eof are also sent as TELNET protocol sequences. quit is then sent as a TELNET ABORT instead of BREAK. The options toggle autoflush and toggle autosynch cause this action to flush subsequent output to the terminal (until the remote host acknowledges the TELNET sequence); and to flush previous terminal input, in the case of quit and intr.</p> <p>While connected to a remote host, the user can enter telnet command mode by typing the telnet escape character (initially ^]). When in command mode, the normal terminal editing conventions are available. Pressing RETURN at the telnet command prompt causes telnet to exit command mode.</p>

OPTIONS	The following options are supported:
-8	Specifies an 8-bit data path. Negotiating the TELNET BINARY option is attempted for both input and output.
-c	Disables the reading of the user's telnetrc file. (See the toggle skiprc command on this reference page.)
-d	Sets the initial value of the debug toggle to TRUE.
-e <i>escape_char</i>	Sets the initial escape character to <i>escape_char</i> . <i>escape_char</i> may also be a two character sequence consisting of '^' followed by one character. If the second character is '?', the DEL character is selected. Otherwise, the second character is converted to a control character and used as the escape character. If the escape character is the null string (that is, -e ''), it is disabled.
-E	Stops any character from being recognized as an escape character.
-l <i>user</i>	When connecting to a remote system that understands the ENVIRON option, then <i>user</i> will be sent to the remote system as the value for the ENVIRON variable USER.
-L	Specifies an 8-bit data path on output. This causes the BINARY option to be negotiated on output.
-n <i>tracefile</i>	Opens <i>tracefile</i> for recording trace information. See the set <i>tracefile</i> command below.
-r	Specifies a user interface similar to rlogin. In this mode, the escape character is set to the tilde (~) character, unless modified by the -e option. The rlogin escape character is only recognized when it is preceded by a carriage return. In this mode, the telnet escape character, normally '^]', must still precede a telnet command. The rlogin escape character can also be followed by '.\r' or '^Z', and, like rlogin(1), closes or suspends the connection, respectively. This option is an uncommitted interface and may change in the future.

telnet Commands The commands described in this section are available with telnet. It is necessary to type only enough of each command to uniquely identify it. (This is also true for arguments to the mode, set, toggle, unset, environ, and display commands.)

open [-l *user*] [[!] @*hop1* [@*hop2* ...]@*host* [*port*]

Open a connection to the named host. If no port number is specified, telnet will attempt to contact a TELNET server at the default port. The host specification may be either a host name (see hosts(4), ipnodes(4)) or an Internet address specified in the "dot notation" (see inet(7P) or inet6(7P)). If the *host* is specified as @*hop1*@*hop2*@*host*, the connection goes through hosts *hop1* and *hop2*, using loose source routing to end at *host*. The "@" symbol is required as a separator between the hosts specified. If a leading ! is used with IPv4, the connection follows strict source routing.

telnet(1)

The `-l` option passes the *user* as the value of the ENVIRON variable USER to the remote system.

close

Close any open TELNET session and exit `telnet`. An EOF (in command mode) will also close a session and exit.

quit

Same as `close`.

z

Suspend `telnet`. This command only works when the user is using a shell that supports job control, such as `sh(1)`.

mode *type*

The remote host is asked for permission to go into the requested mode. If the remote host is capable of entering that mode, the requested mode will be entered. The argument *type* is one of the following:

<code>character</code>	Disable the TELNET LINEMODE option, or, if the remote side does not understand the LINEMODE option, then enter "character at a time" mode.
<code>line</code>	Enable the TELNET LINEMODE option, or, if the remote side does not understand the LINEMODE option, then attempt to enter "old-line-by-line" mode.
<code>isig (-isig)</code>	Attempt to enable (disable) the TRAPSIG mode of the LINEMODE option. This requires that the LINEMODE option be enabled.
<code>edit (-edit)</code>	Attempt to enable (disable) the EDIT mode of the LINEMODE option. This requires that the LINEMODE option be enabled.
<code>softtabs (-softtabs)</code>	Attempt to enable (disable) the SOFT_TAB mode of the LINEMODE option. This requires that the LINEMODE option be enabled.
<code>litecho (-litecho)</code>	Attempt to enable (disable) the LIT_ECHO mode of the LINEMODE option. This requires that the LINEMODE option be enabled.
<code>?</code>	Prints out help information for the mode command.

status

Show the current status of `telnet`. This includes the peer one is connected to, as well as the current mode.

display

[*argument . . .*] Display all, or some, of the set and toggle values (see `toggle argument . . .`).

?

[*command*] Get help. With no arguments, `telnet` prints a help summary. If a command is specified, `telnet` will print the help information for just that command.

send *argument* . . .

Send one or more special character sequences to the remote host. The following are the arguments that can be specified (more than one argument may be specified at a time):

escape	Send the current <code>telnet</code> escape character (initially ^]).
synch	Send the TELNET SYNCH sequence. This sequence discards all previously typed, but not yet read, input on the remote system. This sequence is sent as TCP urgent data and may not work if the remote system is a 4.2 BSD system. If it does not work, a lower case "r" may be echoed on the terminal.
brk or break	Send the TELNET BRK (Break) sequence, which may have significance to the remote system.
ip	Send the TELNET IP (Interrupt Process) sequence, which aborts the currently running process on the remote system.
abort	Send the TELNET ABORT (Abort Process) sequence.
ao	Send the TELNET AO (Abort Output) sequence, which flushes all output from the remote system to the user's terminal.
ayt	Send the TELNET AYT (Are You There) sequence, to which the remote system may or may not respond.
ec	Send the TELNET EC (Erase Character) sequence, which erases the last character entered.
el	Send the TELNET EL (Erase Line) sequence, which should cause the remote system to erase the line currently being entered.
eof	Send the TELNET EOF (End Of File) sequence.
eor	Send the TELNET EOR (End Of Record) sequence.
ga	Send the TELNET GA (Go Ahead) sequence, which probably has no significance for the remote system.
getstatus	If the remote side supports the TELNET STATUS command, <code>getstatus</code> will send the subnegotiation to request that the server send its current option status.
nop	Send the TELNET NOP (No Operation) sequence.
susp	Send the TELNET SUSP (Suspend Process) sequence.

telnet(1)

<i>do option</i>	
<i>dont option</i>	
<i>will option</i>	
<i>wont option</i>	Send the TELNET protocol option negotiation indicated. Option may be the text name of the protocol option, or the number corresponding to the option. The command will be silently ignored if the option negotiation indicated is not valid in the current state. If the <i>option</i> is given as 'help' or '?', the list of option names known is listed. This command is mostly useful for unusual debugging situations.
?	Print out help information for the send command.
<i>set argument [value]</i>	
<i>unset argument</i>	Set any one of a number of telnet variables to a specific value. The special value "off" turns off the function associated with the variable. The values of variables may be interrogated with the <i>display</i> command. If <i>value</i> is omitted, the value is taken to be true, or "on". If the <i>unset</i> form is used, the value is taken to be false, or "off." The variables that may be specified are:
<i>echo</i>	This is the value (initially ^E) that, when in "line by line" mode, toggles between local echoing of entered characters for normal processing, and suppressing echoing of entered characters, for example, entering a password.
<i>escape</i>	This is the telnet escape character (initially ^]) that enters telnet command mode when connected to a remote system.
<i>interrupt</i>	If telnet is in <i>localchars</i> mode (see <i>toggle</i> , <i>localchars</i>) and the <i>interrupt</i> character is typed, a TELNET IP sequence (see <i>send</i> and <i>ip</i>) is sent to the remote host. The initial value for the <i>interrupt</i> character is taken to be the terminal's <i>intr</i> character.
<i>quit</i>	If telnet is in <i>localchars</i> mode and the <i>quit</i> character is typed, a TELNET BRK sequence (see <i>send</i> , <i>brk</i>) is sent to the remote host. The initial value for the <i>quit</i> character is taken to be the terminal's <i>quit</i> character.
<i>flushoutput</i>	If telnet is in <i>localchars</i> mode and the <i>flushoutput</i> character is typed, a TELNET AO sequence (see <i>send</i> , <i>ao</i>) is sent to the remote host. The initial value for the <i>flush</i> character is taken to be the terminal's <i>flush</i> character.
<i>erase</i>	If telnet is in <i>localchars</i> mode <i>and</i> operating in "character at a time" mode, then when the <i>erase</i> character is typed, a TELNET EC sequence (see <i>send</i> , <i>ec</i>) is sent to the remote system. The initial value for the <i>erase</i> character is taken to be the terminal's <i>erase</i> character.

kill	If telnet is in localchars mode <i>and</i> operating in "character at a time" mode, then when the kill character is typed, a TELNET EL sequence (see send, e1) is sent to the remote system. The initial value for the kill character is taken to be the terminal's kill character.
eof	If telnet is operating in "line by line" mode, entering the eof character as the first character on a line sends this character to the remote system. The initial value of eof is taken to be the terminal's eof character.
ayt	If telnet is in localchars mode, or LINEMODE is enabled, and the status character is typed, a TELNET AYT ("Are You There") sequence is sent to the remote host. (See send, ayt above.) The initial value for ayt is the terminal's status character.
forw1 forw2	If telnet is operating in LINEMODE, and the forw1 or forw2 characters are typed, this causes the forwarding of partial lines to the remote system. The initial values for the forwarding characters come from the terminal's eol and eol2 characters.
lnext	If telnet is operating in LINEMODE or "old line by line" mode, then the lnext character is assumed to be the terminal's lnext character. The initial value for the lnext character is taken to be the terminal's lnext character.
reprint	If telnet is operating in LINEMODE or "old line by line" mode, then the reprint character is assumed to be the terminal's reprint character. The initial value for reprint is taken to be the terminal's reprint character.
rlogin	This is the rlogin escape character. If set, the normal telnet escape character is ignored, unless it is preceded by this character at the beginning of a line. The rlogin character, at the beginning of a line followed by a "." closes the connection. When followed by a ^Z, the rlogin command suspends the telnet command. The initial state is to disable the rlogin escape character.
start	If the TELNET TOGGLE-FLOW-CONTROL option has been enabled, then the start character is taken to be the terminal's start character. The initial value for the kill character is taken to be the terminal's start character.
stop	If the TELNET TOGGLE-FLOW-CONTROL option has been enabled, then the stop character is taken to be the terminal's stop character. The initial value for the kill character is taken to be the terminal's stop character.

telnet(1)

<code>susp</code>	If <code>telnet</code> is in <code>localchars</code> mode, or <code>LINEMODE</code> is enabled, and the suspend character is typed, a TELNET SUSP sequence (see <code>send</code> , <code>susp</code> above) is sent to the remote host. The initial value for the suspend character is taken to be the terminal's suspend character.
<code>tracefile</code>	This is the file to which the output, generated when the <code>netdata</code> or the <code>debug</code> option is <code>TRUE</code> , will be written. If <code>tracefile</code> is set to "-", then tracing information will be written to standard output (the default).
<code>worderase</code>	If <code>telnet</code> is operating in <code>LINEMODE</code> or "old line by line" mode, then this character is taken to be the terminal's worderase character. The initial value for the worderase character is taken to be the terminal's worderase character.
<code>?</code>	Displays the legal set and unset commands.

`slc state`

The `slc` (Set Local Characters) command is used to set or change the state of special characters when the TELNET `LINEMODE` option has been enabled. Special characters are characters that get mapped to TELNET commands sequences (like `ip` or `quit`) or line editing characters (like `erase` and `kill`). By default, the local special characters are exported. The following values for `state` are valid:

<code>check</code>	Verifies the settings for the current special characters. The remote side is requested to send all the current special character settings. If there are any discrepancies with the local side, the local settings will switch to the remote values.
<code>export</code>	Switches to the local defaults for the special characters. The local default characters are those of the local terminal at the time when <code>telnet</code> was started.
<code>import</code>	Switches to the remote defaults for the special characters. The remote default characters are those of the remote system at the time when the TELNET connection was established.
<code>?</code>	Prints out help information for the <code>slc</code> command.

`toggle argument ...`

Toggle between `TRUE` and `FALSE` the various flags that control how `telnet` responds to events. More than one argument may be specified. The state of these flags may be interrogated with the `display` command. Valid arguments are:

<code>autoflush</code>	If <code>autoflush</code> and <code>localchars</code> are both <code>TRUE</code> , then when the <code>ao</code> , <code>intr</code> , or <code>quit</code> characters are recognized (and transformed into TELNET sequences; see <code>set</code> for details), <code>telnet</code> refuses to display any data on the user's terminal until the remote system acknowledges (using a TELNET Timing Mark option) that it has processed those TELNET sequences. The initial value for this
------------------------	---

	toggle is TRUE if the terminal user has not done an "stty noflush". Otherwise, the value is FALSE (see <code>stty(1)</code>).
<code>autosynch</code>	If <code>autosynch</code> and <code>localchars</code> are both TRUE, then when either the <code>interrupt</code> or <code>quit</code> characters are typed (see <code>set</code> for descriptions of <code>interrupt</code> and <code>quit</code>), the resulting TELNET sequence sent is followed by the TELNET SYNCH sequence. This procedure <i>should</i> cause the remote system to begin throwing away all previously typed input until both of the TELNET sequences have been read and acted upon. The initial value of this toggle is FALSE.
<code>binary</code>	Enable or disable the TELNET BINARY option on both input and output.
<code>inbinary</code>	Enable or disable the TELNET BINARY option on input.
<code>outbinary</code>	Enable or disable the TELNET BINARY option on output.
<code>crlf</code>	Determines how carriage returns are sent. If the value is TRUE, then carriage returns will be sent as <CR><LF>. If the value is FALSE, then carriage returns will be sent as <CR><NUL>. The initial value for this toggle is FALSE.
<code>crmod</code>	Toggle RETURN mode. When this mode is enabled, most RETURN characters received from the remote host will be mapped into a RETURN followed by a line feed. This mode does not affect those characters typed by the user, only those received from the remote host. This mode is useful only for remote hosts that send RETURN but never send LINEFEED. The initial value for this toggle is FALSE.
<code>debug</code>	Toggle socket level debugging (only available to the super-user). The initial value for this toggle is FALSE.
<code>localchars</code>	If this toggle is TRUE, then the <code>flush</code> , <code>interrupt</code> , <code>quit</code> , <code>erase</code> , and <code>kill</code> characters (see <code>set</code>) are recognized locally, and transformed into appropriate TELNET control sequences, respectively <code>ao</code> , <code>ip</code> , <code>brk</code> , <code>ec</code> , and <code>el</code> (see <code>send</code>). The initial value for this toggle is TRUE in "line by line" mode, and FALSE in "character at a time" mode. When the LINEMODE option is enabled, the value of <code>localchars</code> is ignored, and assumed always to be TRUE. If LINEMODE has ever been enabled, then <code>quit</code> is sent as <code>abort</code> , and <code>eof</code> and <code>suspend</code> are sent as <code>eof</code> and <code>susp</code> (see <code>send</code> above).
<code>netdata</code>	Toggle the display of all network data (in hexadecimal format). The initial value for this toggle is FALSE.
<code>options</code>	Toggle the display of some internal TELNET protocol processing (having to do with telnet options). The initial value for this toggle is FALSE.

telnet(1)

<code>prettydump</code>	When the <code>netdata</code> toggle is enabled, if <code>prettydump</code> is enabled, the output from the <code>netdata</code> command will be formatted in a more user readable format. Spaces are put between each character in the output. The beginning of any TELNET escape sequence is preceded by an asterisk (*) to aid in locating them.
<code>skiprc</code>	When the <code>skiprc</code> toggle is TRUE, TELNET skips the reading of the <code>.telnetrc</code> file in the user's home directory when connections are opened. The initial value for this toggle is FALSE.
<code>termdata</code>	Toggles the display of all terminal data (in hexadecimal format). The initial value for this toggle is FALSE.
<code>?</code>	Display the legal toggle commands.

`environ` *argument* . . .

The `environ` command is used to manipulate variables that may be sent through the TELNET ENVIRON option. The initial set of variables is taken from the users environment. Only the `DISPLAY` and `PRINTER` variables are exported by default. Valid arguments for the `environ` command are:

<code>define</code> <i>variable</i> <i>value</i>	Define <i>variable</i> to have a value of <i>value</i> . Any variables defined by this command are automatically exported. The <i>value</i> may be enclosed in single or double quotes, so that tabs and spaces may be included.
<code>undefine</code> <i>variable</i>	Remove <i>variable</i> from the list of environment variables.
<code>export</code> <i>variable</i>	Mark the <i>variable</i> to be exported to the remote side.
<code>unexport</code> <i>variable</i>	Mark the <i>variable</i> to not be exported unless explicitly requested by the remote side.
<code>list</code>	List the current set of environment variables. Those marked with an asterisk (*) will be sent automatically. Other variables will be sent only if explicitly requested.
<code>?</code>	Prints out help information for the <code>environ</code> command.

`logout`

Sends the `telnet` `logout` option to the remote side. This command is similar to a `close` command. However, if the remote side does not support the `logout` option, nothing happens. If, however, the remote side does support the `logout` option, this command should cause the remote side to close the TELNET connection. If the remote side also supports the concept of suspending a user's session for later reattachment, the `logout` argument indicates that the remote side should

terminate the session immediately.

FILES \$HOME/.telnetrc
 file that contains commands to be executed before initiating a telnet session

/etc/nologin
 file that contains a message displayed to users attempting to login during machine shutdown

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO rlogin(1), sh(1), stty(1), hosts(4), ipnodes(4), nologin(4), telnetrc(4), attributes(5), inet(7P), inet6(7P)

DIAGNOSTICS NO LOGINS: System going down in *N* minutes
 The machine is in the process of being shut down and logins have been disabled.

NOTES On some remote systems, echo has to be turned off manually when in "line by line" mode.

In "old line by line" mode, or LINEMODE, the terminal's EOF character is only recognized (and sent to the remote system) when it is the first character on a line.

test(1B)

NAME	test – condition evaluation command
SYNOPSIS	<code>/usr/ucb/test</code> <i>expression</i> <i>expression</i>
DESCRIPTION	<p><code>test</code> evaluates the expression <i>expression</i> and, if its value is true, sets 0 (true) exit status; otherwise, a non-zero (false) exit status is set. <code>test</code> also sets a non-zero exit status if there are no arguments. When permissions are tested, the effective user ID of the process is used.</p> <p>All operators, flags, and brackets (brackets used as shown in the second SYNOPSIS line) must be separate arguments to the <code>test</code> command; normally these items are separated by spaces.</p>
Primitives	<p>The following primitives are used to construct <i>expression</i>:</p> <ul style="list-style-type: none"> <code>-r filename</code> True if <i>filename</i> exists and is readable. <code>-w filename</code> True if <i>filename</i> exists and is writable. <code>-x filename</code> True if <i>filename</i> exists and is executable. <code>-f filename</code> True if <i>filename</i> exists and is a regular file. Alternatively, if <code>/usr/bin/sh</code> users specify <code>/usr/ucb</code> before <code>/usr/bin</code> in their <code>PATH</code> environment variable, then <code>test</code> will return true if <i>filename</i> exists and is (not-a-directory). This is also the default for <code>/usr/bin/csh</code> users. <code>-d filename</code> True if <i>filename</i> exists and is a directory. <code>-c filename</code> True if <i>filename</i> exists and is a character special file. <code>-b filename</code> True if <i>filename</i> exists and is a block special file. <code>-p filename</code> True if <i>filename</i> exists and is a named pipe (fifo). <code>-u filename</code> True if <i>filename</i> exists and its set-user- ID bit is set. <code>-g filename</code> True if <i>filename</i> exists and its set-group- ID bit is set. <code>-k filename</code> True if <i>filename</i> exists and its sticky bit is set. <code>-s filename</code> True if <i>filename</i> exists and has a size greater than zero. <code>-t[<i>fildev</i>]</code> True if the open file whose file descriptor number is <i>fildev</i> (1 by default) is associated with a terminal device. <code>-z s1</code> True if the length of string <i>s1</i> is zero. <code>-n s1</code> True if the length of the string <i>s1</i> is non-zero. <code>s1 = s2</code> True if strings <i>s1</i> and <i>s2</i> are identical. <code>s1 != s2</code> True if strings <i>s1</i> and <i>s2</i> are <i>not</i> identical. <code>s1</code> True if <i>s1</i> is <i>not</i> the null string.

n1 -eq n2 True if the integers *n1* and *n2* are algebraically equal. Any of the comparisons *-ne*, *-gt*, *-ge*, *-lt*, and *-le* may be used in place of *-eq*.

Operators These primaries may be combined with the following operators:

! Unary negation operator.
 -a Binary *and* operator.
 -o Binary *or* operator (*-a* has higher precedence than *-o*).
 (*expression*) Parentheses for grouping. Notice also that parentheses are meaningful to the shell and, therefore, must be quoted.

ATTRIBUTES See *attributes(5)* for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWscpu

SEE ALSO *find(1)*, *sh(1)*, *attributes(5)*

NOTES The *not-a-directory* alternative to the *-f* option is a transition aid for BSD applications and may not be supported in future releases.

If you test a file you own (the *-r*, *-w*, or *-x* tests), but the permission tested does not have the *owner* bit set, a non-zero (false) exit status will be returned even though the file may have the *group* or *other* bit set for that permission. The correct exit status will be set if you are super-user.

The *=* and *!=* operators have a higher precedence than the *-r* through *-n* operators, and *=* and *!=* always expect arguments; therefore, *=* and *!=* cannot be used with the *-r* through *-n* operators.

If more than one argument follows the *-r* through *-n* operators, only the first argument is examined; the others are ignored, unless a *-a* or a *-o* is the second argument.

test(1F)

NAME	test – condition evaluation command																														
SYNOPSIS	test <i>expression</i> <i>expression</i>																														
DESCRIPTION	<p>test evaluates the expression <i>expression</i> and if its value is true, sets a 0 (TRUE) exit status; otherwise, a non-zero (FALSE) exit status is set; test also sets a non-zero exit status if there are no arguments. -r <i>filename</i>	True if <i>filename</i> exists and is readable.																														
-w <i>filename</i>	True if <i>filename</i> exists and is writable.																														
-x <i>filename</i>	True if <i>filename</i> exists and is executable.																														
-f <i>filename</i>	True if <i>filename</i> exists and is a regular file.																														
-d <i>filename</i>	True if <i>filename</i> exists and is a directory.																														
-c <i>filename</i>	True if <i>filename</i> exists and is a character special file.																														
-b <i>filename</i>	True if <i>filename</i> exists and is a block special file.																														
-p <i>filename</i>	True if <i>filename</i> exists and is a named pipe (FIFO).																														
-u <i>filename</i>	True if <i>filename</i> exists and its set-user-ID bit is set.																														
-g <i>filename</i>	True if <i>filename</i> exists and its set-group-ID bit is set.																														
-k <i>filename</i>	True if <i>filename</i> exists and its sticky bit is set.																														
-s <i>filename</i>	True if <i>filename</i> exists and has a size greater than 0.																														
-t[<i>fildev</i>]	True if the open file whose file descriptor number is <i>fildev</i> (1 by default) is associated with a terminal device.																														
-z <i>s1</i>	True if the length of string <i>s1</i> is 0.																														
-n <i>s1</i>	True if the length of the string <i>s1</i> is non-zero.																														

$s1 = s2$	True if strings $s1$ and $s2$ are identical.
$s1 != s2$	True if strings $s1$ and $s2$ are <i>not</i> identical.
$s1$	True if $s1$ is <i>not</i> the null string.
$n1 -eq n2$	True if the integers $n1$ and $n2$ are algebraically equal. Any of the comparisons $-ne$, $-gt$, $-ge$, $-lt$, and $-le$ may be used in place of $-eq$.

Operators These primaries may be combined with the following operators:

- !
 - Unary negation operator.
- a
 - Binary *and* operator.
- o
 - Binary *or* operator ($-a$ has higher precedence than $-o$).
- '(*expression*)'
 - Parentheses for grouping. Notice also that parentheses are meaningful to the shell and, therefore, must be quoted.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO `find(1)`, `sh(1)`, `attributes(5)`

NOTES If you test a file you own (the $-r$, $-w$, or $-x$ tests), but the permission tested does not have the *owner* bit set, a non-zero (false) exit status will be returned even though the file may have the *group* or *other* bit set for that permission. The correct exit status will be set if you are super-user.

The $=$ and $!=$ operators have a higher precedence than the $-r$ through $-n$ operators, and $=$ and $!=$ always expect arguments; therefore, $=$ and $!=$ cannot be used with the $-r$ through $-n$ operators.

If more than one argument follows the $-r$ through $-n$ operators, only the first argument is examined; the others are ignored, unless a $-a$ or a $-o$ is the second argument.

tftp(1)

NAME	tftp – trivial file transfer program
SYNOPSIS	tftp [<i>host</i>]
DESCRIPTION	tftp is the user interface to the Internet TFTP (Trivial File Transfer Protocol), which allows users to transfer files to and from a remote machine. The remote <i>host</i> may be specified on the command line, in which case tftp uses <i>host</i> as the default host for future transfers (see the connect command below).
USAGE	Once tftp is running, it issues the prompt tftp> and recognizes the following commands:
Commands	<p>connect <i>host-name</i> [<i>port</i>]</p> <p>Set the <i>host</i> (and optionally <i>port</i>) for transfers. The TFTP protocol, unlike the FTP protocol, does not maintain connections between transfers; thus, the connect command does not actually create a connection, but merely remembers what host is to be used for transfers. You do not have to use the connect command; the remote host can be specified as part of the get or put commands.</p> <p>mode <i>transfer-mode</i></p> <p>Set the mode for transfers; <i>transfer-mode</i> may be one of <i>ascii</i> or <i>binary</i>. The default is <i>ascii</i>.</p> <p>put <i>filename</i></p> <p>put <i>localfile remotefile</i></p> <p>put <i>filename1 filename2 . . . filenameN remote-directory</i></p> <p>Transfer a file, or a set of files, to the specified remote file or directory. The destination can be in one of two forms: a filename on the remote host if the host has already been specified, or a string of the form:</p> <p><i>host:filename</i> to specify both a <i>host</i> and <i>filename</i> at the same time. If the latter form is used, the specified host becomes the default for future transfers. If the remote-directory form is used, the remote host is assumed to be running the UNIX system.</p> <p>The <i>host</i> can be a host name (see <i>hosts(4)</i> or <i>ipnodes(4)</i>) or an IPv4 or IPv6 address string (see <i>inet(7P)</i> or <i>inet6(7P)</i>). Since IPv6 addresses already contain ":", the <i>host</i> should be enclosed in square brackets when an IPv6 address is used. Otherwise, the first occurrence of a colon will be interpreted as the separator between the <i>host</i> and the <i>filename</i>. For example,</p> <pre>[1080::8:800:200c:417A]:myfile</pre> <p>Files may be written only if they already exist and are publicly writable. See <i>in.tftpd(1M)</i>.</p> <p>get <i>filename</i></p> <p>get <i>remotename localname</i></p> <p>get <i>filename1 filename2 filename3 . . . filenameN</i></p>

Get a file or set of files (three or more) from the specified remote *sources*. *source* can be in one of two forms: a filename on the remote host if the host has already been specified, or a string of the form:

host:filename

to specify both a host and filename at the same time. If the latter form is used, the last host specified becomes the default for future transfers. See the `put` command regarding specifying a *host*.

`quit`

Exit `tftp`. An EOF also exits.

`verbose`

Toggle verbose mode.

`trace`

Toggle packet tracing.

`status`

Show current status.

`rexmt` *retransmission-timeout*

Set the per-packet retransmission timeout, in seconds.

`timeout` *total-transmission-timeout*

Set the total transmission timeout, in seconds.

`ascii`

Shorthand for mode `ascii`.

`binary`

Shorthand for mode `binary`.

? [*command-name ...*]

Print help information.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO `in.tftpd(1M)`, `hosts(4)`, `ipnodes(4)`, `attributes(5)`, `inet(7P)`, `inet6(7P)`

NOTES The default *transfer-mode* is `ascii`. This differs from pre-SunOS 4.0 and pre-4.3BSD systems, so explicit action must be taken when transferring non-ASCII binary files such as executable commands.

tftp(1)

Because there is no user-login or validation within the TFTP protocol, many remote sites restrict file access in various ways. Approved methods for file access are specific to each site, and therefore cannot be documented here.

When using the `get` command to transfer multiple files from a remote host, three or more files must be specified. If two files are specified, the second file is used as a local file.

NAME	time – time a simple command
SYNOPSIS	time [-p] <i>utility</i> [<i>argument. ...</i>]
DESCRIPTION	<p>The <code>time</code> utility invokes <i>utility</i> operand with <i>argument</i>, and writes a message to standard error that lists timing statistics for <i>utility</i>. The message includes the following information:</p> <ul style="list-style-type: none"> ■ The elapsed (real) time between invocation of <i>utility</i> and its termination. ■ The User CPU time, equivalent to the sum of the <code>tms_utime</code> and <code>tms_cutime</code> fields returned by the <code>times(2)</code> function for the process in which <i>utility</i> is executed. ■ The System CPU time, equivalent to the sum of the <code>tms_stime</code> and <code>tms_cstime</code> fields returned by the <code>times()</code> function for the process in which <i>utility</i> is executed. <p>When <code>time</code> is used as part of a pipeline, the times reported are unspecified, except when it is the sole command within a grouping command in that pipeline. For example, the commands on the left are unspecified; those on the right report on utilities <code>a</code> and <code>c</code>, respectively.</p> <pre>time a b c { time a } b c a b time c a b (time c)</pre>
OPTIONS	<p>The following option is supported:</p> <p><code>-p</code> Write the timing output to standard error in the following format:</p> <pre>real %f\nuser %f\nsys %f\n < real seconds>, <user seconds>, <system seconds></pre>
OPERANDS	<p>The following operands are supported:</p> <p><i>utility</i> The name of the utility that is to be invoked.</p> <p><i>argument</i> Any string to be supplied as an argument when invoking <i>utility</i>.</p>
USAGE	<p>The <code>time</code> utility returns exit status 127 if an error occurs so that applications can distinguish “failure to find a utility” from “invoked utility exited with an error indication.” The value 127 was chosen because it is not commonly used for other meanings; most utilities use small values for “normal error conditions” and the values above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could be found, but not invoked.</p>
EXAMPLES	<p>EXAMPLE 1 Using The <code>time</code> Command</p> <p>It is frequently desirable to apply <code>time</code> to pipelines or lists of commands. This can be done by placing pipelines and command lists in a single file; this file can then be invoked as a utility, and the <code>time</code> applies to everything in the file.</p>

time(1)

EXAMPLE 1 Using The time Command (Continued)

Alternatively, the following command can be used to apply `time` to a complex command:

```
time sh -c 'complex-command-line'
```

EXAMPLE 2 Using time In The csh Shell

The following two examples show the differences between the `csh` version of `time` and the version in `/usr/bin/time`. These examples assume that `csh` is the shell in use.

```
example% time find / -name csh.1 -print
/usr/share/man/man1/csh.1
95.0u 692.0s 1:17:52 16% 0+0k 0+0io 0pf+0w
```

See `csh(1)` for an explanation of the format of `time` output.

```
example% /usr/bin/time find / -name csh.1 -print
/usr/share/man/man1/csh.1
real 1:23:31.5
user 1:33.2
sys 11:28.2
```

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `time`: `LC_CTYPE`, `LC_MESSAGES`, `LC_NUMERIC`, `NLSPATH`, and `PATH`.

EXIT STATUS

If *utility* is invoked, the exit status of `time` will be the exit status of *utility*; otherwise, the `time` utility will exit with one of the following values:

1-125	An error occurred in the <code>time</code> utility.
126	<i>utility</i> was found but could not be invoked.
127	<i>utility</i> could not be found.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO

`csh(1)`, `shell_builtins(1)`, `timex(1)`, `times(2)`, `attributes(5)`, `environ(5)`

NOTES

When the `time` command is run on a multiprocessor machine, the total of the values printed for `user` and `sys` can exceed `real`. This is because on a multiprocessor machine it is possible to divide the task between the various processors.

When the command being timed is interrupted, the timing values displayed may not always be accurate.

time(1)

BUGS Elapsed time is accurate to the second, while the CPU times are measured to the 100th second. Thus the sum of the CPU times can be up to a second larger than the elapsed time.

times(1)

NAME times – shell built-in function to report time usages of the current shell

sh **times**

ksh **times**

sh Print the accumulated user and system times for processes run from the shell.

ksh Print the accumulated user and system times for the shell and for processes run from the shell.

On this man page, `ksh(1)` commands that are preceded by one or two * (asterisks) are treated specially in the following ways:

1. Variable assignment lists preceding the command remain in effect when the command completes.
2. I/O redirections are processed after variable assignments.
3. Errors cause a script that contains them to abort.
4. Words, following a command preceded by ** that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the = sign and word splitting and file name generation are not performed.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

NAME	timex – time a command; report process data and system activity
SYNOPSIS	timex [-o] [-p [-fhkmrt]] [-s] <i>command</i>
DESCRIPTION	<p>The given <i>command</i> is executed; the elapsed time, user time and system time spent in execution are reported in seconds. Optionally, process accounting data for the <i>command</i> and all its children can be listed or summarized, and total system activity during the execution interval can be reported.</p> <p>The output of <i>timex</i> is written on standard error.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -o Report the total number of blocks read or written and total characters transferred by <i>command</i> and all its children. This option works only if the process accounting software is installed. -p List process accounting records for <i>command</i> and all its children. This option works only if the process accounting software is installed. Suboptions <i>f</i>, <i>h</i>, <i>k</i>, <i>m</i>, <i>r</i>, and <i>t</i> modify the data items reported. The options are as follows: <ul style="list-style-type: none"> -f Print the <i>fork(2)/ exec(2)</i> flag and system exit status columns in the output. -h Instead of mean memory size, show the fraction of total available CPU time consumed by the process during its execution. This “hog factor” is computed as (total CPU time)/(elapsed time). -k Instead of memory size, show total kcore-minutes. -m Show mean core size (the default). -r Show CPU factor (user time/(system-time + user-time)). -t Show separate system and user CPU times. The number of blocks read or written and the number of characters transferred are always reported. -s Report total system activity (not just that due to <i>command</i>) that occurred during the execution interval of <i>command</i>. All the data items listed in <i>sar(1)</i> are reported.
EXAMPLES	<p>EXAMPLE 1 Examples of <i>timex</i>.</p> <p>A simple example:</p> <pre>example% timex -ops sleep 60</pre> <p>A terminal session of arbitrary complexity can be measured by timing a sub-shell:</p> <pre>example% timex -opskmt sh session commands EOT</pre>

timex(1)

EXAMPLE 1 Examples of timex. (Continued)

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWaccu

SEE ALSO sar(1), time(1), exec(2), fork(2), times(2), attributes(5)

NOTES Process records associated with command are selected from the accounting file /var/adm/pacct by inference, since process genealogy is not available. Background processes having the same user ID, terminal ID, and execution time window will be spuriously included.

NAME	tip – connect to remote system
SYNOPSIS	tip [-v] [-speed-entry] {hostname phone-number device}
DESCRIPTION	<p>The <code>tip</code> utility establishes a full-duplex terminal connection to a remote host. Once the connection is established, a remote session using <code>tip</code> behaves like an interactive session on a local terminal.</p> <p>The <code>remote</code> file contains entries describing remote systems and line speeds used by <code>tip</code>.</p> <p>Each host has a default baud rate for the connection, or you can specify a speed with the <code>-speed-entry</code> command line argument.</p> <p>When <code>phone-number</code> is specified, <code>tip</code> looks for an entry in the <code>remote</code> file of the form:</p> <pre>tip -speed-entry</pre> <p>When it finds such an entry, it sets the connection speed accordingly. If it finds no such entry, <code>tip</code> interprets <code>-speed-entry</code> as if it were a system name, resulting in an error message.</p> <p>If you omit <code>-speed-entry</code>, <code>tip</code> uses the <code>tip0</code> entry to set a speed for the connection.</p> <p>When <code>device</code> is specified, <code>tip</code> attempts to open that device, but will do so using the access privileges of the user, rather than <code>tip</code>'s usual access privileges (<code>setuid uucp</code>). The user must have read/write access to the device. The <code>tip</code> utility interprets any character string beginning with the slash character (/) as a device name.</p> <p>When establishing the connection <code>tip</code> sends a connection message to the remote system. The default value for this message can be found in the <code>remote</code> file.</p> <p>When <code>tip</code> attempts to connect to a remote system, it opens the associated device with an exclusive-open <code>ioctl(2)</code> call. Thus only one user at a time may access a device. This is to prevent multiple processes from sampling the terminal line. In addition, <code>tip</code> honors the locking protocol used by <code>uucp(1C)</code>.</p> <p>When <code>tip</code> starts up it reads commands from the file <code>.tiprc</code> in your home directory.</p>
OPTIONS	<code>-v</code> Display commands from the <code>.tiprc</code> file as they are executed.
USAGE	<p>Typed characters are normally transmitted directly to the remote machine (which does the echoing as well).</p> <p>At any time that <code>tip</code> prompts for an argument (for example, during setup of a file transfer) the line typed may be edited with the standard erase and kill characters. A null line in response to a prompt, or an interrupt, aborts the dialogue and returns you to the remote machine.</p>

tip(1)

Commands	<p>A tilde (~) appearing as the first character of a line is an escape signal which directs <code>tip</code> to perform some special action. <code>tip</code> recognizes the following escape sequences:</p> <p><code>~^D</code></p> <p><code>~.</code> Drop the connection and exit (you may still be logged in on the remote machine).</p> <p><code>~c [name]</code> Change directory to <i>name</i> (no argument implies change to your home directory).</p> <p><code>~!</code> Escape to an interactive shell on the local machine (exiting the shell returns you to <code>tip</code>).</p> <p><code>~></code> Copy file from local to remote.</p> <p><code>~<</code> Copy file from remote to local.</p> <p><code>~p from [to]</code> Send a file to a remote host running the UNIX system. When you use the <code>put</code> command, the remote system runs the command string</p> <pre>cat > to</pre> <p>while <code>tip</code> sends it the <i>from</i> file. If the <i>to</i> file is not specified, the <i>from</i> file name is used. This command is actually a UNIX-system-specific version of the '<code>~></code>' command.</p> <p><code>~t from [to]</code> Take a file from a remote host running the UNIX system. As in the <code>put</code> command the <i>to</i> file defaults to the <i>from</i> file name if it is not specified. The remote host executes the command string</p> <pre>cat from ; echo ^A</pre> <p>to send the file to <code>tip</code>.</p> <p><code>~ </code> Pipe the output from a remote command to a local process. The command string sent to the local system is processed by the shell.</p> <p><code>~C</code> Connect a program to the remote machine. The command string sent to the program is processed by the shell. The program inherits file descriptors 0 as remote line input, 1 as remote line output, and 2 as tty standard error.</p> <p><code>~\$</code> Pipe the output from a local process to the remote host. The command string sent to the local system is processed by the shell.</p>
-----------------	---

~#	Send a BREAK to the remote system.
~s	Set a variable (see the discussion below).
~^Z	Stop <code>tip</code> (only available when run under a shell that supports job control, such as the C shell).
~^Y	Stop only the "local side" of <code>tip</code> (only available when run under a shell that supports job control, such as the C shell); the "remote side" of <code>tip</code> , the side that displays output from the remote host, is left running.
~?	Get a summary of the tilde escapes.

Copying files requires some cooperation on the part of the remote host. When a `~>` or `~<` escape is used to send a file, `tip` prompts for a file name (to be transmitted or received) and a command to be sent to the remote system, in case the file is being transferred from the remote system. While `tip` is transferring a file the number of lines transferred will be continuously displayed on the screen. A file transfer may be aborted with an interrupt.

Auto-call Units

`tip` may be used to dial up remote systems using a number of auto-call unit's (ACU's). When the remote system description contains the `du` capability, `tip` uses the call-unit (`cu`), ACU type (`at`), and phone numbers (`pn`) supplied. Normally `tip` displays verbose messages as it dials.

Depending on the type of auto-dialer being used to establish a connection the remote host may have garbage characters sent to it upon connection. The user should never assume that the first characters typed to the foreign host are the first ones presented to it. The recommended practice is to immediately type a `kill` character upon establishing a connection (most UNIX systems either support `@` or `CTRL-U` as the initial kill character).

`tip` currently supports the Ventel MD-212+ modem and DC Hayes-compatible modems.

When `tip` initializes a Hayes-compatible modem for dialing, it sets up the modem to auto-answer. Normally, after the conversation is complete, `tip` drops DTR, which causes the modem to "hang up."

Most modems can be configured such that when DTR drops, they re-initialize themselves to a preprogrammed state. This can be used to reset the modem and disable auto-answer, if desired.

Additionally, it is possible to start the phone number with a Hayes `S` command so that you can configure the modem before dialing. For example, to disable auto-answer, set up all the phone numbers in `/etc/remote` using something like `pn=S0=0DT5551212`. The `S0=0` disables auto-answer.

Remote Host Description

Descriptions of remote hosts are normally located in the system-wide file `/etc/remote`. However, a user may maintain personal description files (and phone

tip(1)

numbers) by defining and exporting the REMOTE shell variable. The remote file must be readable by tip, but a secondary file describing phone numbers may be maintained readable only by the user. This secondary phone number file is /etc/phones, unless the shell variable PHONES is defined and exported. The phone number file contains lines of the form:

system-name phone-number

Each phone number found for a system is tried until either a connection is established, or an end of file is reached. Phone numbers are constructed from '0123456789-=*', where the '=' and '*' are used to indicate a second dial tone should be waited for (ACU dependent).

tip Internal Variables

tip maintains a set of variables which are used in normal operation. Some of these variables are read-only to normal users (root is allowed to change anything of interest). Variables may be displayed and set through the ~s escape. The syntax for variables is patterned after vi(1) and mail(1). Supplying all as an argument to the ~s escape displays all variables that the user can read. Alternatively, the user may request display of a particular variable by attaching a ? to the end. For example '~s escape?' displays the current escape character.

Variables are numeric (num), string (str), character (char), or Boolean (bool) values. Boolean variables are set merely by specifying their name. They may be reset by prepending a ! to the name. Other variable types are set by appending an = and the value. The entire assignment must not have any blanks in it. A single set command may be used to interrogate as well as set a number of variables.

Variables may be initialized at run time by placing set commands (without the ~s prefix) in a .tiprc file in one's home directory. The -v option makes tip display the sets as they are made. Comments preceded by a # sign can appear in the .tiprc file.

Finally, the variable names must either be completely specified or an abbreviation may be given. The following list details those variables known to tip.

beautify	(bool) Discard unprintable characters when a session is being scripted; abbreviated be. If the nb capability is present, beautify is initially set to off; otherwise, beautify is initially set to on.
baudrate	(num) The baud rate at which the connection was established; abbreviated ba. If a baud rate was specified on the command line, baudrate is initially set to the specified value; otherwise, if the br capability is present, baudrate is initially set to the value of that capability; otherwise, baudrate is set to 300 baud. Once tip has been started, baudrate can only be changed by the super-user.
dialtimeout	(num) When dialing a phone number, the time (in seconds) to wait for a connection to be established; abbreviated dial. dialtimeout is initially set to 60 seconds, and can only be changed by the super-user.

