|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Concatenation Path</b> | <p>Normally, all the entries for a certain type of information are stored within the table itself. However, there are times when it is desirable for the table to point to other tables where entries can be found. For example, you may want to store all the IP addresses in the host table for their own domain, and yet want to be able to resolve hosts in some other domain without explicitly specifying the new domain name. NIS+ provides a mechanism for concatenating different but related tables with a "NIS+ Concatenation Path". With a concatenation path, you can create a sort of flat namespace from a hierarchical structure. You can also create a table with no entries and just point the hosts or any other table to its parent domain. Note that with such a setup, you are moving the administrative burden of managing the tables to the parent domain. The concatenation path will slow down the request response time because more tables and more servers are searched. It will also decrease the availability if all the servers are incapacitated for a particular directory in the table path.</p> <p>The NIS+ Concatenation Path is also referred to as the "table path". This path is set up at table creation time through <code>nistbladm(1)</code>. You can specify more than one table to be concatenated and they will be searched in the given order. Note that the NIS+ client libraries, by default, will not follow the concatenation path set in site-specific tables. Refer to <code>nis_list(3NSL)</code> for more details.</p> |
| <b>Namespaces</b>         | <p>The NIS+ service defines two additional <i>disjoint</i> namespaces for its own use. These namespaces are the NIS+ <i>Principal</i> namespace, and the NIS+ <i>Group</i> namespace. The names associated with the group and principal namespaces are syntactically identical to simple names. However, the information they represent <i>cannot</i> be obtained by directly presenting these names to the NIS+ interfaces. Instead, special interfaces are defined to map these names into NIS+ names so that they may then be resolved.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Principal Names</b>    | <p>NIS+ principal names are used to uniquely identify users and machines that are making NIS+ requests. These names have the form:</p> <p><i>principal.domain</i></p> <p>Here <i>domain</i> is the fully qualified name of an NIS+ directory where the named principal's credentials can be found. See <i>Directories and Domains</i> for more information on domains. Note that in this name, <i>principal</i>, is not a leaf in the NIS+ namespace.</p> <p>Credentials are used to map the identity of a host or user from one context such as a process UID into the NIS+ context. They are stored as records in an NIS+ table named <i>cred</i>, which always appears in the <i>org_dir</i> subdirectory of the directory named in the principal name.</p> <p>This mapping can be expressed as a replacement function:</p> <p><i>principal.domain</i> -&gt; [cname=<i>principal.domain</i> ], cred.org_dir.<i>domain</i></p> <p>This latter name is an NIS+ name that can be presented to the <code>nis_list(3NSL)</code> interface for resolution. NIS+ principal names are administered using the <code>nisaddcred(1M)</code> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |

nis+(1)

The *cred* table contains five columns named *cname*, *auth\_name*, *auth\_type*, *public\_data*, and *private\_data*. There is one record in this table for each identity mapping for an NIS+ principal. The current service supports three types of mappings:

|         |                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOCAL   | This mapping is used to map from the UID of a given process to the NIS+ principal name associated with that UID. If no mapping exists, the name <i>nobody</i> is returned. When the effective UID of the process is 0 (for example, the superuser), the NIS+ name associated with the host is returned. Note that UIDs are sensitive to the context of the machine on which the process is executing. |
| DES     | This mapping is used to map to and from a Secure RPC "netname" into an NIS+ principal name. See <i>secure_rpc(3NSL)</i> for more information on netnames. Note that since netnames contain the notion of a domain, they span NIS+ directories.                                                                                                                                                        |
| DHnnn-m | Example: DH640-0, DH1024-0. Analogous to DES mappings, these are used to map netnames and NIS+ principal names for extended Diffie-Hellman keys. See <i>nisauthconf(1M)</i> for further information.                                                                                                                                                                                                  |

The NIS+ client library function *nis\_local\_principal(3NSL)* uses the *cred.org\_dir* table to map the UNIX notion of an identity, a process' UID, into an NIS+ principal name. Shell programs can use the program *nisdefaults(1)* with the *-p* switch to return this information.

Mapping from UIDs to an NIS+ principal name is accomplished by constructing a query of the form:

```
[auth_type=LOCAL, auth_name=uid], cred.org_dir.default-domain.
```

This query will return a record containing the NIS+ principal name associated with this UID, in the machine's default domain.

The NIS+ service uses the DES mapping to map the names associated with Secure RPC requests into NIS+ principal names. RPC requests that use Secure RPC include the *netname* of the client making the request in the RPC header. This netname has the form:

```
unix.UID@domain
```

The service constructs a query using this name of the form:

```
[auth_type=DES, auth_name=netname], cred.org_dir.domain.
```

where the domain part is extracted from the netname rather than using the default domain. This query is used to look up the mapping of this netname into an NIS+ principal name in the domain where it was created.

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Group Names</b>             | <p>This mechanism of mapping UID and netnames into an NIS+ principal name guarantees that a client of the NIS+ service has only one principal name. This principal name is used as the basis for authorization which is described below. All objects in the NIS+ namespace and all entries in NIS+ tables must have an owner specified for them. This owner field always contains an NIS+ principal name.</p>                                                                                                                           |
|                                | <p>Like NIS+ principal names, NIS+ group names take the form:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                | <pre>group_name.domain</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                | <p>All objects in the NIS+ namespace and all entries in NIS+ tables may optionally have a <i>group owner</i> specified for them. This group owner field, when filled in, always contains the fully qualified NIS+ group name.</p>                                                                                                                                                                                                                                                                                                       |
|                                | <p>The NIS+ client library defines several interfaces (<code>nis_groups(3NSL)</code>) for dealing with NIS+ groups. These interfaces internally map NIS+ group names into an NIS+ simple name which identifies the NIS+ group object associated with that group name. This mapping can be shown as follows:</p>                                                                                                                                                                                                                         |
|                                | <pre>group.domain -&gt; group.groups_dir.domain</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                | <p>This mapping eliminates collisions between NIS+ group names and NIS+ directory names. For example, without this mapping, a directory with the name <i>engineering.foo.com.</i>, would make it impossible to have a group named <i>engineering.foo.com.</i>. This is due to the restriction that within the NIS+ namespace, a name unambiguously identifies a single object. With this mapping, the NIS+ <i>group</i> name <i>engineering.foo.com.</i> maps to the NIS+ <i>object</i> name <i>engineering.groups_dir.foo.com.</i></p> |
|                                | <p>The contents of a group object is a list of NIS+ principal names, and the names of other NIS+ groups. See <code>nis_groups(3NSL)</code> for a more complete description of their use.</p>                                                                                                                                                                                                                                                                                                                                            |
| <b>NIS+ SECURITY</b>           | <p>NIS+ defines a security model to control access to information managed by the service. The service defines access rights that are selectively granted to individual clients or groups of clients. Principal names and group names are used to define clients and groups of clients that may be granted or denied access to NIS+ information. These principals and groups are associated with NIS+ domains as defined below.</p>                                                                                                      |
|                                | <p>The security model also uses the notion of a class of principals called <i>nobody</i>, which contains all clients, whether or not they have authenticated themselves to the service. The class <i>world</i> includes any client who has been authenticated.</p>                                                                                                                                                                                                                                                                      |
| <b>Directories and Domains</b> | <p>Some directories within the NIS+ namespace are referred to as NIS+ <i>Domains</i>. Domains are those NIS+ directories that contain the subdirectories <i>groups_dir</i> and <i>org_dir</i>. Further, the subdirectory <i>org_dir</i> should contain the table named <i>cred</i>. NIS+ Group names and NIS+ Principal names always include the NIS+ domain name after their first label.</p>                                                                                                                                          |

nis+(1)

**Authentication**

The NIS+ name service uses Secure RPC for the integrity of the NIS+ service. This requires that users of the service and their machines must have a Secure RPC key pair associated with them. This key is initially generated with either the `nisaddcred(1M)` or `nisclient(1M)` commands and modified with the `chkey(1)` or `nispaswd(1)` commands.

The use of Secure RPC allows private information to be stored in the name service that will not be available to untrusted machines or users on the network.

In addition to the Secure RPC key, users need a mapping of their UID into an NIS+ principal name. This mapping is created by the system administrator using either the `nisclient(1M)` or the `nisaddcred(1M)` command.

Users that will be using machines in several NIS+ domains must insure that they have a *local* credential entry in each of those domains. This credential should be created with the NIS+ principal name of the user in the user's "home" domain. For the purposes of NIS+ and Secure RPC, the home domain is defined to be the one where the user's Secure RPC key pair is located.

Although extended Diffie-Hellman keys use an alternative to Secure RPC, administration is done through the same commands. See `nisauthconf(1M)`.

**Authorization**

The NIS+ service defines four access rights that can be granted or denied to clients of the service. These rights are *read*, *modify*, *create*, and *destroy*. These rights are specified in the object structure at creation time and may be modified later with the `nischmod(1)` command. In general, the rights granted for an object apply only to that object. However, for purposes of authorization, rights granted to clients reading *directory* and *table* objects are granted to those clients for all of the objects "contained" by the parent object. This notion of containment is abstract. The objects do not actually contain other objects within them. Note that *group* objects do contain the list of principals within their definition.

Access rights are interpreted as follows:

- |        |                                                                                                                                                                                                                                                                                                                                                          |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| read   | This right grants read access to an object. For directory and table objects, having read access on the parent object conveys read access to all of the objects that are direct children of a directory, or entries within a table.                                                                                                                       |
| modify | This right grants modification access to an existing object. Read access is not required for modification. However, in many applications, one will need to read an object before modifying it. Such modify operations will fail unless read access is also granted.                                                                                      |
| create | This right gives a client permission to create new objects where one had not previously existed. It is only used in conjunction with directory and table objects. Having create access for a table allows a client to add additional entries to the table. Having create access for a directory allows a client to add new objects to an NIS+ directory. |

**destroy** This right gives a client permission to destroy or remove an existing object or entry. When a client attempts to destroy an entry or object by removing it, the service first checks to see if the table or directory containing that object grants the client destroy access. If it does, the operation proceeds, if the containing object does not grant this right then the object itself is checked to see if it grants this right to the client. If the object grants the right, then the operation proceeds; otherwise the request is rejected.

Each of these rights may be granted to any one of four different categories.

**owner** A right may be granted to the *owner* of an object. The owner is the NIS+ principal identified in the owner field. The owner can be changed with the `nischown(1)` command. Note that if the owner does not have modification access rights to the object, the owner cannot change any access rights to the object, unless the owner has modification access rights to its parent object.

**group owner** A right may be granted to the *group owner* of an object. This grants the right to any principal that is identified as a member of the group associated with the object. The group owner may be changed with the `nischgrp(1)` command. The object owner need not be a member of this group.