<code>disconnect</code>	(str) The string to send to the remote host to disconnect from it; abbreviated <code>di</code> . If the <code>di</code> capability is present, <code>disconnect</code> is initially set to the value of that capability; otherwise, <code>disconnect</code> is set to a null string ("").
<code>echocheck</code>	(bool) Synchronize with the remote host during file transfer by waiting for the echo of the last character transmitted; abbreviated <code>ec</code> . If the <code>ec</code> capability is present, <code>echocheck</code> is initially set to <code>on</code> ; otherwise, <code>echocheck</code> is initially set to <code>off</code> .
<code>eofread</code>	(str) The set of characters which signify an end-of-transmission during a <code>~<</code> file transfer command; abbreviated <code>eofr</code> . If the <code>ie</code> capability is present, <code>eofread</code> is initially set to the value of that capability; otherwise, <code>eofread</code> is set to a null string ("").
<code>eofwrite</code>	(str) The string sent to indicate end-of-transmission during a <code>~></code> file transfer command; abbreviated <code>eofw</code> . If the <code>oe</code> capability is present, <code>eofread</code> is initially set to the value of that capability; otherwise, <code>eofread</code> is set to a null string ("").
<code>eol</code>	(str) The set of characters which indicate an end-of-line. <code>tip</code> will recognize escape characters only after an end-of-line. If the <code>e1</code> capability is present, <code>eol</code> is initially set to the value of that capability; otherwise, <code>eol</code> is set to a null string ("").
<code>escape</code>	(char) The command prefix (escape) character; abbreviated <code>es</code> . If the <code>es</code> capability is present, <code>escape</code> is initially set to the value of that capability; otherwise, <code>escape</code> is set to <code>' ~ '</code> .
<code>etimeout</code>	(num) The amount of time, in seconds, that <code>tip</code> should wait for the echo-check response when <code>echocheck</code> is set; abbreviated <code>et</code> . If the <code>et</code> capability is present, <code>etimeout</code> is initially set to the value of that capability; otherwise, <code>etimeout</code> is set to 10 seconds.
<code>exceptions</code>	(str) The set of characters which should not be discarded due to the beautification switch; abbreviated <code>ex</code> . If the <code>ex</code> capability is present, <code>exceptions</code> is initially set to the value of that capability; otherwise, <code>exceptions</code> is set to <code>'\t\n\f\b'</code> .
<code>force</code>	(char) The character used to force literal data transmission; abbreviated <code>fo</code> . If the <code>fo</code> capability is present, <code>force</code> is initially set to the value of that capability; otherwise, <code>force</code> is set to <code>\377</code> (which disables it).
<code>framesize</code>	(num) The amount of data (in bytes) to buffer between file system writes when receiving files; abbreviated <code>fr</code> . If the <code>fs</code> capability is present, <code>framesize</code> is initially set to the value of that capability; otherwise, <code>framesize</code> is set to 1024.
<code>halfduplex</code>	(bool) Do local echoing because the host is half-duplex; abbreviated <code>hdx</code> . If the <code>hd</code> capability is present, <code>halfduplex</code> is initially set to <code>on</code> ; otherwise, <code>halfduplex</code> is initially set to <code>off</code> .

tip(1)

hardwareflow	(bool) Do hardware flow control; abbreviated <code>hf</code> . If the <code>hf</code> capability is present, <code>hardwareflow</code> is initially set to <code>on</code> ; otherwise, <code>hardwareflowcontrol</code> is initially set to <code>off</code> .
host	(str) The name of the host to which you are connected; abbreviated <code>ho</code> . <code>host</code> is permanently set to the name given on the command line or in the <code>HOST</code> environment variable.
localecho	(bool) A synonym for <code>halfduplex</code> ; abbreviated <code>le</code> .
log	(str) The name of the file to which to log information about outgoing phone calls. <code>log</code> is initially set to <code>/var/adm/aculog</code> , and can only be inspected or changed by the super-user.
parity	(str) The parity to be generated and checked when talking to the remote host; abbreviated <code>par</code> . The possible values are: none> zero Parity is not checked on input, and the parity bit is set to zero on output. one Parity is not checked on input, and the parity bit is set to one on output. even Even parity is checked for on input and generated on output. odd Odd parity is checked for on input and generated on output. If the <code>pa</code> capability is present, <code>parity</code> is initially set to the value of that capability; otherwise, <code>parity</code> is set to <code>none</code> .
phones	The file in which to find hidden phone numbers. If the environment variable <code>PHONES</code> is set, <code>phones</code> is set to the value of <code>PHONES</code> ; otherwise, <code>phones</code> is set to <code>/etc/phones</code> . The value of <code>phones</code> cannot be changed from within <code>tip</code> .
prompt	(char) The character which indicates an end-of-line on the remote host; abbreviated <code>pr</code> . This value is used to synchronize during data transfers. The count of lines transferred during a file transfer command is based on receipt of this character. If the <code>pr</code> capability is present, <code>prompt</code> is initially set to the value of that capability; otherwise, <code>prompt</code> is set to <code>\n</code> .
raise	(bool) Upper case mapping mode; abbreviated <code>ra</code> . When this mode is enabled, all lower case letters will be mapped to upper case by <code>tip</code> for transmission to the remote machine. If the <code>ra</code> capability is present, <code>raise</code> is initially set to <code>on</code> ; otherwise, <code>raise</code> is initially set to <code>off</code> .
raisechar	(char) The input character used to toggle upper case mapping mode; abbreviated <code>rc</code> . If the <code>rc</code> capability is present, <code>raisechar</code>

	is initially set to the value of that capability; otherwise, <code>raisechar</code> is set to <code>\377</code> (which disables it).
<code>rawftp</code>	(bool) Send all characters during file transfers; do not filter non-printable characters, and do not do translations like <code>\n</code> to <code>\r</code> . Abbreviated <code>raw</code> . If the <code>rw</code> capability is present, <code>rawftp</code> is initially set to <code>on</code> ; otherwise, <code>rawftp</code> is initially set to <code>off</code> .
<code>record</code>	(str) The name of the file in which a session script is recorded; abbreviated <code>rec</code> . If the <code>re</code> capability is present, <code>record</code> is initially set to the value of that capability; otherwise, <code>record</code> is set to <code>tip.record</code> .
<code>remote</code>	The file in which to find descriptions of remote systems. If the environment variable <code>REMOTE</code> is set, <code>remote</code> is set to the value of <code>REMOTE</code> ; otherwise, <code>remote</code> is set to <code>/etc/remote</code> . The value of <code>remote</code> cannot be changed from within <code>tip</code> .
<code>script</code>	(bool) Session scripting mode; abbreviated <code>sc</code> . When <code>script</code> is <code>on</code> , <code>tip</code> will record everything transmitted by the remote machine in the script record file specified in <code>record</code> . If the <code>beautify</code> switch is <code>on</code> , only printable ASCII characters will be included in the script file (those characters between 040 and 0177). The variable <code>exceptions</code> is used to indicate characters which are an exception to the normal beautification rules. If the <code>sc</code> capability is present, <code>script</code> is initially set to <code>on</code> ; otherwise, <code>script</code> is initially set to <code>off</code> .
<code>tabexpand</code>	(bool) Expand TAB characters to SPACE characters during file transfers; abbreviated <code>tab</code> . When <code>tabexpand</code> is <code>on</code> , each <code>tab</code> is expanded to 8 SPACE characters. If the <code>tb</code> capability is present, <code>tabexpand</code> is initially set to <code>on</code> ; otherwise, <code>tabexpand</code> is initially set to <code>off</code> .
<code>tandem</code>	(bool) Use XON/XOFF flow control to limit the rate that data is sent by the remote host; abbreviated <code>ta</code> . If the <code>nt</code> capability is present, <code>tandem</code> is initially set to <code>off</code> ; otherwise, <code>tandem</code> is initially set to <code>on</code> .
<code>verbose</code>	(bool) Verbose mode; abbreviated <code>verb</code> ; When verbose mode is enabled, <code>tip</code> prints messages while dialing, shows the current number of lines transferred during a file transfer operations, and more. If the <code>nv</code> capability is present, <code>verbose</code> is initially set to <code>off</code> ; otherwise, <code>verbose</code> is initially set to <code>on</code> .
<code>SHELL</code>	(str) The name of the shell to use for the <code>~!</code> command; default value is <code>/bin/sh</code> , or taken from the environment.
<code>HOME</code>	(str) The home directory to use for the <code>~c</code> command; default value is taken from the environment.

tip(1)

EXAMPLES

EXAMPLE 1 An example of `tip`.

An example of the dialogue used to transfer files is given below.

```
arpa% tip monet
[connected]
. . .(assume we are talking to a UNIX system). . .
uchmonet login: sam
Password:
monet% cat sylvester.c
-> Filename: sylvester.c
32 lines transferred in 1 minute 3 seconds
monet%
monet% ~< Filename: reply.c
List command for remote host: cat reply.c
65 lines transferred in 2 minutes
monet%
. . .(or, equivalently). . .
monet% ~p sylvester.c
. . .(actually echoes as ~[put] sylvester.c). . .
32 lines transferred in 1 minute 3 seconds
monet%
monet% ~t reply.c
. . .(actually echoes as ~[take] reply.c). . .
65 lines transferred in 2 minutes
monet%
. . .(to print a file locally). . .
monet% ~|Local command: pr h sylvester.c | lpr
List command for remote host: cat sylvester.c
monet% ~^D
[EOT]
. . .(back on the local system). . .
```

**ENVIRONMENT
VARIABLES**

The following environment variables are read by `tip`.

REMOTE The location of the remote file.
PHONES The location of the file containing private phone numbers.
HOST A default host to connect to.
HOME One's log-in directory (for `chdirs`).
SHELL The shell to fork on a '~!' escape.

FILES

`/etc/phones`
`/etc/remote`
`/var/spool/locks/LCK.*`
lock file to avoid conflicts with UUCP
`/var/adm/aculog`
file in which outgoing calls are logged
`~/ .tiprc`
initialization file

BUGS There are two additional variables `chardelay` and `linedelay` that are currently not implemented.

tnfdump(1)

NAME	tnfdump – convert binary TNF file to ASCII
SYNOPSIS	tnfdump [-r] <i>tnf_file...</i>
DESCRIPTION	The <code>tnfdump</code> utility converts the specified binary TNF trace files to ASCII. The ASCII output can be used to do performance analysis. The default mode (without the <code>-r</code> option) prints all the event records (that were generated by <code>TNF_PROBE(3TNF)</code>) and the event descriptor records only. It also orders the events by time.
OPTIONS	The following option is supported: <code>-r</code> Does a raw conversion of TNF to ASCII. The output is a literal translation of the binary TNF file and includes all the records in the file. This output is useful only if you have a good understanding of TNF. A sample output is listed in EXAMPLES below.
RETURN VALUES	<code>tnfdump</code> returns 0 on successful exit.
EXAMPLES	<p>EXAMPLE 1 Examples of the <code>tnfdump</code> command</p> <p>To convert the file <code>/tmp/trace-2130</code> into ASCII, use the <code>tnfdump</code> command and the name of the binary trace file. Be aware that the <code>tnfdump</code> output goes to <code>stdout</code> by default.</p> <pre>example% tnf_dump /tmp/trace-2130 probe tnf_name: "inloop" tnf_string: "keys cookie main loop;\ file cookie2.c;line 50;sunw%debug in the loop" probe tnf_name: "end" tnf_string: "keys cookie main end;\ file cookie2.c;line 41;sunw%debug exiting program" ----- Elapsed (ms) Delta (ms) PID LWPID TID CPU Probe Data/ Name Description . . . ----- 0.000000 0.000000 8792 1 0 - inloop loop_count: 0 total_iterations: 0 0.339000 0.339000 8792 1 0 - inloop loop_count: 1 total_iterations: 1 0.350500 0.011500 8792 1 0 - inloop loop_count: 2 total_iterations: 2 0.359500 0.009000 8792 1 0 - inloop loop_count: 3 total_iterations: 3 0.369500 0.010000 8792 1 0 - inloop loop_count: 4 total_iterations: 4 7775.969500 7775.600000 8792 1 0 - inloop loop_count: 0 total_iterations: 5 7776.016000 0.046500 8792 1 0 - inloop loop_count: 1 total_iterations: 6 7776.025000 0.009000 8792 1 0 - inloop loop_count: 2 total_iterations: 7 7776.034000 0.009000 8792 1 0 - inloop loop_count: 3 total_iterations: 8 7776.043000 0.009000 8792 1 0 - inloop loop_count: 4 total_iterations: 9 7776.052000 0.009000 8792 1 0 - inloop loop_count: 5</pre>

EXAMPLE 1 Examples of the tnfdump command (Continued)

```

7776.061000      0.009000   8792   1     0   - inloop   total_iterations: 10
                                                loop_count: 6
9475.979500  1699.918500   8792   1     0   - end     total_iterations: 11
                                                node_struct:
                                                { type: node_tnf
                                                cur_sum: 9 max_cnt: 12 }

```

All probes that are encountered during execution have a description of it printed out. The description is one per line prefixed by the keyword 'probe'. The name of the probe is in double quotes after the keyword 'tnf_name'. The description of this probe is in double quotes after the keyword 'tnf_string'.

A heading is printed after all the description of the probes are printed. The first column gives the elapsed time in milli-seconds since the first event. The second column gives the elapsed time in milli-seconds since the previous event. The next four columns are the process id, lwp id, thread id, and cpu number. The next column is the name of the probe that generated this event. This can be matched to the probe description explained above. The last column is the data that the event contains formatted as `arg_name_n` (see `TNF_PROBE(3TNF)`) followed by a colon and the value of that argument. The format of the value depends on its type: `tnf_opaque` arguments are printed in hex; all other integers are printed in decimal; strings are printed in double quotes; and user-defined records are enclosed in braces '{ }'. The first field of a user defined record indicates its TNF type (see `TNF_DECLARE_RECORD(3TNF)`) and the rest of the fields are the members of the record.

A '-' in any column indicates that there is no data for that particular column.

To do a raw conversion of the file `/tmp/trace-4000` into ASCII use:

```
example% tnfdump -r /tmp/trace-4000
```

The output will look like the following:

```

0x10e00 : {
    tnf_tag 0x109c0   tnf_block_header
    generation 1
    bytes_valid 320
    A_lock 0
    B_lock 0
    next_block 0x0
}
0x10e10 : {
    tnf_tag 0x10010   probe1
    tnf_tag_arg 0x10e24 <tnf_sched_rec>
    time_delta 128
    test_ulong 4294967295
    test_long -1
}
0x10e24 : {
    tnf_tag 0x10cf4   tnf_sched_rec

```

    }

```

EXAMPLE 1 Examples of the `tnfdump` command (Continued)

```

1 0x10c20    tnf_time_delta
2 0x1114c    tnf_uint64
3 0x10d54    tnf_int64
4 0x11188    tnf_float32
}

```

The first number is the file offset of the record. The record is enclosed in braces '{ }'. The first column in a record is the slot name (for records whose fields do not have names, it is the type name). The second column in the record is the value of that slot if it is a scalar (only scalars that are of type `tnf_opaque` are printed in hex), or the offset of the record if it is a reference to another record.

The third column in a record is optional. It does not exist for scalar slots of records. If it exists, the third column is a type name with or without angle brackets, or a string in double quotes. Unadorned names indicate a reference to the named metatag record (that is, a reference to a record with that name in the `tnf_name` field). Type names in angled brackets indicate a reference to a record that is an instance of that type (that is, a reference to a record with that name in the `tnf_tag` field). The content of strings are printed out in double quotes at the reference site.

Records that are arrays have their array elements follow the header slots, and are numbered 0, 1, 2, and so on, except strings where the string is written as the 'chars' (pseudo-name) slot.

Records that are events (generated by `TNF_PROBE(3TNF)`) will have a slot name of `tnf_tag_arg` as their second field which is a reference to the schedule record. Schedule records describe more information about the event like the thread-id, process-id, and the `time_base`. The `time_delta` of an event can be added to the `time_base` of the schedule record that the event references, to give an absolute time. This time is expressed as nanoseconds since some arbitrary time in the past (see `gethrtime(3C)`).

tnfextract(1)

NAME	tnfextract – extract kernel probes output into a trace file
SYNOPSIS	tnfextract [-d <i>dumpfile</i> -n <i>namelist</i>] <i>tnf_file</i>
DESCRIPTION	<p>The <code>tnfextract</code> utility collects kernel trace output from an in-core buffer in the Solaris kernel, or from the memory image of a crashed system, and generates a binary TNF trace file like those produced directly by user programs being traced.</p> <p>Either both or neither of the <code>-d</code> and <code>-n</code> options must be specified. If neither is specified, trace output is extracted from the running kernel. If both are specified, the <code>-d</code> argument names the file containing the (crashed) system memory image, and the <code>-n</code> argument names the file containing the symbol table for the system memory image.</p> <p>The TNF trace file <i>tnf_file</i> produced is exactly the same size as the in-core buffer; it is essentially a snapshot of that buffer. It is legal to run <code>tnfextract</code> while kernel tracing is active, i.e., while the in-core buffer is being written. <code>tnfextract</code> insures that the output file it generates is low-level consistent, i.e., that only whole probes are written out, and that internal data structures in the buffer are not corrupted because the buffer is being concurrently written.</p> <p>The TNF trace file generated is suitable as input to <code>tnfdump(1)</code>, which will generate an ASCII file.</p>
OPTIONS	<p>The following options are supported:</p> <p><code>-d <i>dumpfile</i></code> Use <i>dumpfile</i> as the system memory image, instead of the running kernel. The <i>dumpfile</i> is normally the path name of a file generated by the <code>savecore</code> utility.</p> <p><code>-n <i>namelist</i></code> Use <i>namelist</i> as the file containing the symbol table information for the given <i>dumpfile</i>.</p>
OPERANDS	<p>The following operand is supported:</p> <p><i>tnf_file</i> output file generated by <code>tnfextract</code> based on kernel trace output from an in-core buffer in the Solaris kernel.</p>
EXAMPLES	<p>EXAMPLE 1 Extracting probes from a running kernel</p> <p>Extract probes from the running kernel into <code>ktrace.out</code>:</p> <pre>example% tnfextract ktrace.out</pre> <p>EXAMPLE 2 Extracting probes from a kernel crash dump</p> <p>Extract probes from a kernel crash dump into <code>ktrace.out</code>:</p> <pre>example% tnfextract -d /var/crash/`uname -n`/vmcore.0 \ -n /var/crash/`uname -n`/unix.0 ktrace.out</pre>

EXAMPLE 2 Extracting probes from a kernel crash dump *(Continued)*

EXIT STATUS The following exit values are returned:

0 Successful completion.

>0 An error occurred.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWtnfc (32-bit)
	SUNWtnfcx (64-bit)

SEE ALSO `prex(1)`, `tnfdump(1)`, `savecore(1M)`, `tnf_kernel_probes(4)`, `attributes(5)`

touch(1)

NAME	touch, settime – change file access and modification times
SYNOPSIS	touch [-acm] [-r <i>ref_file</i> -t <i>time</i>] <i>file</i> ... touch [-acm] [<i>date_time</i>] <i>file</i> ... settime [-f <i>ref_file</i>] <i>file</i> ...
DESCRIPTION	<p>The touch utility sets the access and modification times of each file. The <i>file</i> operand is created if it does not already exist.</p> <p>The time used can be specified by -t <i>time</i>, by the corresponding time fields of the file referenced by -r <i>ref_file</i>, or by the <i>date_time</i> operand. If none of these are specified, touch uses the current time (the value returned by the <code>time(2)</code> function).</p> <p>If neither the -a nor -m options are specified, touch updates both the modification and access times.</p> <p>The settime utility is equivalent to touch -c.</p>
touch	<p>The following options are supported for the touch utility:</p> <ul style="list-style-type: none">-a Change the access time of <i>file</i>. Do not change the modification time unless -m is also specified.-c Do not create a specified <i>file</i> if it does not exist. Do not write any diagnostic messages concerning this condition.-m Change the modification time of <i>file</i>. Do not change the access time unless -a is also specified.-r <i>ref_file</i> Use the corresponding times of the file named by <i>ref_file</i> instead of the current time.-t <i>time</i> Use the specified <i>time</i> instead of the current time. <i>time</i> will be a decimal number of the form: [[CC] YY] MMDDhhmm [.SS] where each two digits represents the following: <i>MM</i> The month of the year [01-12]. <i>DD</i> The day of the month [01-31]. <i>hh</i> The hour of the day [00-23]. <i>mm</i> The minute of the hour [00-59]. <i>CC</i> The first two digits of the year. <i>YY</i> The second two digits of the year. <i>SS</i> The second of the minute [00-61].

touch(1)

Both *CC* and *YY* are optional. If neither is given, the current year will be assumed. If *YY* is specified, but *CC* is not, *CC* will be derived as follows:

If <i>YY</i> is:	<i>CC</i> becomes:
69-99	19
00-38	20
39-68	ERROR

The resulting time will be affected by the value of the *TZ* environment variable. If the resulting time value precedes the Epoch, *touch* will exit immediately with an error status. The range of valid times is the Epoch to January 18, 2038.

The range for *SS* is [00-61] rather than [00-59] because of leap seconds. If *SS* is 60 or 61, and the resulting time, as affected by the *TZ* environment variable, does not refer to a leap second, the resulting time will be one or two seconds after a time where *SS* is 59. If *SS* is not given, it is assumed to be 0.

settime The following option is supported for the *settime* utility:

-f ref_file Use the corresponding times of the file named by *ref_file* instead of the current time.

OPERANDS The following operand is supported for the *touch* and *settime* utilities:

file A path name of a file whose times are to be modified.

touch The following operand is supported for the *touch* utility:

date_time Use the specified *date_time* instead of the current time. This operand is a decimal number of the form:

MMDDhhmm [*YY*] where each two digits represent the following:

MM The month of the year [01-12].

DD The day of the month [01-31].

hh The hour of the day [00-23].

mm The minute of the hour [00-59].

YY The second two digits of the year.

YY is optional. If it is omitted, the current year will be assumed. If *YY* is specified, the year will be derived as

touch(1)

follows:

YY	Corresponding Year
69-99	1969-1999
00-38	2000-2038
39-68	ERROR

If no `-r` option is specified, no `-t` option is specified, at least two operands are specified, and the first operand is an eight- or ten-digit decimal integer, the first operand will be assumed to be a *date_time* operand; otherwise, the first operand will be assumed to be a *file* operand.

USAGE See `largefile(5)` for the description of the behavior of `touch` when encountering files greater than or equal to 2 Gbyte (2^{31} bytes).

ENVIRONMENT VARIABLES See `environ(5)` for descriptions of the following environment variables that affect the execution of `touch`: `LANG`, `LC_ALL`, `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

TZ Determine the timezone to be used for interpreting the *time* option-argument or the *date_time* operand.

EXIT STATUS The following exit values are returned:

- 0 The `touch` utility executed successfully and all requested changes were made.
- >0 An error occurred. The `touch` utility returned the number of files for which the times could not be successfully modified.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu
CSI	enabled

SEE ALSO `time(2)`, `attributes(5)`, `environ(5)`, `largefile(5)`

NOTES Users familiar with the BSD environment will find that for the `touch` utility the `-f` option is accepted but ignored. The `-f` option is unnecessary because `touch` will succeed for all files owned by the user regardless of the permissions on the files.

NAME touch – change file access and modification times

SYNOPSIS `/usr/ucb/touch [-acfm] file...`

DESCRIPTION touch sets the access and modification times of each file to the current time. file is created if it does not already exist.

OPTIONS

- a Change the access time of file. Do not change the modification time unless -m is also specified.
- c Do not create file if it does not exist.
- f Attempt to force the touch in spite of read and write permissions on file.
- m Change the modification time of file. Do not change the access time unless -a is also specified.

USAGE See largefile(5) for the description of the behavior of touch when encountering files greater than or equal to 2 Gbyte (2³¹ bytes).

EXIT STATUS The following exit values are returned:

- 0 touch executed successfully and all requested changes were made.
- >0 An error occurred. touch returns the number of files for which the times could not be successfully modified.

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

tplot(1)

NAME tplot, t300, t300s, t4014, t450, tek, ver – graphics filters for various plotters

SYNOPSIS /usr/bin/tplot [-T *terminal*]

DESCRIPTION tplot reads plotting instructions from the standard input and produces plotting instructions suitable for a particular *terminal* on the standard output.

If no *terminal* is specified, the environment variable TERM is used. The default *terminal* is tek.

ENVIRONMENT VARIABLES Except for ver, the following terminal-types can be used with 'lpr -g' (see lpr) to produce plotted output:

300	DASI 300 or GSI terminal (Diablo® mechanism).
300s 300S	DASI 300s terminal (Diablo mechanism).
450	DASI Hyterm 450 terminal (Diablo mechanism).
4014 tek	Tektronix 4014 and 4015 storage scope with Enhanced Graphics Module. (Use 4013 for Tektronix 4014 or 4015 without the Enhanced Graphics Module).
ver	Versatec® D1200A printer-plotter. The output is scan-converted and suitable input to 'lpr -v'.

NAME	tput – initialize a terminal or query terminfo database								
SYNOPSIS	tput [-T <i>type</i>] <i>capname</i> [<i>parm...</i>] tput -S <<								
DESCRIPTION	tput uses the <code>terminfo</code> database to make the values of terminal-dependent capabilities and information available to the shell (see <code>sh(1)</code>); to clear, initialize or reset the terminal; or to return the long name of the requested terminal type. tput outputs a string if the capability attribute (<i>capname</i>) is of type string, or an integer if the attribute is of type integer. If the attribute is of type boolean, tput simply sets the exit status (0 for TRUE if the terminal has the capability, 1 for FALSE if it does not), and produces no output. Before using a value returned on standard output, the user should test the exit status (<code> \$? </code> , see <code>sh(1)</code>) to be sure it is 0. See the <code>EXIT STATUS</code> section.								
OPTIONS	The following options are supported: <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;">-T<i>type</i></td> <td>Indicates the type of terminal. Normally this option is unnecessary, because the default is taken from the environment variable <code>TERM</code>. If <code>-T</code> is specified, then the shell variables <code>LINES</code> and <code>COLUMNS</code> and the layer size will not be referenced.</td> </tr> <tr> <td style="padding-right: 20px;">-S</td> <td>Allows more than one capability per invocation of tput. The capabilities must be passed to tput from the standard input instead of from the command line (see the example in the <code>EXAMPLES</code> section). Only one <i>capname</i> is allowed per line. The <code>-S</code> option changes the meaning of the 0 and 1 boolean and string exit statuses (see the <code>EXIT STATUS</code> section).</td> </tr> </table>	-T <i>type</i>	Indicates the type of terminal. Normally this option is unnecessary, because the default is taken from the environment variable <code>TERM</code> . If <code>-T</code> is specified, then the shell variables <code>LINES</code> and <code>COLUMNS</code> and the layer size will not be referenced.	-S	Allows more than one capability per invocation of tput. The capabilities must be passed to tput from the standard input instead of from the command line (see the example in the <code>EXAMPLES</code> section). Only one <i>capname</i> is allowed per line. The <code>-S</code> option changes the meaning of the 0 and 1 boolean and string exit statuses (see the <code>EXIT STATUS</code> section).				
-T <i>type</i>	Indicates the type of terminal. Normally this option is unnecessary, because the default is taken from the environment variable <code>TERM</code> . If <code>-T</code> is specified, then the shell variables <code>LINES</code> and <code>COLUMNS</code> and the layer size will not be referenced.								
-S	Allows more than one capability per invocation of tput. The capabilities must be passed to tput from the standard input instead of from the command line (see the example in the <code>EXAMPLES</code> section). Only one <i>capname</i> is allowed per line. The <code>-S</code> option changes the meaning of the 0 and 1 boolean and string exit statuses (see the <code>EXIT STATUS</code> section).								
OPERANDS	The following operands are supported: <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;"><i>capname</i></td> <td>Indicates the capability attribute from the <code>terminfo</code> database. See <code>terminfo(4)</code> for a complete list of capabilities and the <i>capname</i> associated with each.</td> </tr> <tr> <td colspan="2" style="padding-top: 10px;">The following strings will be supported as operands by the implementation in the "C" locale:</td> </tr> <tr> <td style="padding-right: 20px;"><code>clear</code></td> <td>Display the clear-screen sequence.</td> </tr> <tr> <td style="padding-right: 20px;"><code>init</code></td> <td>If the <code>terminfo</code> database is present and an entry for the user's terminal exists (see <code>-Ttype</code>, above), the following will occur: <ul style="list-style-type: none"> 1. if present, the terminal's initialization strings will be output (<code>is1</code>, <code>is2</code>, <code>is3</code>, <code>if</code>, <code>iprog</code>), 2. any delays (for instance, newline) specified in the entry will be set in the tty driver, 3. tabs expansion will be turned on or off according to the specification in the entry, </td> </tr> </table>	<i>capname</i>	Indicates the capability attribute from the <code>terminfo</code> database. See <code>terminfo(4)</code> for a complete list of capabilities and the <i>capname</i> associated with each.	The following strings will be supported as operands by the implementation in the "C" locale:		<code>clear</code>	Display the clear-screen sequence.	<code>init</code>	If the <code>terminfo</code> database is present and an entry for the user's terminal exists (see <code>-Ttype</code> , above), the following will occur: <ul style="list-style-type: none"> 1. if present, the terminal's initialization strings will be output (<code>is1</code>, <code>is2</code>, <code>is3</code>, <code>if</code>, <code>iprog</code>), 2. any delays (for instance, newline) specified in the entry will be set in the tty driver, 3. tabs expansion will be turned on or off according to the specification in the entry,
<i>capname</i>	Indicates the capability attribute from the <code>terminfo</code> database. See <code>terminfo(4)</code> for a complete list of capabilities and the <i>capname</i> associated with each.								
The following strings will be supported as operands by the implementation in the "C" locale:									
<code>clear</code>	Display the clear-screen sequence.								
<code>init</code>	If the <code>terminfo</code> database is present and an entry for the user's terminal exists (see <code>-Ttype</code> , above), the following will occur: <ul style="list-style-type: none"> 1. if present, the terminal's initialization strings will be output (<code>is1</code>, <code>is2</code>, <code>is3</code>, <code>if</code>, <code>iprog</code>), 2. any delays (for instance, newline) specified in the entry will be set in the tty driver, 3. tabs expansion will be turned on or off according to the specification in the entry, 								

tput(1)

	and
	4. if tabs are not expanded, standard tabs will be set (every 8 spaces). If an entry does not contain the information needed for any of the four above activities, that activity will silently be skipped.
reset	Instead of putting out initialization strings, the terminal's reset strings will be output if present (<i>rs1</i> , <i>rs2</i> , <i>rs3</i> , <i>rf</i>). If the reset strings are not present, but initialization strings are, the initialization strings will be output. Otherwise, <i>reset</i> acts identically to <i>init</i> .
longname	If the <i>terminfo</i> database is present and an entry for the user's terminal exists (see <i>-Ttype</i> above), then the long name of the terminal will be put out. The long name is the last name in the first line of the terminal's description in the <i>terminfo</i> database (see <i>term(5)</i>).
<i>parm</i>	If the attribute is a string that takes parameters, the argument <i>parm</i> will be instantiated into the string. An all numeric argument will be passed to the attribute as a number.

EXAMPLES **EXAMPLE 1** Using the tput command.

This example initializes the terminal according to the type of terminal in the environment variable *TERM*. This command should be included in everyone's .profile after the environment variable *TERM* has been exported, as illustrated on the *profile(4)* manual page.

```
example% tput init
```

The next example resets an AT&T 5620 terminal, overriding the type of terminal in the environment variable *TERM*:

```
example% tput -T5620 reset
```

The following example sends the sequence to move the cursor to row 0, column 0 (the upper left corner of the screen, usually known as the "home" cursor position).

```
example% tput cup 0 0
```

The next example echos the clear-screen sequence for the current terminal.

```
example% tput clear
```

The next command prints the number of columns for the current terminal.

```
example% tput cols
```

The following command prints the number of columns for the 450 terminal.

EXAMPLE 1 Using the tput command. (Continued)

```
example% tput -T450 cols
```

The next example sets the shell variables `bold`, to begin stand-out mode sequence, and `offbold`, to end standout mode sequence, for the current terminal. This might be followed by a prompt:

```
echo "${bold}Please type in your name: ${offbold}\c"
```

```
example% bold='tput smso'
```

```
example% offbold='tput rmso'
```

This example sets the exit status to indicate if the current terminal is a hardcopy terminal.

```
example% tput hc
```

This next example sends the sequence to move the cursor to row 23, column 4.

```
example% tput cup 23 4
```

The next command prints the long name from the `terminfo` database for the type of terminal specified in the environment variable `TERM`.

```
example% tput longname
```

This last example shows `tput` processing several capabilities in one invocation. This example clears the screen, moves the cursor to position 10, 10 and turns on bold (extra bright) mode. The list is terminated by an exclamation mark (!) on a line by itself.

```
example% tput -S <<!
```

```
> clear
```

```
> cup 10 10
```

```
> bold
```

```
> !
```

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `tput`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

TERM Determine the terminal type. If this variable is unset or null, and if the `-T` option is not specified, an unspecified default terminal type will be used.

EXIT STATUS

The following exit values are returned:

0

- If *capname* is of type boolean and `-S` is not specified, indicates `TRUE`.
- If *capname* is of type string and `-S` is not specified, indicates *capname* is defined for this terminal type.
- If *capname* is of type boolean or string and `-S` is specified, indicates that all lines were successful.
- *capname* is of type integer.
- The requested string was written successfully.

1

- If *capname* is of type boolean and `-S` is not specified, indicates `FALSE`.

tput(1)

- If *capname* is of type string and *-S* is not specified, indicates that *capname* is not defined for this terminal type.

- 2 Usage error.
- 3 No information is available about the specified terminal type.
- 4 The specified operand is invalid.
- >4 An error occurred.
- 1 *capname* is a numeric variable that is not specified in the terminfo database; for instance, `tput -T450 lines` and `tput -T2621 xmc`.

Availability	SUNWcsu

SEE ALSO `clear(1)`, `sh(1)`, `stty(1)`, `tabs(1)`, `curses(3CURSES)`, `profile(4)`, `terminfo(4)`, `attributes(5)`, `environ(5)`, `term(5)`

NAME	tr – translate characters
SYNOPSIS	<pre> /usr/bin/tr [-cs] string1 string2 /usr/bin/tr -s -d [-c] string1 /usr/bin/tr -ds [-c] string1 string2 /usr/xpg4/bin/tr [-cs] string1 string2 /usr/xpg4/bin/tr -s -d [-c] string1 /usr/bin/xpg4/tr -ds [-c] string1 string2 </pre>
DESCRIPTION	<p>The <code>tr</code> utility copies the standard input to the standard output with substitution or deletion of selected characters. The options specified and the <code>string1</code> and <code>string2</code> operands control translations that occur while copying characters and single-character collating elements.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -c Complement the set of characters specified by <code>string1</code>. -d Delete all occurrences of input characters that are specified by <code>string1</code>. -s Replace instances of repeated characters with a single character. <p>When the <code>-d</code> option is not specified:</p> <ul style="list-style-type: none"> ■ Each input character found in the array specified by <code>string1</code> is replaced by the character in the same relative position in the array specified by <code>string2</code>. When the array specified by <code>string2</code> is shorter than the one specified by <code>string1</code>, the results are unspecified. ■ If the <code>-c</code> option is specified, the complements of the characters specified by <code>string1</code> (the set of all characters in the current character set, as defined by the current setting of <code>LC_CTYPE</code>, except for those actually specified in the <code>string1</code> operand) are placed in the array in ascending collation sequence, as defined by the current setting of <code>LC_COLLATE</code>. ■ Because the order in which characters specified by character class expressions or equivalence class expressions is undefined, such expressions should only be used if the intent is to map several characters into one. An exception is case conversion, as described previously. <p>When the <code>-d</code> option is specified:</p> <ul style="list-style-type: none"> ■ Input characters found in the array specified by <code>string1</code> will be deleted. ■ When the <code>-c</code> option is specified with <code>-d</code>, all characters except those specified by <code>string1</code> will be deleted. The contents of <code>string2</code> will be ignored, unless the <code>-s</code> option is also specified. ■ The same string cannot be used for both the <code>-d</code> and the <code>-s</code> option; when both options are specified, both <code>string1</code> (used for deletion) and <code>string2</code> (used for squeezing) are required.

tr(1)

When the `-s` option is specified, after any deletions or translations have taken place, repeated sequences of the same character will be replaced by one occurrence of the same character, if the character is found in the array specified by the last operand. If the last operand contains a character class, such as the following example:

```
tr -s '[:space:]'
```

the last operand's array will contain all of the characters in that character class. However, in a case conversion, as described previously, such as

```
tr -s '[:upper:]' '[:lower:]'
```

the last operand's array will contain only those characters defined as the second characters in each of the `toupper` or `tolower` character pairs, as appropriate. (See `toupper(3C)` and `tolower(3C)`).

An empty string used for *string1* or *string2* produces undefined results.

OPERANDS The following operands are supported:

string1

string2 Translation control strings. Each string represents a set of characters to be converted into an array of characters used for the translation.

The operands *string1* and *string2* (if specified) define two arrays of characters. The constructs in the following list can be used to specify characters or single-character collating elements. If any of the constructs result in multi-character collating elements, `tr` will exclude, without a diagnostic, those multi-character elements from the resulting array.

character Any character not described by one of the conventions below represents itself.

`\ octal` Octal sequences can be used to represent characters with specific coded values. An octal sequence consists of a backslash followed by the longest sequence of one-, two-, or three-octal-digit characters (01234567). The sequence causes the character whose encoding is represented by the one-, two- or three-digit octal integer to be placed into the array. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading `\` for each byte.

`\ character` The backslash-escape sequences `\a`, `\b`, `\f`, `\n`, `\r`, `\t`, and `\v` are supported. The results of using any other character, other than an octal digit, following the backslash are unspecified.

/usr/xpg4/bin/tr	c-c	
/usr/bin/tr	[c-c]	<p>Represents the range of collating elements between the range endpoints, inclusive, as defined by the current setting of the LC_COLLATE locale category. The starting endpoint must precede the second endpoint in the current collation order. The characters or collating elements in the range are placed in the array in ascending collation sequence.</p>
	[:class:]	<p>Represents all characters belonging to the defined character class, as defined by the current setting of the LC_CTYPE locale category. The following character class names will be accepted when specified in <i>string1</i>:</p>
		<pre> alnum blank digit lower punct upper alpha cntrl graph print space xdigit </pre>
		<p>In addition, character class expressions of the form [:name:] are recognized in those locales where the <i>name</i> keyword has been given a charclass definition in the LC_CTYPE category.</p>
		<p>When both the -d and -s options are specified, any of the character class names will be accepted in <i>string2</i>. Otherwise, only character class names lower or upper are valid in <i>string2</i> and then only if the corresponding character class upper and lower, respectively, is specified in the same relative position in <i>string1</i>. Such a specification is interpreted as a request for case conversion. When [:lower:] appears in <i>string1</i> and [:upper:] appears in <i>string2</i>, the arrays will contain the characters from the toupper mapping in the LC_CTYPE category of the current locale. When [:upper:] appears in <i>string1</i> and [:lower:] appears in <i>string2</i>, the arrays will contain the characters from the tolower mapping in the LC_CTYPE category of the current locale. The first character from each mapping pair will be in the array for <i>string1</i> and the second character from each mapping pair will be in the array for <i>string2</i> in the same relative position.</p>
		<p>Except for case conversion, the characters specified by a character class expression are placed in the array in an unspecified order.</p>
		<p>If the name specified for <i>class</i> does not define a valid character class in the current locale, the behavior is undefined.</p>
	[=equiv=]	<p>Represents all characters or collating elements belonging to the same equivalence class as <i>equiv</i>, as defined by the current setting of the LC_COLLATE locale category. An equivalence class expression is allowed only in <i>string1</i>, or in <i>string2</i> when it is being used by the combined -d and -s options. The characters belonging to the equivalence class are placed in the array in an unspecified order.</p>

tr(1)

	<p>[x*n] Represents <i>n</i> repeated occurrences of the character <i>x</i>. Because this expression is used to map multiple characters to one, it is only valid when it occurs in <i>string2</i>. If <i>n</i> is omitted or is 0, it is interpreted as large enough to extend the <i>string2</i>-based sequence to the length of the <i>string1</i>-based sequence. If <i>n</i> has a leading 0, it is interpreted as an octal value. Otherwise, it is interpreted as a decimal value.</p>
USAGE	See <code>largefile(5)</code> for the description of the behavior of <code>tr</code> when encountering files greater than or equal to 2 Gbyte (2 ³¹ bytes).
EXAMPLES	<p>EXAMPLE 1 Creating a list of words</p> <p>The following example creates a list of all words in <i>file1</i>, one per line in <i>file2</i>, where a word is taken to be a maximal string of letters.</p> <pre>tr -cs "[:alpha:]" "[\n*]" <file1 >file2</pre> <p>EXAMPLE 2 Translating characters</p> <p>This example translates all lower-case characters in <i>file1</i> to upper-case and writes the results to standard output.</p> <pre>tr "[:lower:]" "[:upper:]" <file1</pre> <p>Note that the caveat expressed in the corresponding example in XPG3 is no longer in effect. This case conversion is now a special case that employs the <code>tolower</code> and <code>toupper</code> classifications, ensuring that proper mapping is accomplished (when the locale is correctly defined).</p> <p>EXAMPLE 3 Identifying equivalent characters</p> <p>This example uses an equivalence class to identify accented variants of the base character <i>e</i> in <i>file1</i>, which are stripped of diacritical marks and written to <i>file2</i>.</p> <pre>tr "[=e]" e <file1 >file2</pre>
ENVIRONMENT VARIABLES	See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>tr</code> : <code>LC_COLLATE</code> , <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .
EXIT STATUS	The following exit values are returned: 0 All input was processed successfully. >0 An error occurred.
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:

tr(1)

/usr/bin/tr

SEE ALSO ed(1), sed(1), sh(1), tolower(3C), toupper(3C), ascii(5), attributes(5), environ(5), largefile(5), XPG4(5)

NOTES Unlike some previous versions, /usr/xpg4/bin/tr correctly processes NUL characters in its input stream. NUL characters can be stripped by using `tr -d '\000'`.

tr(1B)

NAME	tr – translate characters				
SYNOPSIS	<code>/usr/ucb/tr [-c ds] [string1 [string2]]</code>				
DESCRIPTION	<p>The <code>tr</code> utility copies the standard input to the standard output with substitution or deletion of selected characters. The arguments <i>string1</i> and <i>string2</i> are considered sets of characters. Any input character found in <i>string1</i> is mapped into the character in the corresponding position within <i>string2</i>. When <i>string2</i> is short, it is padded to the length of <i>string1</i> by duplicating its last character.</p> <p>In either string the notation:</p> <p><i>a-b</i></p> <p>denotes a range of characters from <i>a</i> to <i>b</i> in increasing ASCII order. The character <code>\</code>, followed by 1, 2 or 3 octal digits stands for the character whose ASCII code is given by those digits. As with the shell, the escape character <code>\</code>, followed by any other character, escapes any special meaning for that character.</p>				
OPTIONS	<p>Any combination of the options <code>-c</code>, <code>-d</code>, or <code>-s</code> may be used:</p> <ul style="list-style-type: none"><code>-c</code> Complement the set of characters in <i>string1</i> with respect to the universe of characters whose ASCII codes are 01 through 0377 octal.<code>-d</code> Delete all input characters in <i>string1</i>.<code>-s</code> Squeeze all strings of repeated output characters that are in <i>string2</i> to single characters.				
EXAMPLES	<p>EXAMPLE 1 Creating a list of all the words in a filename</p> <p>The following example creates a list of all the words in <i>filename1</i>, one per line, in <i>filename2</i>, where a word is taken to be a maximal string of alphabetic. The second string is quoted to protect <code>' \ '</code> from the shell. 012 is the ASCII code for NEWLINE.</p> <pre>example% tr -cs A-Za-z '\012' < filename1 > filename2</pre>				
ATTRIBUTES	<p>See <code>attributes(5)</code> for descriptions of the following attributes:</p> <table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Availability</td><td>SUNWscpu</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWscpu
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWscpu				
SEE ALSO	<code>ed(1)</code> , <code>ascii(5)</code> , <code>attributes(5)</code>				
NOTES	Will not handle ASCII NUL in <i>string1</i> or <i>string2</i> . <code>tr</code> always deletes NUL from input.				

NAME	trap, onintr – shell built-in functions to respond to (hardware) signals
sh	trap [<i>argument</i> <i>n</i> [<i>n2</i> ...]]
cs	onintr [- <i>label</i>]
ksh	*trap [<i>arg</i> <i>sig</i> [<i>sig2</i> ...]]
sh	The trap command <i>argument</i> is to be read and executed when the shell receives numeric or symbolic signal(s) (<i>n</i>). (Note: <i>argument</i> is scanned once when the trap is set and once when the trap is taken.) Trap commands are executed in order of signal number or corresponding symbolic names. Any attempt to set a trap on a signal that was ignored on entry to the current shell is ineffective. An attempt to trap on signal 11 (memory fault) produces an error. If <i>argument</i> is absent all trap(s) <i>n</i> are reset to their original values. If <i>argument</i> is the null string this signal is ignored by the shell and by the commands it invokes. If <i>n</i> is 0 the command <i>argument</i> is executed on exit from the shell. The trap command with no arguments prints a list of commands associated with each signal number.
cs	onintr controls the action of the shell on interrupts. With no arguments, onintr restores the default action of the shell on interrupts. (The shell terminates shell scripts and returns to the terminal command input level). With the - argument, the shell ignores all interrupts. With a <i>label</i> argument, the shell executes a goto <i>label</i> when an interrupt is received or a child process terminates because it was interrupted.
ksh	trap uses <i>arg</i> as a command to be read and executed when the shell receives signal(s) <i>sig</i> . (Note that <i>arg</i> is scanned once when the trap is set and once when the trap is taken.) Each <i>sig</i> can be given as a number or as the name of the signal. trap commands are executed in order of signal number. Any attempt to set a trap on a signal that was ignored on entry to the current shell is ineffective. If <i>arg</i> is omitted or is - , then the trap(s) for each <i>sig</i> are reset to their original values. If <i>arg</i> is the null (the empty string, e.g., "") string then this signal is ignored by the shell and by the commands it invokes. If <i>sig</i> is ERR then <i>arg</i> will be executed whenever a command has a non-zero exit status. If <i>sig</i> is DEBUG then <i>arg</i> will be executed after each command. If <i>sig</i> is 0 or EXIT for a trap set outside any function then the command <i>arg</i> is executed on exit from the shell. The trap command with no arguments prints a list of commands associated with each signal number.
	On this man page, ksh(1) commands that are preceded by one or two * (asterisks) are treated specially in the following ways:
	<ol style="list-style-type: none"> 1. Variable assignment lists preceding the command remain in effect when the command completes. 2. I/O redirections are processed after variable assignments. 3. Errors cause a script that contains them to abort. 4. Words, following a command preceded by ** that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the = sign and word splitting and file name generation are not performed.

trap(1)

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

NAME	troff – typeset or format documents
SYNOPSIS	troff [-a] [-f] [-F <i>dir</i>] [-i] [-m <i>name</i>] [-n <i>N</i>] [-o <i>list</i>] [-r <i>aN</i>] [-s <i>N</i>] [-T <i>dest</i>] [-u <i>N</i>] [-z] [<i>filename...</i>]
DESCRIPTION	<p>troff formats text in the <i>filenames</i> for typesetting or laser printing. Input to troff is expected to consist of text interspersed with formatting requests and macros. If no <i>filename</i> argument is present, troff reads standard input. A minus sign (-) as a <i>filename</i> indicates that standard input should be read at that point in the list of input files.</p> <p>The output of troff is usually piped through dpost(1) to create a printable postscript file (see EXAMPLES).</p>
OPTIONS	<p>The following options are supported. They may appear in any order, but all must appear before the first <i>filename</i>.</p> <ul style="list-style-type: none"> -a Send an ASCII approximation of formatted output to standard output. (Note: a rough ASCII version can also be printed out on ordinary terminals with an old and rarely used command, /usr/bin/ta.) -f Do not print a trailer after the final page of output or cause the postprocessor to relinquish control of the device. -F<i>dir</i> Search directory <i>dir</i> for font width or terminal tables instead of the system default directory. -i Read standard input after all input files are exhausted. -m<i>name</i> Prepend the macro file /usr/share/lib/tmac/<i>name</i> to the input <i>filenames</i>. Note: most references to macro packages include the leading <i>m</i> as part of the name; for example, the man(5) macros reside in /usr/share/lib/tmac/an. The macro directory can be changed by setting the TROFFMACS environment variable to a specific path. Be certain to include the trailing ' / ' (slash) at the end of the path. -n<i>N</i> Number the first generated page <i>N</i>. -o<i>list</i> Print only pages whose page numbers appear in the comma-separated <i>list</i> of numbers and ranges. A range <i>N-M</i> means pages <i>N</i> through <i>M</i>; an initial -<i>N</i> means from the beginning to page <i>N</i>; and a final <i>N-</i> means from <i>N</i> to the end. -q Quiet mode in nroff; ignored in troff. -r<i>aN</i> Set register <i>a</i> (one-character names only) to <i>N</i>. -s<i>N</i> Stop the phototypesetter every <i>N</i> pages. On some devices, troff produces a trailer so you can change cassettes; resume by pressing the typesetter's start button.

troff(1)

- Tdest** Prepare output for typesetter *dest*. The following values can be supplied for *dest*:
- post** A PostScript printer; this is the default value. The output of the **-T** option must go through `dpost(1)` before it is sent to a PostScript printer to obtain the proper output.
- aps** Autologic APS-5.
- uN** Set the emboldening factor for the font mounted in position 3 to *N*. If *N* is missing, then set the emboldening factor to 0.
- z** Suppress formatted output. Only diagnostic messages and messages output using the `.tm` request are output.

OPERANDS The following operand is supported:

filename The file containing text to be processed by `troff`.

EXAMPLES **EXAMPLE 1** Using `troff`

The following example shows how to print an input text file `mytext`, coded with formatting requests and macros. The input file contains equations and tables and must go through the `tbl(1)` and `eqn(1)` preprocessors before it is formatted by `troff` with `ms` macros, processed by `dpost(1)`, and printed by `lp(1)`:

```
tbl mytext | eqn | troff -ms | dpost | lp
```

FILES

<code>/tmp/trtmp</code>	temporary file
<code>/usr/share/lib/tmac/*</code>	standard macro files
<code>/usr/lib/font/*</code>	font width tables for alternate mounted <code>troff</code> fonts
<code>/usr/share/lib/nterm/*</code>	terminal driving tables for <code>nroff</code>

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdoc

SEE ALSO `checknr(1)`, `col(1)`, `dpost(1)`, `eqn(1)`, `lp(1)`, `man(1)`, `nroff(1)`, `tbl(1)`, `attributes(5)`, `man(5)`, `me(5)`, `ms(5)`

NOTES `troff` is not 8-bit clean because it is by design based on 7-bit ASCII.

Previous documentation incorrectly described the numeric register `yr` as being the "Last two digits of current year". `yr` is in actuality the number of years since 1900. To

correctly obtain the last two digits of the current year through the year 2099, the definition given below of string register `yy` may be included in a document and subsequently used to display a two-digit year. Note that any other available one- or two-character register name may be substituted for `yy`.

```
.\ " definition of new string register yy--last two digits of year
.\ " use yr (# of years since 1900) if it is < 100
.ie \n(yr<100 .ds yy \n(yr
.el \{          .\ " else, subtract 100 from yr, store in ny
.nr ny \n(yr-100
.ie \n(ny>9 \{   .\ " use ny if it is two digits
.ds yy \n(ny
.\ " remove temporary number register ny
.rr ny \}
.el \{.ds yy 0
.\ " if ny is one digit, append it to 0
.as yy \n(ny
.rr ny \} \}
```

true(1)

NAME true, false – provide truth values

SYNOPSIS **true**
false

DESCRIPTION true does nothing, successfully. false does nothing, unsuccessfully. They are typically used in a shell script sh as:

```
while true
do
    command
done
```

which executes command forever.

EXIT STATUS true has exit status 0.
false always will exit with a non-zero value.

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

NAME	truss – trace system calls and signals
SYNOPSIS	truss [-fcaeildD] [- [tTvX] [!] <i>syscall</i> ,...] [- [sS] [!] <i>signal</i> ,...] [- [mM] [!] <i>fault</i> ,...] [- [rw] [!] <i>fd</i> ,...] [- [uU] [!] <i>lib</i> ,... : [:] [!] <i>func</i> ,...] [-o <i>outfile</i>] <i>command</i> -p <i>pid</i> ...
DESCRIPTION	<p>The <code>truss</code> utility executes the specified command and produces a trace of the system calls it performs, the signals it receives, and the machine faults it incurs. Each line of the trace output reports either the fault or signal name or the system call name with its arguments and return value(s). System call arguments are displayed symbolically when possible using defines from relevant system headers; for any path name pointer argument, the pointed-to string is displayed. Error returns are reported using the error code names described in <code>intro(3)</code>.</p> <p>Optionally (see the <code>-u</code> option), <code>truss</code> will also produce an entry/exit trace of user-level function calls executed by the traced process, indented to indicate nesting.</p>
OPTIONS	<p>The following options are recognized. For those options that take a list argument, the name <code>all</code> can be used as a shorthand to specify all possible members of the list. If the list begins with a <code>!</code>, the meaning of the option is negated (for example, exclude rather than trace). Multiple occurrences of the same option may be specified. For the same name in a list, subsequent options (those to the right) override previous ones (those to the left).</p> <p><code>-p</code> Interprets the <i>command</i> arguments to <code>truss</code> as a list of process-ids for existing processes (see <code>ps(1)</code>) rather than as a command to be executed. <code>truss</code> takes control of each process and begins tracing it provided that the <code>userid</code> and <code>groupid</code> of the process match those of the user or that the user is a privileged user. Processes may also be specified by their names in the <code>/proc</code> directory, for example, <code>/proc/12345</code>.</p> <p><code>-f</code> Follows all children created by <code>fork()</code> or <code>vfork()</code> and includes their signals, faults, and system calls in the trace output. Normally, only the first-level command or process is traced. When <code>-f</code> is specified, the process-id is included with each line of trace output to indicate which process executed the system call or received the signal.</p> <p><code>-c</code> Counts traced system calls, faults, and signals rather than displaying the trace line-by-line. A summary report is produced after the traced command terminates or when <code>truss</code> is interrupted. If <code>-f</code> is also specified, the counts include all traced system calls, faults, and signals for child processes.</p> <p><code>-a</code> Shows the argument strings that are passed in each <code>exec()</code> system call.</p> <p><code>-e</code> Shows the environment strings that are passed in each <code>exec()</code> system call.</p>

truss(1)

- i
Do not display interruptible sleeping system calls. Certain system calls, such as `open()` and `read()` on terminal devices or pipes, can sleep for indefinite periods and are interruptible. Normally, `truss` reports such sleeping system calls if they remain asleep for more than one second. The system call is reported again a second time when it completes. The `-i` option causes such system calls to be reported only once, when they complete.
- l
Includes the id of the responsible lightweight process (*LWP*) with each line of trace output. If `-f` is also specified, both the process-id and the LWP-id are included.
- d
Includes a time stamp on each line of trace output. The time stamp appears as a field containing *seconds . fraction* at the start of the line. This represents a time in seconds relative to the beginning of the trace. The first line of the trace output will show the base time from which the individual time stamps are measured, both as seconds since the epoch (see `time(2)`) and as a date string (see `ctime(3C)` and `date(1)`). The times that are reported are the times that the event in question occurred. For all system calls, the event is the completion of the system call, not the start of the system call.
- D
Includes a time delta on each line of trace output. The value appears as a field containing *seconds . fraction* and represents the elapsed time for the LWP that incurred the event since the last reported event incurred by that LWP. Specifically, for system calls, this is not the time spent within the system call.
- t [!]syscall, . . .
System calls to trace or exclude. Those system calls specified in the comma-separated list are traced. If the list begins with a `!`, the specified system calls are excluded from the trace output. Default is `-tall`.
- T [!]syscall, . . .
System calls that stop the process. The specified system calls are added to the set specified by `-t`. If one of the specified system calls is encountered, `truss` leaves the process stopped and abandoned. That is, `truss` releases the process and exits but leaves the process in the stopped state at completion of the system call in question. A debugger or other process inspection tool (see `proc(1)`) can then be applied to the stopped process. `truss` can be reapplied to the stopped process with the same or different options to continue tracing. Default is `-T!all`.

A process left stopped in this manner cannot be restarted by the application of `kill -CONT` because it is stopped on an event of interest via `/proc`, not by the default action of a stopping signal (see `signal(3HEAD)`). The `prun(1)` command described in `proc(1)` can be used to set the stopped process running again.
- v [!]syscall, . . .
Verbose. Displays the contents of any structures passed by address to the specified system calls (if traced by `-t`). Input values as well as values returned by the

operating system are shown. For any field used as both input and output, only the output value is shown. Default is `-v!all`.

`-x [!]syscall,...`

Displays the arguments to the specified system calls (if traced by `-t`) in raw form, usually hexadecimal, rather than symbolically. This is for unredeemed hackers who must see the raw bits to be happy. Default is `-x!all`.

`-s [!]signal,...`

Signals to trace or exclude. Those signals specified in the comma-separated list are traced. The trace output reports the receipt of each specified signal, even if the signal is being ignored (not blocked). (Blocked signals are not received until they are unblocked.) Signals may be specified by name or number (see `<sys/signal.h>`). If the list begins with a `!`, the specified signals are excluded from the trace output. Default is `-sall`.

`-S [!]signal,...`

Signals that stop the process. The specified signals are added to the set specified by `-s`. If one of the specified signals is received, `truss` leaves the process stopped and abandoned (see the `-T` option). Default is `-S!all`.

`-m [!]fault,...`

Machine faults to trace or exclude. Those faults specified in the comma-separated list are traced. Faults may be specified by name or number (see `<sys/fault.h>`). If the list begins with a `!`, the specified faults are excluded from the trace output. Default is `-mall -m!fltpage`.

`-M [!]fault,...`

Machine faults that stop the process. The specified faults are added to the set specified by `-m`. If one of the specified faults is incurred, `truss` leaves the process stopped and abandoned (see the `-T` option). Default is `-M!all`.

`-r [!]fd,...`

Shows the full contents of the I/O buffer for each `read()` on any of the specified file descriptors. The output is formatted 32 bytes per line and shows each byte as an ASCII character (preceded by one blank) or as a 2-character C language escape sequence for control characters such as horizontal tab (`\t`) and newline (`\n`). If ASCII interpretation is not possible, the byte is shown in 2-character hexadecimal representation. (The first 12 bytes of the I/O buffer for each traced `read()` are shown even in the absence of `-r`.) Default is `-r!all`.

`-w [!]fd,...`

Shows the contents of the I/O buffer for each `write()` on any of the specified file descriptors (see the `-r` option). Default is `-w!all`.

`-u [!]lib, ... : [!]func, ...`

User-level function call tracing. `lib, ...` is a comma-separated list of dynamic library names, excluding the `".so.n"` suffix. `func, ...` is a comma-separated list of function names. In both cases the names can include name-matching metacharacters `*`, `?`, `[]` with the same meanings as those of `sh(1)` but as applied to the library/function name spaces, not to files. An empty library or function list defaults to `*`, trace all

truss(1)

libraries or functions in a library. A leading ! on either list specifies an exclusion list, names of libraries or functions not to be traced. Excluding a library excludes all functions in that library; any function list following a library exclusion list is ignored.

A single : separating the library list from the function list means to trace calls into the libraries from outside the libraries, but omit calls made to functions in a library from other functions in the same library. A double : : means to trace all calls, regardless of origin.

Library patterns do not match either the executable file or the dynamic linker unless there is an exact match (l* will not match ld.so.1). To trace functions in either of these objects, the names must be specified exactly, as in: `truss -u a.out -u ld ... a.out` is the literal name to be used for this purpose; it does not stand for the name of the executable file. Tracing `a.out` function calls implies all calls (default is : :).

Multiple `-u` options may be specified and they are honored left-to-right. If the process is linked with `-lthread`, the id of the thread that performed the function call is included in the trace output for the call. `truss` searches the dynamic symbol table in each library to find function names and will also search the standard symbol table if it has not been stripped.

`-U [!]lib, ... :[:][!]func, ...`

User-level function calls that stop the process. The specified functions are added to the set specified by `-u`. If one of the specified functions is called, `truss` leaves the process stopped and abandoned (see the `-T` option).

`-o outfile`

File to be used for the trace output. By default, the output goes to standard error.

See *man pages section 2: System Calls* for system call names accepted by the `-t`, `-T`, `-v`, and `-x` options. System call numbers are also accepted.

If `truss` is used to initiate and trace a specified command and if the `-o` option is used or if standard error is redirected to a non-terminal file, then `truss` runs with `hangup`, `interrupt`, and `quit` signals ignored. This facilitates tracing of interactive programs that catch `interrupt` and `quit` signals from the terminal.

If the trace output remains directed to the terminal, or if existing processes are traced (the `-p` option), then `truss` responds to `hangup`, `interrupt`, and `quit` signals by releasing all traced processes and exiting. This enables the user to terminate excessive trace output and to release previously-existing processes. Released processes continue normally, as though they had never been touched.

EXAMPLES

EXAMPLE 1 Tracing a command

This example produces a trace of the `find(1)` command on the terminal:

```
example$ truss find . -print >find.out
```

EXAMPLE 1 Tracing a command *(Continued)***EXAMPLE 2** Tracing common system calls

To see only a trace of the open, close, read, and write system calls:

```
example$ truss -t open,close,read,write find . -print >find.out
```

EXAMPLE 3 Tracing a shell script

This produces a trace of the spell(1) command on the file truss.out:

```
example$ truss -f -o truss.out spell document
```

spell is a shell script, so the -f flag is needed to trace not only the shell but also the processes created by the shell. (The spell script runs a pipeline of eight processes.)

EXAMPLE 4 Abbreviating output

A particularly boring example is:

```
example$ truss nroff -mm document >nroff.out
```

because 97% of the output reports lseek(), read(), and write() system calls. To abbreviate it:

```
example$ truss -t ! lseek,read,write nroff -mm document >nroff.out
```

EXAMPLE 5 Tracing library calls from outside the C library

This example traces all user-level calls made to any function in the C library from outside the C library:

```
example$ truss -u libc . . .
```

EXAMPLE 6 Tracing library calls from within the C library

This example includes calls made to functions in the C library from within the C library itself:

```
example$ truss -u libc : : . . .
```

EXAMPLE 7 Tracing library calls other than the C library

This example traces all user-level calls made to any library other than the C library:

```
example$ truss -u '*' -u !libc . . .
```

truss(1)

EXAMPLE 7 Tracing library calls other than the C library (Continued)

EXAMPLE 8 Tracing printf and scanf function calls

This example traces all user-level calls to functions in the printf and scanf family contained in the C library:

```
example$ truss -u 'libc : *printf,*scanf' . . .
```

EXAMPLE 9 Tracing any user-level function call

This example traces every user-level function call from anywhere to anywhere:

```
example$ truss -u a.out -u ld : : -u : : . . .
```

EXAMPLE 10 Tracing a system call verbosely

This example verbosely traces the system call activity of process #1, `init(1M)` (if you are a privileged user):

```
example# truss -p -v all 1
```

Interrupting `truss` returns `init` to normal operation.

FILES /proc/* process files

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

man pages section 2: System Calls

NOTES Some of the system calls described in *man pages section 2: System Calls* differ from the actual operating system interfaces. Do not be surprised by minor deviations of the trace output from the descriptions in that document.

Every machine fault (except a page fault) results in the posting of a signal to the LWP that incurred the fault. A report of a received signal will immediately follow each report of a machine fault (except a page fault) unless that signal is being blocked.

The operating system enforces certain security restrictions on the tracing of processes. In particular, any command whose object file (`a.out`) cannot be read by a user cannot be traced by that user; `set-uid` and `set-gid` commands can be traced only by a privileged user. Unless it is run by a privileged user, `truss` loses control of any process that performs an `exec()` of a `set-id` or unreadable object file; such processes continue normally, though independently of `truss`, from the point of the `exec()`.

To avoid collisions with other controlling processes, `truss` will not trace a process that it detects is being controlled by another process via the `/proc` interface. This allows `truss` to be applied to `proc(4)`-based debuggers as well as to another instance of itself.

The trace output contains tab characters under the assumption that standard tab stops are set (every eight positions).

The trace output for multiple processes or for a multithreaded process (one that contains more than one LWP) is not produced in strict time order. For example, a `read()` on a pipe may be reported before the corresponding `write()`. For any one LWP (a traditional process contains only one), the output is strictly time-ordered.

When tracing more than one process, `truss` runs as one controlling process for each process being traced. For the example of the `spell` command shown above, `spell` itself uses 9 process slots, one for the shell and 8 for the 8-member pipeline, while `truss` adds another 9 processes, for a total of 18.

Not all possible structures passed in all possible system calls are displayed under the `-v` option.

tset(1B)

NAME	tset, reset – establish or restore terminal characteristics
SYNOPSIS	tset [-InQrs] [-ec] [-kc] [-m [<i>port-ID</i> [<i>baudrate</i>] : <i>type...</i>]] [<i>type</i>] reset [-] [-ec] [-I] [-kc] [-n] [-Q] [-r] [-s] [-m [<i>indent</i>] [<i>test</i> <i>baudrate</i>] : <i>type...</i>] [<i>type</i>]
DESCRIPTION	<p>The <code>tset</code> utility sets up your terminal, typically when you first log in. It does terminal dependent processing such as setting erase and kill characters, setting or resetting delays, sending any sequences needed to properly initialize the terminal, and the like. <code>tset</code> first determines the <code>type</code> of terminal involved, and then does necessary initializations and mode settings. If a port is not wired permanently to a specific terminal (not hardwired) it is given an appropriate generic identifier such as <code>dialup</code>.</p> <p><code>reset</code> clears the terminal settings by turning off CBREAK and RAW modes, output delays and parity checking, turns on NEWLINE translation, echo and TAB expansion, and restores undefined special characters to their default state. It then sets the modes as usual, based on the terminal type (which will probably override some of the above). See <code>stty(1)</code> for more information. All arguments to <code>tset</code> may be used with <code>reset</code>. <code>reset</code> also uses <code>rs=</code> and <code>rf=</code> to reset the initialization string and file. This is useful after a program dies and leaves the terminal in a funny state. Often in this situation, characters will not echo as you type them. You may have to type <code>LINEFEED reset LINEFEED</code> since <code>RETURN</code> may not work.</p> <p>When no arguments are specified, <code>tset</code> reads the terminal type from the <code>TERM</code> environment variable and re-initializes the terminal, and performs initialization of mode, environment and other options at login time to determine the terminal type and set up terminal modes.</p> <p>When used in a startup script (<code>.profile</code> for <code>sh(1)</code> users or <code>.login</code> for <code>csh(1)</code> users) it is desirable to give information about the type of terminal you will usually use on ports that are not hardwired. Any of the alternate generic names given in the file <code>/etc/termcap</code> are possible identifiers. Refer to the <code>-m</code> option below for more information. If no mapping applies and a final <code>type</code> option, not preceded by a <code>-m</code>, is given on the command line then that type is used.</p> <p>It is usually desirable to return the terminal type, as finally determined by <code>tset</code>, and information about the terminal's capabilities, to a shell's environment. This can be done using the <code>-</code>, <code>-s</code>, or <code>-S</code> options.</p> <p>For the Bourne shell, put this command in your <code>.profile</code> file:</p> <pre>eval `tset -s options...`</pre> <p>or using the C shell, put these commands in your <code>.login</code> file:</p> <pre>set noglob eval `tset -s options...`unset noglob</pre> <p>With the C shell, it is also convenient to make an alias in your <code>.cshrc</code> file:</p>

```
alias ts 'eval `tset -s \!*`'
```

This also allows the command:

```
ts 2621
```

to be invoked at any time to set the terminal and environment. It is not possible to get this aliasing effect with a Bourne shell script, because shell scripts cannot set the environment of their parent. If a process could set its parent's environment, none of this nonsense would be necessary in the first place.

Once the terminal type is known, `tset` sets the terminal driver mode. This normally involves sending an initialization sequence to the terminal, setting the single character erase (and optionally the line-kill (full line erase)) characters, and setting special character delays. TAB and NEWLINE expansion are turned off during transmission of the terminal initialization sequence.

On terminals that can backspace but not overstrike (such as a CRT), and when the erase character is '#', the erase character is changed as if `-e` had been used.

OPTIONS

- The name of the terminal finally decided upon is output on the standard output. This is intended to be captured by the shell and placed in the `TERM` environment variable.
- ec Set the erase character to be the named character *c* on all terminals. Default is the BACKSPACE key on the keyboard, usually `^H` (CTRL-H). The character *c* can either be typed directly, or entered using the circumflex-character notation used here.
- ic Set the interrupt character to be the named character *c* on all terminals. Default is `^C` (CTRL-C). The character *c* can either be typed directly, or entered using the circumflex-character notation used here.
- I Suppress transmitting terminal-initialization strings.
- kc Set the line kill character to be the named character *c* on all terminals. Default is `^U` (CTRL-U). The kill character is left alone if `-k` is not specified. Control characters can be specified by prefixing the alphabetical character with a circumflex (as in CTRL-U) instead of entering the actual control key itself. This allows you to specify control keys that are currently assigned.
- n Specify that the new tty driver modes should be initialized for this terminal. Probably useless since `stty new` is the default.
- Q Suppress printing the 'Erase set to' and 'Kill set to' messages.
- r In addition to other actions, reports the terminal type.
- s Output commands to set and export `TERM`. This can be used with

tset(1B)

```
set noglob
eval `tset -s . . .`
unset noglob
```

to bring the terminal information into the environment. Doing so makes programs such as `vi(1)` start up faster. If the `SHELL` environment variable ends with `csh`, C shell commands are output, otherwise Bourne shell commands are output.

`-m [port-ID [baudrate] : type] . . .`

Specify (map) a terminal type when connected to a generic port (such as *dialup* or *plugboard*) identified by *port-ID*. The *baudrate* argument can be used to check the baudrate of the port and set the terminal type accordingly. The target rate is prefixed by any combination of the following operators to specify the conditions under which the mapping is made:

>	Greater than
@	Equals or "at"
<	Less than
!	It is not the case that (negates the above operators)
?	Prompt for the terminal type. If no response is given, then <code>type</code> is selected by default.

In the following example, the terminal type is set to `adm3a` if the port is a dialup with a speed of greater than 300 or to `dw2` if the port is a dialup at 300 baud or less. In the third case, the question mark preceding the terminal type indicates that the user is to verify the type desired. A NULL response indicates that the named type is correct. Otherwise, the user's response is taken to be the type desired.

```
tset -m 'dialup>300:adm3a' -m 'dialup:dw2' -m 'plugboard:?adm3a'
```

To prevent interpretation as metacharacters, the entire argument to `-m` should be enclosed in single quotes. When using the C shell, exclamation points should be preceded by a backslash (`\`).

EXAMPLES

These examples all use the `'-'` option. A typical use of `tset` in a `.profile` or `.login` will also use the `-e` and `-k` options, and often the `-n` or `-Q` options as well. These options have been omitted here to keep the examples short.

EXAMPLE 1 Selecting a terminal

To select a 2621, you might put the following sequence of commands in your `.login` file (or `.profile` for Bourne shell users).

```
set noglob
eval `tset -s 2621`
unset noglob
```

If you want to make the selection based only on the baud rate, you might use the following:

EXAMPLE 1 Selecting a terminal (Continued)

```
set noglob
eval `tset -s -m '>1200:wy' 2621`
unset noglob
```

EXAMPLE 2 Selecting terminals according to speed or baud rate

If you have a switch which connects to various ports (making it impractical to identify which port you may be connected to), and use various terminals from time to time, you can select from among those terminals according to the *speed* or baud rate. In the example below, `tset` will prompt you for a terminal type if the baud rate is greater than 1200 (say, 9600 for a terminal connected by an RS-232 line), and use a Wyse® 50 by default. If the baud rate is less than or equal to 1200, it will select a 2621. Note the placement of the question mark, and the quotes to protect the `>` and `?` from interpretation by the shell.

```
set noglob
eval `tset -s -m 'switch>1200:?wy' -m 'switch<=1200:2621`
unset noglob
```

EXAMPLE 3 Selecting the terminal used most often

The following entry is appropriate if you always dial up, always at the same baud rate, on many different kinds of terminals, and the terminal you use most often is an `adm3a`.

```
set noglob
eval `tset -s ?adm3a`
unset noglob
```

EXAMPLE 4 Selecting a terminal with specific settings

The following example quietly sets the erase character to `BACKSPACE`, and `kill` to `CTRL-U`. If the port is switched, it selects a Concept™ 100 for speeds less than or equal to 1200, and asks for the terminal type otherwise (the default in this case is a Wyse 50). If the port is a direct dialup, it selects Concept 100 as the terminal type. If logging in over the ARPANET, the terminal type selected is a Datamedia® 2500 terminal or emulator. Note the backslash escaping the `NEWLINE` at the end of the first line in the example.

```
set noglob
eval `tset -e -k^U -Q -s -m 'switch<=1200:concept100' -m\
'switch:?wy' -m dialup:concept100 -m arpanet:dm2500`
unset noglob
```

tset(1B)

EXAMPLE 4 Selecting a terminal with specific settings (Continued)

FILES .login
.profile
/etc/termcap

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWscpu

SEE ALSO `csh(1)`, `sh(1)`, `stty(1)`, `vi(1)`, `attributes(5)`, `environ(5)`

NOTES The `tset` command is one of the first commands a user must master when getting started on a UNIX system. Unfortunately, it is one of the most complex, largely because of the extra effort the user must go through to get the environment of the `login` shell set. Something needs to be done to make all this simpler, either the `login` program should do this stuff, or a default shell alias should be made, or a way to set the environment of the parent should exist.

This program cannot intuit personal choices for erase, interrupt and line kill characters, so it leaves these set to the local system standards.

It could well be argued that the shell should be responsible for ensuring that the terminal remains in a sane state; this would eliminate the need for the `reset` program.

NAME	tsort – topological sort				
SYNOPSIS	<code>/usr/ccs/bin/tsort</code> [<i>file</i>]				
DESCRIPTION	<p>The <code>tsort</code> command produces on the standard output a totally ordered list of items consistent with a partial ordering of items mentioned in the input <code>file</code>.</p> <p>The input consists of pairs of items (nonempty strings) separated by blanks. Pairs of different items indicate ordering. Pairs of identical items indicate presence, but not ordering.</p>				
OPERANDS	<p>The following operand is supported:</p> <p><code>file</code> A path name of a text file to order. If no <code>file</code> operand is given, the standard input is used.</p>				
EXAMPLES	<p>EXAMPLE 1 An example of the <code>tsort</code> command.</p> <p>The command:</p> <pre>tsort <<EOF a b c c d e g g f g e f EOF</pre> <p>produces the output:</p> <pre>a b c d e f g</pre>				
ENVIRONMENT VARIABLES	See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>tsort</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .				
EXIT STATUS	<p>The following exit values are returned:</p> <p>0 Successful completion.</p> <p>>0 An error occurred.</p>				
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:

tsort(1)

DIAGNOSTICS Odd data: there are an odd number of fields in the input file.

NAME	tty – return user’s terminal name						
SYNOPSIS	tty [-l] [-s]						
DESCRIPTION	The tty utility writes to the standard output the name of the terminal that is open as standard input. The name that is used is equivalent to the string that would be returned by the ttyname(3C) function.						
OPTIONS	The following options are supported: <ul style="list-style-type: none"> -l Prints the synchronous line number to which the user’s terminal is connected, if it is on an active synchronous line. -s Inhibits printing of the terminal path name, allowing one to test just the exit status. 						
ENVIRONMENT VARIABLES	See environ(5) for descriptions of the following environment variables that affect the execution of tty: LC_CTYPE, LC_MESSAGES, and NLSPATH.						
EXIT STATUS	The following exit values are returned: <ul style="list-style-type: none"> 0 Standard input is a terminal. 1 Standard input is not a terminal. >1 An error occurred. 						
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:						
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWcsu</td> </tr> <tr> <td>CSI</td> <td>enabled</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWcsu	CSI	enabled
ATTRIBUTE TYPE	ATTRIBUTE VALUE						
Availability	SUNWcsu						
CSI	enabled						
SEE ALSO	isatty(3C), ttyname(3C), attributes(5), environ(5)						
DIAGNOSTICS	not on an active synchronous line The standard input is not a synchronous terminal and -l is specified. not a tty The standard input is not a terminal and -s is not specified.						
NOTES	The -s option is useful only if the exit status is wanted. It does not rely on the ability to form a valid path name. Portable applications should use test -t.						

type(1)

NAME	type – write a description of command type				
SYNOPSIS	type <i>name</i> ...				
DESCRIPTION	<p>The <code>type</code> utility indicates how each <i>name</i> operand would be interpreted if used as a command. <code>type</code> displays information about each operand identifying the operand as a shell built-in, function, alias, hashed command, or keyword, and where applicable, may display the operand's path name.</p> <p>There is also a shell built-in version of <code>type</code> that is similar to the <code>type</code> utility.</p>				
OPERANDS	<p>The following operand is supported:</p> <p><i>name</i> A name to be interpreted.</p>				
ENVIRONMENT VARIABLES	<p>See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>type</code>: <code>LC_CTYPE</code>, <code>LC_MESSAGES</code>, and <code>NLSPATH</code>.</p> <p><code>PATH</code> Determine the location of <i>name</i>.</p>				
EXIT STATUS	<p>The following exit values are returned:</p> <p>0 Successful completion.</p> <p>>0 An error occurred.</p>				
ATTRIBUTES	<p>See <code>attributes(5)</code> for descriptions of the following attributes:</p> <table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Availability</td><td>SUNWcsu</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWcsu

Availability	SUNWcsu				
SEE ALSO	<code>typeset(1)</code> , <code>attributes(5)</code> , <code>environ(5)</code>				

NAME	typeset, whence – shell built-in functions to set/get attributes and values for shell variables and functions
SYNOPSIS	typeset [\pm HLRZfilrtux [<i>n</i>]] [<i>name</i> [= <i>value</i>]]... whence [-pv] <i>name</i> ...
DESCRIPTION	<p>typeset sets attributes and values for shell variables and functions. When typeset is invoked inside a function, a new instance of the variables <i>name</i> is created. The variables <i>value</i> and <i>type</i> are restored when the function completes. The following list of attributes may be specified:</p> <ul style="list-style-type: none"> -H This flag provides UNIX to host-name file mapping on non-UNIX machines. -L Left justify and remove leading blanks from <i>value</i>. If <i>n</i> is non-zero it defines the width of the field; otherwise, it is determined by the width of the value of first assignment. When the variable is assigned to, it is filled on the right with blanks or truncated, if necessary, to fit into the field. Leading zeros are removed if the -Z flag is also set. The -R flag is turned off. -R Right justify and fill with leading blanks. If <i>n</i> is non-zero it defines the width of the field, otherwise it is determined by the width of the value of first assignment. The field is left filled with blanks or truncated from the end if the variable is reassigned. The -L flag is turned off. -Z Right justify and fill with leading zeros if the first non-blank character is a digit and the -L flag has not been set. If <i>n</i> is non-zero it defines the width of the field; otherwise, it is determined by the width of the value of first assignment. -f The names refer to function names rather than variable names. No assignments can be made and the only other valid flags are -t, -u and -x. The flag -t turns on execution tracing for this function. The flag -u causes this function to be marked undefined. The FPATH variable will be searched to find the function definition when the function is referenced. The flag -x allows the function definition to remain in effect across shell procedures invoked by name. -i Parameter is an integer. This makes arithmetic faster. If <i>n</i> is non-zero it defines the output arithmetic base; otherwise, the first assignment determines the output base. -l All upper-case characters are converted to lower-case. The upper-case flag, -u is turned off. -r The given <i>names</i> are marked readonly and these names cannot be changed by subsequent assignment. -t Tags the variables. Tags are user definable and have no special meaning to the shell.

typeset(1)

- u All lower-case characters are converted to upper-case characters. The lower-case flag, -l is turned off.
- x The given *names* are marked for automatic export to the environment of subsequently-executed commands.

The -i attribute can not be specified along with -R, -L, -Z, or -f.

Using + rather than - causes these flags to be turned off. If no *name* arguments are given but flags are specified, a list of *names* (and optionally the *values*) of the *variables* which have these flags set is printed. (Using + rather than - keeps the values from being printed.) If no *names* and flags are given, the *names* and *attributes* of all *variables* are printed.

For each *name*, *whence* indicates how it would be interpreted if used as a command name.

The -v flag produces a more verbose report.

The -p flag does a path search for *name* even if name is an alias, a function, or a reserved word.

On this man page, ksh(1) commands that are preceded by one or two * (asterisks) are treated specially in the following ways:

1. Variable assignment lists preceding the command remain in effect when the command completes.
2. I/O redirections are processed after variable assignments.
3. Errors cause a script that contains them to abort.
4. Words, following a command preceded by ** that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the = sign and word splitting and file name generation are not performed.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

SEE ALSO `ksh(1)`, `set(1)`, `sh(1)`, `attributes(5)`

NAME ucblinks – adds /dev entries to give SunOS 4.x compatible names to SunOS 5.x devices

SYNOPSIS `/usr/ucb/ucblinks [-e rulebase] [-r rootdir]`

DESCRIPTION ucblinks creates symbolic links under the /dev directory for devices whose SunOS 5.x names differ from their SunOS 4.x names. Where possible, these symbolic links point to the device's SunOS 5.x name rather than to the actual /devices entry.

ucblinks does not remove unneeded compatibility links; these must be removed by hand.

ucblinks should be called each time the system is reconfiguration-booted, after any new SunOS 5.x links that are needed have been created, since the reconfiguration may have resulted in more compatibility names being needed.

In releases prior to SunOS 5.4, ucblinks used a `nawk` rule-base to construct the SunOS 4.x compatible names. ucblinks no longer uses `nawk` for the default operation, although `nawk` rule-bases can still be specified with the `-e` option. The `nawk` rule-base equivalent to the SunOS 5.4 default operation can be found in `/usr/ucblib/ucblinks.awk`.

OPTIONS

- `-e rulebase` Specify *rulebase* as the file containing `nawk(1)` pattern-action statements.
- `-r rootdir` Specify *rootdir* as the directory under which `dev` and `devices` will be found, rather than the standard root directory `/`.

FILES `/usr/ucblib/ucblinks.awk` sample rule-base for compatibility links

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ul(1)

NAME | ul – do underlining

SYNOPSIS | **ul** [-i] [-t *terminal*] [*filename...*]

DESCRIPTION | ul reads the named *filenames* (or the standard input if none are given) and translates occurrences of underscores to the sequence which indicates underlining for the terminal in use, as specified by the environment variable TERM. ul uses the /usr/share/lib/terminfo entry to determine the appropriate sequences for underlining. If the terminal is incapable of underlining, but is capable of a standout mode then that is used instead. If the terminal can overstrike, or handles underlining automatically, ul degenerates to cat(1). If the terminal cannot underline, underlining is ignored.

OPTIONS | -t *terminal* | Override the terminal kind specified in the environment. If the terminal cannot underline, underlining is ignored. If the terminal name is not found, no underlining is attempted.

 | -i | Indicate underlining by a separate line containing appropriate dashes '-'; this is useful when you want to look at the underlining which is present in an nroff(1) output stream on a CRT-terminal.

RETURN VALUES | ul returns exit code 1 if the file specified is not found.

FILES | /usr/share/lib/terminfo/*

ATTRIBUTES | See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdoc

SEE ALSO | cat(1), man(1), nroff(1), attributes(5)

BUGS | nroff usually generates a series of backspaces and underlines intermixed with the text to indicate underlining. ul makes attempt to optimize the backward motion.

NAME	umask – get or set the file mode creation mask
SYNOPSIS	<code>/usr/bin/umask [-S] [mask]</code>
sh	<code>umask [000]</code>
cs	<code>umask [000]</code>
ksh	<code>umask [-S] [mask]</code>
DESCRIPTION	<p>The <code>umask</code> utility sets the file mode creation mask of the current shell execution environment to the value specified by the <code>mask</code> operand. This mask affects the initial value of the file permission bits of subsequently created files. If <code>umask</code> is called in a subshell or separate utility execution environment, such as one of the following:</p> <pre>(umask 002) nohup umask . . . find . -exec umask . . .</pre> <p>it does not affect the file mode creation mask of the caller's environment. For this reason, the <code>/usr/bin/umask</code> utility cannot be used to change the <code>umask</code> in an ongoing session. Its usefulness is limited to checking the caller's <code>umask</code>. To change the <code>umask</code> of an ongoing session you must use one of the shell builtins.</p> <p>If the <code>mask</code> operand is not specified, the <code>umask</code> utility writes the value of the invoking process's file mode creation mask to standard output.</p> <p>sh The user file-creation mode mask is set to <code>000</code>. The three octal digits refer to read/write/execute permissions for owner, group, and other, respectively (see <code>chmod(1)</code>, <code>chmod(2)</code>, and <code>umask(2)</code>). The value of each specified digit is subtracted from the corresponding "digit" specified by the system for the creation of a file (see <code>creat(2)</code>). For example, <code>umask 022</code> removes write permission for group and other (files normally created with mode <code>777</code> become mode <code>755</code>; files created with mode <code>666</code> become mode <code>644</code>).</p> <ul style="list-style-type: none"> ■ If <code>000</code> is omitted, the current value of the mask is printed. ■ <code>umask</code> is recognized and executed by the shell. ■ <code>umask</code> can be included in the user's <code>.profile</code> (see <code>profile(4)</code>) and invoked at login to automatically set the user's permissions on files or directories created. <p>cs See the description above for the Bourne shell (<code>sh</code>)<code>umask</code> built-in.</p> <p>ksh The user file-creation mask is set to <code>mask</code>. <code>mask</code> can either be an octal number or a symbolic value as described in <code>chmod(1)</code>. If a symbolic value is given, the new <code>umask</code> value is the complement of the result of applying <code>mask</code> to the complement of the previous <code>umask</code> value. If <code>mask</code> is omitted, the current value of the mask is printed.</p> <p>OPTIONS The following option is supported:</p> <p><code>-S</code> Produce symbolic output.</p>

umask(1)

The default output style is unspecified, but will be recognized on a subsequent invocation of `umask` on the same system as a *mask* operand to restore the previous file mode creation mask.

OPERANDS The following operand is supported:

mask A string specifying the new file mode creation mask. The string is treated in the same way as the *mode* operand described in the `chmod(1)` manual page.

For a *symbolic_mode* value, the new value of the file mode creation mask is the logical complement of the file permission bits portion of the file mode specified by the *symbolic_mode* string.

In a *symbolic_mode* value, the permissions *op* characters `+` and `-` are interpreted relative to the current file mode creation mask. `+` causes the bits for the indicated permissions to be cleared in the mask. `-` causes the bits of the indicated permissions to be set in the mask.

The interpretation of *mode* values that specify file mode bits other than the file permission bits is unspecified.

The file mode creation mask is set to the resulting numeric value.

The default output of a prior invocation of `umask` on the same system with no operand will also be recognized as a *mask* operand. The use of an operand obtained in this way is not obsolescent, even if it is an octal number.

OUTPUT When the *mask* operand is not specified, the `umask` utility will write a message to standard output that can later be used as a `umask mask` operand.

If `-s` is specified, the message will be in the following format:

```
"u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>, <other permissions>
```

where the three values will be combinations of letters from the set `{r, w, x}`; the presence of a letter will indicate that the corresponding bit is clear in the file mode creation mask.

If a *mask* operand is specified, there will be no output written to standard output.

EXAMPLES **EXAMPLE 1** Using The `umask` Command

Either of the commands:

```
umask a=rx,ug+w
umask 002
```

sets the mode mask so that subsequently created files have their `S_IWOTH` bit cleared.

After setting the mode mask with either of the above commands, the `umask` command can be used to write the current value of the mode mask:

EXAMPLE 1 Using The umask Command (Continued)

```
$ umask
0002
```

(The output format is unspecified, but historical implementations use the obsolescent octal integer mode format.)