**world** A right may be granted to everyone in the *world*. This grants the right to all clients who have authenticated themselves with the service.

**nobody** A right may be granted to the *nobody* principal. This has the effect of granting the right to any client that makes a request of the service, regardless of whether they are authenticated or not.

Note that for bootstrapping reasons, directory objects that are NIS+ domains, the *org\_dir* subdirectory and the *cred* table within that subdirectory must have `read` access to the *nobody* principal. This makes navigation of the namespace possible when a client is in the process of locating its credentials. Granting this access does not allow the contents of other tables within *org\_dir* to be read (such as the entries in the password table) unless the table itself gives "real" access rights to the *nobody* principal.

## Directory Authorization

Additional capabilities are provided for granting access rights to clients for directories. These rights are contained within the *object access rights* (OAR) structure of the directory. This structure allows the NIS+ service to grant rights that are not granted by the directory object to be granted for objects contained by the directory of a specific type.

An example of this capability is a directory object which does not grant create access to all clients, but does grant create access in the OAR structure for *group* type objects to clients who are members of the NIS+ group associated with the directory. In this example the only objects that could be created as children of the directory would have to be of the type *group*.

nis+(1)

Another example is a directory object that grants create access only to the owner of the directory, and then additionally grants create access through the OAR structure for objects of type *table*, *link*, *group*, and *private* to any member of the directory's group. This has the effect of giving nearly complete create access to the group with the exception of creating subdirectories. This restricts the creation of new NIS+ domains because creating a domain requires creating both a *groups\_dir* and *org\_dir* subdirectory.

Note that there is currently no command line interface to set or change the OAR of the directory object.

#### **Table Authorization**

As with directories, additional capabilities are provided for granting access to entries within tables. Rights granted to a client by the access rights field in a table object apply to the table object and all of the entry objects "contained" by that table. If an access right is not granted by the table object, it may be granted by an entry within the table. This holds for all rights except *create*.

For example, a table may not grant read access to a client performing a `nis_list(3NSL)` operation on the table. However, the access rights field of entries within that table may grant read access to the client. Note that access rights in an entry are granted to the owner and group owner of the *entry* and not the owner or group of the table. When the list operation is performed, all entries that the client has read access to are returned. Those entries that do not grant read access are not returned. If none of the entries that match the search criterion grant read access to the client making the request, no entries are returned and the result status contains the `NIS_NOTFOUND` error code.

Access rights that are granted by the rights field in an entry are granted for the entire entry. However, in the table object an additional set of access rights is maintained for each column in the table. These rights apply to the equivalent column in the entry. The rights are used to grant access when neither the table nor the entry itself grant access. The access rights in a column specification apply to the owner and group owner of the entry rather than the owner and group owner of the table object.

When a read operation is performed, if read access is not granted by the table and is not granted by the entry but *is* granted by the access rights in a column, that entry is returned with the correct values in all columns that are readable and the string `*NP*` (No Permission) in columns where read access is not granted.

As an example, consider a client that has performed a list operation on a table that does not grant read access to that client. Each entry object that satisfied the search criterion specified by the client is examined to see if it grants read access to the client. If it does, it is included in the returned result. If it does not, then each column is checked to see if it grants read access to the client. If any columns grant read access to the client, data in those columns is returned. Columns that do not grant read access have their contents replaced by the string `*NP*`. If none of the columns grant read access, then the entry is not returned.

**Protocol Operation  
Authorization**

Most NIS+ operations have implied access control through the permissions on the objects that they manipulate. For example, in order to read an entry in a table, you must have read permission on that entry. However, some NIS+ operations by default perform no access checking at all and so are allowed for anyone.

| <i>Operation</i> | <i>Example of commands that use the operation</i> |
|------------------|---------------------------------------------------|
|------------------|---------------------------------------------------|

|                |                        |
|----------------|------------------------|
| NIS_CHECKPOINT | nisping -C             |
| NIS_CPTIME     | nisping, rpc.nisd      |
| NIS_MKDIR      | nismkdir               |
| NIS_PING       | nisping, rpc.nisd      |
| NIS_RMDIR      | nisrmdir               |
| NIS_SERVSTATE  | nisbackup, nisrestore  |
| NIS_STATUS     | nisstat, rpc.nispasswd |

See `nisopaccess(1)` for a description of how to enforce access control to these NIS+ operations.

**LIST OF  
COMMANDS  
NIS+ User  
Commands**

The following lists all commands and programming functions related to NIS+:

|                             |                                                                  |
|-----------------------------|------------------------------------------------------------------|
| <code>nisaddent(1M)</code>  | add /etc files and NIS maps into their corresponding NIS+ tables |
| <code>niscat(1)</code>      | display NIS+ tables and objects                                  |
| <code>nischgrp(1)</code>    | change the group owner of a NIS+ object                          |
| <code>nischmod(1)</code>    | change access rights on a NIS+ object                            |
| <code>nischown(1)</code>    | change the owner of a NIS+ object                                |
| <code>nischttl(1)</code>    | change the time to live value of a NIS+ object                   |
| <code>nisdefaults(1)</code> | display NIS+ default values                                      |
| <code>niserror(1)</code>    | display NIS+ error messages                                      |
| <code>nisgrep(1)</code>     | utilities for searching NIS+ tables                              |
| <code>nisgrpadm(1)</code>   | NIS+ group administration command                                |
| <code>nisln(1)</code>       | symbolically link NIS+ objects                                   |
| <code>nisls(1)</code>       | list the contents of a NIS+ directory                            |
| <code>nismatch(1)</code>    | utilities for searching NIS+ tables                              |
| <code>nismkdir(1)</code>    | create NIS+ directories                                          |
| <code>nisopaccess(1)</code> | access control for protocol operations                           |
| <code>nispasswd(1)</code>   | change NIS+ password information                                 |

nis+(1)