```
$ umask -S
u=rwx,g=rwx,o=rwx
```

Either of these outputs can be used as the mask operand to a subsequent invocation of the `umask` utility.

Assuming the mode mask is set as above, the command:

```
umask g-w
```

sets the mode mask so that subsequently created files have their `S_IWGRP`, and `S_IWOTH` bits cleared.

The command:

```
umask - -w
```

sets the mode mask so that subsequently created files have all their write bits cleared. Note that *mask* operands `r`, `w`, `x`, or anything beginning with a hyphen (`-`), must be preceded by `-` (two hyphens) to keep it from being interpreted as an option.

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `umask`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

EXIT STATUS

The following exit values are returned:

0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

>0 An error occurred.

uname(1)

NAME	uname – print name of current system
SYNOPSIS	uname [-aimnprsvX] uname [-S <i>system_name</i>]
DESCRIPTION	The uname utility prints information about the current system on the standard output. When options are specified, symbols representing one or more system characteristics will be written to the standard output. If no options are specified, uname prints the current operating system's name. The options print selected information returned by uname(2), sysinfo(2), or both.
OPTIONS	The following options are supported: -a Prints basic information currently available from the system. -i Prints the name of the hardware implementation (platform). -m Prints the machine hardware name (class). Use of this option is discouraged; use uname -p instead. See NOTES section below. -n Prints the nodename (the nodename is the name by which the system is known to a communications network). -p Prints the current host's ISA or processor type. -r Prints the operating system release level. -s Prints the name of the operating system. This is the default. -S <i>system_name</i> The nodename may be changed by specifying a system name argument. The system name argument is restricted to SYS_NMLN characters. SYS_NMLN is an implementation specific value defined in <sys/utsname.h>. Only the super-user is allowed this capability. This change does not persist across reboots of the system. Use sys-unconfig(1M) to change a host's name permanently. -v Prints the operating system version. -X Prints expanded system information, one information element per line, as expected by SCO UNIX. The displayed information includes: <ul style="list-style-type: none">■ system name, node, release, version, machine, and number of CPUs.■ BusType, Serial, and Users (set to "unknown" in Solaris)■ OEM# and Origin# (set to 0 and 1, respectively)
EXAMPLES	EXAMPLE 1 Printing the OS name and release level The following command: example% uname -sr prints the operating system name and release level, separated by

one SPACE character.

ENVIRONMENT VARIABLES

SYSV3 This variable is used to override the default behavior of `uname`. This is necessary to make it possible for some INTERACTIVE UNIX Systems and SCO UNIX programs and scripts to work properly. Many scripts use `uname` to determine the `SYSV3` type or the version of the OS to ensure software is compatible with that OS. Setting `SYSV3` to an empty string will make `uname` print the following default values:

```
nodename nodename 3.2 2 i386
```

The individual elements that `uname` displays can also be modified by setting `SYSV3` in the following format:

```
os,sysname,node,rel,ver,mach
```

<i>os</i>	Operating system (IUS or SCO).
<i>sysname</i>	System name.
<i>node</i>	Nodename as displayed by the <code>-n</code> option.
<i>rel</i>	Release level as displayed by the <code>-r</code> option.
<i>ver</i>	Version number as displayed by the <code>-v</code> option.
<i>mach</i>	Machine name as displayed by <code>-m</code> option.

Do not put spaces between the elements. If an element is omitted, the current system value will be used.

See `environ(5)` for descriptions of the following environment variables that affect the execution of `uname`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

EXIT STATUS

The following exit values are returned:

0	Successful completion.
>0	An error occurred.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO

`arch(1)`, `isalist(1)`, `sys-unconfig(1M)`, `sysinfo(2)`, `uname(2)`, `nodename(4)`, `attributes(5)`, `environ(5)`

uname(1)

NOTES | Independent software vendors (ISVs) and others who need to determine detailed characteristics of the platform on which their software is either being installed or executed should use the `uname` command.

To determine the operating system name and release level, use `uname -sr`. To determine only the operating system release level, use `uname -r`. Notice that operating system release levels are not guaranteed to be in *x.y* format (such as 5.3, 5.4, 5.5, and so forth); future releases could be in the *x.y.z* format (such as 5.3.1, 5.3.2, 5.4.1, and so forth).

In SunOS 4.x releases, the `arch(1)` command was often used to obtain information similar to that obtained by using the `uname` command. The `arch(1)` command output "sun4" was often incorrectly interpreted to signify a SunOS SPARC system. If hardware platform information is desired, use `uname -sp`.

The `arch -k` and `uname -m` commands return equivalent values; however, the use of either of these commands by third party programs is discouraged, as is the use of the `arch` command in general. To determine the machine's Instruction Set Architecture (ISA or processor type), use `uname` with the `-p` option.

NAME	unifdef – resolve and remove <code>ifdef</code> 'ed lines from C program source
SYNOPSIS	unifdef [-c t] [-Dname] [-Uname] [-iDname] [-iUname] ... [filename]
DESCRIPTION	<p><code>unifdef</code> removes <code>ifdef</code>ed lines from a file while otherwise leaving the file alone. It is smart enough to deal with the nested <code>ifdef</code>s, comments, single and double quotes of C syntax, but it does not do any including or interpretation of macros. Neither does it strip out comments, though it recognizes and ignores them. You specify which symbols you want defined with <code>-D</code> options, and which you want undefined with <code>-U</code> options. Lines within those <code>ifdef</code>s will be copied to the output, or removed, as appropriate. Any <code>ifdef</code>, <code>ifndef</code>, <code>else</code>, and <code>endif</code> lines associated with <i>filename</i> will also be removed.</p> <p><code>ifdef</code>s involving symbols you do not specify are untouched and copied out along with their associated <code>ifdef</code>, <code>else</code>, and <code>endif</code> lines.</p> <p>If an <code>ifdefX</code> occurs nested inside another <code>ifdefX</code>, then the inside <code>ifdef</code> is treated as if it were an unrecognized symbol. If the same symbol appears in more than one argument, only the first occurrence is significant.</p> <p><code>unifdef</code> copies its output to the standard output and will take its input from the standard input if no <i>filename</i> argument is given.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -c Complement the normal operation. Lines that would have been removed or blanked are retained, and vice versa. -l Replace "lines removed" lines with blank lines. -t Plain text option. <code>unifdef</code> refrains from attempting to recognize comments and single and double quotes. -Dname Lines associated with the defined symbol <i>name</i>. -Uname Lines associated with the undefined symbol <i>name</i>. -iDname Ignore, but print out, lines associated with the defined symbol <i>name</i>. If you use <code>ifdef</code>s to delimit non-C lines, such as comments or code which is under construction, then you must tell <code>unifdef</code> which symbols are used for that purpose so that it will not try to parse for quotes and comments within them. -iUname Ignore, but print out, lines associated with the undefined symbol <i>name</i>.
EXIT STATUS	<p>The following exit values are returned:</p> <ul style="list-style-type: none"> 0 Successful operation. 1 Operation failed.

DIAGNOSTICS Premature EOF Inappropriate else or endif.

NAME	unig – report or filter out repeated lines in a file
SYNOPSIS	unig [-c -d -u] [-f <i>fields</i>] [-s <i>char</i>] [<i>input_file</i> [<i>output_file</i>]] unig [-c -d -u] [-n] [+ <i>m</i>] [<i>input_file</i> [<i>output_file</i>]]
DESCRIPTION	The unig utility will read an input file comparing adjacent lines, and write one copy of each input line on the output. The second and succeeding copies of repeated adjacent input lines will not be written. Repeated lines in the input will not be detected if they are not adjacent.
OPTIONS	The following options are supported: -c Precede each output line with a count of the number of times the line occurred in the input. -d Suppress the writing of lines that are not repeated in the input. -f <i>fields</i> Ignore the first <i>fields</i> fields on each input line when doing comparisons, where <i>fields</i> is a positive decimal integer. A field is the maximal string matched by the basic regular expression: [:blank:]*^[[:blank:]]*If <i>fields</i> specifies more fields than appear on an input line, a null string will be used for comparison. -s <i>chars</i> Ignore the first <i>chars</i> characters when doing comparisons, where <i>chars</i> is a positive decimal integer. If specified in conjunction with the -f option, the first <i>chars</i> characters after the first <i>fields</i> fields will be ignored. If <i>chars</i> specifies more characters than remain on an input line, a null string will be used for comparison. -u Suppress the writing of lines that are repeated in the input. -n Equivalent to -f <i>fields</i> with <i>fields</i> set to <i>n</i> . +m Equivalent to -s <i>chars</i> with <i>chars</i> set to <i>m</i> .
OPERANDS	The following operands are supported: <i>input_file</i> A path name of the input file. If <i>input_file</i> is not specified, or if the <i>input_file</i> is -, the standard input will be used. <i>output_file</i> A path name of the output file. If <i>output_file</i> is not specified, the standard output will be used. The results are unspecified if the file named by <i>output_file</i> is the file named by <i>input_file</i> .
EXAMPLES	EXAMPLE 1 Using The unig Command The following example lists the contents of the unig.test file and outputs a copy of the repeated lines. example% cat unig.test This is a test.

uniq(1)

EXAMPLE 1 Using The uniq Command (Continued)

```
This is a test.
TEST.
Computer.
TEST.
TEST.
Software.

example% uniq -d uniq.test
This is a test.
TEST.
example%
```

The next example outputs just those lines that are not repeated in the `uniq.test` file.

```
example% uniq -u uniq.test
TEST.
Computer.
Software.
example%
```

The last example outputs a report with each line preceded by a count of the number of times each line occurred in the file:

```
example% uniq -c uniq.test
  2 This is a test.
  1 TEST.
  1 Computer.
  2 TEST.
  1 Software.
example%
```

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `uniq`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

EXIT STATUS

The following exit values are returned:

```
0          Successful completion.
>0         An error occurred.
```

NAME	units – converts quantities expressed in standard scales to other scales
SYNOPSIS	units
DESCRIPTION	<p>units converts quantities expressed in various standard scales to their equivalents in other scales. It works interactively in this fashion:</p> <pre>You have:~~inch You want:~~cm * 2.540000e+00 / 3.937008e-01</pre> <p>A quantity is specified as a multiplicative combination of units optionally preceded by a numeric multiplier. Powers are indicated by suffixed positive integers, division by the usual sign:</p> <pre>You have:~~15 lbs force/in2 You want:~~atm * 1.020689e+00 / 9.797299e-01</pre> <p>units only does multiplicative scale changes; thus it can convert Kelvin to Rankine, but not Celsius to Fahrenheit. Most familiar units, abbreviations, and metric prefixes are recognized, together with a generous leavening of exotica and a few constants of nature including:</p> <pre>pi ratio of circumference to diameter, c speed of light, e charge on an electron, g acceleration of gravity, force same as g, mole Avogadro's number, water pressure head per unit height of water, au astronomical unit.</pre> <p>Pound is not recognized as a unit of mass; lb is. Compound names are run together, (for example, lightyear). British units that differ from their U.S. counterparts are prefixed thus: brgallon. For a complete list of units, type:</p> <pre>cat /usr/share/lib/unittab</pre>

NAME unix2dos – convert text file from ISO format to DOS format

SYNOPSIS `unix2dos [-ascii] [-iso] [-7] originalfile convertedfile`

DESCRIPTION unix2dos converts ISO standard characters to the corresponding characters in the DOS extended character set.

This command may be invoked from either DOS or SunOS. However, the filenames must conform to the conventions of the environment in which the command is invoked.

If the original file and the converted file are the same, unix2dos will rewrite the original file after converting it.

OPTIONS

- ascii Adds carriage returns and converts end of file characters in SunOS format text files to conform to DOS requirements.
- iso This is the default. Converts ISO standard characters to the corresponding character in the DOS extended character set.
- 7 Convert 8 bit SunOS characters to 7 bit DOS characters.

DIAGNOSTICS

File *filename* not found, or no read permission
 The input file you specified does not exist, or you do not have read permission (check with the SunOS command `ls -l`).

Bad output filename *filename*, or no write permission
 The output file you specified is either invalid, or you do not have write permission for that file or the directory that contains it. Check also that the drive or diskette is not write-protected.

Error while writing to temporary file
 An error occurred while converting your file, possibly because there is not enough space on the current drive. Check the amount of space on the current drive using the DIR command. Also be certain that the default diskette or drive is write-enabled (not write-protected). Note that when this error occurs, the original file remains intact.

Could not rename tmpfile to *filename*.

Translated tmpfile name = *filename*.
 The program could not perform the final step in converting your file. Your converted file is stored under the name indicated on the second line of this message.

NAME	uptime – show how long the system has been up				
SYNOPSIS	uptime				
DESCRIPTION	The <code>uptime</code> command prints the current time, the length of time the system has been up, and the average number of jobs in the run queue over the last 1, 5 and 15 minutes. It is, essentially, the first line of a <code>w(1)</code> command.				
EXAMPLES	Below is an example of the output <code>uptime</code> provides: <pre>example% uptime 10:47am up 27 day(s), 50 mins, 1 user, load average: 0.18, 0.26, 0.20</pre>				
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWcsu				
SEE ALSO	<code>w(1)</code> , <code>who(1)</code> , <code>whodo(1M)</code> , <code>attributes(5)</code>				
NOTES	<code>who -b</code> gives the time the system was last booted.				

users(1B)

NAME users – display a compact list of users logged in

SYNOPSIS /usr/ucb/users [*filename*]

DESCRIPTION The users utility lists the login names of the users currently on the system in a compact, one-line format.

Specifying *filename* tells users where to find its information; by default it checks /var/adm/utmp.

Typing users is equivalent to typing who -q.

EXAMPLES **EXAMPLE 1** Listing current users

```
example% users
paul george ringoexample%
```

FILES /var/adm/utmp

NAME	uucp, uulog, uuname – UNIX-to-UNIX system copy
SYNOPSIS	<p>uucp [-c -C] [-d -f] [-ggrade] [-jmr] [-nuser] [-sfile] [-xdebug_level] <i>source-file destination-file</i></p> <p>uulog [-ssys] [-fsystem] [-x] [-number] <i>system</i></p> <p>uuname [-c -l]</p>
uucp	uucp copies files named by the <i>source-file</i> arguments to the <i>destination-file</i> argument.
uulog	uulog queries a log file of uucp or uuxqt transactions in file <i>/var/uucp/.Log/uucico/system</i> or <i>/var/uucp/.Log/uuxqt/system</i> .
uuname	uuname lists the names of systems known to uucp.
uucp	<p>The following options are supported by uucp:</p> <ul style="list-style-type: none"> -c Do not copy local file to the spool directory for transfer to the remote machine (default). -C Force the copy of local files to the spool directory for transfer. -d Make all necessary directories for the file copy (default). -f Do not make intermediate directories for the file copy. -g <i>grade</i> <i>grade</i> can be either a single letter, number, or a string of alphanumeric characters defining a service grade. The <code>uuglist</code> command can determine whether it is appropriate to use the single letter, number, or a string of alphanumeric characters as a service grade. The output from the <code>uuglist</code> command will be a list of service grades that are available, or a message that says to use a single letter or number as a grade of service. -j Print the uucp job identification string on standard output. This job identification can be used by <code>uustat</code> to obtain the status of a uucp job or to terminate a uucp job. The uucp job is valid as long as the job remains queued on the local system. -m Send mail to the requester when the copy is complete. -n <i>user</i> Notify <i>user</i> on the remote system that a file was sent. -r Do not start the file transfer, just queue the job. -s <i>file</i> Report status of the transfer to <i>file</i>. This option is accepted for compatibility, but it is ignored because it is insecure.

uucp(1C)

	<p><code>-x <i>debug_level</i></code> Produce debugging output on standard output. <i>debug_level</i> is a number between 0 and 9; as it increases to 9, more detailed debugging information is given. This option may not be available on all systems.</p>
uulog	<p>The following options cause <code>uulog</code> to print logging information:</p> <p><code>-s <i>sys</i></code> Print information about file transfer work involving system <i>sys</i>.</p> <p><code>-f <i>system</i></code> Do a "<code>tail -f</code>" of the file transfer log for <i>system</i>. (You must hit BREAK to exit this function.)</p> <p>Other options used in conjunction with the above options are:</p> <p><code>-x</code> Look in the <code>uuxqt</code> log file for the given system.</p> <p><code>-number</code> Execute a <code>tail</code> command of <i>number</i> lines.</p>
uuname	<p>The following options are supported by <code>uuname</code>:</p> <p><code>-c</code> Display the names of systems known to <code>cu</code>. The two lists are the same, unless your machine is using different <code>Systems</code> files for <code>cu</code> and <code>uucp</code>. See the <code>Sysfiles</code> file.</p> <p><code>-l</code> Display the local system name.</p>
OPERANDS	<p>The source file name may be a path name on your machine, or may have the form:</p> <p><i>system-name!pathname</i></p> <p>where <i>system-name</i> is taken from a list of system names that <code>uucp</code> knows about. <i>source_file</i> is restricted to no more than one <i>system-name</i>. The destination <i>system-name</i> may also include a list of system names such as</p> <p><i>system-name!system-name! . . . !system-name!pathname</i></p> <p>In this case, an attempt is made to send the file, using the specified route, to the destination. Care should be taken to ensure that intermediate nodes in the route are willing to forward information (see NOTES below for restrictions).</p> <p>For C-Shell users, the "!" character must be surrounded by single quotes ('), or preceded by a backslash (\).</p> <p>The shell metacharacters <code>?</code>, <code>*</code> and <code>[. . .]</code> appearing in <i>pathname</i> will be expanded on the appropriate system.</p> <p>Pathnames may be one of the following:</p> <p>(1) An absolute pathname.</p>

- (2) A pathname preceded by *~user* where *user* is a login name on the specified system and is replaced by that user's login directory.
- (3) A pathname preceded by *~/destination* where *destination* is appended to */var/spool/uucppublic*. (Note: This destination will be treated as a filename unless more than one file is being transferred by this request or the destination is already a directory. To ensure that the destination is a directory, follow it with a *'/'*. For example *~/dan/* as the destination will make the directory */var/spool/uucppublic/dan* if it does not exist and put the requested file(s) in that directory).

Anything else is prefixed by the current directory.

If the result is an erroneous path name for the remote system, the copy will fail. If the *destination-file* is a directory, the last part of the *source-file* name is used.

Invoking *uucp* with shell wildcard characters as the remote *source-file* invokes the *uux(1C)* command to execute the *uucp* command on the remote machine. The remote *uucp* command spools the files on the remote machine. After the first session terminates, if the remote machine is configured to transfer the spooled files to the local machine, the remote machine will initiate a call and send the files; otherwise, the user must "call" the remote machine to transfer the files from the spool directory to the local machine. This call can be done manually using *Uutry(1M)*, or as a side effect of another *uux(1C)* or *uucp* call.

Note that the local machine must have permission to execute the *uucp* command on the remote machine in order for the remote machine to send the spooled files.

uucp removes execute permissions across the transmission and gives 0666 read and write permissions (see *chmod(2)*).

ENVIRONMENT VARIABLES

See *environ(5)* for descriptions of the following environment variables that affect the execution of *uucp*: *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_TIME*, *TZ*, and *NLSPATH*.

EXIT STATUS

The following exit values are returned:

- 0 Successful completion.
- >0 An error occurred.

NOTES For security reasons, the domain of remotely accessible files may be severely restricted. You will probably not be able to access files by path name; ask a responsible person on the remote system to send them to you. For the same reasons you will probably not be able to send files to arbitrary path names. As distributed, the remotely accessible files are those whose names begin `/var/spool/uucppublic` (equivalent to `~/`).

All files received by `uucp` will be owned by `uucp`.

The `-m` option will only work when sending files or receiving a single file. Receiving multiple files specified by special shell characters `?`, `&`, and `[. . .]` will not activate the `-m` option.

The forwarding of files through other systems may not be compatible with the previous version of `uucp`. If forwarding is used, all systems in the route must have compatible versions of `uucp`.

Protected files and files that are in protected directories that are owned by the requester can be sent by `uucp`. However, if the requester is `root`, and the directory is not searchable by "other" or the file is not readable by "other", the request will fail.

Strings that are passed to remote systems may not be evaluated in the same locale as the one in use by the process that invoked `uucp` on the local system.

Configuration files must be treated as C (or POSIX) locale text files.

NAME	uuencode, uudecode – encode a binary file, or decode its encoded representation
SYNOPSIS	uuencode [<i>source-file</i>] <i>decode_pathname</i> uudecode [-p] [<i>encoded-file</i>]
uuencode	uuencode converts a binary file into an encoded representation that can be sent using mail(1). It encodes the contents of <i>source-file</i> , or the standard input if no <i>source-file</i> argument is given. The <i>decode_pathname</i> argument is required. The <i>decode_pathname</i> is included in the encoded file's header as the name of the file into which uudecode is to place the binary (decoded) data. uuencode also includes the permission modes of <i>source-file</i> , (except <i>setuid</i> , <i>setgid</i> , and sticky-bits), so that <i>decode_pathname</i> is recreated with those same permission modes.
uudecode	uudecode reads an <i>encoded-file</i> , strips off any leading and trailing lines added by mailer programs, and recreates the original binary data with the filename and the mode specified in the header. The encoded file is an ordinary portable character set text file; it can be edited by any text editor. It is best only to change the mode or <i>decode_pathname</i> in the header to avoid corrupting the decoded binary.
uudecode	-p decode <i>encoded-file</i> and send it to standard output. This allows uudecode to be used in a pipeline.
uuencode	The following operands are supported by uuencode: <i>decode_pathname</i> The pathname of the file into which the uudecode utility will place the decoded file. If there are characters in <i>decode_pathname</i> that are not in the portable filename character set the results are unspecified. <i>source-file</i> A pathname of the file to be encoded.
uudecode	The following operand is supported by uudecode: <i>encoded-file</i> The pathname of a file containing the output of uuencode.
USAGE	See largefile(5) for the description of the behavior of uuencode and uudecode when encountering files greater than or equal to 2 Gbyte (2 ³¹ bytes).
ENVIRONMENT VARIABLES	See environ(5) for descriptions of the following environment variables that affect the execution of uuencode and uudecode: LC_CTYPE, LC_MESSAGES, and NLSPATH.
stdout	The standard output is a text file (encoded in the character set of the current locale) that begins with the line: "begin%s%s\n", < <i>mode</i> >, <i>decode_pathname</i> and ends with the line:

uuencode(1C)

end\n

In both cases, the lines have no preceding or trailing blank characters.

The algorithm that is used for lines in between `begin` and `end` takes three octets as input and writes four characters of output by splitting the input at six-bit intervals into four octets, containing data in the lower six bits only. These octets are converted to characters by adding a value of `0x20` to each octet, so that each octet is in the range `0x20–0x5f`, and then it is assumed to represent a printable character. It then will be translated into the corresponding character codes for the codeset in use in the current locale. (For example, the octet `0x41`, representing `A`, would be translated to `A` in the current codeset, such as `0xc1` if it were EBCDIC.)

Where the bits of two octets are combined, the least significant bits of the first octet are shifted left and combined with the most significant bits of the second octet shifted right. Thus the three octets `A`, `B`, `C` are converted into the four octets:

```
0x20 + (( A >> 2                                     ) & 0x3F)
0x20 + (((A << 4)  ((B >> 4) & 0xF)) & 0x3F)
0x20 + (((B << 2)  ((C >> 6) & 0x3)) & 0x3F)
0x20 + (( C                                     ) & 0x3F)
```

These octets are then translated into the local character set.

Each encoded line contains a length character, equal to the number of characters to be decoded plus `0x20` translated to the local character set as described above, followed by the encoded characters. The maximum number of octets to be encoded on each line is 45.

EXIT STATUS The following exit values are returned:

0 Successful completion.
>0 An error occurred.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWesu

SEE ALSO `mail(1)`, `mailx(1)`, `uucp(1C)`, `uux(1C)`, `attributes(5)`, `largefile(5)`

NOTES The encoded file's size is expanded by 35% (3 bytes become 4, plus control information), causing it to take longer to transmit than the equivalent binary.

The user on the remote system who is invoking `uudecode` (typically `uucp`) must have write permission on the file specified in the `decode_pathname`.

uuencode(1C)

If you uuencode then uudecode a file in the same directory, you will overwrite the original file.

uuglist(1C)

- NAME** | uuglist – print the list of service grades that are available on this UNIX system
- SYNOPSIS** | **uuglist** [-u]
- DESCRIPTION** | uuglist prints the list of service grades that are available on the system to use with the -g option of uucp(1C) and uux(1C).
- OPTIONS** | -u List the names of the service grades that the user is allowed to use with the -g option of the uucp and uux commands.
- FILES** | /etc/uucp/Grades contains the list of service grades
- ATTRIBUTES** | See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWbnuu

SEE ALSO | uucp(1C), uux(1C), attributes(5)

NAME	uustat – uucp status inquiry and job control
SYNOPSIS	<pre>uustat [[-m] [-p] [-q] [-k <i>jobid</i> [-n]] [-r <i>jobid</i> [-n]]] uustat [-a] [-s <i>system</i> [-j]] [-u <i>user</i>] [-S <i>qric</i>] uustat -t <i>system</i> [-c] [-d <i>number</i>]</pre>
DESCRIPTION	<p>uustat functions in the following three areas:</p> <ol style="list-style-type: none"> 1.) Displays the general status of, or cancels, previously specified uucp commands. 2.) Provides remote system performance information, in terms of average transfer rates or average queue times. 3.) Provides general remote system-specific and user-specific status of uucp connections to other systems.
General Status	<p>These options obtain general status of, or cancel, previously specified uucp commands:</p> <ul style="list-style-type: none"> -a List all jobs in queue. -j List the total number of jobs displayed. The -j option can be used in conjunction with the -a or the -s option. -k<i>jobid</i> Kill the uucp request whose job identification is <i>jobid</i>. The killed uucp request must belong to the user issuing the uustat command unless the user is the super-user or uucp administrator. If the job is killed by the super-user or uucp administrator, electronic mail is sent to the user. -m Report the status of accessibility of all machines. -n Suppress all standard output, but not standard error. The -n option is used in conjunction with the -k and -r options. -p Execute the command <code>ps -flp</code> for all the process-ids that are in the lock files. -q List the jobs queued for each machine. If a status file exists for the machine, its date, time and status information are reported. In addition, if a number appears in parentheses next to the number of C or X files, it is the age in days of the oldest C./X. file for that system. The Retry field represents the number of hours until the next possible call. The Count is the number of failure attempts. Note: For systems with a moderate number of outstanding jobs, this could take 30 seconds or more of real-time to execute. An example of the output produced by the -q option is: <pre>eagle 3C 04/07-11:07 NO DEVICES AVAILABLE mh3bs3 2C 07/07-10:42 SUCCESSFUL</pre> <p>This indicates the number of command files that are waiting for each system. Each command file may have zero or more files to be sent (zero</p>

uustat(1C)

	<p>means to call the system and see if work is to be done). The date and time refer to the previous interaction with the system followed by the status of the interaction.</p>
	<p><i>-rjobid</i> Rejuvenate <i>jobid</i>. The files associated with <i>jobid</i> are touched so that their modification time is set to the current time. This prevents the cleanup daemon from deleting the job until the jobs' modification time reaches the limit imposed by the daemon.</p>
Remote System Status	<p>These options provide remote system performance information, in terms of average transfer rates or average queue times; the <i>-c</i> and <i>-d</i> options can only be used in conjunction with the <i>-t</i> option:</p>
	<p><i>-t</i><i>system</i> Report the average transfer rate or average queue time for the past 60 minutes for the remote <i>system</i>. The following parameters can only be used with this option:</p>
	<p><i>-c</i> Average queue time is calculated when the <i>-c</i> parameter is specified and average transfer rate when <i>-c</i> is not specified. For example, the command:</p> <pre>example% uustat -teagle -d50 -c</pre> <p>produces output in the following format:</p> <pre>average queue time to eagle for last 50 minutes: 5 seconds</pre> <p>The same command without the <i>-c</i> parameter produces output in the following format:</p> <pre>average transfer rate with eagle for last 50 minutes: 2000.88 bytes/sec</pre>
	<p><i>-d</i><i>number</i> <i>number</i> is specified in minutes. Used to override the 60 minute default used for calculations. These calculations are based on information contained in the optional performance log and therefore may not be available. Calculations can only be made from the time that the performance log was last cleaned up.</p>
User- or System-Specific Status	<p>These options provide general remote system-specific and user-specific status of uucp connections to other systems. Either or both of the following options can be specified with <i>uustat</i>. The <i>-j</i> option can be used in conjunction with the <i>-s</i> option to list the total number of jobs displayed:</p>
	<p><i>-ssystem</i> Report the status of all uucp requests for remote system <i>system</i>.</p>
	<p><i>-uuser</i> Report the status of all uucp requests issued by <i>user</i>.</p>

Output for both the `-s` and `-u` options has the following format:

```
eagleN1bd7 4/07-11:07 S eagle dan 522 /home/dan/A
eagleC1bd8 4/07-11:07 S eagle dan 59 D.3b2a1ce4924
4/07-11:07 S eagle dan rmail mike
```

With the above two options, the first field is the *jobid* of the job. This is followed by the date/time. The next field is an `S` if the job is sending a file or an `R` if the job is requesting a file. The next field is the machine where the file is to be transferred. This is followed by the user-id of the user who queued the job. The next field contains the size of the file, or in the case of a remote execution (`rmail` is the command used for remote mail), the name of the command. When the size appears in this field, the file name is also given. This can either be the name given by the user or an internal name (for example, `D.3b2a1ce4924`) that is created for data files associated with remote executions (`rmail` in this example).

`-Sqric` Report the job state:

```
q for queued jobs
r for running jobs
i for interrupted jobs
c for completed jobs
```

A job is queued if the transfer has not started. A job is running when the transfer has begun. A job is interrupted if the transfer began but was terminated before the file was completely transferred. A completed job is a job that successfully transferred. The completed state information is maintained in the accounting log, which is optional and therefore may be unavailable. The parameters can be used in any combination, but at least one parameter must be specified. The `-S` option can also be used with `-s` and `-u` options. The output for this option is exactly like the output for `-s` and `-u` except that the job states are appended as the last output word. Output for a completed job has the following format:

```
eagleC1bd3 completed
```

When no options are given, `uustat` writes to standard output the status of all `uucp` requests issued by the current user.

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `uustat`: `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, `TZ`, and `NLSPATH`.

EXIT STATUS

The following exit values are returned:

```
0 Successful completion.
>0 An error occurred.
```

FILES

```
/var/spool/uucp/*          spool directories
/var/uucp/.Admin/account  accounting log
```

uustat(1C)

/var/uucp/.Admin/perflog performance log

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWbnuu

SEE ALSO `uucp(1C)`, `attributes(5)`

DIAGNOSTICS The `-t` option produces no message when the data needed for the calculations is not being recorded.

NOTES After the user has issued the `uucp` request, if the file to be transferred is moved, deleted or was not copied to the spool directory (`-C` option) when the `uucp` request was made, `uustat` reports a file size of `-99999`. This job will eventually fail because the file(s) to be transferred can not be found.

NAME	uuto, uupick – public UNIX-to-UNIX system file copy																
SYNOPSIS	uuto [-mp] <i>source-file... destination</i> uupick [-s <i>system</i>]																
uuto	<p>uuto sends <i>source-file</i> to <i>destination</i>. uuto uses the uucp(1C) facility to send files, while it allows the local system to control the file access. A source-file name is a path name on your machine. Destination has the form:</p> <p><i>system</i>[!<i>system</i>] ... !<i>user</i></p> <p>where <i>system</i> is taken from a list of system names that uucp knows about. <i>User</i> is the login name of someone on the specified system.</p> <p>The files (or sub-trees if directories are specified) are sent to PUBDIR on <i>system</i>, where PUBDIR is a public directory defined in the uucp source. By default, this directory is /var/spool/uucppublic. Specifically the files are sent to</p> <p>PUBDIR/receive/<i>user</i>/<i>mysystem</i>/files.</p> <p>The recipient is notified by mail(1) of the arrival of files.</p>																
uupick	<p>uupick accepts or rejects the files transmitted to the user. Specifically, uupick searches PUBDIR for files destined for the user. For each entry (file or directory) found, the following message is printed on standard output:</p> <p>from <i>system sysname</i>: [file <i>file-name</i>] [dir <i>dirname</i>] ?</p> <p>uupick then reads a line from standard input to determine the disposition of the file:</p> <table border="0"> <tr> <td style="padding-right: 20px;"><new-line></td> <td>Go to next entry.</td> </tr> <tr> <td>d</td> <td>Delete the entry.</td> </tr> <tr> <td>m [<i>dir</i>]</td> <td>Move the entry to named directory <i>dir</i>. If <i>dir</i> is not specified as a complete path name (in which \$HOME is legitimate), a destination relative to the current directory is assumed. If no destination is given, the default is the current directory.</td> </tr> <tr> <td>a [<i>dir</i>]</td> <td>Same as m above, except it moves all the files sent from <i>system</i>.</td> </tr> <tr> <td>p</td> <td>Print the content of the file.</td> </tr> <tr> <td>q</td> <td>Stop.</td> </tr> <tr> <td>EOT (control-d)</td> <td>Same as q.</td> </tr> <tr> <td>!command</td> <td>Escape to the shell to do command.</td> </tr> </table>	<new-line>	Go to next entry.	d	Delete the entry.	m [<i>dir</i>]	Move the entry to named directory <i>dir</i> . If <i>dir</i> is not specified as a complete path name (in which \$HOME is legitimate), a destination relative to the current directory is assumed. If no destination is given, the default is the current directory.	a [<i>dir</i>]	Same as m above, except it moves all the files sent from <i>system</i> .	p	Print the content of the file.	q	Stop.	EOT (control-d)	Same as q.	!command	Escape to the shell to do command.
<new-line>	Go to next entry.																
d	Delete the entry.																
m [<i>dir</i>]	Move the entry to named directory <i>dir</i> . If <i>dir</i> is not specified as a complete path name (in which \$HOME is legitimate), a destination relative to the current directory is assumed. If no destination is given, the default is the current directory.																
a [<i>dir</i>]	Same as m above, except it moves all the files sent from <i>system</i> .																
p	Print the content of the file.																
q	Stop.																
EOT (control-d)	Same as q.																
!command	Escape to the shell to do command.																

uuto(1C)

- *** Print a command summary.
- uuto** The following options are supported by `uuto`:
- `-m` Send mail to the sender when the copy is complete.
 - `-p` Copy the source file into the spool directory before transmission.
- uupick** The following option is supported by `uupick`:
- `-s system` Search only the PUBDIR for files sent from `system`.
- OPERANDS** The following operands are supported for `uuto`:
- destination* A string of the form:
- system-name ! user*
- where *system-name* is taken from a list of system names that `uucp` knows about; see `uname`. The argument *user* is the login name of someone on the specified system. The destination *system-name* can also be a list of names such as
- system-name ! system-name ! ... ! system-name ! user*
- in which case, an attempt is made to send the file via the specified route to the destination. Care should be taken to ensure that intermediate nodes in the route are willing to forward information.
- source-file* A pathname of a file on the local system to be copied to *destination*.
- ENVIRONMENT VARIABLES** See `environ(5)` for descriptions of the following environment variables that affect the execution of `uuto` and `uupick`: `LC_TYPE`, `LC_MESSAGES`, and `NLSPATH`.
- EXIT STATUS** The following exit values are returned:
- 0 Successful completion.
 - >0 An error occurred.
- FILES** `PUBDIR` `/var/spool/uucppublic` public directory
- ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:
- | ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability | SUNWbnuu |
- SEE ALSO** `mail(1)`, `uucp(1C)`, `uustat(1C)`, `uux(1C)`, `uucleanup(1M)`, `attributes(5)`

NOTES In order to send files that begin with a dot (for instance, `.profile`), the files must be qualified with a dot. For example, the following files are correct:

```
.profile .prof* .profil?
```

The following files are incorrect:

```
*prof* ?profile
```

uux(1C)

NAME	<code>uux</code> – UNIX-to-UNIX system command execution
SYNOPSIS	<code>uux [-] [-bcCjnprz] [-aname] [-ggrade] [-sfilename] [-xdebug_level] <i>command-string</i></code>
DESCRIPTION	<p><code>uux</code> will gather zero or more files from various systems, execute a command on a specified system and then send standard output to a file on a specified system.</p> <p>Note: For security reasons, most installations limit the list of commands executable on behalf of an incoming request from <code>uux</code>, permitting only the receipt of mail (see <code>mail(1)</code>). (Remote execution permissions are defined in <code>/etc/uucp/Permissions</code>.)</p> <p>The <i>command-string</i> is made up of one or more arguments that look like a shell command line, except that the command and file names may be prefixed by <i>system-name!</i>. A null <i>system-name</i> is interpreted as the local system.</p> <p>File names may be one of the following:</p> <ul style="list-style-type: none">■ An absolute path name.■ A path name preceded by <code>~xxx</code>, where <code>xxx</code> is a login name on the specified system and is replaced by that user's login directory. <p>Anything else is prefixed by the current directory.</p> <p>As an example, the command:</p> <pre>example% uux "!diff sys1!/home/dan/filename1 sys2!/a4/dan/filename2 > !~/dan/filename.diff"</pre> <p>will get the <i>filename1</i> and <i>filename2</i> files from the "sys1" and "sys2" machines, execute a <code>diff(1)</code> command and put the results in <i>filename.diff</i> in the local <code>PUBDIR/dan/</code> directory. <code>PUBDIR</code> is a public directory defined in the <code>uucp</code> source. By default, this directory is <code>/var/spool/uucppublic</code>.</p> <p>Any special shell characters such as <code><</code>, <code>></code>, <code>;</code>, <code> </code> should be quoted either by quoting the entire <i>command-string</i>, or quoting the special characters as individual arguments. The redirection operators <code>>></code>, <code><<</code>, <code>></code> and <code>>&</code> cannot be used.</p> <p><code>uux</code> will attempt to get all appropriate files to the specified system where they will be processed. For files that are output files, the file name must be escaped using parentheses. For example, the command:</p> <pre>example% uux "a!cut -f1 b!/usr/filename > c!/usr/filename"</pre> <p>gets <code>/usr/filename</code> from system "b" and sends it to system "a", performs a <code>cut</code> command on that file and sends the result of the <code>cut</code> command to system "c".</p>

uux will notify you if the requested command on the remote system was disallowed. This notification can be turned off by the `-n` option. The response comes by remote mail from the remote machine.

OPTIONS

- `-` The standard input to `uux` is made the standard input to the *command-string*.
- `-aname` Use *name* as the user job identification replacing the initiator user-id. (Notification will be returned to user-id *name*.)
- `-b` Return whatever standard input was provided to the `uux` command if the exit status is non-zero.
- `-c` Do not copy local file to the spool directory for transfer to the remote machine (default).
- `-C` Force the copy of local files to the spool directory for transfer.
- `-g grade` *grade* can be either a single letter, number, or a string of alphanumeric characters defining a service grade. The `uuglist(1C)` command determines whether it is appropriate to use the single letter, number, or a string of alphanumeric characters as a service grade. The output from the `uuglist` command will be a list of service grades that are available or a message that says to use a single letter or number as a grade of service.
- `-j` Output the jobid string on the standard output which is the job identification. This job identification can be used by `uustat(1C)` to obtain the status or terminate a job.
- `-n` Do not notify the user if the command fails.
- `-p` Same as `-`: The standard input to `uux` is made the standard input to the *command-string*.
- `-r` Do not start the file transfer, just queue the job.
- `-s filename` Report status of the transfer in *filename*. This option is accepted for compatibility, but it is ignored because it is insecure.
- `-x debug_level` Produce debugging output on the standard output. *debug_level* is a number between 0 and 9; as it increases to 9, more detailed debugging information is given.
- `-z` Send success notification to the user.

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `uux`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

uux(1C)

EXIT STATUS The following exit values are returned:

0 Successful completion.
>0 An error occurred.

FILES

/etc/uucp/*	other data and programs
/etc/uucp/Permissions	remote execution permissions
/usr/lib/uucp/*	other programs
/var/spool/uucp	spool directories

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWbnuu

SEE ALSO `cut(1)`, `mail(1)`, `uucp(1C)`, `uuglist(1C)`, `uustat(1C)`, `attributes(5)`

NOTES The execution of commands on remote systems takes place in an execution directory known to the uucp system.

All files required for the execution will be put into this directory unless they already reside on that machine. Therefore, the simple file name (without path or machine reference) must be unique within the uux request. The following command will NOT work:

```
example% uux "a!diff b!/home/dan/xyz c!/home/dan/xyz > !xyz.diff"
```

But the command:

```
example% uux "a!diff a!/home/dan/xyz c!/home/dan/xyz > !xyz.diff"
```

will work. (If `diff` is a permitted command.)

Protected files and files that are in protected directories that are owned by the requester can be sent in commands using uux. However, if the requester is root, and the directory is not searchable by "other", the request will fail.

The following restrictions apply to the shell pipeline processed by uux:

- In gathering files from different systems, pathname expansion is not performed by uux. Thus, a request such as

```
uux "c89 remsys!~/*.c"
```

would attempt to copy the file named literally *.c to the local system.

- Only the first command of a shell pipeline may have a *system-name*!. All other commands are executed on the system of the first command.
- The use of the shell metacharacter * will probably not do what you want it to do.
- The shell tokens << and >> are not implemented.
- The redirection operators >>, <<, >| and >& cannot be used.
- The reserved word ! cannot be used at the head of the pipeline to modify the exit status.
- Alias substitution is not performed.

vacation(1)

NAME	vacation – reply to mail automatically
SYNOPSIS	vacation [-I] vacation [-a <i>alias</i>] [-f <i>database_file</i>] [-j] [-m <i>message_file</i>] [-s <i>sender</i>] [-tN] <i>username</i>
DESCRIPTION	The <code>vacation</code> utility automatically replies to incoming mail.
Installation	<p>The installation consists of an interactive program which sets up <code>vacation</code>'s basic configuration.</p> <p>To install <code>vacation</code>, type it with no arguments on the command line. The program creates a <code>.vacation.msg</code> file, which contains the message that is automatically sent to all senders when <code>vacation</code> is enabled, and starts an editor for you to modify the message. (See USAGE section.) Which editor is invoked is determined by the <code>VISUAL</code> or <code>EDITOR</code> environment variable, or <code>vi(1)</code> if neither of those environment variables are set.</p> <p>A <code>.forward</code> file is also created if one does not exist in your home directory. Once created, the <code>.forward</code> file will contain a line of the form:</p> <pre>\username, " /usr/bin/vacation username"</pre> <p>One copy of an incoming message is sent to the <code>username</code> and another copy is piped into <code>vacation</code>.</p> <p>If a <code>.forward</code> file is present in your home directory, it will ask whether you want to remove it, which disables <code>vacation</code> and ends the installation.</p> <p>The program automatically creates <code>.vacation.pag</code> and <code>.vacation.dir</code>, which contain a list of senders when <code>vacation</code> is enabled.</p>
Activation and Deactivation	The presence of the <code>.forward</code> file determines whether or not <code>vacation</code> is disabled or enabled. To disable <code>vacation</code> , remove the <code>.forward</code> file, or move it to a new name.
Initialization	The <code>-I</code> option clears the <code>vacation</code> log files, <code>.vacation.pag</code> and <code>.vacation.dir</code> , erasing the list of senders from a previous <code>vacation</code> session. (See OPTIONS section.)
Additional Configuration	<code>vacation</code> provides configuration options that are not part of the installation, these being <code>-a</code> , <code>-f</code> , <code>-j</code> , <code>-m</code> , <code>-s</code> , and <code>-t</code> . (See OPTIONS section.)
OPTIONS	<p>The following options are supported:</p> <p><code>-I</code> Initializes the <code>.vacation.pag</code> and <code>.vacation.dir</code> files and enables <code>vacation</code>. If the <code>-I</code> flag is not specified, and a <code>user</code> argument is given, <code>vacation</code> reads the first line from the standard input (for a <code>From:</code> line, no colon). If absent, it produces an error message.</p>

Options `-a`, `-f`, `-j`, `-m`, `-t`, and `-s` are configuration options to be used in conjunction with `vacation` in the `.forward` file, not on the command line. For example,

```
\username, "|usr/bin/vacation -t1m username" repeats replies to the sender every
minute.
```

<code>-a alias</code>	Indicates that <i>alias</i> is one of the valid aliases for the user running <code>vacation</code> , so that mail addressed to that alias generates a reply.
<code>-f file</code>	Uses <i>file</i> instead of <code>.vacation</code> as the base name for the database file.
<code>-j</code>	Does not check whether the recipient appears in the <code>To:</code> or the <code>Cc:</code> line. Warning: use of this option can result in vacation replies being sent to mailing lists and other inappropriate places; its use is therefore strongly discouraged.
<code>-m file</code>	Uses <i>file</i> instead of <code>.vacation.msg</code> as the message to send for the reply.
<code>-s sender</code>	Replies to <i>sender</i> instead of the value read from the UNIX <code>From</code> line of the incoming message.
<code>-tN</code>	Changes the interval between repeat replies to the same sender. The default is 1 week. A trailing <code>s</code> , <code>m</code> , <code>h</code> , <code>d</code> , or <code>w</code> scales <i>N</i> to seconds, minutes, hours, days, or weeks, respectively.

Files `.vacation.msg` should include a header with at least a `Subject:` line (it should not include a `From:` or a `To:` line). For example:

```
Subject: I am on vacation
I am on vacation until July 22. If you have something urgent,
please contact Joe Jones (jones@fb0).
--John
```

If the string `$SUBJECT` appears in the `.vacation.msg` file, it is replaced with the subject of the original message when the reply is sent; thus, a `.vacation.msg` file such as

```
Subject: I am on vacation
I am on vacation until July 22.
Your mail regarding "$SUBJECT" will be read when I return.
If you have something urgent, please contact
Joe Jones (jones@fb0).
--John
```

will include the subject of the message in the reply.

No message is sent if the `To:` or the `Cc:` line does not list the user to whom the original message was sent or one of a number of aliases for them, if the initial `From` line includes the string `-REQUEST@`, or if a `Precedence: bulk` or `Precedence: junk` line is included in the header.

vacation(1)

vacation will also not respond to mail from either postmaster or Mailer-Daemon.

FILES

~/.forward
~/.vacation.msg

A list of senders is kept in the dbm format files .vacation.pag and .vacation.dir in your home directory. These files are dbm files and cannot be viewed directly with text editors.

NAME	vc – version control
SYNOPSIS	vc [-a] [-t] [-c <i>char</i>] [-s] [<i>keyword=value... keyword=value</i>]
DESCRIPTION	<p>This command is obsolete and will be removed in the next release.</p> <p>The vc command copies lines from the standard input to the standard output under control of its arguments and of “control statements” encountered in the standard input. In the process of performing the copy operation, user-declared <i>keywords</i> may be replaced by their string <i>value</i> when they appear in plain text and/or control statements.</p> <p>The copying of lines from the standard input to the standard output is conditional, based on tests (in control statements) of keyword values specified in control statements or as vc command arguments.</p> <p>A control statement is a single line beginning with a control character, except as modified by the -t keyletter (see below). The default control character is colon (:), except as modified by the -c keyletter (see below). Input lines beginning with a backslash (\) followed by a control character are not control lines and are copied to the standard output with the backslash removed. Lines beginning with a backslash followed by a non-control character are copied in their entirety.</p> <p>A keyword is composed of 9 or less alphanumeric; the first must be alphabetic. A value is any ASCII string that can be created with ed; a numeric value is an unsigned string of digits. Keyword values may not contain blanks or tabs.</p> <p>Replacement of keywords by values is done whenever a keyword surrounded by control characters is encountered on a version control statement. The -a keyletter (see below) forces replacement of keywords in all lines of text. An uninterpreted control character may be included in a value by preceding it with \. If a literal \ is desired, then it too must be preceded by \.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -a Forces replacement of keywords surrounded by control characters with their assigned value in all text lines and not just in vc statements. -t All characters from the beginning of a line up to and including the first tab character are ignored for the purpose of detecting a control statement. If a control statement is found, all characters up to and including the tab are discarded. -cchar Specifies a control character to be used in place of the “:” default. -s Silences warning messages (not error) that are normally printed on the diagnostic output. <p>vc recognizes the following version control statements:</p> <pre style="margin-left: 0;">:dc1 <i>keyword</i>[, ..., <i>keyword</i>] Declare keywords. All keywords must be declared.</pre>

vc(1)

```
:asg keyword=value
```

Assign values to keywords. An `asg` statement overrides the assignment for the corresponding keyword on the `vc` command line and all previous `asg` statements for that keyword. Keywords that are declared but are not assigned values have null values.