**NIS+  
Administrative  
Commands**

|                  |                                                                       |
|------------------|-----------------------------------------------------------------------|
| nisrm(1)         | remove NIS+ objects from the namespace                                |
| nisrmdir(1)      | remove NIS+ directories                                               |
| nisshowcache(1M) | NIS+ utility to print out the contents of the shared cache file       |
| nistbladm(1)     | NIS+ table administration command                                     |
| nistest(1)       | return the state of the NIS+ namespace using a conditional expression |
| aliasadm(1M)     | manipulate the NIS+ aliases map                                       |
| nis_cachemgr(1M) | NIS+ utility to cache location information about NIS+ servers         |
| nisaddcred(1M)   | create NIS+ credentials                                               |
| nisaddent(1M)    | create NIS+ tables from corresponding /etc files or NIS+ maps         |
| nisauthconf(1M)  | configure extended Diffie-Hellman keys                                |
| nisbackup(1M)    | backup NIS+ directories                                               |
| nisclient(1M)    | initialize NIS+ credentials for NIS+ principals                       |
| nisd(1M)         | NIS+ service daemon                                                   |
| nisd_resolv(1M)  | NIS+ service daemon                                                   |
| nisinit(1M)      | NIS+ client and server initialization utility                         |
| nislog(1M)       | display the contents of the NIS+ transaction log                      |
| nisping(1M)      | send ping to NIS+ servers                                             |
| nispopulate(1M)  | populate the NIS+ tables in a NIS+ domain                             |
| nisprefadm(1M)   | NIS+ utility to set server preferences for NIS+ clients               |
| nisrestore(1M)   | restore NIS+ directory backup                                         |
| nisserver(1M)    | set up NIS+ servers                                                   |
| nissetup(1M)     | initialize a NIS+ domain                                              |
| nisshowcache(1M) | NIS+ utility to print out the contents of the shared cache file       |
| nisstat(1M)      | report NIS+ server statistics                                         |
| nisupdkeys(1M)   | update the public keys in a NIS+ directory object                     |

**NIS+  
Programming API**

|                           |                                                 |
|---------------------------|-------------------------------------------------|
| rpc.nisd(1M)              | NIS+ service daemon                             |
| rpc.nisd_resolv(1M)       | NIS+ service daemon                             |
| sysidns(1M)               | system configuration                            |
| nis_add(3NSL)             | NIS+ namespace functions                        |
| nis_add_entry(3NSL)       | NIS+ table functions                            |
| nis_addmember(3NSL)       | NIS+ group manipulation functions               |
| nis_checkpoint(3NSL)      | miscellaneous NIS+ log administration functions |
| nis_clone_object(3NSL)    | NIS+ subroutines                                |
| nis_creategroup(3NSL)     | NIS+ group manipulation functions               |
| nis_destroy_object(3NSL)  | NIS+ subroutines                                |

nis\_lookup(3NSL), nis\_objects(3NSL)

*NIS+ Transition Guide*

Describes how to make the transition from NIS to NIS+.

*ONC+ Developer's Guide*

Describes the application programming interfaces for networks including NIS+.

*OpenWindows Advanced User's Guide*

Describes the admintool(1M) window interface for modifying the data in NIS+ tables.

*Solaris Naming Setup and Configuration Guide*

Describes how to plan for and configure an NIS+ namespace.

*System Administration Guide, Volume 3*

Describes IPv6 extensions to Solaris name services.

| <b>DESCRIPTION</b> | In the first synopsis, <i>niscat</i> displays the contents of the NIS+ tables named by <i>tablename</i> . In the second synopsis, it displays the internal representation of the NIS+ objects named by <i>name</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>OPTIONS</b>     | The following options are supported: <ul style="list-style-type: none"><li>-A Display the data within the table and all of the data in tables in the initial table's concatenation path.</li><li>-h Display the header line prior to displaying the table. The header consists of the '#' (hash) character followed by the name of each column. The column names are separated by the table separator character.</li><li>-L Follow links. When this option is specified, if <i>tablename</i> or <i>name</i> names a LINK type object, the link is followed and the object or table named by the link is displayed.</li><li>-M Master server only. This option specifies that the request should be sent to the master server of the named data. This guarantees that the most up-to-date information is seen at the possible expense of increasing the load on the master server and increasing the possibility of the NIS+ server being unavailable or busy for updates.</li><li>-P Follow concatenation path. This option specifies that the request should follow the concatenation path of a table if the initial search is unsuccessful. This option is only useful when using an indexed name for <i>name</i> and the -o option.</li><li>-v Display binary data directly. This option displays columns containing binary data on the standard output. Without this option binary data is displayed as the string *BINARY*.</li><li>-o <i>name</i> Display the internal representation of the named NIS+ object(s). If <i>name</i> is an indexed name (see <i>nismatch(1)</i>), then each of the matching entry objects is displayed. This option is used to display access rights and other attributes of individual columns.</li><li>-s <i>sep</i> This option specifies the character to use to separate the table columns. If no character is specified, the default separator for the table is used.</li></ul> |
| <b>EXAMPLES</b>    | <b>EXAMPLE 1</b> Examples of the <i>niscat</i> command<br><br>This example displays the contents of the hosts table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**EXAMPLE 1** Examples of the niscat command (Continued)

```
example% niscat -h hosts.org_dir
cname name addr comment
client1 client1 129.144.201.100 Joe Smith
crunchy crunchy 129.144.201.44 Jane Smith
crunchy softy 129.144.201.44
```

The string `*NP*` is returned in those fields where the user has insufficient access rights.