```
:if condition
```

```
...
```

```
:end
```

Skip lines of the standard input. If the condition is true, all lines between the `if` statement and the matching `end` statement are copied to the standard output. If the condition is false, all intervening lines are discarded, including control statements. Note: Intervening `if` statements and matching `end` statements are recognized solely for the purpose of maintaining the proper `if`-`end` matching.

The syntax of a condition is:

<code><cond></code>	::= ["not"] <code><or></code>
<code><or></code>	::= <code><and></code> <code><and></code> " " <code><or></code>
<code><and></code>	::= <code><exp></code> <code><exp></code> "&" <code><and></code>
<code><exp></code>	::= " (" <code><or></code> ") " <code><value></code> <code><op></code> <code><value></code>
<code><op></code>	::= "=" "!=" "<" ">"
<code><value></code>	::= <code><arbitrary ASCII string></code> <code><numeric string></code>

The available operators and their meanings are:

=	equal
!=	not equal
&	and
	or
>	greater than

< less than
 () used for logical groupings
 not may only occur immediately
 after the `if`, and when present,
 inverts the value of the entire
 condition

The `>` and `<` operate only on unsigned integer values (for example, `: 012 > 12` is false). All other operators take strings as arguments (for example, `: 012 != 12` is true).

The precedence of the operators (from highest to lowest) is:

= != > < all of equal precedence
 &
 |

Parentheses may be used to alter the order of precedence.

Values must be separated from operators or parentheses by at least one blank or tab.

`: :text`

Replace keywords on lines that are copied to the standard output. The two leading control characters are removed, and keywords surrounded by control characters in text are replaced by their value before the line is copied to the output file. This action is independent of the `-a` keyletter.

`:on`

`:off`

Turn on or off keyword replacement on all lines.

`:ctl char`

Change the control character to *char*.

`:msg message`

Print *message* on the diagnostic output.

`:err message`

Print *message* followed by:

```
ERROR: err statement on line ...
(915)
```

vc(1)

on the diagnostic output. vc halts execution, and returns an exit code of 1.

NAME	vgrind – grind nice program listings
SYNOPSIS	vgrind [-2fntwWx] [-d <i>defs-file</i>] [-h <i>header</i>] [-l <i>language</i>] [-s <i>n</i>] [-o <i>pagelist</i>] [-P <i>printer</i>] [-T <i>output-device</i>] <i>filename...</i>
DESCRIPTION	<p>The <code>vgrind</code> utility formats the program sources named by the <i>filename</i> arguments in a nice style using <code>troff(1)</code>. Comments are placed in italics, keywords in bold face, and as each function is encountered its name is listed on the page margin.</p> <p><code>vgrind</code> runs in two basic modes, filter mode or regular mode. In filter mode, <code>vgrind</code> acts as a filter in a manner similar to <code>tbl(1)</code>. The standard input is passed directly to the standard output except for lines bracketed by the <code>troff</code>-like macros:</p> <pre>.vS starts processing .vE ends processing</pre> <p>These lines are formatted as described above. The output from this filter can be passed to <code>troff</code> for output. There need be no particular ordering with <code>eqn(1)</code> or <code>tbl(1)</code>.</p> <p>In regular mode, <code>vgrind</code> accepts input <i>filenames</i>, processes them, and passes them to <code>troff</code> for output. Use a hyphen ('-') to specify standard input; otherwise, <code>vgrind</code> will exit without attempting to read from the standard input. Filenames must be specified after all other option arguments.</p> <p>In both modes, <code>vgrind</code> passes any lines beginning with a decimal point without conversion.</p>
OPTIONS	<p>The following options are supported.</p> <p>Note: The syntax of options with arguments is important. Some require a SPACE between the option name and the argument, while those that do not have a SPACE below will not tolerate one.</p> <pre>-2 Produces two column output. Specifying this option changes the default point size to 8 (as if the -s8 option were supplied). It also arranges for output to appear in landscape mode, by supplying the -L flag to the formatter and changing the page height and width accordingly. -f Forces filter mode. -n Does not make keywords boldface. -w Considers TAB characters to be spaced four columns apart instead of the usual eight. -x Outputs the index file in a "pretty" format. The index file itself is produced whenever <code>vgrind</code> is run with a file called <code>index</code> present in the current directory. The index of function definitions can then be run off by giving <code>vgrind</code> the -x option and the file <code>index</code> as argument.</pre>

vgrind(1)

<code>-d <i>defs-file</i></code>	Specify an alternate language definitions file (default is <code>/usr/lib/vgrindefs</code>).
<code>-h <i>header</i></code>	Specify a header to appear in the center of every output page.
<code>-l <i>language</i></code>	Specify the language to use. Among the languages currently known are: Bourne shell (<code>-lsh</code>), C (<code>-lc</code> , the default), C++ (<code>-lc++</code>), C shell (<code>-lcs</code>), emacs MLisp (<code>-lm1</code>), FORTRAN (<code>-lf</code>), Icon (<code>-lI</code>), ISP (<code>-i</code>), LDL (<code>-lLDL</code>), Model (<code>-lm</code>), Pascal (<code>-lp</code>), and RATFOR (<code>-lr</code>).
<code>-sn</code>	Specify a point size to use on output (exactly the same as the argument of a <code>troff .ps</code> point size request).

vgrind passes the following options to the formatter specified by the `TROFF` environment variable. See `ENVIRONMENT`.

<code>-t</code>	Similar to the same option in <code>troff</code> ; that is, formatted text goes to the standard output.
<code>-W</code>	Forces output to the (wide) Versatec printer rather than the (narrow) Varian.
<code>-o <i>pagelist</i></code>	Prints only those pages whose page numbers appear in the comma-separated <i>pagelist</i> of numbers and ranges. A range <code>N-M</code> means pages <code>N</code> through <code>M</code> ; an initial <code>-N</code> means from the beginning to page <code>N</code> ; and a final <code>N-</code> means from <code>N</code> to the end.
<code>-P <i>printer</i></code>	Sends output to the named <i>printer</i> .
<code>-T <i>output-device</i></code>	Formats output for the specified <i>output-device</i> .

OPERANDS The following operand is supported:

filename Name of the program source to be processed by vgrind. Use `'-'` to specify the standard input.

ENVIRONMENT VARIABLES In regular mode, vgrind feeds its intermediate output to the text formatter given by the value of the `TROFF` environment variable, or to `troff` if this variable is not defined in the environment. This mechanism allows for local variations in `troff`'s name.

FILES

- `index`
 - file where source for index is created
- `/usr/lib/vgrindefs`
 - language descriptions
- `/usr/lib/vfontedpr`
 - preprocessor
- `/usr/share/lib/tmac/tmac.vgrind`
 - macro package

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdoc

SEE ALSO `csh(1)`, `ctags(1)`, `eqn(1)`, `tbl(1)`, `troff(1)`, `attributes(5)`, `vgrinddefs(5)`

BUGS `vgrind` assumes that a certain programming style is followed:

C	Function names can be preceded on a line only by SPACE, TAB, or an asterisk. The parenthesized arguments must also be on the same line.
FORTTRAN	Function names need to appear on the same line as the keywords <code>function</code> or <code>subroutine</code> .
MLisp	Function names should not appear on the same line as the preceding <code>defun</code> .
Model	Function names need to appear on the same line as the keywords <code>is beginproc</code> .
Pascal	Function names need to appear on the same line as the keywords <code>function</code> or <code>procedure</code> .

If these conventions are not followed, the indexing and marginal function name comment mechanisms will fail.

More generally, arbitrary formatting styles for programs usually give unsightly results. To prepare a program for `vgrind` output, use TAB rather than SPACE characters to align source code properly, since `vgrind` use variable width fonts.

The mechanism of `ctags(1)` in recognizing functions should be used here.

The `-w` option is annoying, but there is no other way to achieve the desired effect.

The macros defined in `tmac.vgrind` do not coexist gracefully with those of other macro packages, making filter mode difficult to use effectively.

`vgrind` does not process certain special characters in `csh(1)` scripts correctly.

The `tmac.vgrind` formatting macros wire in the page height and width used in two-column mode, effectively making two column output useless for paper sizes other than the standard American size of 8.5 inches by 11 inches. For other paper sizes, it is necessary to edit the size values given in `tmac.vgrind`. A better solution would be to create a `troff` output device specification intended specifically for landscape output and record size information there.

vi(1)

NAME	vi, view, vedit – screen-oriented (visual) display editor based on ex								
SYNOPSIS	<pre>/usr/bin/vi [- -s] [-l] [-L] [-R] [-r [filename]] [-S] [-t tag] [-v] [-V] [-x] [-wn] [-C] [+command -c command]filename... /usr/bin/view [- -s] [-l] [-L] [-R] [-r [filename]] [-S] [-t tag] [-v] [-V] [-x] [-wn] [-C] [+command -c command]filename... /usr/bin/vedit [- -s] [-l] [-L] [-R] [-r [filename]] [-S] [-t tag] [-v] [-V] [-x] [-wn] [-C] [+command -c command]filename... /usr/xpg4/bin/vi [- -s] [-l] [-L] [-R] [-r [filename]] [-S] [-t tag] [-v] [-V] [-x] [-wn] [-C] [+command -c command]filename... /usr/xpg4/bin/view [- -s] [-l] [-L] [-R] [-r [filename]] [-S] [-t tag] [-v] [-V] [-x] [-wn] [-C] [+command -c command]filename... /usr/xpg4/bin/vedit [- -s] [-l] [-L] [-R] [-r [filename]] [-S] [-t tag] [-v] [-V] [-x] [-wn] [-C] [+command -c command]filename...</pre>								
DESCRIPTION	<p>vi (visual) is a display-oriented text editor based on an underlying line editor ex. It is possible to use the command mode of ex from within vi and to use the command mode of vi from within ex. The visual commands are described on this manual page; how to set options (like automatically numbering lines and automatically starting a new output line when you type carriage return) and all ex line editor commands are described on the ex(1) manual page.</p> <p>When using vi, changes you make to the file are reflected in what you see on your terminal screen. The position of the cursor on the screen indicates the position within the file.</p> <p>The view invocation is the same as vi except that the readonly flag is set.</p> <p>The vedit invocation is intended for beginners. It is the same as vi except that the report flag is set to 1, the showmode and novice flags are set, and magic is turned off. These defaults make it easier to learn how to use vi.</p>								
Invocation Options	<p>The following invocation options are interpreted by vi (previously documented options are discussed in the NOTES section of this manual page):</p> <table><tr><td>- -s</td><td>Suppress all interactive user feedback. This is useful when processing editor scripts.</td></tr><tr><td>-C</td><td>Encryption option; same as the -x option, except that vi simulates the C command of ex. The C command is like the X command of ex, except that all text read in is assumed to have been encrypted.</td></tr><tr><td>-l</td><td>Set up for editing LISP programs.</td></tr><tr><td>-L</td><td>List the name of all files saved as the result of an editor or system crash.</td></tr></table>	- -s	Suppress all interactive user feedback. This is useful when processing editor scripts.	-C	Encryption option; same as the -x option, except that vi simulates the C command of ex. The C command is like the X command of ex, except that all text read in is assumed to have been encrypted.	-l	Set up for editing LISP programs.	-L	List the name of all files saved as the result of an editor or system crash.
- -s	Suppress all interactive user feedback. This is useful when processing editor scripts.								
-C	Encryption option; same as the -x option, except that vi simulates the C command of ex. The C command is like the X command of ex, except that all text read in is assumed to have been encrypted.								
-l	Set up for editing LISP programs.								
-L	List the name of all files saved as the result of an editor or system crash.								

<code>-r filename</code>	Edit <i>filename</i> after an editor or system crash. (Recovers the version of <i>filename</i> that was in the buffer when the crash occurred.)
<code>-R</code>	Readonly mode; the <code>readonly</code> flag is set, preventing accidental overwriting of the file.
<code>-S</code>	This option is used in conjunction with the <code>-t tag</code> option to tell <code>vi</code> that the tags file may not be sorted and that, if the binary search (which relies on a sorted tags file) for <i>tag</i> fails to find it, the much slower linear search should also be done. Since the linear search is slow, users of large tags files should ensure that the tags files are sorted rather than use this flag. Creation of tags files normally produces sorted tags files. See <code>ctags(1)</code> for more information on tags files.
<code>-t tag</code>	Edit the file containing the tag, <i>tag</i> , and position the editor at its definition.
<code>-v</code>	Start up in display editing state using <code>vi</code> . You can achieve the same effect by simply typing the <code>vi</code> command itself.
<code>-V</code>	Verbose. When <code>ex</code> commands are read by means of standard input, the input will be echoed to standard error. This may be useful when processing <code>ex</code> commands within shell scripts.
<code>-wn</code>	Set the default window size to <i>n</i> . This is useful when using the editor over a slow speed line.
<code>-x</code>	Encryption option; when used, <code>vi</code> simulates the <code>X</code> command of <code>ex</code> and prompts the user for a key. This key is used to encrypt and decrypt text using the algorithm of the <code>crypt</code> command. The <code>X</code> command makes an educated guess to determine whether text read in is encrypted or not. The temporary buffer file is encrypted also, using a transformed version of the key typed in for the <code>-x</code> option. If an empty encryption key is entered (that is, if the return key is pressed right after the prompt), the file will not be encrypted. This

vi(1)

		is a good way to decrypt a file erroneously encrypted with a mistyped encryption key, such as a backspace or undo key.
	<code>+command -c command</code>	Begin editing by executing the specified editor <i>command</i> (usually a search or positioning command).
<code>/usr/xpg4/bin/vi</code>		If both the <code>-t tag</code> and the <code>-c command</code> options are given, the <code>-t tag</code> option will be processed first. That is, the file containing <i>tag</i> is selected by <code>-t</code> and then the command is executed.
OPERANDS	The following operands are supported:	
	<i>filename</i>	A file to be edited.
vi Modes	Command	Normal and initial mode. Other modes return to command mode upon completion. ESC (escape) is used to cancel a partial command.
	Input	Entered by setting any of the following options: a A i I o O c C s S RArbitrary text may then be entered. Input mode is normally terminated with the ESC character, or, abnormally, with an interrupt.
	Last line	Reading input for : / ? or !. Terminate by typing a carriage return. An interrupt cancels termination.
Sample commands	In the descriptions, CR stands for carriage return and ESC stands for the escape key.	
	→	
	down-arrow	
	up-arrow	arrow keys move the cursor
	h j k l	same as arrow keys
	i <i>text</i> ESC	insert <i>text</i>
	cw <i>new</i> ESC	change word to <i>new</i>
	easESC	pluralize word (end of word; append s; escape from input state)
	x	delete a character
	dw	delete a word
	dd	delete a line
	3dd	delete 3 lines
	u	undo previous change

	ZZ	exit <i>vi</i> , saving changes
	:q!CR	quit, discarding changes
	/textCR	search for <i>text</i>
	^U ^D	scroll up or down
	:cmdCR	any <i>ex</i> or <i>ed</i> command
Counts before vi commands	Numbers may be typed as a prefix to some commands. They are interpreted in one of these ways:	
	line/column number	z G
	scroll amount	^D ^U
	repeat effect	most of the rest
Interrupting, canceling	ESC	end insert or incomplete command
	DEL	(delete or rubout) interrupts
File manipulation	ZZ	if file modified, write and exit; otherwise, exit
	:wCR	write back changes
	:w!CR	forced write, if permission originally not valid
	:qCR	quit
	:q!CR	quit, discard changes
	:e nameCR	edit file <i>name</i>
	:e!CR	reedit, discard changes
	:e + nameCR	edit, starting at end
	:e +nCR	edit, starting at line <i>n</i>
	:e #CR	edit alternate file
	:e! #CR	edit alternate file, discard changes
	:w nameCR	write file <i>name</i>
	:w! nameCR	overwrite file <i>name</i>
	:shCR	run shell, then return
	:!cmdCR	run <i>cmd</i> , then return
	:nCR	edit next file in arglist
	:n argsCR	specify new arglist
	^G	show current file and line
	:ta tagCR	position cursor to <i>tag</i>

vi(1)

	In general, any <i>ex</i> or <i>ed</i> command (such as <i>substitute</i> or <i>global</i>) may be typed, preceded by a colon and followed by a carriage return.	
Positioning within file	F	forward screen
	^B	backward screen
	^D	scroll down half screen
	^U	scroll up half screen
	<i>n</i> G	go to the beginning of the specified line (end default), where <i>n</i> is a line number
	<i>/pat</i>	next line matching <i>pat</i>
	? <i>pat</i>	previous line matching <i>pat</i>
	<i>n</i>	repeat last <i>/</i> or ? command
	<i>N</i>	reverse last <i>/</i> or ? command
	<i>/pat/+n</i>	<i>n</i> th line after <i>pat</i>
	? <i>pat?-n</i>	<i>n</i> th line before <i>pat</i>
]]	next section/function
	[[previous section/function
	(beginning of sentence
)	end of sentence
	{	beginning of paragraph
	}	end of paragraph
%	find matching () or { }	
Adjusting the screen	^L	clear and redraw window
	^R	clear and redraw window if ^L is → key
	zCR	redraw screen with current line at top of window
	z-CR	redraw screen with current line at bottom of window
	z.CR	redraw screen with current line at center of window
	<i>/pat/z-CR</i>	move <i>pat</i> line to bottom of window
	<i>zn.CR</i>	use <i>n</i> -line window
Marking and returning	^E	scroll window down one line
	^Y	scroll window up one line
	``	move cursor to previous context
``	move cursor to first non-white space in line	

Line positioning	mx	mark current position with the ASCII lower-case letter <i>x</i>	
	`x	move cursor to mark <i>x</i>	
	´x	move cursor to first non-white space in line marked by <i>x</i>	
	H	top line on screen	
	L	last line on screen	
	M	middle line on screen	
	+	next line, at first non-white space character	
	-	previous line, at first non-white space character	
	CR	return, same as +	
	down-arrow or j	next line, same column	
	up-arrow or k	previous line, same column	
	Character positioning	^	first non-white space character
		0	beginning of line
		\$	end of line
l or →		forward	
h or		backward	
^H		same as (backspace)	
space		same as → (space bar)	
fx		find next <i>x</i>	
Fx		find previous <i>x</i>	
tx		move to character following the next <i>x</i>	
Tx		move to character following the previous <i>x</i>	
;		repeat last f, F, t, or T	
,		repeat inverse of last f, F, t, or T	
<i>n</i> l		move to column <i>n</i>	
%	find matching () or { }		
Words, sentences, paragraphs	w	forward a word	
	b	back a word	
	e	end of word	
)	to next sentence	

vi(1)

	}	to next paragraph
	(back a sentence
	{	back a paragraph
	W	forward a blank-delimited word
	B	back a blank-delimited word
	E	end of a blank-delimited word
Corrections during insert	^H	erase last character (backspace)
	^W	erase last word
	erase	your erase character, same as ^H (backspace)
	kill	your kill character, erase this line of input
	\	quotes your erase and kill characters
	ESC	ends insertion, back to command mode
	CTRL-C	interrupt, suspends insert mode
	^D	backtab one character; reset left margin of <i>autoindent</i>
	^^D	caret (^) followed by control-d (^D); backtab to beginning of line; do not reset left margin of <i>autoindent</i>
	0^D	backtab to beginning of line; reset left margin of <i>autoindent</i>
Insert and replace	^V	quote non-printable character
	a	append after cursor
	A	append at end of line
	i	insert before cursor
	I	insert before first non-blank
	o	open line below
	O	open line above
	rx	replace single character with <i>x</i>
	R <i>text</i> ESC	replace characters
	Operators	Operators are followed by a cursor motion and affect all text that would have been moved over. For example, since <i>w</i> moves over a word, <i>dw</i> deletes the word that would be moved over. Double the operator, for example <i>dd</i> , to affect whole lines.
d		delete
c		change
y		yank lines to buffer

	<	left shift
	>	right shift
	!	filter through command
Miscellaneous Operations	C	change rest of line (c\$)
	D	delete rest of line (d\$)
	s	substitute characters (c1)
	S	substitute lines (cc)
	J	join lines
	x	delete characters (d1)
	X	delete characters before cursor dh)
	Y	yank lines (yy)
Yank and Put		Put inserts the text most recently deleted or yanked; however, if a buffer is named (using the ASCII lower-case letters a - z), the text in that buffer is put instead.
	3yy	yank 3 lines
	3yl	yank 3 characters
	p	put back text after cursor
	P	put back text before cursor
	"xp	put from buffer x
	"xy	yank to buffer x
	"xd	delete into buffer x
Undo, Redo, Retrieve	u	undo last change
	U	restore current line
	.	repeat last change
	"dp	retrieve d'th last delete
USAGE		See <code>largefile(5)</code> for the description of the behavior of <code>vi</code> and <code>view</code> when encountering files greater than or equal to 2 Gbyte (2^{31} bytes).
ENVIRONMENT VARIABLES		See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>vi</code> : <code>LC_CTYPE</code> , <code>LC_TIME</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .
FILES	<code>/var/tmp</code>	default directory where temporary work files are placed; it can be changed using the <code>directory</code> option (see the <code>ex(1)</code> command)
	<code>/usr/share/lib/terminfo/?/*</code>	compiled terminal description database

vi(1)

`/usr/lib/.COREterm/?/*` subset of compiled terminal description database

OpenWindows Advanced User's Guide

AUTHOR `vi` and `ex` were developed by The University of California, Berkeley California, Computer Science Division, Department of Electrical Engineering and Computer Science.

NOTES Two options, although they continue to be supported, have been replaced in the documentation by options that follow the Command Syntax Standard (see `intro(1)`). An `-r` option that is not followed with an option-argument has been replaced by `-L` and `+command` has been replaced by `-c` command.

The message file `too large to recover` with `-r` option, which is seen when a file is loaded, indicates that the file can be edited and saved successfully, but if the editing session is lost, recovery of the file with the `-r` option will not be possible.

The editing environment defaults to certain configuration options. When an editing session is initiated, `vi` attempts to read the `EXINIT` environment variable. If it exists, the editor uses the values defined in `EXINIT`; otherwise the values set in `$HOME/.exrc` are used. If `$HOME/.exrc` does not exist, the default values are used.

To use a copy of `.exrc` located in the current directory other than `$HOME`, set the `exrc` option in `EXINIT` or `$HOME/.exrc`. Options set in `EXINIT` can be turned off in a local `.exrc` only if `exrc` is set in `EXINIT` or `$HOME/.exrc`.

Tampering with entries in `/usr/share/lib/terminfo/?/*` or `/usr/share/lib/terminfo/?/*` (for example, changing or removing an entry) can affect programs such as `vi` that expect the entry to be present and correct. In particular, removing the "dumb" terminal may cause unexpected problems.

Software tabs using `^T` work only immediately after the *autoindent*.

Left and right shifts on intelligent terminals do not make use of insert and delete character operations in the terminal.

The standard Solaris version of `vi` will be replaced by the POSIX.2-conforming version (see `standards(5)`) in the future. Scripts which use the `ex` family of addressing and features should use the `/usr/xpg4/bin` version of these utilities.

vipw(1B)

NAME vipw – edit the password file

SYNOPSIS /usr/ucb/vipw

DESCRIPTION vipw edits the password file while setting the appropriate locks, and does any necessary processing after the password file is unlocked. If the password file is already being edited, then you will be told to try again later. The vi(1) editor will be used unless the environment variable VISUAL or EDITOR indicates an alternate editor.

vipw performs a number of consistency checks on the password entry for root, and will not allow a password file with a “mangled” root entry to be installed. It also checks the /etc/shells file to verify the login shell for root.

FILES /etc/ptmp
/etc/shells

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

NAME	volcancel – cancel user’s request for removable media that is not currently in drive				
SYNOPSIS	<code>/usr/lib/vold/volcancel [-n] [volume]</code>				
DESCRIPTION	<p>volcancel cancels a user’s request to access a particular floppy or CD-ROM file system. This command is useful when the removable media containing the file system is not currently in the drive.</p> <p>Use the path <code>/vol/rdisk/name_of_volume</code> to specify the volume. If called without a volume name to cancel, volcancel checks for Volume Management running.</p>				
OPTIONS	<code>-n</code> Display the nickname to the device name translation table.				
EXAMPLES	<p>EXAMPLE 1 A sample of the volcancel command.</p> <p>To cancel a request to access an unnamed CD-ROM, use</p> <pre>example% /usr/lib/vold/volcancel vol/rdisk/unnamed_cdrom</pre> <p>To check if volume management is running, use:</p> <pre>example% /usr/lib/vold/volcancel echo volmgmt not running</pre>				
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWvolu</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWvolu

Availability	SUNWvolu				
SEE ALSO	rmmount(1M), volcheck(1), vold(1M), volmissing(1), rmmount.conf(4), vold.conf(4), attributes(5), volfs(7FS)				

volcheck(1)

NAME	volcheck – checks for media in a drive and by default checks all floppy media				
SYNOPSIS	volcheck [-v] [-i <i>secs</i>] [-t <i>secs</i>] <i>pathname</i>				
DESCRIPTION	<p>The <code>volcheck</code> utility tells Volume Management to look at each <code>dev/pathname</code> in sequence and determine if new media has been inserted in the drive.</p> <p>The default action is to <code>volcheck</code> all checkable media managed by volume management.</p>				
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none">-i <i>secs</i> Set the frequency of device checking to <i>secs</i> seconds. The default is 2 seconds. The minimum frequency is 1 second.-t <i>secs</i> Check the named device(s) for the next <i>secs</i> seconds. The maximum number of seconds allowed is 28800, which is 8 hours. The frequency of checking is specified by -i. There is no default total time.-v Verbose.				
OPERANDS	<p>The following operands are supported:</p> <p><i>pathname</i> The path name of a media device.</p>				
EXAMPLES	<p>EXAMPLE 1 A sample of the <code>volcheck</code> command.</p> <p>The following example</p> <pre>example% volcheck -v /dev/diskette /dev/diskette has media</pre> <p>asks Volume Management to examine the floppy drive for new media.</p> <p>The following example</p> <pre>example% volcheck -i 2 -t 600 /dev/diskette1 &</pre> <p>asks Volume Management if there is a floppy in the floppy drive every 2 seconds for 600 seconds (10 minutes).</p>				
FILES	<code>/dev/volctl</code> Volume Management control port				
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:				
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Availability</td><td>SUNWvolu</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWvolu
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWvolu

WARNINGS | Due to a hardware limitation in many floppy drives, the act of checking for media causes mechanical action in the floppy drive. Continuous polling of the floppy drive will cause the drive to wear out. It is recommended that polling the drive only be performed during periods of high use.

volmissing(1)

NAME	volmissing – notify user that volume requested is not in the CD-ROM or floppy drive				
SYNOPSIS	<code>/usr/lib/vold/volmissing [-c] [-p] [-s] [-m <i>alias</i>]</code>				
DESCRIPTION	<p>volmissing informs a user when a requested volume is not available. Depending on the option selected, users are notified through their console window, <code>syslogd(1M)</code>, or a mail message.</p> <p>volmissing -p is the default action taken by <code>vold(1M)</code>, the Volume Management daemon, when it needs to notify a user that the requested volume is not available. If you want to change this default event, modify the <code>/etc/vold.conf</code> file. See <code>vold.conf(4)</code>.</p> <p>You can change the notification method for your system by editing the <code>vold.conf</code> configuration file and providing a new option for volmissing in the notify entry under the Events category.</p>				
OPTIONS	<p>-c Send a message to the user's console requesting the volume be inserted. To end the notification without inserting the requested volume, use <code>volcancel(1)</code>.</p> <p>-p All volmissing events will be handled through a GUI, provided a window system is running on the console. If this option is specified, and no window system is running, all messages go to the system console.</p> <p>-s Send one message to the <code>syslogd(1M)</code>.</p> <p>-m <i>alias</i> Send a mail message to the specified mail alias about the missing volume.</p>				
FILES	<p><code>/etc/vold.conf</code> Volume Management daemon configuration file. Directs the Volume Management daemon to control certain devices, and causes action to be taken when specific criteria is met.</p> <p><code>/usr/lib/vold/volmissing_popup</code> Pop-up used when the -p option is supplied and a window system is running.</p>				
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:

NAME	volrmmount – call rmmount to mount or unmount media
SYNOPSIS	volrmmount [-i -e] [<i>name</i> <i>nickname</i>] volrmmount [-d]
DESCRIPTION	<p>volrmmount calls rmmount(1M) to, in effect, simulate an insertion (-i) or an ejection (-e). Simulating an insertion often means that rmmount will mount the media. Conversely, simulating an ejection often means that rmmount will unmount the media. However, these actions can vary depending on the rmmount configuration and media type (see rmmount.conf(4)).</p> <p>For example, if you use the default /etc/rmmount.conf and insert a music CD, it won't be mounted. However, you can configure rmmount so that it calls workman whenever a music CD is inserted.</p> <p>This command allows you to override Volume Management's usual handling of media (see EXAMPLES below).</p>
OPTIONS	<p>-i Simulate an insertion of the specified media by calling rmmount.</p> <p>-e Simulate an ejection of the specified media by calling rmmount.</p> <p>-d Display the name of the default device for volrmmount to handle. This device is used if no <i>name</i> or <i>nickname</i> is supplied.</p>
OPERANDS	<p><i>name</i> The name that Volume Management recognizes as the device's name, see volfs(7FS).</p> <p><i>nickname</i> A shortened version of the device's name. Following is the list of recognized nicknames:</p>

Nickname	Path
fd	/dev/rdiskette
fd0	/dev/rdiskette
fd1	/dev/rdiskette1
diskette	/dev/rdiskette
diskette0	/dev/rdiskette0
diskette1	/dev/rdiskette1
rdiskette	/dev/rdiskette
rdiskette0	/dev/rdiskette0
rdiskette1	/dev/rdiskette1
floppy	/dev/rdiskette
floppy0	/dev/rdiskette0

volrmmount(1)

Nickname	Path
floppy1	/dev/rdiskette1

EXAMPLES **EXAMPLE 1** A sample case of `volrmmount` command.

When Volume Management finds a floppy that contains a filesystem, it calls `rmmount` to mount it. If you wish to run `tar(1)` or `cpio(1)` on that floppy, it must first be unmounted. To unmount the floppy use:

```
example% volrmmount -e floppy0
```

After `volrmmount` unmounts the floppy, if you wish to re-mount it (rather than ejecting it and reinserting it) use:

```
example% volrmmount -i floppy0
```

Note that if you are using a named floppy you can use its name in place of `floppy0`.

FILES `/dev/volctl` Volume Management control port

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWvolu

SEE ALSO `cpio(1)`, `eject(1)`, `tar(1)`, `rmmount(1M)`, `vold(1M)`, `rmmount.conf(4)`, `attributes(5)`, `volfs(7FS)`

NOTES Volume Management (`vold`) must be running to use this command.

NAME	vsig – synchronize a co-process with the controlling FMLI application				
SYNOPSIS	vsig				
DESCRIPTION	The <code>vsig</code> executable sends a <code>SIGUSR2</code> signal to the controlling FMLI process. This signal/alarm causes FMLI to execute the FMLI built-in command <code>checkworld</code> which causes all posted objects with a <code>reread</code> descriptor evaluating to <code>TRUE</code> to be reread. <code>vsig</code> takes no arguments.				
EXAMPLES	<p>EXAMPLE 1 A sample output of <code>vsig</code> command.</p> <p>The following is a segment of a shell program:</p> <pre>echo "Sending this string to an FMLI process" vsig</pre> <p>The <code>vsig</code> executable will flush the output buffer <i>before</i> it sends the <code>SIGUSR2</code> signal to make sure the string is actually in the pipe created by the <code>cocreate</code> function.</p>				
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWesu</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWesu
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWesu				
SEE ALSO	<code>coproc(1F)</code> , <code>kill(1)</code> , <code>kill(2)</code> , <code>signal(3C)</code> , <code>attributes(5)</code>				
NOTES	Because <code>vsig</code> synchronize with FMLI, it should be used rather than <code>kill</code> to send a <code>SIGUSR2</code> signal to FMLI.				

w(1)

NAME	w – display information about currently logged-in users
SYNOPSIS	w [-hlsuw] [<i>user</i>]
DESCRIPTION	<p>The w command displays a summary of the current activity on the system, including what each user is doing. The heading line shows the current time, the length of time the system has been up, the number of users logged into the system, and the average number of jobs in the run queue over the last 1, 5 and 15 minutes.</p> <p>The fields displayed are: the user's login name, the name of the tty the user is on, the time of day the user logged on (in <i>hours:minutes</i>), the idle time—that is, the number of minutes since the user last typed anything (in <i>hours:minutes</i>), the CPU time used by all processes and their children on that terminal (in <i>minutes:seconds</i>), the CPU time used by the currently active processes (in <i>minutes:seconds</i>), and the name and arguments of the current process.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none">-h Suppress the heading.-l Produce a long form of output, which is the default.-s Produce a short form of output. In the short form, the tty is abbreviated, the login time and CPU times are left off, as are the arguments to commands.-u Produces the heading line which shows the current time, the length of time the system has been up, the number of users logged into the system, and the average number of jobs in the run queue over the last 1, 5 and 15 minutes.-w Produces a long form of output, which is also the same as the default.
OPERANDS	<i>user</i> Name of a particular user for whom login information is displayed. If specified, output is restricted to that user.
EXAMPLES	<p>EXAMPLE 1 A sample of w command.</p> <pre>example% w 10:54am up 27 day(s), 57 mins, 1 user, load average: 0.28, 0.26, 0.22 User tty login@ idle JCPU PCPU what ralph console 7:10am 1 10:05 4:31 w</pre>
ENVIRONMENT VARIABLES	See environ(5) for descriptions of the following environment variables that affect the execution of w : LC_CTYPE , LC_MESSAGES and LC_TIME .
FILES	/var/adm/utmp user and accounting information
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO ps(1), who(1), whodo(1M), utmp(4), attributes(5), environ(5)

NOTES The notion of the “current process” is unclear. The current algorithm is ‘the highest numbered process on the terminal that is not ignoring interrupts, or, if there is none, the highest numbered process on the terminal’. This fails, for example, in critical sections of programs like the shell and editor, or when faulty programs running in the background fork and fail to ignore interrupts. In cases where no process can be found, w prints –.

The CPU time is only an estimate, in particular, if someone leaves a background process running after logging out, the person currently on that terminal is “charged” with the time.

Background processes are not shown, even though they account for much of the load on the system.

Sometimes processes, typically those in the background, are printed with null or garbaged arguments. In these cases, the name of the command is printed in parentheses.

w does not know about the conventions for detecting background jobs. It will sometimes find a background job instead of the right one.

wait(1)

NAME	wait – await process completion
/bin/sh	wait [<i>pid</i> ...]
/bin/jsh	wait [<i>pid</i> ...]
/bin/ksh	wait [% <i>jobid</i> ...]
/usr/xpg4/bin/sh	wait [% <i>jobid</i> ...]
/bin/csh	wait
DESCRIPTION	<p>The shell itself executes <code>wait</code>, without creating a new process. If you get the error message <code>cannot fork, too many processes</code>, try using the <code>wait</code> command to clean up your background processes. If this doesn't help, the system process table is probably full or you have too many active foreground processes. (There is a limit to the number of process IDs associated with your login, and to the number the system can keep track of.)</p> <p>Not all the processes of a pipeline with three or more stages are children of the shell, and thus cannot be waited for.</p> <p>/bin/sh, /bin/jsh Wait for your background process whose process ID is <i>pid</i> and report its termination status. If <i>pid</i> is omitted, all your shell's currently active background processes are waited for and the return code will be 0. The <code>wait</code> utility accepts a job identifier, when Job Control is enabled (<code>jsh</code>), and the argument, <i>jobid</i>, is preceded by a percent sign (%).</p> <p>If <i>pid</i> is not an active process ID, the <code>wait</code> utility will return immediately and the return code will be 0.</p> <p>csh Wait for your background processes.</p> <p>ksh When an asynchronous list is started by the shell, the process ID of the last command in each element of the asynchronous list becomes known in the current shell execution environment.</p> <p>If the <code>wait</code> utility is invoked with no operands, it will wait until all process IDs known to the invoking shell have terminated and exit with an exit status of 0.</p> <p>If one or more <i>pid</i> or <i>jobid</i> operands are specified that represent known process IDs (or jobids), the <code>wait</code> utility will wait until all of them have terminated. If one or more <i>pid</i> or <i>jobid</i> operands are specified that represent unknown process IDs (or jobids), <code>wait</code> will treat them as if they were known process IDs (or jobids) that exited with exit status 127. The exit status returned by the <code>wait</code> utility will be the exit status of the process requested by the last <i>pid</i> or <i>jobid</i> operand.</p> <p>The known process IDs are applicable only for invocations of <code>wait</code> in the current shell execution environment.</p>
OPERANDS	<p>The following operands are supported:</p> <p>One of the following:</p>

pid The unsigned decimal integer process ID of a command, for which the utility is to wait for the termination.

jobid A job control job ID that identifies a background process group to be waited for. The job control job ID notation is applicable only for invocations of `wait` in the current shell execution environment, and only on systems supporting the job control option.

USAGE On most implementations, `wait` is a shell built-in. If it is called in a subshell or separate utility execution environment, such as one of the following,

```
(wait)
nohup wait . . .
find . -exec wait . . . \;
```

it will return immediately because there will be no known process IDs to wait for in those environments.

EXAMPLES **EXAMPLE 1** Using A Script To Identify The Termination Signal

For Although the exact value used when a process is terminated by a signal is unspecified, if it is known that a signal terminated a process, a script can still reliably figure out which signal is using `kill`, as shown by the following (`/bin/ksh` and `/usr/xpg4/bin/sh`):

```
sleep 1000&
pid=$!
kill -kill $pid
wait $pid
echo $pid was terminated by a SIG$(kill -l ${ $?-128}) signal.
```

EXAMPLE 2 Returning The Exit Status Of A Process

If the following sequence of commands is run in less than 31 seconds (`/bin/ksh` and `/usr/xpg4/bin/sh`):