Display the `passwd.org_dir` on the standard output.

```
example% niscat passwd.org_dir
```

Display the contents of table `frodo` and the contents of all tables in its concatenation path.

```
example% niscat -A frodo
```

Display the entries in the table `groups.org_dir` as NIS+ objects. Note that the brackets are protected from the shell by single quotes.

```
example% niscat -o '[]groups.org_dir'
```

Display the table object of the `passwd.org_dir` table.

```
example% niscat -o passwd.org_dir
```

The previous example displays the `passwd` table object and not the `passwd` table. The table object include information such as the number of columns, column type, searchable or not searchable separator, access rights, and other defaults.

Display the directory object for `org_dir`, which includes information such as the access rights and replica information.

```
example% niscat -o org_dir
```

**ENVIRONMENT VARIABLES**

**NIS\_PATH** If this variable is set, and the NIS+ table name is not fully qualified, each directory specified will be searched until the table is found (see `nisdefaults(1)`).

**EXIT STATUS**

`niscat` returns the following values:

0 Successful completion

1 An error occurred.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

niscat(1)

**SEE ALSO** | nis+(1), nisdefaults(1), nismatch(1), nistbladm(1), nis\_objects(3NSL),  
nis\_tables(3NSL), attributes(5)

**NOTES** | Columns without values in the table are displayed by two adjacent separator  
characters.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>NAME</b>                  | nischgrp – change the group owner of a NIS+ object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>              | <b>nischgrp</b> [-AfLP] <i>group name...</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DESCRIPTION</b>           | <p>nischgrp changes the group owner of the NIS+ objects or entries specified by <i>name</i> to the specified NIS+ <i>group</i>. Entries are specified using indexed names (see nismatch(1)). If <i>group</i> is not a fully qualified NIS+ group name, it will be resolved using the directory search path (see nisdefaults(1)).</p> <p>The only restriction on changing an object’s group owner is that you must have modify permissions for the object.</p> <p>This command will fail if the master NIS+ server is not running.</p>                                                                                                                                                                                                                                                                                    |
| <b>OPTIONS</b>               | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-A        Modify all entries in all tables in the concatenation path that match the search criterion specified in <i>name</i>. This option implies the -P switch.</li> <li>-f        Force the operation and fail silently if it does not succeed.</li> <li>-L        Follow links and change the group owner of the linked object or entries rather than the group owner of the link itself.</li> <li>-P        Follow the concatenation path within a named table. This option only makes sense when either <i>name</i> is an indexed name or the -L switch is also specified and the named object is a link pointing to entries.</li> </ul>                                                                                        |
| <b>EXAMPLES</b>              | <p><b>EXAMPLE 1</b> Examples of the nischgrp command.</p> <p>The following two examples show how to change the group owner of an object to a group in a different domain, and how to change it to a group in the local domain, respectively.</p> <pre>example% nischgrp newgroup.remote.domain. object example% nischgrp my-buds object</pre> <p>This example shows how to change the group owner for a password entry.</p> <pre>example% nischgrp admins '[uid=99],passwd.org_dir'</pre> <p>In the previous example, admins is a NIS+ group in the same domain.</p> <p>The next two examples change the group owner of the object or entries pointed to by a link, and the group owner of all entries in the hobbies table.</p> <pre>example% nischgrp -L my-buds linkname example% nischgrp my-buds '[],hobbies'</pre> |
| <b>ENVIRONMENT VARIABLES</b> | <p>NIS_PATH                      If this variable is set, and the NIS+ name is not fully qualified, each directory specified will be searched until the object is found (see nisdefaults(1)).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

nischgrp(1)

**EXIT STATUS** The following exit values are returned:

- 0 Successful operation.
- 1 Operation failed.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

## nischmod(1)

- L Follow links and change the permission of the linked object or entries rather than the permission of the link itself.
- P Follow the concatenation path within a named table. This option is only applicable when either *name* is an indexed name or the -L switch is also specified and the named object is a link pointing to an entry.

### EXAMPLES

**EXAMPLE 1** Examples of the `nischmod` command.

This example gives everyone read access to an object. (that is, access for owner, group, and all).

```
example% nischmod a+r object
```

This example denies create and modify privileges to group and unauthenticated clients (*nobody*).

```
example% nischmod gn-cm object
```

In this example, a complex set of permissions are set for an object.

```
example% nischmod o=rmd,g=rm,w=rc,n=r object
```

This example sets the permissions of an entry in the password table so that the group owner can modify them.

```
example% nischmod g+m '[uid=55],passwd.org_dir'
```

The next example changes the permissions of a linked object.

```
example% nischmod -L w+mr linkname
```

### ENVIRONMENT VARIABLES

`NIS_PATH`

If this variable is set, and the NIS+ name is not fully qualified, each directory specified will be searched until the object is found (see `nisdefaults(1)`).

### EXIT STATUS

The following exit values are returned:

- 0 Successful operation.
- 1 Operation failed.