```
sleep 257 | sleep 31 &

jobs -l %%
then either of the following commands will return the exit status of the second sleep
in the pipeline:

wait <pid of sleep 31>
wait %%
```

ENVIRONMENT VARIABLES See `environ(5)` for descriptions of the following environment variables that affect the execution of `wait`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

NAME	wc – display a count of lines, words and characters in a file
SYNOPSIS	wc [-c -m -C] [-l _w] [<i>file</i> ...]
DESCRIPTION	<p>The wc utility reads one or more input files and, by default, writes the number of newline characters, words and bytes contained in each input file to the standard output.</p> <p>The utility also writes a total count for all named files, if more than one input file is specified.</p> <p>wc considers a <i>word</i> to be a non-zero-length string of characters delimited by white space (for example, SPACE, TAB). See <code>iswspace(3C)</code> or <code>isspace(3C)</code>.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -c Count bytes. -m Count characters. -C Same as -m. -l Count lines. -w Count words delimited by white space characters or new line characters. Delimiting characters are Extended Unix Code (EUC) characters from any code set defined by <code>iswspace()</code>. <p>If no option is specified the default is <code>-lwc</code> (count lines, words, and bytes.)</p>
OPERANDS	<p>The following operand is supported:</p> <p><i>file</i> A path name of an input file. If no <i>file</i> operands are specified, the standard input will be used.</p>
USAGE	See <code>largefile(5)</code> for the description of the behavior of wc when encountering files greater than or equal to 2 Gbyte (2^{31} bytes).
ENVIRONMENT VARIABLES	See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of wc : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .
EXIT STATUS	<p>The following exit values are returned:</p> <ul style="list-style-type: none"> 0 Successful completion. >0 An error occurred.

NAME	what – extract SCCS version information from a file				
SYNOPSIS	what [-s] <i>filename...</i>				
DESCRIPTION	what searches each <i>filename</i> for occurrences of the pattern @(#) that the SCCS <code>get</code> command (see <code>sccs-get(1)</code>) substitutes for the @(#) ID keyword, and prints what follows up to a ", >, NEWLINE, \, or null character.				
OPTIONS	The following option is supported: -s Stop after the first occurrence of the pattern.				
EXAMPLES	EXAMPLE 1 Extracting SCCS version information If a C program in file <code>program.c</code> contains <pre>char sccsid[] = " @(#)identification information ";</pre> and <code>program.c</code> is compiled to yield <code>program.o</code> and <code>a.out</code> , the command: <pre>example% what program.c program.o a.out</pre> produces: <pre>program.c: identification information program.o: identification information a.out: identification information</pre>				
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes: <table border="1" data-bbox="461 1157 1430 1247" style="margin-left: 2em;"> <thead> <tr> <th style="text-align: center;">ATTRIBUTE TYPE</th> <th style="text-align: center;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWspot</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWspot
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWspot				
SEE ALSO	<code>sccs(1)</code> , <code>sccs-admin(1)</code> , <code>sccs-cdc(1)</code> , <code>sccs-comb(1)</code> , <code>sccs-delta(1)</code> , <code>sccs-get(1)</code> , <code>sccs-help(1)</code> , <code>sccs-prs(1)</code> , <code>sccs-prt(1)</code> , <code>sccs-rmdel(1)</code> , <code>sccs-sact(1)</code> , <code>sccs-sccsdiff(1)</code> , <code>sccs-unget(1)</code> , <code>sccs-val(1)</code> , <code>sccsfile(4)</code> , <code>attributes(5)</code>				
DIAGNOSTICS	Use the SCCS <code>help</code> command for explanations (see <code>sccs-help(1)</code>).				
BUGS	There is a remote possibility that a spurious occurrence of the '@(#)' pattern could be found by <code>what</code> .				

whatis(1)

NAME | `whatis` – display a one-line summary about a keyword

SYNOPSIS | `whatis` *command*...

DESCRIPTION | `whatis` looks up a given *command* and displays the header line from the manual section. You can then run the `man(1)` command to get more information. If the line starts '*name (section) ...*' you can do '`man -s section name`' to get the documentation for it. Try '`whatis ed`' and then you should do '`man -s 1 ed`' to get the manual page for `ed(1)`.

| `whatis` is actually just the `-f` option to the `man(1)` command.

| `whatis` uses the `/usr/share/man/windex` database. This database is created by `catman(1M)`. If this database does not exist, `whatis` will fail.

FILES | `/usr/share/man/windex` | Table of contents and keyword database

ATTRIBUTES | See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdoc
CSI	enabled

SEE ALSO | `apropos(1)`, `man(1)`, `catman(1M)`, `attributes(5)`

NAME	whereis – locate the binary, source, and manual page files for a command
SYNOPSIS	<code>/usr/ucb/whereis [-bmsu] [-BMS directory... -f] filename...</code>
DESCRIPTION	<p>The <code>whereis</code> utility locates source/binary and manuals sections for specified files. The supplied names are first stripped of leading pathname components and any (single) trailing extension of the form <code>.ext</code>, for example, <code>.c</code>. Prefixes of <code>s.</code> resulting from use of source code control are also dealt with. <code>whereis</code> then attempts to locate the desired program in a list of standard places:</p> <pre> /usr/bin /usr/bin /usr/5bin /usr/games /usr/hosts /usr/include /usr/local /usr/etc /usr/lib /usr/share/man /usr/src /usr/ucb </pre>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -b Search only for binaries. -m Search only for manual sections. -s Search only for sources. -u Search for unusual entries. A file is said to be unusual if it does not have one entry of each requested type. Thus <code>'whereis -m -u *'</code> asks for those files in the current directory which have no documentation. -B Change or otherwise limit the places where <code>whereis</code> searches for binaries. -M Change or otherwise limit the places where <code>whereis</code> searches for manual sections. -S Change or otherwise limit the places where <code>whereis</code> searches for sources. -f Terminate the last directory list and signals the start of file names, and <i>must</i> be used when any of the <code>-B</code>, <code>-M</code>, or <code>-S</code> options are used.
EXAMPLES	<p>EXAMPLE 1 Finding files with the <code>whereis</code> command</p> <p>Find all files in <code>/usr/bin</code> which are not documented in <code>/usr/share/man/man1</code> with source in <code>/usr/src/cmd</code>:</p> <pre> example% cd /usr/ucbexample% whereis -u -M /usr/share/man/man1 -S /usr/src/cmd -f * </pre>

whereis(1B)

EXAMPLE 1 Finding files with the whereis command (Continued)

FILES /usr/src/*
/usr/{doc,man}/*
/etc, /usr/{lib,bin,ucb,old,new,local}

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWscpu

SEE ALSO chdir(2), attributes(5)

BUGS Since whereis uses chdir(2) to run faster, pathnames given with the -M, -S, or -B must be full; that is, they must begin with a '/'.

while(1)

NAME	while, until – shell built-in functions to repetitively execute a set of actions while/until conditions are evaluated TRUE
sh	while [<i>conditions</i>] ; do <i>actions</i> ; done until [<i>conditions</i>] ; do <i>actions</i> ; done
csk	while (<i>conditions</i>) [...] #do <i>actions</i> end
ksh	while [<i>conditions</i>] ; do <i>actions</i> ; done until [<i>conditions</i>] ; do <i>actions</i> ; done
sh	A while command repeatedly executes the while <i>conditions</i> and, if the exit status of the last command in the <i>conditions</i> list is 0, executes the do <i>actions</i> ; otherwise the loop terminates. If no commands in the do <i>actions</i> are executed, then the while command returns a 0 exit status; until may be used in place of while to negate the loop termination test.
csk	While <i>conditions</i> is TRUE (evaluates to nonzero), repeat commands between the while and the matching end statement. The while and end must appear alone on their input lines. If the shell's input is a terminal, it prompts for commands with a question-mark until the end command is entered and then performs the commands in the loop.
ksh	A while command repeatedly executes the while <i>conditions</i> and, if the exit status of the last command in the <i>conditions</i> list is zero, executes the do <i>actions</i> ; otherwise the loop terminates. If no commands in the do <i>actions</i> are executed, then the while command returns a 0 exit status; until may be used in place of while to negate the loop termination test.
loop interrupts	The built-in command continue may be used to terminate the execution of the current iteration of a while or until loop, and the built-in command break may be used to terminate execution of a while or until command.
EXAMPLES	EXAMPLE 1 Using The while Command With sh and ksh In these examples, the user is repeated prompted for a name of a file to be located, until the user chooses to finish the execution by entering an empty line. <pre>filename=anything while [\$filename] do echo "file?" read filename # read from terminal find . -name \$filename -print done</pre> The brackets surrounding <code>\$filename</code> are necessary for evaluation. (See the <code>test</code> built-in command in the <code>if(1)</code> man page). Additionally, there must be a blank space

EXAMPLE 1 Using The while Command With sh and ksh (Continued)

separating each bracket from any characters within.

EXAMPLE 2 Using The while Command With csh

```
set filename = anything
while ( "$filename" != "" )
    echo "file?"
    set filename = $<          # read from terminal
    find . -name $filename -print
end
```

SEE ALSO `break(1)`, `csh(1)`, `if(1)`, `ksh(1)`, `sh(1)`, `attributes(5)`

NOTES Both the Bourne shell, `sh`, and the Korn shell, `ksh`, can use the semicolon and the carriage return interchangeably in their syntax of the `if`, `for`, and `while` built-in commands.

who(1)

NAME	who – who is on the system																
SYNOPSIS	<pre>/usr/bin/who [-abdHlmpqrstTu] [file] /usr/bin/who -q [-n x] [file] /usr/bin/who am i /usr/bin/who am I /usr/xpg4/bin/who [-abdHlmpqrstTu] [file] /usr/xpg4/bin/who -q [-n x] [file] /usr/xpg4/bin/who -s [-bdHlmpqrtu] [file] /usr/xpg4/bin/who am i /usr/xpg4/bin/who am I</pre>																
DESCRIPTION	<p>The who utility can list the user's name, terminal line, login time, elapsed time since activity occurred on the line, and the process-ID of the command interpreter (shell) for each current UNIX system user. It examines the <code>/var/adm/utmp</code> file to obtain its information. If <i>file</i> is given, that file (which must be in utmp(4) format) is examined. Usually, <i>file</i> will be <code>/var/adm/wtmp</code>, which contains a history of all the logins since the file was last created.</p> <p>The general format for output is:</p> <pre>name [state] line time [idle] [pid] [comment] [exit]</pre> <p>where:</p> <table><tr><td><i>name</i></td><td>user's login name.</td></tr><tr><td><i>state</i></td><td>capability of writing to the terminal.</td></tr><tr><td><i>line</i></td><td>name of the line found in <code>/dev</code>.</td></tr><tr><td><i>time</i></td><td>time since user's login.</td></tr><tr><td><i>idle</i></td><td>time elapsed since the user's last activity.</td></tr><tr><td><i>pid</i></td><td>user's process id.</td></tr><tr><td><i>comment</i></td><td>comment line in <code>inittab(4)</code>.</td></tr><tr><td><i>exit</i></td><td>exit status for dead processes.</td></tr></table>	<i>name</i>	user's login name.	<i>state</i>	capability of writing to the terminal.	<i>line</i>	name of the line found in <code>/dev</code> .	<i>time</i>	time since user's login.	<i>idle</i>	time elapsed since the user's last activity.	<i>pid</i>	user's process id.	<i>comment</i>	comment line in <code>inittab(4)</code> .	<i>exit</i>	exit status for dead processes.
<i>name</i>	user's login name.																
<i>state</i>	capability of writing to the terminal.																
<i>line</i>	name of the line found in <code>/dev</code> .																
<i>time</i>	time since user's login.																
<i>idle</i>	time elapsed since the user's last activity.																
<i>pid</i>	user's process id.																
<i>comment</i>	comment line in <code>inittab(4)</code> .																
<i>exit</i>	exit status for dead processes.																
OPTIONS	<p>The following options are supported:</p> <table><tr><td>-a</td><td>Process <code>/var/adm/utmp</code> or the named <i>file</i> with <code>-b</code>, <code>-d</code>, <code>-l</code>, <code>-p</code>, <code>-r</code>, <code>-t</code>, <code>-T</code>, and <code>-u</code> options turned on.</td></tr><tr><td>-b</td><td>Indicate the time and date of the last reboot.</td></tr></table>	-a	Process <code>/var/adm/utmp</code> or the named <i>file</i> with <code>-b</code> , <code>-d</code> , <code>-l</code> , <code>-p</code> , <code>-r</code> , <code>-t</code> , <code>-T</code> , and <code>-u</code> options turned on.	-b	Indicate the time and date of the last reboot.												
-a	Process <code>/var/adm/utmp</code> or the named <i>file</i> with <code>-b</code> , <code>-d</code> , <code>-l</code> , <code>-p</code> , <code>-r</code> , <code>-t</code> , <code>-T</code> , and <code>-u</code> options turned on.																
-b	Indicate the time and date of the last reboot.																

	-d	Display all processes that have expired and not been respawned by <code>init</code> . The <code>exit</code> field appears for dead processes and contains the termination and exit values (as returned by <code>wait(3UCB)</code>), of the dead process. This can be useful in determining why a process terminated.
	-H	Output column headings above the regular output.
	-l	List only those lines on which the system is waiting for someone to login. The <code>name</code> field is <code>LOGIN</code> in such cases. Other fields are the same as for user entries except that the <code>state</code> field does not exist.
	-m	Output only information about the current terminal.
	-n <i>x</i>	Take a numeric argument, <i>x</i> , which specifies the number of users to display per line. <i>x</i> must be at least 1. The <code>-n</code> option may only be used with <code>-q</code> .
	-p	List any other process which is currently active and has been previously spawned by <code>init</code> . The <code>name</code> field is the name of the program executed by <code>init</code> as found in <code>/sbin/inittab</code> . The <code>state</code> , <code>line</code> , and <code>idle</code> fields have no meaning. The <code>comment</code> field shows the <code>id</code> field of the line from <code>/sbin/inittab</code> that spawned this process. See <code>inittab(4)</code> .
	-q	(quick who) display only the names and the number of users currently logged on. When this option is used, all other options are ignored.
	-r	Indicate the current <i>run-level</i> of the <code>init</code> process.
	-s	(default) List only the <code>name</code> , <code>line</code> , and <code>time</code> fields.
<code>/usr/bin/who</code>	-T	Same as the <code>-s</code> option, except that the <code>state</code> , <code>idle</code> , <code>pid</code> , and <code>comment</code> , fields are also written. <code>state</code> is one of the following characters: <ul style="list-style-type: none"> + The terminal allows write access to other users. - The terminal denies write access to other users. ? The terminal write-access state cannot be determined.
<code>/usr/xpg4/bin/who</code>	-T	Same as the <code>-s</code> option, except that the <code>state</code> field is also written. <code>state</code> is one of the characters listed under the <code>/usr/bin/who</code> version of this option. If the <code>-u</code> option is used with <code>-T</code> , the <code>idle</code> time is added to the end of the previous format.
	-t	Indicate the last change to the system clock (using the <code>date</code> utility) by <code>root</code> . See <code>su(1M)</code> and <code>date(1)</code> .
	-u	List only those users who are currently logged in. The <code>name</code> is the user's login name. The <code>line</code> is the name of the line as found in the directory <code>/dev</code> . The <code>time</code> is the time that the user logged in. The <code>idle</code> column contains the number of hours and minutes since activity last occurred on that particular line. A dot (.) indicates that the terminal has seen activity in the last minute and is therefore "current". If more than twenty-four hours have elapsed or the line has not been used since boot time, the entry is marked <code>old</code> . This field is useful when trying to determine whether a

who(1)

person is working at the terminal or not. The *pid* is the process-ID of the user's shell. The *comment* is the comment field associated with this line as found in `/sbin/inittab` (see `inittab(4)`). This can contain information about where the terminal is located, the telephone number of the dataset, type of terminal if hard-wired, and so forth.

OPERANDS The following operands are supported:

`am i`

`am I` In the "C" locale, limit the output to describing the invoking user, equivalent to the `-m` option. The `am` and `i` or `I` must be separate arguments.

file Specify a path name of a file to substitute for the database of logged-on users that `who` uses by default.

ENVIRONMENT VARIABLES See `environ(5)` for descriptions of the following environment variables that affect the execution of `who`: `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, and `NLSPATH`.

EXIT STATUS The following exit values are returned:

0 Successful completion.

>0 An error occurred.

FILES

<code>/sbin/inittab</code>	script for <code>init</code> .
<code>/var/adm/utmp</code>	current user and accounting information
<code>/var/adm/wtmp</code>	historic user and accounting information

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

`/usr/bin/who`

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

`/usr/xpg4/bin/who`

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWxcu4

SEE ALSO `date(1)`, `login(1)`, `mesg(1)`, `init(1M)`, `su(1M)`, `wait(3UCB)`, `inittab(4)`, `utmp(4)`, `attributes(5)`, `environ(5)`, `XPG4(5)`

NOTES Super user: After a shutdown to the single-user state, `who` returns a prompt; since `/var/adm/utmp` is updated at login time and there is no login in single-user state, `who` cannot report accurately on this state. `who am i`, however, returns the correct information.

NAME | whoami – display the effective current username

SYNOPSIS | `/usr/ucb/whoami`

DESCRIPTION | whoami displays the login name corresponding to the current effective user ID. If you have used `su` to temporarily adopt another user, `whoami` will report the login name associated with that user ID. `whoami` gets its information from the `geteuid` and `getpwuid` library routines (see `getuid` and `getpwnam(3C)`, respectively).

FILES | `/etc/passwd` username data base

whocalls(1)

- NAME** whocalls – report on the calls to a specific procedure.
- SYNOPSIS** `/usr/ccs/bin/whocalls whocalls [-l wholib] funcname executable`
[executable arguments...]
- DESCRIPTION** whocalls is a simple example of a utility based on the *Link-Auditing* library, which permits the tracking of a given function call. See *Linker and Libraries Guide* The *executable* is run as normal. Each time the procedure *funcname* is called, both the arguments to that procedure and a stack trace are displayed on standard output.
- OPTIONS** -l *wholib* Specify an alternate *who.so* *Link-Auditing* library to use.
- EXAMPLES** **EXAMPLE 1** A sample of the whocalls command.
- This examples tracks the calls to *printf()* made by a simple `hello_world` program
- ```
% whocalls printf hello
printf(0x106e4, 0xef625310, 0xef621ba8)
 hello:main+0x10
 hello:_start+0x5c
hello
%
```
- ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| <b>NAME</b>        | write – write to another user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>SYNOPSIS</b>    | <b>write</b> <i>user</i> [ <i>terminal</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>The <code>write</code> utility reads lines from the user's standard input and writes them to the terminal of another user. When first invoked, it writes the message:</p> <pre>Message from <i>sender-login-id</i> (<i>sending-terminal</i>) [<i>date</i>]...</pre> <p>to <i>user</i>. When it has successfully completed the connection, the sender's terminal will be alerted twice to indicate that what the sender is typing is being written to the recipient's terminal.</p> <p>If the recipient wants to reply, this can be accomplished by typing</p> <pre>write <i>sender-login-id</i> [<i>sending-terminal</i>]</pre> upon receipt of the initial message. Whenever a line of input as delimited by a NL, EOF, or EOL special character is accumulated while in canonical input mode, the accumulated data will be written on the other user's terminal. Characters are processed as follows: <ul style="list-style-type: none"><li>■ Typing the alert character will write the alert character to the recipient's terminal.</li><li>■ Typing the erase and kill characters will affect the sender's terminal in the manner described by the <code>termios(3C)</code> interface.</li><li>■ Typing the interrupt or end-of-file characters will cause <code>write</code> to write an appropriate message (EOT\n in the "C" locale) to the recipient's terminal and exit.</li><li>■ Typing characters from LC_CTYPE classifications <code>print</code> or <code>space</code> will cause those characters to be sent to the recipient's terminal.</li><li>■ When and only when the <code>stty iexten</code> local mode is enabled, additional special control characters and multi-byte or single-byte characters are processed as printable characters if their wide character equivalents are printable.</li><li>■ Typing other non-printable characters will cause them to be written to the recipient's terminal as follows: control characters will appear as '^' followed by the appropriate ASCII character, and characters with the high-order bit set will appear in "meta" notation. For example, '\003' is displayed as '^C' and '\372' as 'M-Z'.</li></ul> <p>To write to a user who is logged in more than once, the <i>terminal</i> argument can be used to indicate which terminal to write to; otherwise, the recipient's terminal is the first writable instance of the user found in <code>/usr/adm/utmp</code>, and the following informational message will be written to the sender's standard output, indicating which terminal was chosen:</p> <pre><i>user</i> is logged on more than one place.<br/>You are connected to <i>terminal</i>.</pre> <p>Other locations are:<i>terminal</i>Permission to be a recipient of a <code>write</code> message can be denied or granted by use of the <code>mesg</code> utility. However, a user's privilege may further constrain the domain of accessibility of other users' terminals. The <code>write</code> utility will fail when the user lacks the appropriate privileges to perform the requested action.</p> |

If the character `!` is found at the beginning of a line, `write` calls the shell to execute the rest of the line as a command.

`write` runs `setgid()` (see `setuid(2)`) to the group ID `tty`, in order to have write permissions on other user's terminals.

The following protocol is suggested for using `write`: when you first `write` to another user, wait for them to `write` back before starting to send. Each person should end a message with a distinctive signal (that is, `(o)` for "over") so that the other person knows when to reply. The signal `(oo)` (for "over and out") is suggested when conversation is to be terminated.

**OPERANDS** The following operands are supported:

*user* User (login) name of the person to whom the message will be written. This operand must be of the form returned by the `who(1)` utility.

*terminal* Terminal identification in the same format provided by the `who` utility.

**ENVIRONMENT VARIABLES** See `environ(5)` for descriptions of the following environment variables that affect the execution of `write`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 The addressed user is not logged on or the addressed user denies permission.

**FILES**

|                            |                                                        |
|----------------------------|--------------------------------------------------------|
| <code>/var/adm/utmp</code> | user and accounting information for <code>write</code> |
| <code>/usr/bin/sh</code>   | Bourne shell executable file                           |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | enabled         |

**SEE ALSO** `mail(1)`, `mesg(1)`, `pr(1)`, `sh(1)`, `talk(1)`, `who(1)`, `setuid(2)`, `termios(3C)`, `attributes(5)`, `environ(5)`

**DIAGNOSTICS** `user is not logged on`

The person you are trying to `write` to is not logged on.

`Permission denied`

The person you are trying to `write` to denies that permission (with `mesg`).

write(1)

Warning: cannot respond, set mesg -y

Your terminal is set to mesg n and the recipient cannot respond to you.

Can no longer write to user

The recipient has denied permission (mesg n) after you had started writing.

| <b>NAME</b>        | xargs – construct argument lists and invoke utility                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | <b>xargs</b> [-t] [-p] [-e <i>eofstr</i> ] [-E <i>eofstr</i> ] [-I <i>replstr</i> ] [-i [ <i>replstr</i> ]]<br>[-L <i>number</i> ] [-l [ <i>number</i> ]] [-n <i>number</i> [-x]] [-s <i>size</i> ] [ <i>utility</i><br><i>argument. ...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | <p>The <i>xargs</i> utility constructs a command line consisting of the <i>utility</i> and <i>argument</i> operands specified followed by as many arguments read in sequence from standard input as will fit in length and number constraints specified by the options. The <i>xargs</i> utility then invokes the constructed command line and waits for its completion. This sequence is repeated until an end-of-file condition is detected on standard input or an invocation of a constructed command line returns an exit status of 255.</p> <p>Arguments in the standard input must be separated by unquoted blank characters, or unescaped blank characters or newline characters. A string of zero or more non-double-quote (") and non-newline characters can be quoted by enclosing them in double-quotes. A string of zero or more non-apostrophe (') and non-newline characters can be quoted by enclosing them in apostrophes. Any unquoted character can be escaped by preceding it with a backslash (\). The <i>utility</i> will be executed one or more times until the end-of-file is reached. The results are unspecified if the utility named by <i>utility</i> attempts to read from its standard input.</p> <p>The generated command line length will be the sum of the size in bytes of the utility name and each argument treated as strings, including a null byte terminator for each of these strings. The <i>xargs</i> utility will limit the command line length such that when the command line is invoked, the combined argument and environment lists will not exceed {ARG_MAX}-2048 bytes. Within this constraint, if neither the -n nor the -s option is specified, the default command line length will be at least {LINE_MAX}.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p>-e <i>eofstr</i>            Use <i>eofstr</i> as the logical end-of-file string. Underscore ( _ ) is assumed for the logical EOF string if neither -e nor -E is used. When the -<i>eofstr</i> option-argument is omitted, the logical EOF string capability is disabled and underscores are taken literally. The <i>xargs</i> utility reads standard input until either end-of-file or the logical EOF string is encountered.</p> <p>-E <i>eofstr</i>            Specify a logical end-of-file string to replace the default underscore. The <i>xargs</i> utility reads standard input until either end-of-file or the logical EOF string is encountered.</p> <p>-I <i>replstr</i>            Insert mode. <i>utility</i> will be executed for each line from standard input, taking the entire line as a single argument, inserting it in <i>argument s</i> for each occurrence of <i>replstr</i>. A maximum of five arguments in <i>arguments</i> can each contain one or more instances of <i>replstr</i>. Any blank characters at the beginning of each line are ignored. Constructed arguments cannot grow larger than 255 bytes. Option -x is forced on. The -I and -i options are mutually exclusive; the last one specified takes effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## xargs(1)

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| -i [ <i>replstr</i> ] | This option is equivalent to -I <i>replstr</i> . The string { } is assumed for <i>replstr</i> if the option-argument is omitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -L <i>number</i>      | The <i>utility</i> will be executed for each non-empty <i>number</i> lines of arguments from standard input. The last invocation of <i>utility</i> will be with fewer lines of arguments if fewer than <i>number</i> remain. A line is considered to end with the first newline character unless the last character of the line is a blank character; a trailing blank character signals continuation to the next non-empty line, inclusive. The -L, -l, and -n options are mutually exclusive; the last one specified takes effect.                                                                                                                                                                                                                                                                                                                                                       |
| -l [ <i>number</i> ]  | (The letter ell.) This option is equivalent to -L <i>number</i> . If <i>number</i> is omitted, 1 is assumed. Option -x is forced on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -n <i>number</i>      | Invoke <i>utility</i> using as many standard input arguments as possible, up to <i>number</i> (a positive decimal integer) arguments maximum. Fewer arguments will be used if: <ul style="list-style-type: none"><li>■ The command line length accumulated exceeds the size specified by the -s option (or {LINE_MAX} if there is no -s option), or</li><li>■ The last iteration has fewer than <i>number</i>, but not zero, operands remaining.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| -p                    | Prompt mode. The user is asked whether to execute <i>utility</i> at each invocation. Trace mode (-t) is turned on to write the command instance to be executed, followed by a prompt to standard error. An affirmative response (specific to the user's locale) read from /dev/tty will execute the command; otherwise, that particular invocation of <i>utility</i> is skipped.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -s <i>size</i>        | Invoke <i>utility</i> using as many standard input arguments as possible yielding a command line length less than <i>size</i> (a positive decimal integer) bytes. Fewer arguments will be used if: <ul style="list-style-type: none"><li>■ The total number of arguments exceeds that specified by the -n option, or</li><li>■ The total number of lines exceeds that specified by the -L option, or</li><li>■ End of file is encountered on standard input before <i>size</i> bytes are accumulated.</li></ul> <p>Values of <i>size</i> up to at least {LINE_MAX} bytes are supported, provided that the constraints specified in DESCRIPTION are met. It is not considered an error if a value larger than that supported by the implementation or exceeding the constraints specified in DESCRIPTION is given; xargs will use the largest value it supports within the constraints.</p> |

xargs(1)

- t Enable trace mode. Each generated command line will be written to standard error just prior to invocation.
- x Terminate if a command line containing *number* arguments (see the -n option above) or *number* lines (see the -L option above) will not fit in the implied or specified size (see the -s option above).

**OPERANDS** The following operands are supported:

- utility* The name of the utility to be invoked, found by search path using the PATH environment variable; see `environ(5)`. If *utility* is omitted, the default is the `echo(1)` utility. If the *utility* operand names any of the special built-in utilities in `shell_builtins(1)`, the results are undefined.
- argument* An initial option or operand for the invocation of *utility*.

**USAGE** The 255 exit status allows a utility being used by `xargs` to tell `xargs` to terminate if it knows no further invocations using the current data stream will succeed. Thus, *utility* should explicitly `exit` with an appropriate value to avoid accidentally returning with 255.

Note that input is parsed as lines; blank characters separate arguments. If `xargs` is used to bundle output of commands like `find dir -print` or `ls` into commands to be executed, unexpected results are likely if any filenames contain any blank characters or newline characters. This can be fixed by using `find` to call a script that converts each file found into a quoted string that is then piped to `xargs`. Note that the quoting rules used by `xargs` are not the same as in the shell. They were not made consistent here because existing applications depend on the current rules and the shell syntax is not fully compatible with it. An easy rule that can be used to transform any string into a quoted form that `xargs` will interpret correctly is to precede each character in the string with a backslash (`\`).

On implementations with a large value for `{ARG_MAX}`, `xargs` may produce command lines longer than `{LINE_MAX}`. For invocation of utilities, this is not a problem. If `xargs` is being used to create a text file, users should explicitly set the maximum command line length with the `-s` option.

The `xargs` utility returns exit status 127 if an error occurs so that applications can distinguish “failure to find a utility” from “invoked utility exited with an error indication.” The value 127 was chosen because it is not commonly used for other meanings; most utilities use small values for “normal error conditions” and the values above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could be found, but not invoked.

**EXAMPLES** **EXAMPLE 1** Using The `xargs` Command

The following will move all files from directory \$1 to directory \$2, and echo each move command just before doing it:

## xargs(1)

### EXAMPLE 1 Using The xargs Command (Continued)

```
ls $1 | xargs -I {} -t mv $1/{} $2/{}
```

The following command will combine the output of the parenthesised commands onto one line, which is then written to the end of file `log`:

```
(logname; date; printf "%s\n" "$0 $*") | xargs >>log
```

The following command will invoke `diff` with successive pairs of arguments originally typed as command line arguments (assuming there are no embedded blank characters in the elements of the original argument list):

```
printf "%s\n" "$*" | xargs -n 2 -x diff
```

The user is asked which files in the current directory are to be archived. The files are archived into `arch`; `a`, one at a time, or `b`, many at a time:

```
ls | xargs -p -L 1 ar -r arch
ls | xargs -p -L 1 | xargs ar -r arch
```

The following will execute with successive pairs of arguments originally typed as command line arguments:

```
echo $* | xargs -n 2 diff
```

### ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `xargs`: `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `NLSPATH`, and `PATH`.

### EXIT STATUS

The following exit values are returned:

|       |                                                                                                                                                                                           |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0     | All invocations of <i>utility</i> returned exit status 0.                                                                                                                                 |
| 1–125 | A command line meeting the specified requirements could not be assembled, one or more of the invocations of <i>utility</i> returned a non-zero exit status, or some other error occurred. |
| 126   | The utility specified by <i>utility</i> was found but could not be invoked.                                                                                                               |
| 127   | The utility specified by <i>utility</i> could not be found.                                                                                                                               |

If a command line meeting the specified requirements cannot be assembled, the utility cannot be invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits with exit status 255, the `xargs` utility will write a diagnostic message and exit without processing any remaining input.

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>NAME</b>        | xgettext – extract gettext call strings from C programs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>SYNOPSIS</b>    | <b>xgettext</b> [-ns] [-a [-x <i>exclude-file</i> ]] [-c <i>comment-tag</i> ] [-d <i>default-domain</i> ]<br>[-j] [-m <i>prefix</i> ] [-M <i>suffix</i> ] [-p <i>pathname</i> ] -   <i>filename...</i><br><b>xgettext</b> -h                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b> | <p>The <code>xgettext</code> utility is used to automate the creation of portable message files (<code>.po</code>). A <code>.po</code> file contains copies of “C” strings that are found in ANSI C source code in <i>filename</i> or the standard input if ‘-’ is specified on the command line. The <code>.po</code> file can be used as input to the <code>msgfmt(1)</code> utility, which produces a binary form of the message file that can be used by application during run-time.</p> <p><code>xgettext</code> writes <i>msgid</i> strings from <code>gettext(3C)</code> calls in <i>filename</i> to the default output file <code>messages.po</code>. The default output file name can be changed by <code>-d</code> option. <i>msgid</i> strings in <code>dgettext()</code> calls are written to the output file <code>domainname.po</code> where <code>domainname</code> is the first parameter to the <code>dgettext()</code> call.</p> <p>By default, <code>xgettext</code> creates a <code>.po</code> file in the current working directory, and each entry is in the same order that the strings are extracted from <i>filenames</i>. When the <code>-p</code> option is specified, the <code>.po</code> file is created in the <i>pathname</i> directory. An existing <code>.po</code> file is overwritten.</p> <p>Duplicate <i>msgids</i> are written to the <code>.po</code> file as comment lines. When the <code>-s</code> option is specified, the <code>.po</code> is sorted by the <i>msgid</i> string, and all duplicated <i>msgids</i> are removed. All <i>msgstr</i> directives in the <code>.po</code> file are empty unless the <code>-m</code> option is used.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li>-n                   Add comment lines to the output file indicating file name and line number in the source file where each extracted string is encountered. These lines appear before each <i>msgid</i> in the following format:<br/><br/># # File: <i>filename</i>, line: <i>line-number</i></li><li>-s                   Generate output sorted by <i>msgids</i> with all duplicate <i>msgids</i> removed.</li><li>-a                   Extract all strings, not just those found in <code>gettext(3C)</code>, and <code>dgettext()</code> calls. Only one <code>.po</code> file is created.</li><li>-c <i>comment-tag</i>    The comment block beginning with <i>comment-tag</i> as the first token of the comment block is added to the output <code>.po</code> file as # delimited comments. For multiple domains, <code>xgettext</code> directs comments and messages to the prevailing text domain.</li><li>-d <i>default-domain</i>  Rename default output file from <code>messages.po</code> to <i>default-domain.po</i>.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

- j Join messages with existing message files. If a .po file does not exist, it is created. If a .po file does exist, new messages are appended. Any duplicate `msgid`s are commented out in the resulting .po file. Domain directives in the existing .po file are ignored. Results not guaranteed if the existing message file has been edited.
- m *prefix* Fill in the `msgstr` with *prefix*. This is useful for debugging purposes. To make `msgstr` identical to `msgid`, use an empty string (" ") for *prefix*.
- M *suffix* Fill in the `msgstr` with *suffix*. This is useful for debugging purposes.
- p *pathname* Specify the directory where the output files will be placed. This option overrides the current working directory.
- x *exclude-file* Specify a .po file that contains a list of `msgid`s that are not to be extracted from the input files. The format of *exclude-file* is identical to the .po file. However, only the `msgid` directive line in *exclude-file* is used. All other lines are simply ignored. The -x option can only be used with the -a option.
- h Print a help message on the standard output.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWloc         |

**SEE ALSO** `msgfmt(1)`, `gettext(3C)`, `attributes(5)`

**NOTES** `xgettext` is not able to extract cast strings, for example ANSI C casts of literal strings to `(const char *)`. This is unnecessary anyway, since the prototypes in `<libintl.h>` already specify this type.

In messages and translation notes, lines greater than 2048 characters are truncated to 2048 characters and a warning message is printed to `stderr`.

## xstr(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>NAME</b>        | <code>xstr</code> – extract strings from C programs to implement shared strings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SYNOPSIS</b>    | <pre><b>xstr</b> -c <i>filename</i> [-v] [-l <i>array</i>]<br/><b>xstr</b> [-l <i>array</i>]<br/><b>xstr</b> <i>filename</i> [-v] [-l <i>array</i>]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DESCRIPTION</b> | <p><code>xstr</code> maintains a file called <code>strings</code> into which strings in component parts of a large program are hashed. These strings are replaced with references to this common area. This serves to implement shared constant strings, which are most useful if they are also read-only.</p> <p>The command:</p> <pre>example% xstr -c <i>filename</i></pre> <p>extracts the strings from the C source in <code>name</code>, replacing string references by expressions of the form <code>&amp;xstr[<i>number</i>]</code> for some <code>number</code>. An appropriate declaration of <code>xstr</code> is prepended to the file. The resulting C text is placed in the file <code>x.c</code>, to then be compiled. The strings from this file are placed in the <code>strings</code> data base if they are not there already. Repeated strings and strings which are suffixes of existing strings do not cause changes to the data base.</p> <p>After all components of a large program have been compiled, a file declaring the common <code>xstr</code> space called <code>xs.c</code> can be created by a command of the form:</p> <pre>example% xstr</pre> <p>This <code>xs.c</code> file should then be compiled and loaded with the rest of the program. If possible, the array can be made read-only (shared) saving space and swap overhead.</p> <p><code>xstr</code> can also be used on a single file. A command:</p> <pre>example% xstr <i>filename</i></pre> <p>creates files <code>x.c</code> and <code>xs.c</code> as before, without using or affecting any <code>strings</code> file in the same directory.</p> <p>It may be useful to run <code>xstr</code> after the C preprocessor if any macro definitions yield strings or if there is conditional code which contains strings which may not, in fact, be needed. <code>xstr</code> reads from the standard input when the argument <code>'-'</code> is given. An appropriate command sequence for running <code>xstr</code> after the C preprocessor is:</p> <pre>example% cc -E name.c   xstr -c -<br/>example% cc -c x.c<br/>example% mv x.o name.o</pre> <p><code>xstr</code> does not touch the file <code>strings</code> unless new items are added; thus <code>make(1S)</code> can avoid remaking <code>xs.o</code> unless truly necessary.</p> |

**OPTIONS**

`-c filename` Take C source text from *filename*.

`-v` Verbose: display a progress report indicating where new or duplicate strings were found.

`-l array` Specify the named *array* in program references to abstracted strings. The default array name is `xstr`.

**FILES**

`strings` data base of strings

`x.c` massaged C source

`xs.c` C source for definition of array "`xstr*(rq`

`/tmp/xs*` temp file when `xstr filename` doesn't touch `strings`

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `make(1S)`, `attributes(5)`

**BUGS** If a string is a suffix of another string in the data base, but the shorter string is seen first by `xstr` both strings will be placed in the data base, when just placing the longer one there would do.

**NOTES** Be aware that `xstr` indiscriminately replaces all strings with expressions of the form `&xstr[number]` regardless of the way the original C code might have used the string. For example, you will encounter a problem with code that uses `sizeof()` to determine the length of a literal string because `xstr` will replace the literal string with a pointer that most likely will have a different size than the string's. To circumvent this problem:

- use `strlen()` instead of `sizeof()`; note that `sizeof()` returns the size of the array (including the null byte at the end), whereas `strlen()` doesn't count the null byte. The equivalent of `sizeof("xxx")` really is `(strlen("xxx")+1)`.
- use `#define` for operands of `sizeof()` and use the define'd version. `xstr` ignores `#define` statements. Make sure you run `xstr` on *filename* before you run it on the preprocessor.

You will also encounter a problem when declaring an initialized character array of the form

```
char x[] = "xxx";
```

`xstr` will replace `xxx` with an expression of the form `&xstr[number]` which will not compile. To circumvent this problem, use `static char *x = "xxx"` instead of `static char x[] = "xxx"`.

## yacc(1)

| <b>DESCRIPTION</b> | <p>The yacc command converts a context-free grammar into a set of tables for a simple automaton that executes an LALR(1) parsing algorithm. The grammar may be ambiguous; specified precedence rules are used to break ambiguities.</p> <p>The output file, <code>y.tab.c</code>, must be compiled by the C compiler to produce a function <code>yyparse()</code>. This program must be loaded with the lexical analyzer program, <code>yylex()</code>, as well as <code>main()</code> and <code>yyerror()</code>, an error handling routine. These routines must be supplied by the user; the <code>lex(1)</code> command is useful for creating lexical analyzers usable by yacc.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li><code>-b <i>file_prefix</i></code> Use <i>file_prefix</i> instead of <code>y</code> as the prefix for all output files. The code file <code>y.tab.c</code>, the header file <code>y.tab.h</code> (created when <code>-d</code> is specified), and the description file <code>y.output</code> (created when <code>-v</code> is specified), will be changed to <code>file_prefix.tab.c</code>, <code>file_prefix.tab.h</code>, and <code>file_prefix.output</code>, respectively.</li><li><code>-d</code> Generates the file <code>y.tab.h</code> with the <code>#define</code> statements that associate the yacc user-assigned “token codes” with the user-declared “token names.” This association allows source files other than <code>y.tab.c</code> to access the token codes.</li><li><code>-l</code> Specifies that the code produced in <code>y.tab.c</code> will not contain any <code>#line</code> constructs. This option should only be used after the grammar and the associated actions are fully debugged.</li><li><code>-P <i>parser</i></code> Allows you to specify the parser of your choice instead of <code>/usr/ccs/bin/yaccpar</code>. For example, you can specify:<br/><pre>example% yacc -P ~/myparser parser.y</pre></li><li><code>-p <i>sym_prefix</i></code> Use <i>sym_prefix</i> instead of <code>yy</code> as the prefix for all external names produced by yacc. The names affected include the functions <code>yyparse()</code>, <code>yylex()</code> and <code>yyerror()</code>, and the variables <code>yyval</code>, <code>yychar</code> and <code>yydebug</code>. (In the remainder of this section, the six symbols cited are referenced using their default names only as a notational convenience.) Local names may also be affected by the <code>-p</code> option; however, the <code>-p</code> option does not affect <code>#define</code> symbols generated by yacc.</li><li><code>-Q[y   n]</code> The <code>-Qy</code> option puts the version stamping information in <code>y.tab.c</code>. This allows you to know what version of yacc built the file. The <code>-Qn</code> option (the default) writes no version information.</li></ul> |

- t           Compiles runtime debugging code by default. Runtime debugging code is always generated in `y.tab.c` under conditional compilation control. By default, this code is not included when `y.tab.c` is compiled. Whether or not the `-t` option is used, the runtime debugging code is under the control of `YYDEBUG`, a preprocessor symbol. If `YYDEBUG` has a non-zero value, then the debugging code is included. If its value is 0, then the code will not be included. The size and execution time of a program produced without the runtime debugging code will be smaller and slightly faster.
- V           Prints on the standard error output the version information for yacc.
- v           Prepares the file `y.output`, which contains a description of the parsing tables and a report on conflicts generated by ambiguities in the grammar.

**OPERANDS**   The following operand is required:

*file*        A path name of a file containing instructions for which a parser is to be created.

**EXAMPLES**   **EXAMPLE 1** Using The yacc Command

Access to the yacc library is obtained with library search operands to `cc`. To use the yacc library main,

```
example% cc y.tab.c -ly
```

Both the `lex` library and the `yacc` library contain `main`. To access the `yacc` main,

```
example% cc y.tab.c lex.yy.c -ly -ll
```

This ensures that the `yacc` library is searched first, so that its `main` is used.

The historical `yacc` libraries have contained two simple functions that are normally coded by the application programmer. These library functions are similar to the following code:

```
#include <locale.h>
int main(void)
{
 extern int yyparse();

 setlocale(LC_ALL, "");

 /* If the following parser is one created by lex, the
 application must be careful to ensure that LC_CTYPE
 and LC_COLLATE are set to the POSIX locale. */
 (void) yyparse();
 return (0);
}

#include <stdio.h>
```

## yacc(1)

### EXAMPLE 1 Using The yacc Command *(Continued)*