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

### SEE ALSO

`chmod(1)`, `nis+(1)`, `nischgrp(1)`, `nischown(1)`, `nisdefaults(1)`, `nismatch(1)`, `nis_objects(3NSL)`, `attributes(5)`

**NOTES** Unlike the system chmod(1) command, this command does not accept an octal notation.

nischown(1)

- 0 Successful operation.
- 1 Operation failed.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

**SEE ALSO** `nis+(1)`, `nischgrp(1)`, `nischmod(1)`, `nischttl(1)`, `nisdefaults(1)`, `nisaddcred(1M)`, `nismatch(1)`, `nis_objects(3NSL)`, `attributes(5)`

**NOTES** The NIS+ server will check the validity of the name before making the modification.

## nischttl(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>NAME</b>        | nischttl – change the time to live value of a NIS+ object                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <b>nischttl</b> [-AfLP] <i>time name</i> ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>nischttl changes the time to live value (ttl) of the NIS+ objects or entries specified by <i>name</i> to <i>time</i>. Entries are specified using indexed names (see nismatch(1)).</p> <p>The time to live value is used by object caches to expire objects within their cache. When an object is read into the cache, this value is added to the current time in seconds yielding the time when the cached object would expire. The object may be returned from the cache until the current time is earlier than the calculated expiration time. When the expiration time has been reached, the object will be flushed from the cache.</p> <p>The time to live <i>time</i> may be specified in seconds or in days, hours, minutes, seconds format. The latter format uses a suffix letter of d, h, m, or s to identify the units of time. See the examples below for usage.</p> <p>The command will fail if the master NIS+ server is not running.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li>-A        Modify all tables in the concatenation path that match the search criterion specified in <i>name</i>. This option implies the -P switch.</li><li>-f        Force the operation and fail silently if it does not succeed.</li><li>-L        Follow links and change the time to live of the linked object or entries rather than the time to live of the link itself.</li><li>-P        Follow the concatenation path within a named table. This option only makes sense when either <i>name</i> is an indexed name or the -L switch is also specified and the named object is a link pointing to entries.</li></ul>                                                                                                                                                                                                                                            |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Changing the ttl of an object</p> <p>The following example shows how to change the ttl of an object using the seconds format and the days, hours, minutes, seconds format. The ttl of the second object is set to 1 day and 12 hours.</p> <pre>example% nischttl 184000 object example% nischttl 1d12h object</pre> <p><b>EXAMPLE 2</b> Changing the ttl for a password entry</p> <p>This example shows how to change the ttl for a password entry.</p> <pre>example% nischttl 1h30m '[uid=99],passwd.org_dir'</pre>                                                                                                                                                                                                                                                                                                                                                                                                                   |

**EXAMPLE 2** Changing the ttl for a password entry (Continued)

**EXAMPLE 3** Changing the ttl of entries pointed to by a link

The next two examples change the ttl of the object or entries pointed to by a link, and the ttl of all entries in the hobbies table.

```
example% nischttl -L 12h linkname
example% nischttl 3600 '[],hobbies'
```

**ENVIRONMENT  
VARIABLES**

**NIS\_PATH** If this variable is set, and the NIS+ name is not fully qualified, each directory specified will be searched until the object is found (see nisdefaults(1)).

**EXIT STATUS**

The following exit values are returned:

0 Successful operation.  
1 Operation failed.

**ATTRIBUTES**

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

**SEE ALSO**

nis+(1), nischgrp(1), nischmod(1), nischown(1), nisdefaults(1), nismatch(1), nis\_objects(3NSL), attributes(5)

**NOTES**

Setting a high ttl value allows objects to stay persistent in caches for a longer period of time and can improve performance. However, when an object changes, in the worst case, the number of seconds in this attribute must pass before that change is visible to all clients. Setting a ttl value of 0 means that the object should not be cached at all.

A high ttl value is a week, a low value is less than a minute. Password entries should have ttl values of about 12 hours (easily allows one password change per day), entries in the RPC table can have ttl values of several weeks (this information is effectively unchanging).

Only directory and group objects are cached in this implementation.

| <b>NAME</b>        | nisdefaults – display NIS+ default values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>    | <b>nisdefaults</b> [-adghprstv]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | The <code>nisdefaults</code> utility prints the default values that are returned by calls to the NIS+ local name functions (see <code>nis_local_names(3NSL)</code> ). With no options specified, all defaults will be printed in a verbose format. With options, only that option is displayed in a terse form suitable for shell scripts. See the example below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>OPTIONS</b>     | The following options are supported: <ul style="list-style-type: none"><li>-a Print all defaults in a terse format.</li><li>-d Print the default domain name.</li><li>-g Print the default group name.</li><li>-h Print the default host name.</li><li>-p Print the default principal name.</li><li>-r Print the default access rights with which new objects will be created.</li><li>-s Print the default directory search path.</li><li>-t Print the default time to live value.</li><li>-v Print the defaults in a verbose format. This prepends an identifying string to the output.</li></ul>                                                                                                                                                                                                                                                            |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Printing NIS+ defaults</p> <p>The following prints the NIS+ defaults for a root process on machine <code>example</code> in the <code>foo.bar.</code> domain:</p> <pre>example# nisdefaults Principal Name   :   example.foo.bar. Domain Name     :   foo.bar. Host Name       :   example.foo.bar. **EXAMPLE 3** Printing the default time to live in verbose format (Continued)

**EXAMPLE 4** Printing the time to live in terse format

This example prints out the time to live in the terse format:

```
example% nisdefaults -t
43200
```

## ENVIRONMENT VARIABLES

Several environment variables affect the defaults associated with a process.

**NIS\_DEFAULTS**

This variable contains a defaults string that will override the NIS+ standard defaults. The defaults string is a series of tokens separated by colons. These tokens represent the default values to be used for the generic object properties. All of the legal tokens are described below.

*ttl=time*

This token sets the default time to live for objects that are created. The value *time* is specified in the format as defined by the `nischttl(1)` command. The default value is 12 hours.

*owner=ownername*

This token specifies that the NIS+ principal *ownername* should own created objects. The default for this value is the principal who is executing the command.

*group=groupname*

This token specifies that the group *groupname* should be the group owner for created objects. The default is NULL.

*access=rights*

This token specifies the set of access rights that are to be granted for created objects. The value *rights* is specified in the format as defined by the `nischmod(1)` command. The default value is:  
- - - -rmcdr- - -r- - -.

**NIS\_GROUP**

This variable contains the name of the local NIS+ group. If the name is not fully qualified, the default domain will be appended to it.

**NIS\_PATH**

This variable overrides the default NIS+ directory search path. It contains an ordered list of directories separated by ':' (colon) characters. The '\$' (dollar sign) character is treated specially. Directory names that end in '\$' have the default domain appended to them, and a

nisdefaults(1)

'\$' by itself is replaced by the list of directories between the default domain and the global root that are at least two levels deep. The default NIS+ directory search path is '\$'.

Refer to the Name Expansion subsection in nis+(1) for more details.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWnisu        |

**SEE ALSO** nischmod(1), nischttl(1), nis+(1), nis\_local\_names(3NSL), attributes(5)

- NAME** niserror – display NIS+ error messages
- SYNOPSIS** **niserror** *error-num*
- DESCRIPTION** niserror prints the NIS+ error associated with status value *error-num* on the standard output. It is used by shell scripts to translate NIS+ error numbers that are returned into text messages.
- EXAMPLES** **EXAMPLE 1** An example of niserror.
- The following example prints the error associated with the error number 20:
- ```
example% niserror 20
Not Found, no such name
```

nisgrpadm(1)

NAME	<code>nisgrpadm</code> – NIS+ group administration command
SYNOPSIS	<code>nisgrpadm -a -r -t [-s] group principal...</code> <code>nisgrpadm -d -l [-M] [-s] group</code> <code>nisgrpadm -c [-D defaults] [-M] [-s] group</code>
DESCRIPTION	<p>The <code>nisgrpadm</code> utility is used to administer NIS+ groups. This command administers both groups and the groups' membership lists. <code>nisgrpadm</code> can create, destroy, or list NIS+ groups. <code>nisgrpadm</code> can be used to administer a group's membership list. It can add or delete principals to the group, or test principals for membership in the group.</p> <p>The names of NIS+ groups are syntactically similar to names of NIS+ objects but they occupy a separate namespace. A group named <code>a.b.c.d.</code> is represented by a NIS+ group object named <code>a.groups_dir.b.c.d.</code>; the functions described here all expect the name of the group, not the name of the corresponding group object.</p> <p>There are three types of group members:</p> <ul style="list-style-type: none">■ An <i>explicit</i> member is just a NIS+ principal-name. For example: <code>wickedwitch.west.oz.</code>■ An <i>implicit</i> ("domain") member, written <code>*.west.oz.</code>, means that all principals in the given domain belong to this member. No other forms of wildcarding are allowed; <code>wickedwitch.*.oz.</code> is invalid, as is <code>wickedwitch.west.*.</code>. Note that principals in subdomains of the given domain are <i>not</i> included.■ A <i>recursive</i> ("group") member, written <code>@cowards.oz.</code>, refers to another group; all principals that belong to that group are considered to belong here. <p>Any member may be made <i>negative</i> by prefixing it with a minus sign ('-'). A group may thus contain explicit, implicit, recursive, negative explicit, negative implicit, and negative recursive members.</p> <p>A principal is considered to belong to a group if it belongs to at least one non-negative group member of the group and belongs to no negative group members.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none">-a Adds the list of NIS+ principals specified to <i>group</i>. The principal name should be fully qualified.-c Creates <i>group</i> in the NIS+ namespace. The NIS+ group name should be fully qualified.-d Destroys (removes) <i>group</i> from the namespace.-D <i>defaults</i> When creating objects, this option specifies a different set of defaults to be used during this operation. The <i>defaults</i> string is a series of tokens separated by colons. These tokens represent the default values to be used for the generic object properties. All of the legal tokens are described below.

<code>ttl=<i>time</i></code>	This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12 hours.
<code>owner=<i>ownername</i></code>	This token specifies that the NIS+ principal <i>ownername</i> should own the created object. Normally this value is the same as the principal who is executing the command.
<code>group=<i>groupname</i></code>	This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.
<code>access=<i>rights</i></code>	This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is specified in the format as defined by the <code>nischmod(1)</code> command. The default value is <pre>-- -- -rmcdr-- -- -r-- -- --</pre>
<code>-l</code>	Lists the membership list of the specified <i>group</i> . (See <code>-M</code> option.)
<code>-M</code>	Master server only. Sends the lookup to the master server of the named data. This guarantees that the most up to date information is seen at the possible expense that the master server may be busy. Note that the <code>-M</code> flag is applicable only with the <code>-l</code> flag.
<code>-r</code>	Removes the list of principals specified from <i>group</i> . The principal name should be fully qualified.
<code>-s</code>	Work silently. Results are returned using the exit status of the command. This status can be translated into a text string using the <code>niserror(1)</code> command.
<code>-t</code>	Displays whether the principals specified are members in <i>group</i> .