```
int yyerror(const char *msg)
{
 (void) fprintf(stderr, "%s\n", msg);
 return (0);
}
```

### ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `yacc`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

`yacc` can handle characters from EUC primary and supplementary codesets as one-token symbols. EUC codes may only be single character quoted terminal symbols. `yacc` expects `yylex()` to return a wide character (`wchar_t`) value for these one-token symbols.

### EXIT STATUS

The following exit values are returned:

0           Successful completion.  
>0          An error occurred.

### FILES

`y.output`       state transitions of the generated parser  
`y.tab.c`        source code of the generated parser  
`y.tab.h`        header file for the generated parser  
`yacc.acts`     temporary file  
`yacc.debug`    temporary file  
`yacc.tmp`      temporary file  
`yaccpar`       parser prototype for C programs

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWbtool       |

### SEE ALSO

`cc(1B)`, `lex(1)`, `attributes(5)`, `environ(5)`

### DIAGNOSTICS

The number of reduce-reduce and shift-reduce conflicts is reported on the standard error output; a more detailed report is found in the `y.output` file. Similarly, if some rules are not reachable from the start symbol, this instance is also reported.

### NOTES

Because file names are fixed, at most one `yacc` process can be active in a given directory at a given time.

**NAME** ypcat – print values in a NIS database

**SYNOPSIS** **ypcat** [-kx] [-d *ypdomain*] *mname*

**DESCRIPTION** The *ypcat* command prints out values in the NIS name service map specified by *mname*, which may be either a map name or a map nickname. Since *ypcat* uses the NIS network services, no NIS server is specified.

Refer to *ypfiles*(4) for an overview of the NIS name service.

**OPTIONS**

- k Display the keys for those maps in which the values are null or the key is not part of the value. None of the maps derived from files that have an ASCII version in */etc* fall into this class.
- d *ypdomain* Specify a domain other than the default domain.
- x Display map nicknames.

**ATTRIBUTES** See *attributes*(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

**SEE ALSO** *ypmatch*(1), *ypfiles*(4), *attributes*(5)

## ypmatch(1)

| <b>NAME</b>        | ypmatch – print the value of one or more keys from a NIS map                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |              |          |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|----------|
| <b>SYNOPSIS</b>    | <b>ypmatch</b> [-k] [-t] [-d <i>domain</i> ] <i>key</i> [ <i>key...</i> ] <i>mname</i><br><b>ypmatch</b> -x                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |          |
| <b>DESCRIPTION</b> | <p>ypmatch prints the values associated with one or more keys from the NIS's name services map specified by <i>mname</i>, which may be either a map name or a map nickname.</p> <p>Multiple keys can be specified; all keys will be searched for in the same map. The keys must be the same case and length. No pattern matching is available. If a key is not matched, a diagnostic message is produced.</p>                                               |                |                 |              |          |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li>-k Before printing the value of a key, print the key itself, followed by a colon (:).</li><li>-t Inhibit map nickname translation.</li><li>-d <i>domain</i> Specify a domain other than the default domain.</li><li>-x Display the map nickname table. This lists the nicknames the command knows of, and indicates the map name associated with each nickname.</li></ul> |                |                 |              |          |
| <b>OPERANDS</b>    | <p>The following operand is supported:</p> <p><i>mname</i> The NIS's name services map</p>                                                                                                                                                                                                                                                                                                                                                                  |                |                 |              |          |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <ul style="list-style-type: none"><li>0 Successful operation.</li><li>1 An error occurred.</li></ul>                                                                                                                                                                                                                                                                                                         |                |                 |              |          |
| <b>ATTRIBUTES</b>  | <p>See <code>attributes(5)</code> for descriptions of the following attributes:</p> <table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Availability</td><td>SUNWnisu</td></tr></tbody></table>                                                                                                                                                                                                         | ATTRIBUTE TYPE | ATTRIBUTE VALUE | Availability | SUNWnisu |
| ATTRIBUTE TYPE     | ATTRIBUTE VALUE                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |          |
| Availability       | SUNWnisu                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |          |
| <b>SEE ALSO</b>    | ypcat(1), ypfiles(4), attributes(5)                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |          |
| <b>NOTES</b>       | ypmatch will fail with an RPC error message on yp operation if enough file descriptors are not available. The number of file descriptors should be increased if this occurs.                                                                                                                                                                                                                                                                                |                |                 |              |          |

| <b>DESCRIPTION</b> | <p>yppasswd changes the network password associated with the user <i>username</i> in the Network Information Service (NIS+) database. If the user has done a <code>keylogin(1)</code>, and a <code>publickey/secretkey</code> pair exists for the user in the NIS <code>publickey.byname</code> map, yppasswd also re-encrypts the secretkey with the new password. The NIS password may be different from the local one on your own machine. Use <code>passwd(1)</code> to change the password information on the local machine, and <code>nispasswd(1)</code> to change the password information stored in Network Information Service Plus, Version 3 (NIS+).</p> <p>yppasswd prompts for the old NIS password, and then for the new one. You must type in the old password correctly for the change to take effect. The new password must be typed twice, to forestall mistakes.</p> <p>New passwords must be at least four characters long, if they use a sufficiently rich alphabet, and at least six characters long if monospace. These rules are relaxed if you are insistent enough. Only the owner of the name or the super-user may change a password; superuser on the root master will not be prompted for the old password, and does not need to follow password construction requirements.</p> <p>The NIS password daemon, <code>rpc.yppasswdd</code> must be running on your NIS server in order for the new password to take effect.</p> |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |                 |              |         |

| <b>WARNINGS</b>    | Even after the user has successfully changed his or her password using this command, the subsequent <code>login(1)</code> using the new password will be successful only if the user's password and shadow information is obtained from NIS, (see <code>getpwnam(3C)</code> , <code>getspnam(3C)</code> , and <code>nsswitch.conf(4)</code> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |         |
| <b>NOTES</b>       | The use of yppasswd is discouraged, as it is now only a link to the <code>passwd(1)</code> command, which should be used instead. Using <code>passwd(1)</code> with the <code>-r nis</code> option will achieve the same results, and will be consistent across all the different name services available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |         |
| <b>BUGS</b>        | The update protocol passes all the information to the server in one RPC call, without ever looking at it. Thus if you type your old password incorrectly, you will not be notified until after you have entered your new password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |

## ypwhich(1)

**NAME** ypwhich – return name of NIS server or map master

**SYNOPSIS** **ypwhich** [-d *domain*] [ [-t] -m [*mname*] | [-Vn] *hostname*]  
**ypwhich** -x

**DESCRIPTION** ypwhich returns the name of the NIS server that supplies the NIS name services to a NIS client, or which is the master for a map. If invoked without arguments, it gives the NIS server for the local machine. If *hostname* is specified, that machine is queried to find out which NIS master it is using.

Refer to ypfiles(4) for an overview of the NIS name services.

**OPTIONS**

- d *domain* Use *domain* instead of the default domain.
- t This option inhibits map nickname translation.
- m *mname* Find the master NIS server for a map. No *hostname* can be specified with -m. *mname* can be a mapname, or a nickname for a map. When *mname* is omitted, produce a list of available maps.
- x Display the map nickname translation table.
- Vn Version of ypbind, V3 is default.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

**SEE ALSO** ypfiles(4), attributes(5)

## A

- a new version of the network information name service — nis+, 955
- a new version of the network information name service — NIS+, 955
- a new version of the network information name service — nis, 955
- accounting
  - search and print files — acctcom, 28
- acctcom — search and print process accounting files, 28
- adb — debugger, 31
- adb — general-purpose debugger
  - ?, /, and = Modifiers, 33
  - ? and / Modifiers, 35
  - \$ Modifier, 36
  - : Modifier, 35
  - Binary Operators, 32
  - Commands, 33
  - Expressions, 32
  - Unary Operators, 32
  - Variables, 32
  - Verbs, 33
- addbib — create or extend bibliography, 40
- adds /dev entries to give SunOS 4.x compatible names to SunOS 5.x devices —
  - ucblinks, 1503
- alias — shell built-in functions to create your own pseudonym or shorthand for a command or series of commands, 42
- aliases
  - collected by sendmail — praliases, 1127
  - answerbook2 — online documentation system, 45
  - appcert — examine application-level products for unstable use of Solaris interfaces, 46
  - apply changes to files — patch, 1054
  - apptrace — trace application function calls to Solaris shared libraries, 54
  - apropos — locate commands by keyword, 58
  - ar — maintain portable archive or library, 60
  - arch — display architecture of current host, 64
  - archive
    - maintain a portable one across all machines — ar, 60
  - archives
    - create tape archives, and add or extract files — tar, 1412
  - as — assembler, 65
  - asa — convert FORTRAN carriage-control output to printable form, 69
  - assembler
    - as, 65
  - at — execute commands at a later time, 71, 246
  - atq — display the jobs queued to run at specified times, 77
  - atrm — remove jobs spooled by at or batch, 78
  - audio file formats
    - convert — audioconvert, 79
  - audio files
    - play — audioplay, 83
    - record — audiorecord, 86
  - audioconvert — convert audio file formats, 79
  - audioplay — play audio files, 83

audiorecord — record an audio file, 86  
authentication and authorization for network environment  
— kerberos, 567  
auths — print authorizations granted to a user, 89  
awk — pattern scanning and processing language, 90

## B

banner — make posters, 95  
basename — display portions of pathnames, 98  
basename — strips affixes from path names, 96  
batch — execute commands at a later time, 71, 246  
bc — arbitrary precision arithmetic language, 99  
bdiff — display line-by-line differences between pairs of large text files, 103  
bfs — big file scanner, 104  
bfs Commands, 104  
bg — shell built-in functions to control process execution, 554  
bibliography  
create an inverted index to a bibliographic database — indexbib, 542  
create or extend — addbib, 40  
expand and insert references from a bibliographic database — refer, 1194  
find references in a bibliographic database — lookbib, 739  
format and print a bibliographic database — roffbib, 1217  
sort a bibliographic database — sortbib, 1355  
biff — mail notifier, 108  
big file scanner — bfs, 104  
binary file transmission  
decode binary file — uuencode, 1525  
encode binary file — uuencode, 1525  
binary files  
find printable strings — strings, 1371  
locate — whereis, 1577

block count  
for a file — sum, 1391  
blocks, count a in file — sum, 1392  
Bourne shell  
— sh, 1314  
Bourne shell commands  
login command, 1325  
Bourne shell variables, 1317  
— CDPATH, 1317  
— HOME, 1317  
— IFS, 1318  
— MAIL, 1317  
— MAILCHECK, 1317  
— MAILPATH, 1318  
— PATH, 1317  
— PS1, 1318  
— PS2, 1318  
— SHACCT, 1318  
— SHELL, 1318  
break — shell built-in functions to escape from or advance within a controlling while, for, foreach, or until loop, 109  
build programs — make, 810

## C

C compiler, 120  
C language  
C preprocessor — cpp, 196  
C language program  
resolve and remove ifdef'ed lines from C program source — unifdef, 1511  
C program verifier — lint, 698  
C programming language  
create C error messages — mkstr, 890  
extract strings from C code — xstr, 1598  
formats program in nice style using troff — vgrind, 1547  
C shell  
aliases — csh, 224  
built-in commands — csh, 231  
command and filename substitution — csh, 227  
command execution — csh, 230  
command line parsing — csh, 222  
command substitution — csh, 227

## C shell (*continued*)

- control flow — csh, 230
- environment variables and shell variables — csh, 240
- event designators — csh, 222
- expressions and operators — csh, 228
- filename completion — csh, 221
- filename substitution — csh, 228
- history substitution — csh, 222
- I/O redirection — csh, 225
- initialization and termination — csh, 220
- interactive operation — csh, 220
- job control — csh, 231
- lexical structure — csh, 221
- modifiers — csh, 224
- noninteractive operation — csh, 220
- quick substitution — csh, 224
- signal handling — csh, 230
- status reporting — csh, 231
- variable substitution — csh, 226
- word designators — csh, 223

## C shell commands

- :, 231
- %, 239
- @, 239
- alias, 232
- bg, 232
- break, 232
- breaksw, 232
- case, 232
- cd, 232
- chdir, 232
- continue, 232
- default, 232
- dirs, 232
- echo, 232
- else, 234
- end, 233
- endif, 234
- eval, 232
- exec, 233
- exit, 233
- fg, 233
- foreach, 233
- glob, 233
- goto, 233
- hashstat, 233

## C shell commands (*continued*)

- history, 233
  - if, 234
  - jobs, 234
  - kill, 234
  - limit, 234
  - login, 235
  - logout, 235
  - nice, 235
  - nohup, 236
  - notify, 236
  - onintr, 236
  - popd, 236
  - pushd, 236
  - rehash, 236
  - repeat, 236
  - set, 236
  - setenv, 237
  - shift, 237
  - source, 237
  - stop, 238
  - suspend, 238
  - switch, 238
  - time, 238
  - umask, 238
  - unalias, 238
  - unhash, 239
  - unlimit, 239
  - unset, 239
  - unsetenv, 239
  - wait, 239
  - while, 239
- cal — display a calendar, 111
- calculator, desk
  - dc, 266
- calendar — reminder service, 112
- calendar
  - display — cal, 111
- call-graph, display profile data — gprof, 499
- call rmmount to mount or unmount media — volrmmount, 1565
- cancel — cancel print requests, 114
- cancel user's request for removable media that is not currently in drive — volcancel, 1561
- case — shell built-in functions to choose from among a list of actions, 116
- cat — concatenate and display files, 118

cc — C compiler, 120  
 cd — shell built-in functions to change the current working directory, 122  
 CDPATH variable — sh, 1317  
 change a user's Kerberos password — kpasswd, 581  
 change file access and modification times — touch, 1500  
 change file access and modification times — settime, 1464 — touch, 1464  
 character translation — tr, 1473, 1478  
 chdir — shell built-in functions to change the current working directory, 122  
 check spelling — spell, 1359  
 check for media in a drive — volcheck, 1562  
 check path names — pathchk, 1059  
 checkeq — check eqn constructs, 333  
 checknr — check nroff/troff files, 125  
 chgrp — change the group ownership of a file, 126  
 chmod — change the permissions mode of a file, 130  
 chown — change owner of file, 136, 138  
 cksum — write file checksums and sizes, 160  
 clear — clear terminal screen, 168  
 cmp — compare two files, 169  
 cocheck — (FMLI utility) communicate with a process, 181  
 cocreate — (FMLI utility) communicate with a process, 181  
 code formatter  
   formats program in nice style using troff — vgrind, 1547  
 code set  
   conversion utility — iconv, 529  
 codestroy — (FMLI utility) communicate with a process, 181  
 col — filters reverse line-feeds from two-column nroff text, 171  
 comm — select or reject lines common to two files, 173  
 command — execute a simple command, 175  
 command  
   describe — whatis, 1576  
 command options  
   parse — getopt, 484  
 command options (*continued*)  
   parse — getoptcv, 486  
 commands  
   display the last commands executed, in reverse order — lastcomm, 637  
   locate a command; display its pathname or alias — which, 1579  
   locate by keyword — apropos, 58  
 communications  
   connect to remote system — cu, 254  
   connect to remote system — tip, 1449  
   decode binary files — uudecode, 1525  
   encode binary files — uuencode, 1525  
   system to system command execution — uux, 1536  
   talk to another user — talk, 1409  
   UNIX-to-UNIX copy — uucp, 1521  
   user interface to a remote system using the TELNET protocol — telnet, 1426  
   UUCP list of names — uuname, 1521  
   UUCP log — uulog, 1521  
   write to another user — write, 1588  
 Compaq Smart-2 EISA/PCI and Smart-2SL PCI Array Controller ioctl utility — smart2cfg, 1342  
 compilers  
   C compiler — cc, 120  
   C program verifier — lint, 698  
   regular expression compile — regcmp, 1196  
   RPC protocol compiler — rpcgen, 1221  
 compress — compress files, 178  
 concatenate  
   files and display them — cat, 118  
 configure LLC2 interface parameters — llc\_config, 702  
 configure runtime linking environment — crle, 206  
 connect to remote system  
   — cu, 254  
 construct argument lists and invoke utility — xargs, 1591  
 continue — shell built-in functions to escape from or advance within a controlling while, for, foreach, or until loop, 109  
 control  
   audio mixer control — mixerctl, 884  
 control line printer — lpc, 748

control tracing and manipulate probe points in a process or the kernel — prex, 1128

convert binary log file to Common Log File format — ncab2clf, 936

convert binary TNF file to ASCII — tnfdump, 1458

convert FORTRAN carriage-control output to printable form — asa, 69

convert units — units, 1515

coproc — (FMLI utility) communicate with a process, 181

copy

- archives — cpio, 188
- files — cp, 185

core image

- of running processes — gcore, 445

coreceive — (FMLI utility) communicate with a process, 181

cosend — (FMLI utility) communicate with a process, 181

count blocks in file — sum, 1392

count lines, words, characters in file — wc, 1573

cp — copy files, 185

cpio — copy archives, 188

cpp — C preprocessor, 196

cpustrack — monitor process and LWP behavior using CPU performance counters, 202

create

- bibliography — addbib, 40
- create a tags file for use with ex and vi — ctags, 251

create new task — newtask, 951

crle — configure runtime linking environment, 206

crontab — user crontab file, 215

crypt — encrypt, 219

csh — shell command interpreter with a C-like syntax, 220

csplit — split files based on context, 246

ct — spawn login to a remote terminal, 249

ctags — create a tags file for use with ex and vi, 251

cu — connect to remote system, 254

curve, smooth

- interpolate — spline, 1362

cut — cut out selected fields of each line of a file, 260

## D

date — display date and/or set date, 263

date

- prompts for a date — ckdate, 139
- provides error message for date — errdate, 139
- provides help message for date — helpdate, 139
- validates a date — valdate, 139

debug tools

- debugger — adb, 31

decode binary file — uuencode, 1525

decode files

- crypt, 219

decrypt — crypt, 219

define locale environment — localedef, 722

dependencies, dynamic

- of executable files or shared objects — ldd, 669

deroff — remove nroff, troff, tbl and eqn constructs, 270

describe command — whatis, 1576

describe instruction set architectures — isainfo, 551

desk calculator

- dc, 266

determine which variant instruction set is optimal to use — optisa, 1040

devices

- eject media device from drive — eject, 324

df — display status of disk space on file systems, 271

dhcpinfo — display value of parameters received through DHCP, 272

dictionary, system

- find words — look, 738

diff — display line-by-line differences between pairs of text files, 274

diff

- 3-way — diff3, 278
- big — bdiff, 103

diff command  
 side-by-side — `sdiff`, 1287

`diff3` — display line-by-line differences between three text files, 278

`diffmk` — mark differences between versions of a troff input file, 280

`digestp` — frontends to the mp Text to PDL (Printer Description Language) pretty print filter, 783

`dircmp` — compares contents of directories, 281

directories  
 compare contents — `dircmp`, 281  
 list contents — `ls`, 764  
 list contents of — `ls`, 770  
 make — `mkdir`, 886  
 make link to — `ln`, 715  
 print working directory name — `pwd`, 1180  
 remove — `rmdir`, 1208

`dirname` — delivers all but last level of path name, 96

`dirs` — shell built-in functions to change the current working directory, 122

`dis` — object code disassembler, 282

`disable` — disable LP printers, 329

disassembler  
 object code — `dis`, 282

display editor — `vi`, 1550

display  
 a list of all valid user names — `dispuid`, 285  
 architecture of current host — `arch`, 64  
 call-graph profile data — `gprof`, 499  
 contents of directory — `ls`, 764  
 current news — `news`, 950  
 — `date`, 263  
 disk usage — `du`, 293  
 dynamic dependencies of executable files or shared objects — `ldd`, 669  
 effective user name — `whoami`, 1585  
 file names — `ls`, 770  
 first few lines of files — `head`, 516  
 group membership of user — `groups`, 511  
 how long the system has been up — `uptime`, 1519  
 identifier of current host — `hostid`, 527  
 last commands executed, in reverse order — `lastcomm`, 637

display (*continued*)  
 list of all valid group names — `dispgid`, 284  
 login and logout information about users and terminals — `last`, 635  
 name of current host — `hostname`, 528  
 name of the user running the process — `logname`, 736  
 printer queue — `lpq`, 752  
 process status — `ps`, 1174  
 processor type of current host — `mach`, 778  
 selected lines from file — `sed`, 1296  
 size of page of memory — `pagesize`, 1044  
 status of disk space on file system — `df`, 271  
 status of local hosts — `ruptime`, 1234  
 status of network hosts — `rup`, 1232  
 users on system — `users`, 1520  
 working directory name — `pwd`, 1180

display discretionary file information — `getfacl`, 478

display information about currently logged-in users — `w`, 1568

display names and references bound in FNS context — `fnlist`, 418

display package parameter values — `pkgparam`, 1095

display profile data — `prof`, 1158

display reference bound to FNS name — `fnlookup`, 420

display the internal versioning information of dynamic objects — `pvs`, 1177

display the native instruction sets executable on this platform — `isalist`, 553

display value of parameters received through DHCP — `dhcinfo`, 272

document production  
 check spelling — `spell`, 1359  
 check nroff/troff files — `checknr`, 125  
 create an inverted index to a bibliographic database — `indexbib`, 542  
 create or extend bibliography — `addbib`, 40  
 eliminate .so's from nroff input — `soelim`, 1344  
 expand and insert references from a bibliographic database — `refer`, 1194  
 filters reverse line-feeds from two-column nroff text — `col`, 171

document production (*continued*)

- find references in a bibliographic database — lookbib, 739
- format and print a bibliographic database — roffbib, 1217
- format documents for display or line-printer — nroff, 1029
- format tables for nroff or troff — tbl, 1422
- mark differences between versions of a troff input file — diffmk, 280
- remove nroff, troff, tbl and eqn constructs — deroff, 270
- simple text formatters — fmt, 408
- sort a bibliographic database — sortbib, 1355
- troff postprocessor for PostScript printers — dpost, 290
- typeset mathematics — eqn, 333
- typeset or format documents — troff, 1481

DOS

- convert text file from DOS format to ISO format — dos2unix, 286
- convert text file from ISO format to DOS format — unix2dos, 1517

dos2unix — convert text file from DOS format to ISO format, 286

download — host resident PostScript font downloader, 288

download — prepends host resident PostScript fonts to files, 288

dpost — troff postprocessor for PostScript printers, 290

draw graph — graph, 504

du — display disk usage per directory or file, 293

dump — dump selected parts of an object file, 295

dump selected parts of an object file — dump, 295

dump selected parts of an object file — elfdump, 327

dumpcs — show codeset table for the current locale, 298

dumpkeys — dump keyboard translation tables, 718

## E

- echo — echo arguments, 299
- echo — (FMLI utility) put string on virtual output, 304
- echo — echo arguments to standard output, 303
- ed — text editor, 305
- edit — text editor, 317
- editing text
  - sed — stream editor, 1296
- egrep — search a file for a pattern using full regular expressions, 321
- eject — eject media device from drive, 324
- elfdump — dump selected parts of an object file, 327
- enable — enable LP printers, 329
- encode binary file — uuencode, 1525
- encode files
  - crypt, 219
- encryption key, user
  - change — chkey, 128
- env — set environment for command invocation, 331
- environment
  - display variables — printenv, 1141
  - set terminal characteristics — tset, 1492
- environment variables, global
  - FMLI, 1307
- eqn — mathematical typesetting, 333
- eqn
  - remove nroff, troff, tbl and eqn constructs — deroff, 270
- equations
  - typeset mathematics — eqn, 333
- error — analyze error messages, 338
- eval — shell built-in functions to execute other commands, 351
- ex — text editor, 342
- examine application-level products for unstable use of Solaris interfaces — appcert, 46
- exec — shell built-in functions to execute other commands, 351
- execute a command in a profile — pfcsh, 1081
- execute a command in a profile — pfexec, 1081
- execute a command in a profile — pfksh, 1081
- execute a command in a profile — pfsh, 1081
- execute commands at a later time — at, 71, 246

execute commands at a later time — batch  
 batch, 71, 246

execute a simple command — command, 175

exit — shell built-in functions to enable the  
 execution of the shell to advance beyond its  
 sequence of steps, 353

expand — expand TAB characters to SPACE  
 characters, 355

export — shell built-in functions to determine  
 the characteristics for environmental  
 variables of the current shell and its  
 descendants, 1302

exportfs — translates exportfs options to  
 share/unshare commands, 357

expr — evaluate arguments as an  
 expression, 358

expr — evaluate expressions, 361

expression evaluation — expr, 361

exstr — extract strings from source files, 364

extract kernel probes output into a trace file —  
 tnfxtract, 1462

extract strings from C code — xstr, 1598

## F

face — executable for the Framed Access  
 Command Environment Interface, 368

factor — obtain the prime factors of a  
 number, 369

false — provide truth values, 1484

fastboot — reboot system without checking  
 disks, 370

fasthalt — halt system without checking  
 disks, 370

fc — shell built-in functions to re-use previous  
 command-lines from the current shell, 518

fdformat — format floppy diskette or PCMCIA  
 memory card, 371

fg — shell built-in functions to control process  
 execution, 554

fgrep — search file for fixed-character  
 string, 376

file — determine file type, 378

file  
 change ownership — chown, 138  
 determine type of — file, 380

file (*continued*)  
 display names — ls, 770  
 files perusal filter for CRTs — pg, 1082  
 make link to — ln, 715  
 print — lpr, 754  
 strip affixes — basename, 98  
 sum — sum and count blocks in file, 1392  
 update last modified date of — touch, 1467

file — get file type, 380

file system  
 display status of disk space — df, 271  
 make hard or symbolic links to files —  
 ln, 712  
 where am I — pwd, 1180

file transfer program  
 — ftp, 434

filep — frontends to the mp Text to PDL (Printer  
 Description Language) pretty print  
 filter, 783

files  
 change owner of file — chown, 136  
 change the permissions mode of a file —  
 chmod, 130  
 compare two files — cmp, 169  
 compress — compress, 178  
 compress files — pack, 1041  
 compress files — pcat, 1041  
 concatenate and display — cat, 118  
 copy — cp, 185  
 copy archives — cpio, 188  
 crypt — encrypt/decrypt, 219  
 cut out selected fields of each line of a file —  
 cut, 260  
 display uncompressed files but leaves  
 compressed files intact — zcat, 178  
 display a count of lines, words and  
 characters in a file — wc, 1573  
 display first few lines — head, 516  
 display last part — tail, 1406  
 display line-by-line differences between pairs  
 of large text files — bdiff, 103  
 display line-by-line differences between pairs  
 of text files — diff, 274  
 display line-by-line differences between three  
 text files — diff3, 278  
 expand compressed files — unpack, 1041

files (*continued*)

- extract SCCS version information from a file
  - what, 1575
  - find, 389
- mark differences between versions of a troff input file — diffmk, 280
- merge same lines of several files or subsequent lines of one file — paste, 1051
- move — mv, 910
- print checksum and block count for a file — sum, 1391
- print differences between two files
  - side-by-side — sdiff, 1287
- remove — rm, 1208
- search a file for a pattern — grep, 506
- search file for fixed-character string — fgrep, 376
- search for a pattern using full regular expressions — egrep, 321
- sort or merge — sort, 1348
- split a file into pieces — split, 1363
- strip affixes from path names —
  - basename, 96
- transfer to and from a remote machine —
  - ftpp, 1440
- uncompress — uncompress, 178

filesync — synchronize files and directories, 382

- Multiple Nomadic Machines, 384
- Rules File, 383

filofaxp — frontends to the mp Text to PDL (Printer Description Language) pretty print filter, 783

find — find files, 389

find or signal processes by name and other attributes

- pgrep, 1087
- pkill, 1087

fmlcut — (FMLI utility) cut out columns from a table or fields from each line of a file, 398

fmlexpr — (FMLI utility) evaluate arguments as an expression, 400

fmlgrep — (FMLI utility) search afile for a pattern, 403

FMLI

- cocheck — communicate with a process, 181
- cocreate — communicate with a process, 181
- codestroy — communicate with a process, 181
- coproc — communicate with a process, 181
- coreceive — communicate with a process, 181
- cosend — communicate with a process, 181
- echo — put string on virtual output, 304
- fmlcut — cut out columns from a table or fields from each line of a file, 398
- fmlexpr — evaluate arguments as an expression, 400
- fmlgrep — search afile for a pattern, 403
- fml\_i — invoke fml\_i, 405
- getfrm — returns the current frameID number, 482
- getitems — returns a list of currently marked menu items, 483
- indicator — displays application specific alarms or working indicator, or both, on FMLI banner line, 541
- message — puts arguments on FMLI message line, 882
- pathconv — converts an alias to its pathname, 1062
- readfile, longline — reads file, gets longest line, 1192
- regex — match patterns against a string, 1198
- reinit — changes the descriptors in the initialization file, 1200
- reset — (FMLI utility) changes the entry in a field of a form to its default value, 1204
- run — runs a program, 1230
- set, unset — set and unset local or global environment variables, 1307
- setcolor — redefine or create a color, 1309
- shell — run a command using shell, 1332
- test — evaluates the expression expression, 1438
- vsig — synchronize a co-process with the controlling FMLI application, 1567

fmt — simple text formatters, 408

fnattr — update and examine attributes associated with FNS named object, 413

fnlist — display names and references bound in FNS context, 418

fnlookup — display reference bound to FNS name, 420

fnrename — rename the binding of an FNS name, 421

FNS

- display names and references — fnlist, 418
- display reference bound to FNS name — fnlookup, 420
- search for FNS objects — fnsearch, 422
- update attributes — fnattr, 413

fnsearch — search for FNS objects with specified attributes, 422

- Displaying Selected Attributes, 424
- Extended Operations, 426
- Filter Arguments, 424
- Grammar of Filter Expressions, 426
- Logical Operators, 423
- Relational Operators, 423
- Simple Filter Expressions, 423
- Wildcarded Strings, 425

fnunbind — unbind the reference from an FNS name, 428

fold — fold long lines, 429

fonts

- prepends host resident PostScript fonts to files — download, 288

for — shell built-in functions to repeatedly execute action(s) for a selected number of times, 431

foreach — shell built-in functions to repeatedly execute action(s) for a selected number of times, 431

format floppy diskette or PCMCIA memory card — fdformat, 371

formatters, text

- fmt, 408

Forms and Menu Language Interpreter, *See* FMLI

FORTRAN

- create a tags file for use with ex and vi — ctags, 251

Framed Access Command Environment, *See* face

frameID number (FMLI utility) — getfrm, 482

franklinp — frontends to the mp Text to PDL (Printer Description Language) pretty print filter, 783

from — sender of mail messages, 433

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — digestp, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — filep, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — filofxp, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — franklinp, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — mailp, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — newsp, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — timemanp, 783

frontends to the mp Text to PDL (Printer Description Language) pretty print filter — timesysp, 783

ftp — file transfer program, 434

function — shell built-in command to define a function which is usable within this shell, 444

function calls

- trace application function calls to Solaris shared libraries — appttrace, 54

## G

gcore — get core images of running processes, 445

gencat — generate a formatted message catalog, 446

generate iconv code conversion tables — geniconvtbl, 449

generate LLC2 configuration files —  
 llc\_autoconfig, 701

generate message source file from source files —  
 genmsg, 467

generate programs for lexical tasks — lex, 681

geniconvtbl — generate iconv code conversion  
 tables, 449

genmsg — generate message source file from  
 source files, 467  
 Auto Message Numbering, 467  
 Comment Extraction, 467  
 Invocation, 467  
 Testing, 467

get configuration values — getconf, 473

get locale-specific information — locale, 719

get or set the resource limits of running  
 processes  
 — plimit, 1101

getconf — get configuration values, 473

getfac — display discretionary file  
 information, 478

getfrm — (FMLI utility) returns the current  
 frameID number, 482

getitems — (FMLI utility) returns a list of  
 currently marked menu items, 483

getopt — parse command options, 484

getoptcv — parse command options, 486

getopts — shell built-in function to parse  
 command-line options, 489

gettext — retrieve text string from message  
 database, 495

gettxt — retrieve text string from message  
 database, 496

glob — shell built-in function to expand a word  
 list, 498

goto — shell built-in functions to enable the  
 execution of the shell to advance beyond its  
 sequence of steps, 353

gprof — call-graph profile, 499

graph — draw graph, 504

graphics filters for plotters — plot, 1103

graphics filters for plotters — tplot, 1468

graphics  
 interpolate smooth curve — spline, 1362

grep  
 search a file for a pattern — grep, 506

grep (*continued*)  
 search a file for a pattern using full regular  
 expressions — egrep, 321  
 search file for fixed-character string —  
 fgrep, 376

group IDs  
 change real and effective — newgrp, 948  
 change the group ownership of a file —  
 chgrp, 126  
 display a list of all valid group names —  
 dispgid, 284  
 prompts for group ID — ckgid, 142  
 provides error message for group ID —  
 errgid, 142  
 provides help message for group ID —  
 helpgid, 142  
 validates group ID — valgid, 142

groups — display group membership, 512

groups — print group membership of  
 user, 511

grpck — check group database entries, 513

## H

halt system without checking disks —  
 fasthalt, 370

hash — shell built-in functions to evaluate the  
 internal hash table of the contents of  
 directories, 514

hashstat — shell built-in functions to evaluate  
 the internal hash table of the contents of  
 directories, 514

head — display first few lines of files, 516

history — shell built-in functions to re-use  
 previous command-lines from the current  
 shell, 518

HOME variable — sh, 1317

host machines, local  
 show status — ruptime, 1234  
 who is logged in — rwho, 1238

host machines, remote  
 display status of network hosts (RPC  
 version) — rup, 1232  
 who is logged in — rusers, 1237

host resident PostScript font downloader —  
 download, 288

hostid — display host ID, 527  
hostname — display host name, 528

## I

i386 — get processor type truth value, 779  
iAPX286 — get processor type truth value, 779  
if — shell built-in functions to evaluate condition(s) or to make execution of actions dependent upon the evaluation of condition(s), 531  
IFS variable — sh, 1318  
indicator — (FMLI utility) displays application specific alarms or working indicator, or both, on FMLI banner line, 541  
indxbib — create an inverted index to a bibliographic database, 542  
install — install files, 543  
instruction set, determining which variant is optimal to use — optisa, 1040  
integer  
  prompts for an integer — ckint, 144  
  provides error message for integer — errint, 144  
  provides help message for integer — helpint, 144  
  validates an integer — valint, 144  
integer, range  
  prompts for an integer within a specified range — ckrange, 154  
  provides error message for integer within a specified range — errrange, 154  
  provides help message for integer within a specified range — helprange, 154  
  validate an integer within a specified range — valrange, 154  
Internet  
  transfer files to and from a remote machine — tftp, 1440  
  transfer of files to and from remote network sites — ftp, 434  
  user name directory service — whois, 1587  
interprocess communication  
  remove a message queue, semaphore set, or shared memory ID — ipcrm, 545  
  report status — ipcs, 546

invoke a command with an altered scheduling priority — nice, 953  
ipcrm — remove a message queue, semaphore set, or shared memory ID, 545  
ipcs — report inter-process communication facilities status, 546  
isainfo — describe instruction set architectures, 551  
isalist — display the native instruction sets executable on this platform, 553

## J

jobs — shell built-in functions to control process execution, 554  
join — relational database operator, 560  
jsh — the job control shell command interpreter, 1314

## K

kbd — manipulate the state of keyboard or display the type of keyboard or change the default keyboard abort sequence effect, 563  
Kerberos keytab maintenance utility — ktutil, 633  
Kerberos login utility — kinit, 575  
Kerberos system  
  introduction — Kerberos, 567  
Kerberos ticket-granting-ticket  
  fetch and store using service key — ksrvtgt, 632  
Kerberos tickets  
  destroy — kdestroy, 566  
  list currently held — klist, 579  
keyboard  
  load and dump keyboard translation tables — loadkeys, dumpkeys, 718  
  manipulate the state of keyboard or display the type of keyboard or change the default keyboard abort sequence effect — kbd, 563  
keylogin — decrypt and store secret key with keyserv, 569

keylogout — delete stored secret key with  
keyserv, 570

keywords  
prompts for and validates a keyword —  
ckkeywd, 149

kill — terminate a process by default, 571

Korn shell commands  
login command, 619

KornShell  
aliasing — ksh, 584  
arithmetic evaluation — ksh, 600  
blank interpretation — ksh, 599  
command execution — ksh, 608  
command re-entry — ksh, 608  
command substitution — ksh, 587  
commands — ksh, 582  
comments — ksh, 584  
conditional expressions — ksh, 601  
definitions — ksh, 582  
emacs editing mode — ksh, 609  
environment — ksh, 604  
file name generation — ksh, 599  
functions — ksh, 605  
I/O — ksh, 603  
in-line editing options — ksh, 608  
invocation — ksh, 627  
jobs — ksh, 606  
jobs — shell\_builtins, 556  
parameter substitution — ksh, 591  
process substitution — ksh, 590  
prompting — ksh, 601  
quoting — ksh, 600  
restricted command and programming  
language — rksh, 582  
signals — ksh, 608  
special commands — ksh, 616  
tilde substitution — ksh, 586  
vi editing mode — ksh, 612

kpasswd — change a user's Kerberos  
password, 581

ksh — KornShell, a standard command and  
programming language, 582

ktutil — Kerberos keytab maintenance  
utility, 633

## L

languages  
C compiler — cc, 120  
C preprocessor — cpp, 196  
C program verifier — lint, 698  
create C error messages — mkstr, 890  
extract strings from C code — xstr, 1598

last — display login and logout information  
about users and terminals, 635

lastcomm — display the last commands  
executed, in reverse order, 637

ld — link-editor for object files, 639

ld — link editor, 650

ld.so.1 — runtime linker for dynamic  
objects, 673

ldap — LDAP as a naming repository, 651  
LDAP as a naming repository — ldap, 651  
ldap delete entry tool — ldapdelete, 654  
ldap entry addition and modification tools  
— ldapadd, 659  
— ldapmodify, 659

ldap modify entry RDN tool —  
ldapmodrdn, 663

ldap search tool — ldapsearch, 665

ldapadd — ldap entry addition and  
modification tools, 659

ldapdelete — ldap delete entry tool, 654

ldaplist — search and list naming information  
from a LDAP directory service, 656

ldapmodify — ldap entry addition and  
modification tools, 659

ldapmodrdn — ldap modify entry RDN  
tool, 663  
Input Format, 664

ldapsearch — ldap search tool, 665  
Output Format, 665

ldd — list dynamic dependencies of executable  
files or shared objects, 669

let — shell built-in function to evaluate one or  
more arithmetic expressions, 680

lex — generate programs for lexical tasks, 681  
Actions in lex, 688

lex  
create a tags file for use with ex and vi —  
ctags, 251

lex — generate programs for lexical tasks  
Definitions in lex, 683

lex — generate programs for lexical tasks  
*(continued)*  
 Output Files, 682  
 Regular Expressions in lex, 685  
 Rules in lex, 684  
 Stderr, 681  
 Stdout, 681  
 User Subroutines in lex, 685

library archive  
 find ordering relation for an object or library  
 archive — lorder, 740

limit — set or get limitations on the system  
 resources available to the current shell and  
 its descendents, 693  
 csh, 693  
 ksh, 693  
 sh, 693  
 sh/ksh, 695  
 /usr/bin/ulimit, 693

line — read one line from standard input and  
 write to standard output, 697

line numbering filter — nl, 1018

line printer control — lpc, 748

link  
 make hard or symbolic links to files —  
 ln, 712

link editor — ld, 650

link-editor — ld, 639

lint — C program verifier, 698

list  
 contents of directory — ls, 764  
 file names — ls, 770

list, sorted  
 find lines — look, 738

list of service grades  
 print — uuglist, 1528

listusers — list user login information, 700

llc\_autoconfig — generate LLC2 configuration  
 files, 701

llc\_config — configure LLC2 interface  
 parameters, 702

LLC2 Station, SAP, and Connection Statistics —  
 llc2\_stats, 704

llc2\_stats — LLC2 Station, SAP, and Connection  
 Statistics, 704

ln — make hard or symbolic links to files, 712

loadkeys — load keyboard translation  
 tables, 718

locale — get locale-specific information, 719

localedef — define locale environment, 722

log, system  
 add entries — logger, 726

logger — add entries to the system log, 726

logger — make system log entry, 728

login command, 619, 1325

login — sign on to the system, 730

login  
 change login password and password  
 attributes — passwd, 1045  
 display effective user name —  
 whoami, 1585  
 display login and logout information about  
 users and terminals — last, 635  
 get the name of the user running the process  
 — logname, 736  
 list user login information — listusers, 700  
 remote — rlogin, 1205  
 spawn login to a remote terminal — ct, 249  
 who is logged in, and what are they doing —  
 w, 1568

login environment  
 display variables — printenv, 1141  
 set terminal characteristics — tset, 1492

login password  
 change in NIS — yppasswd, 1605

logname — get the name of the user running  
 the process, 736

logout — shell built-in function to exit from a  
 login session, 737

logout  
 display login and logout information about  
 users and terminals — last, 635

look — find words in the system dictionary or  
 lines in a sorted list, 738

lookbib — find references in a bibliographic  
 database, 739

lorder — find ordering relation for an object or  
 library archive, 740

lp — send requests to a print service, 741

LP print services  
 cancel requests — cancel, 114  
 control line printer — lpc, 748  
 display printer queue — lpq, 752

LP print services (*continued*)  
 generate printer test pattern — lptest, 763  
 print files — lp, 741  
 print files (BSD) — lpr, 754  
 remove print jobs — lprm, 757  
 lpc — line printer control, 748  
 lpq — display printer queue, 752  
 lpr — print files, 754  
 lprm — remove print jobs, 757  
 lpstat — print information about the status of  
 the print service, 759  
 lptest — generate printer test pattern, 763  
 ls — list contents of directory, 764  
 ls — list files, 770

## M

m4 — macro processor, 773  
 mach — display processor type of current  
 host, 778  
 machid — get processor type truth value, 779  
 machine IDs  
 get processor type truth value —  
 machid, 779  
 macro processor — m4, 773  
 magnetic tape  
 backspace files — mt, 908  
 backspace records — mt, 908  
 copy — tcopy, 1424  
 erase — mt, 908  
 forward space files — mt, 908  
 forward space records — mt, 908  
 get unit status — mt, 908  
 manipulate — mt, 908  
 place unit off-line — mt, 908  
 retension — mt, 908  
 rewind — mt, 908  
 skip backward files — mt, 908  
 skip backward records — mt, 908  
 skip forward files — mt, 908  
 skip forward records — mt, 908  
 write EOF mark on — mt, 908  
 mail — interactive message processing  
 system, 781  
 MAIL variable — sh, 1317

mail  
 automatic replies — vacation, 1540  
 mail aliases  
 aliases— system mail, 1127  
 mail services  
 mail notifier — biff, 108  
 sender of mail messages — from, 433  
 mail utilities  
 create aliases database — newaliases, 943  
 statistics — mailstats, 786  
 mailbox  
 storage for incoming mail — mailx, 788  
 MAILCHECK variable — sh, 1317  
 mailcompat — provide SunOS compatibility for  
 Solaris mailbox format, 782  
 mailp — frontends to the mp Text to PDL  
 (Printer Description Language) pretty print  
 filter, 783  
 mailstats — mail delivery statistics, 786  
 mailx — interactive message processing  
 system, 788, 809  
 mailx commands  
 — !, 792  
 — #, 792  
 — =, 792  
 — ?, 792  
 — |, 796  
 — z, 799  
 — alias, 792  
 — alternates, 792  
 — cd, 792  
 — chdir, 792  
 — Copy, 792  
 — copy, 792  
 — delete, 792  
 — discard, 793  
 — dp, 793  
 — dt, 793  
 — echo, 793  
 — edit, 793  
 — else, 794  
 — endif, 794  
 — exit, 793  
 — field, 793  
 — file, 793  
 — folder, 793  
 — Followup, 794

mailx commands (*continued*)

- followup, 794
- from, 794
- group, 792
- headers, 794
- help, 794
- hold, 794, 796
- if, 794
- ignore, 793
- inc, 794
- list, 795
- load, 795
- mail, 795
- mbox, 795
- More, 795
- New, 795
- new, 795
- next, 796
- Page, 795
- pipe, 796
- preserve, 794, 796
- Print, 796, 798
- print, 796, 798
- Put, 796
- put, 796
- quit, 796
- Reply, 797
- reply, 796
- replyall, 797
- repliesender, 796
- Respond, 797
- respond, 796
- retain, 797
- Save, 797
- save, 797
- set, 797
- shell, 798
- size, 798
- source, 798
- top, 798
- touch, 798
- Type, 796, 798
- type, 796, 798
- unalias, 798
- undelete, 798
- undiscard, 798
- ungroup, 798

mailx commands (*continued*)

- unignore, 798
  - Unread, 795, 798
  - unread, 795, 798
  - unretain, 798
  - unset, 799
  - version, 799
  - visual, 799
  - write, 799
  - xit, 799
- maintain groups of programs —  
  sysV-make, 1395
- make — maintain, update, and regenerate  
  related programs and files  
    Appending to a Macro, 819  
    Bourne Shell Constructs, 839  
    Clearing Special Targets, 818  
    Command Dependencies, 818  
    Command Execution, 838  
    Command Substitutions, 839  
    Conditional Macro Definitions, 821  
    Dynamic Macros, 821  
    Global, 814  
    Hidden Dependencies, 818  
    Implicit Rules, 824  
    implicit rules, list of make/make.rules, 838  
    Library Maintenance, 838  
    Macros, 815, 818  
    Makefile Target Entries, 813  
    Pattern Matching Rules, 825  
    Pattern Replacement Macro References, 819  
    Predefined Macros, 822  
    Reading Makefiles and the  
      Environment, 812  
    Rules, 816  
    Signals, 840  
    Special Characters, 814  
    Special-Function Targets, 816  
    Special-Purpose Macros, 819  
    Suffix Replacement Macro References, 818  
    Suffix Rules, 825
- make  
  System V version of make —  
    sysV-make, 1395
- make — maintain, update, and regenerate  
  related programs and files  
  Targets and Dependencies, 814

- make — maintain, update, and regenerate related programs and files (*continued*)
    - The Suffixes List, 838
  - man — online display of reference pages, 845
  - manual pages
    - accessing — man, 845
    - describe command — whatis, 1576
    - locate — whereis, 1577
  - matrix display program for PostScript printers — postmd, 1112
  - mbox
    - storage file for read mail — mailx, 788
  - mconnect — open connection to remote mail server, 851
  - mcs — manipulate the comment section of an object file, 852
  - mdb — modular debugger, 854
  - menu item
    - builds a menu and prompts user to choose one item from menu — ckitem, 146
    - provides error message for menu item — erritem, 146
    - provides help message for menu item — helpitem, 146
  - menu items, FMLI
    - returns a list of — getitems, 483
  - mesg — permit or deny messages via write, 881
  - message — puts arguments on FMLI message line, 882
  - messages
    - create message object file — msgfmt, 905
    - creating portable object files — msgfmt, 905
    - display contents of, or search for a text string in, message data bases — srchtxt, 1365
    - display on stderr or system console —
      - fmtmsg, 409
    - editing messages — msgfmt, 905
    - extract gettext call strings — xgettext, 1596
    - generate a formatted message catalog —
      - gencat, 446
    - permit or deny messages via write —
      - mesg, 881
    - retrieve text string from message database —
      - gettext, 495
    - setting the domain — msgfmt, 905
  - messages (*continued*)
    - setting the message identifier —
      - msgfmt, 905
    - setting the message string — msgfmt, 905
  - mixerctl — audio mixer control, 884
  - mkdir — make directories, 886
  - mkmsgs — create message files for use by
    - gettext, 888
  - mkstr — create C error messages, 890
  - .mo files
    - message object files — msgfmt, 905
  - modify the Access Control List (ACL) for a file or files — setfacl, 1310
  - modular debugger — mdb, 854
  - monitor process and LWP behavior using CPU performance counters — cputrack, 202
  - more — browse through a text file, 892
  - mp — text to PDL (Printer Description Language) pretty print filter, 899
  - msgfmt — create message object file, 905
  - mt — manipulate magnetic tape, 908
  - mv — move files, 910
- N**
- nawk — pattern scanning and processing
    - language, 913
    - Actions, 913
    - Arithmetic Functions, 913
    - Expression Patterns, 913
    - Expressions in nawk, 913
    - Functions, 913
    - Input/Output and General Functions, 913
    - Output Statements, 913
    - Pattern Ranges, 913
    - Patterns, 913
    - Regular Expressions, 913
    - Special Patterns, 913
    - String Functions, 913
    - User-defined Functions, 913
    - /usr/bin/nawk, 913
    - /usr/xcu4/bin/awk, 913
    - /usr/xpg4/bin/awk, 913
    - Variables and Special Variables, 913
  - NCA — the Network Cache and Accelerator (NCA), 934

nca — the Network Cache and Accelerator (NCA), 934

ncab2clf — convert binary log file to Common Log File format, 936

ncakmod — start or stop the NCA kernel module, 938

neqn — mathematical typesetting, 333

netscape — start Netscape Communicator for Solaris, 939

newaliases — make mail aliases database, 943

newform — change the format of a text file, 945

newgrp — changes a user's group ID, 948

newgrp — shell built-in function to allow new group permissions to the user, 948

news — print news items, 950

newsp — frontends to the mp Text to PDL (Printer Description Language) pretty print filter, 783

newtask — create new task, 951

NFS, secure

- decrypt and store secret key with key serv — keylogin, 569
- delete stored secret key with key serv — keylogout, 570

nice — invoke a command with an altered scheduling priority, 953

nice

- change process nice value — renice, 1201

nice — invoke a command with an altered scheduling priority

- csh Builtin, 953

nis — a new version of the network information name service, 955

NIS

- change login password in — yppasswd, 1605
- print the value of one or more keys from a NIS map — ypmatch, 1604
- print values in a NIS database — ypcat, 1603
- return name of NIS server or map master — ypwhich, 1606

nis+ — a new version of the network information name service, 955

NIS+ — a new version of the network information name service, 955

NIS+

- Authentication — nis+, 962
- Authorization — nis+, 962
- change access rights on a NIS+ object — nischmod, 975
- change password information — nispasswd, 1003
- change the group owner of a NIS+ object — nischgrp, 973
- change the owner of a NIS+ object — nischown, 978
- change the time to live of a NIS+ object — nischttl, 980
- Concatenation Path — nis+, 959
- create NIS+ directories — nismkdir, 997
- Directories and Domains — nis+, 961
- Directory Authorization — nis+, 963
- display NIS+ defaults — nisdefaults, 982
- display NIS+ error messages — niserror, 985
- display tables — niscat, 970
- Grammar — nis+, 957
- Group Names — nis+, 961
- group administration — nisrpadm, 986
- Indexed Names — nis+, 956
- list the contents of a NIS+ directory — nisls, 992
- Name Expansion — nis+, 957
- Namespaces — nis+, 959
- NIS+ Administrative Commands — nis+, 966
- NIS+ Directory Object — nis+, 955
- NIS+ Files and Directories — nis+, 968
- NIS+ Group Object — nis+, 955
- NIS+ Link Object — nis+, 956
- NIS+ Programming API — nis+, 967
- NIS+ Table Object — nis+, 955
- NIS+ User Commands — nis+, 965
- Principal Names — nis+, 959
- remove directories — nisrmdir, 1008
- remove objects — nisrm, 1007
- return the state of the NIS+ namespace using a conditional expression — nistest, 1016
- Simple Names — nis+, 956
- symbolically link NIS+ objects — nisln, 990
- Table Authorization — nis+, 964
- table administration tool — nistbladm, 1010

NIS+ (*continued*)

- utilities for searching NIS+ tables —
  - nismatch, nisgrep, 994
- niscat — display NIS+ tables, 970
- nischgrp — change the group owner of a NIS+ object, 973
- nischmod — change access rights on a NIS+ object, 975
- nischown — change the owner of a NIS+ object, 978
- nischttl — change the time to live of a NIS+ object, 980
- nisdefaults — display NIS+ defaults, 982
- niserror — display NIS+ error messages, 985
- nisgrep — utility for searching NIS+ tables, 994
- nisgrpadm — NIS+ group administration command, 986
- nisl — symbolically link NIS+ objects, 990
- nisl — list the contents of a NIS+ directory, 992
- nismatch — utility for searching NIS+ tables, 994
- nismkdir — create a NIS+ directory, 997
- nism — remove NIS+ objects, 1007
- nismrmdir — remove a NIS+ directory, 1008
- nistbladm — administer NIS+ tables, 1010
- nistest — return the state of the NIS+ namespace using a conditional expression, 1016
- nl — number lines, 1018
- nm — print name list of an object file, 1021
- nohup — run a command immune to hangups, 1026
- notify — shell built-in functions to control process execution, 554
- notify user that volume requested is not in the CD-ROM or floppy drive —
  - volmissing, 1564
- nroff — format documents for display or line-printer, 1029
- nroff utilities
  - check nroff and troff files — checknr, 125
  - eliminate .so's from nroff input — soelim, 1344
  - filters reverse line-feeds from two-column nroff text — col, 171

nroff utilities (*continued*)

- format tables — tbl, 1422
- remove nroff, troff, tbl and eqn constructs —
  - deroff, 270

## O

- object archive
  - find ordering relation for an object or library archive — lorder, 740
- object files
  - find printable strings — strings, 1371
  - manipulate the comment section —
    - mcs, 852
  - print section sizes in bytes — size, 1339
  - strip symbol table, debugging and line number information — strip, 1373
- octal dump
  - od, 1032
- od — octal dump, 1032
- on — execute a command on a remote system, but with the local environment, 1038
- onintr — shell built-in functions to respond to (hardware) signals, 1479
- online documentation system
  - answerbook2, 45
- online reference pages — man, 845
- optisa — determine which variant instruction set is optimal to use, 1040

## P

- pack — compress files, 1041
- page — page through a text file, 892
- pagesize — display size of a page of memory, 1044
- Pascal
  - create a tags file for use with ex and vi —
    - ctags, 251
- passwd — change login password and password attributes, 1045
- password
  - change in NIS — yppasswd, 1605
- password file
  - edit — vipw, 1560

passwords  
   change login password and password attributes — passwd, 1045  
 paste — merge same lines of several files or subsequent lines of one file, 1051  
 patch — apply changes to files, 1054  
   Filename Determination, 1057  
   Patch Application, 1057  
   Patchfile Format, 1056  
 PATH variable — sh, 1317  
 pathchk — check path names, 1059  
 pathconv — search FMLI criteria for filename, 1062  
 pathname  
   prompts for a pathname — ckpath, 151  
   provides error message for pathname — errpath, 151  
   provides help message for pathname — helpath, 151  
   validates pathname — valpath, 151  
 pattern scanning and processing language — awk, 913  
 pax — portable archive interchange, 1064  
   Modes of Operations, 1064  
   Standard Error, 1070  
   Standard Output, 1069  
 pcat — compress files, 1041  
 pcred — proc tools, 1155  
 pdp11 — get processor type truth value, 779  
 performance monitoring  
   display call-graph profile data — gprof, 499  
   resource usage for a command — rusage, 1235  
   time a command; report process data and system activity — timex, 1447  
 perl — Practical Extraction and Report Language, 1073  
 pfcsh — execute a command in a profile, 1081  
 pfexec — execute a command in a profile, 1081  
 pfiles — proc tools, 1155  
 pfksh — execute a command in a profile, 1081  
 pflags — proc tools, 1155  
 pfsch — execute a command in a profile, 1081  
 pg — files perusal filter for CRTs, 1082  
 pgrep — find processes by name and other attributes, 1087  
 pkginfo — display software package information, 1091  
 pkgmk — produce an installable package, 1093  
 pkgparam — display package parameter values, 1095  
 pkgproto — generate prototype file entries for input to pkgmk command, 1097  
 pkgtrans — translate package format, 1099  
 pkill — signal processes by name and other attributes, 1087  
 pldd — proc tools, 1155  
 plimit — get or set the resource limits of running processes, 1101  
 plot — graphics filters for plotters, 1103  
 plotters  
   graphics filters — plot, 1103  
   graphics filters — tplot  
     graphics filters, 1468  
 pmap — proc tools, 1155  
 .po files  
   portable object files — msgfmt, 905  
 popd — shell built-in functions to change the current working directory, 122  
 portable archive interchange — pax, 1064  
 postplot — PostScript translator for plot(4B) graphics files, 1115  
 postdaisy — PostScript translator for Diablo 630 daisy-wheel files, 1105  
 postdmd — PostScript translator for DMD bitmap files, 1107  
 postio — serial interface for PostScript printers, 1109  
 postmd — matrix display program for PostScript printers, 1112  
 postprint — PostScript translator for text files, 1117  
 postprocessors  
   troff for PostScript printers — dpost, 290  
 postreverse — reverse the page order in a PostScript file, 1119  
 PostScript  
   matrix display program — postmd, 1112  
   prepends host resident PostScript fonts to files — download, 288  
   reverse the page order in a PostScript file — postreverse, 1119

- PostScript (*continued*)
  - serial interface — postio, 1109
  - translator for Diablo 630 daisy-wheel files —
    - postdaisy, 1105
  - translator for DMD bitmap files —
    - postdmd, 1107
  - translator for plot(4B) graphics files —
    - postplot, 1115
  - translator for Tektronix 4014 files —
    - posttek, 1121
  - translator for text files — postprint, 1117
  - troff postprocessor for PostScript printers —
    - dpost, 290
- PostScript translator for Diablo 630 daisy-wheel files — postdaisy, 1105
- PostScript translator for MD bitmap files —
  - postdmd, 1107
- PostScript translator for Tektronix 4014 files —
  - posttek, 1121
- PostScript translator for text files —
  - postprint, 1117
- posttek — PostScript translator for Tektronix 4014 files, 1121
- pr — print files, 1123
- Practical Extraction and Report Language —
  - perl, 1073
- praliases — display system mail aliases, 1127
- prex — control tracing and manipulate probe points in a process or the kernel, 1128
- prime factors
  - obtain for a number — factor, 369
- print — shell built-in function to output characters to the screen or window, 1140
- print
  - formatted output — printf, 1142
  - print files — pr, 1123
- print authorizations granted to a user —
  - auths, 89
- print execution profiles for a user —
  - profiles, 1162
- print files — lpr, 754
- print files
  - prepends host resident PostScript fonts to files — download, 288
- print project membership of user —
  - projects, 1164
- print roles granted to a user — roles, 1219
- print services
  - print information about the status —
    - lpstat, 759
- printenv — display environment variables, 1141
- printers
  - cancel requests — cancel, 114
  - control — lpc, 748
  - display queue — lpq, 752
  - print information about the status —
    - lpstat, 759
  - remove jobs from queue — lprm, 757
  - send requests — lp, 741
  - test — lptest, 763
- printers, LP
  - disable, 329
  - enable, 329
- printf — print formatted output, 1142
- proc tools
  - pcred, 1155
  - pfiles, 1155
  - pflags, 1155
  - pldd, 1155
  - pmap, 1155
  - prun, 1155
  - psig, 1155
  - pstack, 1155
  - pstop, 1155
  - ptime, 1155
  - ptree, 1155
  - pwait, 1155
  - pwdx, 1155
- process, running
  - change priority — renice, 1201
- process accounting
  - search and print files — acctcom, 28
  - time a command; report process data and system activity — timex, 1447
- process scheduler
  - display or set scheduling parameters of specified process(es) — priocntl, 1147
- process status
  - report — ps, 1165
- processes
  - display status — ps, 1174
  - get core images of running processes —
    - gcore, 445

processes (*continued*)  
 terminate a process by default — kill, 571

processors  
 display type — mach, 778

prof — display profile data, 1158

profile  
 display call-graph — gprof, 499

profiles — print execution profiles for a user, 1162

programming languages  
 analyze and disperse compiler error messages — error, 338  
 C compiler — cc, 120  
 C preprocessor — cpp, 196  
 C program verifier — lint, 698  
 extract strings from C code — xstr, 1598  
 formats program in nice style using troff — vgrind, 1547

programming tools  
 arbitrary precision arithmetic language — bc, 99  
 assembler — as, 65  
 create a tags file for use with ex and vi — ctags, 251  
 create C error messages — mkstr, 890  
 debugger — adb, 31  
 display call-graph profile data — gprof, 499  
 dump selected parts of an object file — dump, 295  
 find printable strings in an object or binary file — strings, 1371  
 — install, 543  
 link editor — ld, 650  
 link-editor for object files — ld, 639  
 macro processor — m4, 773  
 make — build programs, 810  
 object code disassembler — dis, 282  
 print name list of an object file — nm, 1021  
 print section sizes in bytes of object files — size, 1339  
 regular expression compile — regcmp, 1196  
 resolve and remove ifdef'ed lines from C program source — unifdef, 1511  
 resource usage for a command — rusage, 1235  
 RPC protocol compiler — rpcgen, 1221  
 Source Code Control System — sccs, 1246

programming tools (*continued*)  
 strip symbol table, debugging and line number information from an object file — strip, 1373  
 touch — update last modified date of file, 1467

projects — print project membership of user, 1164

prun — proc tools, 1155

ps — display process status, 1174

PS1 variable — sh, 1318

PS2 variable — sh, 1318

psig — proc tools, 1155

pstack — proc tools, 1155

pstop — proc tools, 1155

ptime — proc tools, 1155

ptree — proc tools, 1155

pushd — shell built-in functions to change the current working directory, 122

pvs — display the internal versioning information of dynamic objects, 1177

pwait — proc tools, 1155

pwd — print working directory name, 1180

pwdx — proc tools, 1155

## Q

queue, printer  
 display — lpq, 752

queues  
 display the jobs queued to run at specified times — atq, 77  
 remove jobs spooled by at or batch — atrm, 78

## R

true — convert archives to random libraries, 1181

rcp — remote file copy, 1182

rdist — remote file distribution, 1184

read — shell built-in function to receive from standard input (keyboard), 1189

readfile, longline — (FMLI utility) reads file, gets longest line, 1192

readonly — shell built-in function to protect the value of the given variable from reassignment, 1193  
 reboot system without checking disks — fastboot, 370  
 red — text editor, 305  
 refer — expand and insert references from a bibliographic database, 1194  
 regcmp — regular expression compile, 1196  
 regenerate groups of programs — sysV-make, 1395  
 regenerate programs — make, 810  
 regex — (FMLI utility) match patterns against a string, 1198  
 registration, 1345  
 rehash — shell built-in functions to evaluate the internal hash table of the contents of directories, 514  
 reinit — (FMLI utility) changes the descriptors in the initialization file, 1200  
 relational database — join, 560  
 reminder services — calendar, 112  
     mail notifier — biff, 108  
 remote shell — rsh, 1226  
 remote system  
     connect — tip, 1449  
     connect to — cu, 254  
     execute a command on a remote system, but with the local environment — on, 1038  
     file copy — rcp, 1182  
     file distribution — rdist, 1184  
     remote login — rlogin, 1205  
     shell — rsh, 1226  
     show status — rup, 1232  
     spawn login — ct, 249  
     system to system command execution — uux, 1536  
     transfer files to and from — tftp, 1440  
     who is logged in on remote machines — rusers, 1237  
 removable rewritable media format utility — rmformat, 1211  
 rename the binding of an FNS name — fnrename, 421  
 renice — alter priority of running processes, 1201  
 repeat — shell built-in function to execute a command more than once, 431  
 report on the calls to a specific procedure. — whocalls, 1586  
 report or filter out repeated lines in a file — uniq, 1513  
 reset — (FMLI utility) changes the entry in a field of a form to its default value, 1204  
 reset — reset terminal bits, 1492  
 reset terminal bits — reset, 1492  
 return — shell built-in functions to enable the execution of the shell to advance beyond its sequence of steps, 353  
 reverse page order  
     PostScript file — postreverse, 1119  
 reverse the page order in a PostScript file — postreverse, 1119  
 rksh — KornShell, restricted command and programming language, 582  
 rlogin — remote login, 1205  
 rm — remove files, 1208  
 rmdir — remove directories, 1208  
 rmformat — removable rewritable media format utility, 1211  
 roffbib — format and print bibliographic database, 1217  
 roles — print roles granted to a user, 1219  
 RPC  
     display host status of remote machines — rup, 1233  
     display status of network hosts — rup, 1232  
     protocol compiler — rpcgen, 1221  
 RPC, secure  
     decrypt and store secret key with keyserv — keylogin, 569  
     delete stored secret key with keyserv — keylogout, 570  
 RPC Language  
     RPC protocol compiler — rpcgen, 1221  
 rpcgen — RPC protocol compiler, 1221  
 rsh — remote shell, 1226  
 run — (FMLI utility) runs a program, 1230  
 run a command immune to hangups — nohup, 1026

runtime linker for dynamic objects —  
 ld.so.1, 673  
 rup — display status of network hosts (RPC  
 version), 1232  
 rup — display status of network hosts, 1233  
 ruptime — display status of local hosts, 1234  
 rusage — resource usage for a command, 1235  
 rusers — who is logged in on remote  
 machines, 1237  
 rwho — who is logged in on local  
 machines, 1238

## S

sag — system activity graph, 1239  
 sar — system activity reporter, 1241  
 SCCS  
 extract SCCS version information from a file  
 — what, 1575  
 sccs-admin — create and administer SCCS  
 history files, 1255  
 sccs-cdc — change the delta commentary of an  
 SCCS delta, 1259  
 sccs-comb — combine deltas, 1261  
 sccs — Source Code Control System, 1246  
 SCCS commands  
 admin — create and administer SCCS history  
 files, 1255  
 cdc — change the delta commentary of an  
 SCCS delta, 1259  
 comb — combine deltas, 1261  
 delta — change the delta commentary of an  
 SCCS delta, 1263  
 get — retrieve a version of an SCCS  
 file, 1266  
 help — help regarding SCCS error or  
 warning messages, 1272  
 prt — display delta table information from  
 an SCCS file, 1277  
 rmdel — remove a delta from an SCCS  
 file, 1280  
 sact — show editing activity status of an  
 SCCS file, 1281  
 sccs-prs — display selected portions of an  
 SCCS history, 1273

SCCS commands (*continued*)  
 sccsdiff — compare versions of SCCS  
 file, 1282  
 unget — unget SCCS file, 1283  
 val — validate SCCS file, 1284  
 sccs-delta — change the delta commentary of an  
 SCCS delta, 1263  
 SCCS delta  
 change commentary — sccs-cdc, 1259  
 combine — sccs-comb, 1261  
 create — delta, 1263  
 remove — rmdel, 1280  
 SCCS delta table  
 print form an SCCS file — sccs-prt, 1277  
 SCCS files  
 compare versions — sccs-sccsdiff, 1282  
 retrieve a version of a file — sccs-get, 1266  
 show editing activity status —  
 sccs-sact, 1281  
 undo a previous get of an SCCS file —  
 sccs-unget, 1283  
 validate — sccs-val, 1284  
 sccs-get — retrieve a version of an SCCS  
 file, 1266  
 sccs-help — help regarding SCCS error or  
 warning messages, 1272  
 SCCS help  
 regarding SCCS error or warning messages  
 — sccs-help, 1272  
 SCCS history  
 display selected portions — sccs-prs, 1273  
 SCCS history files  
 create and administer — sccs-admin, 1255  
 sccs-prs — display selected portions of an SCCS  
 history, 1273  
 sccs-prt — display delta table information from  
 an SCCS file, 1277  
 sccs-rmdel — remove delta from SCCS  
 file, 1280  
 sccs-sact — show editing activity status of an  
 SCCS file, 1281  
 sccs-sccsdiff — compare versions of SCCS  
 file, 1282  
 sccs-unget — unget SCCS file, 1283  
 sccs-val — validate SCCS file, 1284  
 screen-oriented editor — vi, 1550  
 script — make script of terminal session, 1286

sdiff — print differences between two files  
     side-by-side, 1287  
 search and list naming information from a  
     LDAP directory service — ldaplist, 656  
 search for FNS objects with specified attributes  
     — fnsearch, 422  
 sed — stream editor, 1289, 1296  
     Functions, 1297  
     sed Addresses, 1290  
     sed Editing Commands, 1290  
     sed Regular Expressions, 1290  
     sed Scripts, 1296  
 select — shell built-in functions to choose from  
     among a list of actions, 116  
 select or reject lines common to two files —  
     comm, 173  
 serial interface for PostScript printers —  
     postio, 1109  
 set — shell built-in functions to determine the  
     characteristics for environmental variables of  
     the current shell and its descendents, 1302  
 set, unset — (FLMI utility) set and unset local or  
     global environment variables, 1307  
 set environment for command invocation —  
     env, 331  
 set or get limitations on the system resources  
     available to the current shell and its  
     descendents  
     — limit, 693  
     — ulimit, 693  
     — unlimited, 693  
 setcolor — (FLMI utility) redefine or create a  
     color, 1309  
 setenv — shell built-in functions to determine  
     the characteristics for environmental  
     variables of the current shell and its  
     descendents, 1302  
 setfacl — modify the Access Control List (ACL)  
     for a file or files, 1310  
     acl\_entries Syntax, 1310  
 settime — change file access and modification  
     times, 1464  
 sh — the standard shell command  
     interpreter, 1314  
 SHACCT variable — sh, 1318  
 shell — (FLMI utility) run a command using  
     shell, 1332  
 SHELL variable — sh, 1318  
 shell  
     Korn shell — ksh, 582  
     restricted Korn shell — rksh, 582  
 shell\_builtins — shell command interpreter  
     built-in functions, 1333  
 shell command interpreter built-in functions —  
     shell\_builtins, 1333  
 shell command interpreter builtin-functions  
     — alias, 42  
     — bg, 554  
     — break, 109  
     — case, 116  
     — cd, 122  
     — chdir, 122  
     — continue, 109  
     — dirs, 122  
     — eval, 351  
     — exit, 353  
     — fc, 518  
     — fg, 554  
     — for, 431  
     — foreach, 431  
     — function, 444  
     — getopts, 489  
     — glob, 498  
     — hash, 514  
     — hashstat, 514  
     — history, 518  
     — if, 531  
     — jobs, 554  
     — kill, 571  
     — let, 680  
     — logout, 737  
     — newgrp, 948  
     — notify, 554  
     — onintr, 1479  
     — popd, 122  
     — print, 1140  
     — pushd, 122  
     — read, 1189  
     — readonly, 1193  
     — rehash, 514  
     — repeat, 431  
     — return, 353  
     — select, 116  
     — set, 1302

shell command interpreter builtin-functions  
(continued)

- setenv, 1302
  - shift, 1337
  - source, 351
  - stop, 554
  - suspend, 1393
  - switch, 116
  - test, 531
  - times, 1446
  - trap, 1479
  - typeset, 1501
  - umask, 1505
  - unalias, 42
  - unhash, 514
  - unset, 1302
  - unsetenv, 1302
  - until, 1580
  - wait, 1570
  - whence, 1501
  - while, 1580
- shell programming
- echo arguments — echo, 299
  - read one line from standard input and write to standard output — line, 697
- shell scripts
- display size of page memory — pagesize, 1044
  - provide truth values — true, false, 1484
- shell variables, in Bourne shell, 1317
- shells
- C shell — csh, 220
  - remote — rsh, 1226
  - the job control shell command interpreter — jsh, 1314
  - the standard shell command interpreter — sh, 1314
- shift — shell built-in function to traverse either a shell's argument list or a list of field-separated words, 1337
- show codeset table for the current locale — dumpcs, 298
- shutdown — shut down multiuser operation, 1338
- sign on to the system — login, 730

Simple Mail Transfer Protocol

- connection to remote mailserver — mconnect, 851
- size — print section sizes in bytes of object files, 1339
- sleep — suspend execution for an interval, 1341
- smart2cfg — Compaq Smart-2 EISA/PCI and Smart-2SL PCI Array Controller ioctl utility, 1342
- SMTP, *See* Simple Mail Transfer Protocol
- soelim — eliminate .so's from nroff input, 1344
- software package
  - display information — pkginfo, 1091
  - display parameter values — pkgparam, 1095
  - generate prototype file entries for input to pkgmk command — pkgproto, 1097
  - produce an installable package — pkgmk, 1093
  - translate package format — pkgtrans, 1099
- Solaris user registration — solregis, 1345
- solregis — Solaris user registration, 1345
- sort, topological
  - items mentioned in input — tsort, 1497
- sort — sort and/or merge files, 1348
- sortbib — sort bibliographic database, 1355
- sotruss — trace shared library procedure calls, 1357
- source — shell built-in functions to execute other commands, 351
- Source Code Control System, *See* SCCS
- source files
  - locate — whereis, 1577
- sparc — get processor type truth value, 779
- spell — check spelling, 1359
- spline — interpolate smooth curve, 1362
- split files based on context — csplit, 246
- split — split a file into pieces, 1363
- srchtxt — display contents of, or search for a text string in, message data bases, 1365
- standard output
  - replicate — tee, 1425
- start Netscape Communicator for Solaris — netscape, 939
- start or stop the NCA kernel module — ncakmod, 938

- statistics
  - collected by sendmail — mailstats, 786
- stop — shell built-in functions to control
  - process execution, 554
- strchg — change stream configuration, 1368
- strconf — query stream configuration, 1368
- stream editor — sed, 1289, 1296
- STREAMS
  - change or query stream configuration —
    - strchg, strconf, 1368
- string
  - prompt for defined string answer —
    - ckstr, 157
  - provide an error message for defined string
    - answer — errstr, 157
  - provide an help message for defined string
    - answer — helpstr, 157
  - validate a defined string answer —
    - valstr, 157
- strings — find printable strings in object or
  - binary file, 1371
- strip — strip symbol table, debugging and line
  - number information from an object
    - file, 1373
- stty command, 1384
- stty — set the options for a terminal, 1375
- sum — print checksum and block count for a
  - file, 1391
- sum — sum and count blocks in file, 1392
- sun — get processor type truth value, 779
- SunOS/BSD Source Compatibility Package
  - stty, 1384
- SunOS/BSD Source Compatibility Package
  - commands
    - arch, 64
    - basename, 98
    - biff, 108
    - cc, 120
    - chown, 138
    - df, 271
    - du, 293
    - echo, 303
    - expr, 361
    - fastboot, 370
    - file, 380
    - from, 433
    - groups, 512
  - SunOS/BSD Source Compatibility Package
    - commands (*continued*)
      - grpck, 513
      - hostid, 527
      - hostname, 528
      - install, 543
      - ld, 650
      - lint, 698
      - ln, 715
      - logger, 728
      - lpc, 748
      - lpq, 752
      - lpr, 754
      - lprm, 757
      - lptest, 763
      - ls, 770
      - mach, 778
      - mkstr, 890
      - pagesize, 1044
      - plot, 1103
      - printenv, 1141
      - ps, 1174
      - rusage, 1235
      - shutdown, 1338
      - sum, 1392
      - test, 1436
      - tr, 1478
      - tset, 1492
      - users, 1520
      - vipw, 1560
      - whereis, 1577
      - whoami, 1585
    - provide SunOS compatibility for Solaris
      - mailbox format — mailcompat, 782
    - suspend — shell built-in function to halt the
      - current shell, 1393
    - suspend execution of command
      - sleep, 1341
    - switch — shell built-in functions to choose from
      - among a list of actions, 116
    - symorder — update symbol table
      - ordering, 1394
    - synchronize files and directories —
      - filesync, 382
    - system to system copy — uucp, 1521
    - system activity
      - graphical representation — sag, 1239

- system activity (*continued*)
  - reporter — sar, 1241
  - time a command; report process data and system activity — timex, 1447
- system administration
  - install, 543
- system call and signals
  - trace — truss, 1485
- system log
  - add entries — logger, 726
- system name
  - print — uname, 1508
- system to system command execution — uux, 1536
- system uptime
  - display — uptime, 1519
- sysV-make — maintain, update, and regenerate groups of programs, 1395

## T

- TAB characters
  - expand to SPACE characters, and vice versa — expand, unexpand, 355
- tables
  - format for nroff or troff — tbl, 1422
- tabs — set tabs on a terminal, 1402
- tail — display last part of file, 1406
- talk — talk to another user, 1409
- tape
  - backspace files — mt, 908
  - backspace records — mt, 908
  - erase — mt, 908
  - forward space files — mt, 908
  - forward space records — mt, 908
  - get unit status — mt, 908
  - place unit off-line — mt, 908
  - retension — mt, 908
  - rewind — mt, 908
  - skip backward files — mt, 908
  - skip backward records — mt, 908
  - skip forward files — mt, 908
  - skip forward records — mt, 908
  - write EOF mark on — mt, 908
- tape, magnetic
  - copy, blocking preserved — tcopy, 1424

- tape, magnetic (*continued*)
  - manipulate — mt, 908
  - scan — tcopy, 1424
- tape archives
  - create — tar, 1412
- tar — create tape archives, and add or extract files, 1412
- tbl — format tables for nroff or troff, 1422
- tbl
  - remove nroff, troff, tbl and eqn constructs — deroff, 270
- tcopy — copy a magnetic tape, 1424
- tee — replicate the standard output, 1425
- telnet — user interface to a remote system using the TELNET protocol, 1426
- TELNET protocol
  - user interface to a remote system using the TELNET protocol — telnet, 1426
- terminal
  - set options — stty, 1375
  - set tabs — tabs, 1402
- terminal screen
  - clear, 168
- terminal session
  - make script— script, 1286
- terminals
  - get name — tty, 1499
  - initialize a terminal or query terminfo database — tput, 1469
  - reset bits — reset, 1492
  - set characteristics — tset, 1492
  - set characteristics — stty, 1384
- terminate a process by default — kill, 571
- terminfo database
  - initialize a terminal or query terminfo database — tput, 1469
- test — (FMLI utility) evaluates the expression expression, 1438
- test — shell built-in functions to evaluate condition(s) or to make execution of actions dependent upon the evaluation of condition(s), 531
- test — condition evaluation, 1436
- text editing
  - screen-oriented (visual) display editor based on ex — vi, 1550
  - sed — stream editor, 1296

text editing (*continued*)  
 stream editor — sed, 1289

text editor  
 — ed, 305  
 — edit, 317  
 — ex, 342

text files  
 browse or page through a text file — more,  
 page, 892  
 change format — newform, 945

text formatter  
 format documents for display or line-printer  
 — nroff, 1029

text processing utilities  
 check spelling — spell, 1359  
 concatenate and display files — cat, 118  
 display last part of file — tail, 1406  
 pattern scanning and processing language —  
 awk, 90  
 search a file for a pattern — grep, 506  
 search a file for a pattern using full regular  
 expressions — egrep, 321  
 search file for fixed-character string —  
 fgrep, 376  
 sort and/or merge files — sort, 1348  
 split a file into pieces — split, 1363  
 translate characters — tr, 1473, 1478  
 underline text — ul, 1504

text retrieval tools  
 create message files for use by gettxt —  
 mkmsgs, 888  
 retrieve text string from message database —  
 gettxt, 496

text to PDL (Printer Description Language)  
 pretty print filter — mp, 899

tftp — trivial file transfer program, 1440

the Network Cache and Accelerator (NCA) —  
 NCA, 934

the Network Cache and Accelerator (NCA) —  
 nca, 934

tilde escape commands for mail  
 — mailx, 799

time — time a simple command, 1443

time  
 prompts for time — ckttime, 162  
 provides error message for time —  
 errtime, 162

time (*continued*)  
 provides help message for time —  
 helptime, 162  
 validates time — valtime, 162

time a simple command — time, 1443

timed event services  
 display the jobs queued to run at specified  
 times — atq, 77  
 reminder service — calendar, 112  
 remove jobs spooled by at or batch —  
 atrm, 78  
 user crontab file — crontab, 215

timemanp — frontends to the mp Text to PDL  
 (Printer Description Language) pretty print  
 filter, 783

times — shell built-in function to report time  
 usages of the current shell, 1446

timesysp — frontends to the mp Text to PDL  
 (Printer Description Language) pretty print  
 filter, 783

timex — time a command; report process data  
 and system activity, 1447

tip — connect to remote system, 1449

tnfdump — convert binary TNF file to  
 ASCII, 1458

tnfextract — extract kernel probes output into a  
 trace file, 1462

touch — change file access and modification  
 times, 1464, 1500  
 settime, 1465  
 touch, 1464

touch — update last modified date of file, 1467

tplot — graphics filters for plotters, 1468

tput — initialize a terminal or query terminfo  
 database, 1469

tr — translate characters, 1473, 1478

trace function calls  
 trace application function calls to Solaris  
 shared libraries — apptrace, 54

trace shared library procedure calls —  
 sotruss, 1357

translate characters — tr, 1473, 1478

translates exportfs options to share/unshare  
 commands — exportfs, 357

trap — shell built-in functions to respond to  
 (hardware) signals, 1479

Trivial File Transfer Protocol, *See* TFTP  
troff — typeset or format documents, 1481  
troff utilities  
  check nroff and troff files — checknr, 125  
  eliminate .so's from nroff input —  
  soelim, 1344  
  filters reverse line-feeds from two-column  
  nroff text — col, 171  
  format tables — tbl, 1422  
  formats program code — vgrind, 1547  
  postprocessor for PostScript printers —  
  dpost, 290  
  remove nroff, troff, tbl and eqn constructs —  
  deroff, 270  
true — provide truth values, 1484  
truss — trace system calls and signals, 1485  
tset — set terminal characteristics, 1492  
tsort — topological sort of items mentioned in  
input, 1497  
ttl — time to live value, nischtll, 980  
tty, set characteristics — stty, 1384  
tty, set characteristics — tset, 1492  
tty  
  set options — stty, 1375  
ty — get the name of the terminal, 1499  
typeset — shell built-in functions to set/get  
attributes and values for shell variables and  
functions, 1501  
typeset documents — troff, 1481

## U

u370 — get processor type truth value, 779  
u3b — get processor type truth value, 779  
u3b15 — get processor type truth value, 779  
u3b2 — get processor type truth value, 779  
u3b5 — get processor type truth value, 779  
ucblinks — adds /dev entries to give SunOS 4.x  
compatible names to SunOS 5.x  
devices, 1503  
ul — underline text, 1504  
ulimit — set or get limitations on the system  
resources available to the current shell and  
its descendents, 693  
umask — shell built-in function to restrict  
read/write/execute permissions, 1505

unalias — shell built-in functions to create your  
own pseudonym or shorthand for a  
command or series of commands, 42  
uname — print name of current system, 1508  
unbind the reference from an FNS name —  
fnunbind, 428  
uncompress — uncompress files, 178  
underline text — ul, 1504  
unexpand — unexpand SPACE characters to  
TAB characters, 355  
unhash — shell built-in functions to evaluate  
the internal hash table of the contents of  
directories, 514  
unifdef — resolve and remove ifdef'ed lines  
from C program source, 1511  
uniq — report or filter out repeated lines in a  
file, 1513  
units — converts quantities expressed in  
standard scales to other scales, 1515  
UNIX  
  convert text file from DOS format to ISO  
  format — dos2unix, 286  
UNIX-to-UNIX commands  
  uucp — uucp, 1521  
  uulog — uucp, 1521  
  uuname — uucp, 1521  
unix2dos — convert text file from ISO format to  
DOS format, 1517  
unlimit — set or get limitations on the system  
resources available to the current shell and  
its descendents, 693  
unpack — expand compressed files, 1041  
unset — shell built-in functions to determine  
the characteristics for environmental  
variables of the current shell and its  
descendents, 1302  
unsetenv — shell built-in functions to  
determine the characteristics for  
environmental variables of the current shell  
and its descendents, 1302  
until — shell built-in functions to repetitively  
execute a set of actions while/until  
conditions are evaluated TRUE, 1580  
update and examine attributes associated with  
FNS named object — fnattr, 413  
update groups of programs —  
sysV-make, 1395

- update last modified date of file — touch, 1467
- update programs — make, 810
- uptime — show how long the system has been up, 1519
- user ID
  - change user IDs of files — chown, 138
- user IDs
  - display a list of all valid user names — dispuid, 285
  - prompts for user ID — ckuid, 164
  - provides error message for user ID — erruid, 164
  - provides help message for user ID — helpuid, 164
  - validates user ID — valuid, 164
- users
  - display effective name — whoami, 1585
  - display group membership — groups, 511
  - display information about local and remote users — finger, 395
  - get the name of the user running the process — logname, 736
  - list user login information — listusers, 700
  - talk to another user — talk, 1409
  - who is logged in, and what are they doing — w, 1568
  - who is logged in on local machines — rwho, 1238
  - who is logged in on remote machines — rusers, 1237
  - who is on the system — who, 1582
  - write to another user — write, 1588
- users, network
  - Internet user name directory service — whois, 1587
- users — display users on system, 1520
- uucp — UNIX-to-UNIX copy, 1521
- uucp
  - log — uulog, 1521
  - uucp status inquiry — uustat, 1529
- uudecode — decode binary file, 1525
- uuencode — encode binary file, 1525
- uuglist — print list of service grades available, 1528
- uulog — UUCP log, 1521
- uuname — UUCP list of names, 1521
- uustat — uucp status inquiry, 1529

- uux — system to system command execution, 1536

## V

- vacation — automatic mail replies, 1540
- vax — get processor type truth value, 779
- version control
  - vc, 1543
- vgrind — formats program in nice style using troff, 1547
- vi — screen-oriented (visual) display editor based on ex, 1550
- vipw — edit password file, 1560
- volcancel — cancel user's request for removable media that is not currently in drive, 1561
- volcheck — check for media in a drive, 1562
- volmissing — notify user that volume requested is not in the CD-ROM or floppy drive, 1564
- volrmmount — call rmmount to mount or unmount media, 1565
- Volume Management
  - cancel user's request for removable media that is not currently in drive — volcancel, 1561
  - check for media in a drive — volcheck, 1562
  - missing volume notification — volmissing, 1564
- vsig — synchronize a co-process with the controlling FMLI application, 1567

## W

- w — display information about currently logged-in users, 1568
- w — who is logged in, and what are they doing, 1568
- wait — shell built-in function to wait for other jobs or processes, 1570
- wc — display a count of lines, words and characters in a file, 1573
- what — extract SCCS version information from a file, 1575
- whatis — describe command, 1576

whence — shell built-in functions to set/get attributes and values for shell variables and functions, 1501  
whereis — locate the binary, source and manual page files for a command, 1577  
which — locate a command; display its pathname or alias, 1579  
while — shell built-in functions to repetitively execute a set of actions while/until conditions are evaluated TRUE, 1580  
who is logged in — w, 1568  
who — who is on the system, 1582  
whoami — display effective user name, 1585  
whocalls — report on the calls to a specific procedure., 1586  
whois — Internet user name directory service, 1587  
write — write to another user, 1588  
write file checksums and sizes — cksum, 160

## X

xargs — construct argument lists and invoke utility, 1591  
xgettext — extract gettext call strings, 1596  
xstr — extract strings from C code, 1598

## Y

yacc — yet another compiler-compiler, 1600  
yacc  
    create a tags file for use with ex and vi — ctags, 251  
yes/no answer  
    prompts for yes/no answer — ckyorn, 166  
    provides error message for yes/no answer — erryorn, 166  
    provides help message for yes/no answer — helpyorn, 166  
    validates yes/no answer — valyorn, 166  
yet another compiler-compiler — yacc, 1600  
ypcat — print values in a NIS database, 1603  
ypmatch — print the value of one or more keys from a NIS map, 1604

yppasswd — change your network password in the NIS database, 1605  
ypwhich — return name of NIS server or map master, 1606

## Z

zcat — displays uncompressed files but leaves compressed files intact, 178