Administering Groups

EXAMPLE 1 Creating a group

This example shows how to create a group in the `foo.com.` domain:

```
example% nisgrpadm -c my_buds.foo.com.
```

nisgrpadm(1)

EXAMPLE 1 Creating a group (Continued)

EXAMPLE 2 How to remove a group

This example shows how to remove the group from the current domain.

```
example% nisgrpadm -d fred's_group
```

Administering Members

EXAMPLE 3 Adding to the group

This example shows how one would add two principals, bob and betty, to the group my_buds.foo.com.:

```
example% nisgrpadm -a my_buds.foo.com. bob.bar.com. betty.foo.com.
```

EXAMPLE 4 How to remove a principal from the group

This example shows how to remove betty from fred's_group:

```
example% nisgrpadm -r fred's_group betty.foo.com.
```

ENVIRONMENT VARIABLES

NIS_DEFAULTS This variable contains a defaults string that will override the NIS+ standard defaults.

NIS_PATH If this variable is set, and the NIS+ group name is not fully qualified, each directory specified will be searched until the group is found (see nisdefaults(1)).

ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO

nis+(1), nischgrp(1), nischmod(1), nischttl(1), nisdefaults(1), niserror(1), nis_groups(3NSL), attributes(5)

DIAGNOSTICS

NIS_SUCCESS On success, this command returns an exit status of 0.

NIS_PERMISSION When you do not have the needed access right to change the group, the command returns this error.

NIS_NOTFOUND This is returned when the group does not exist.

NIS_TRYAGAIN This error is returned when the server for the group's domain is currently checkpointing or otherwise in a read-only state. The command should be retried at a later date.

NIS_MODERROR

This error is returned when the group was modified by someone else during the execution of the command. Reissue the command and optionally recheck the group's membership list.

NOTES Principal names *must* be fully qualified, whereas groups can be abbreviated on all operations *except* create.

nisl(1)

NAME	nisl - symbolically link NIS+ objects
SYNOPSIS	nisl [-L] [-D <i>defaults</i>] <i>name linkname</i>
DESCRIPTION	The nisl command links a NIS+ object named <i>name</i> to a NIS+ name <i>linkname</i> . If <i>name</i> is an indexed name (see nismatch(1)), the link points to entries within a NIS+ table. Clients wishing to look up information in the name service can use the FOLLOW_LINKS flag to force the client library to follow links to the name they point to. Further, all of the NIS+ administration commands accept the -L switch indicating they should follow links (see nis_names(3NSL) for a description of the FOLLOW_LINKS flag).
OPTIONS	The following options are supported: -L When present, this option specifies that this command should follow links. If <i>name</i> is itself a link, then this command will follow it to the linked object that it points to. The new link will point to that linked object rather than to <i>name</i> . -D <i>defaults</i> Specify a different set of defaults to be used for the creation of the link object. The <i>defaults</i> string is a series of tokens separated by colons. These tokens represent the default values to be used for the generic object properties. All of the legal tokens are described below. <i>ttl=time</i> This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the nischttl(1) command. The default is 12 hours. <i>owner=ownername</i> This token specifies that the NIS+ principal <i>ownername</i> should own the created object. The default for this value is the the principal who is executing the command. <i>group=groupname</i> This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default is NULL. <i>access=rights</i> This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is specified in the format as defined by the nischmod(1) command. The default value is - - - -rmcdr- - -r- - -.

EXAMPLES **EXAMPLE 1** Creating a link

In this example we create a link in the domain `foo.com.` named `hosts` that points to the object `hosts.bar.com.:`

```
example% nisln hosts.bar.com. hosts.foo.com.
```

In this example we make a link `example.sun.com.` that points to an entry in the `hosts` table in `eng.sun.com.:`

EXAMPLE 2 Making a link that points to an entry in the `hosts` table

```
example% nisln '[name=example],hosts.eng.sun.com.' example.sun.com.
```

ENVIRONMENT VARIABLES

NIS_PATH If this variable is set, and the NIS+ name is not fully qualified, each directory specified will be searched until the object is found (see `nisdefaults(1)`).

EXIT STATUS

The following exit values are returned:

0 Successful operation.

1 Operation failed.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO

`nisdefaults(1)`, `nismatch(1)`, `nismrm(1)`, `nistbladm(1)`, `nis_names(3NSL)`, `nis_tables(3NSL)`, `attributes(5)`

NOTES

When creating the link, `nisln` verifies that the linked object exists. Once created, the linked object may be deleted or replaced and the link will not be affected. At that time the link will become invalid and attempts to follow it will return `NIS_LINKNAMEERROR` to the client. When the `path` attribute in tables specifies a link rather than another table, the link will be followed if the flag `FOLLOW_LINKS` was present in the call to `nis_list()` (see `nis_tables(3NSL)`) and ignored if the flag is not present. If the flag is present and the link is no longer valid, a warning is sent to the system logger and the link is ignored.

nisls(1)

NAME nisls – list the contents of a NIS+ directory

SYNOPSIS **nisls** [-dglLmMR] [*name...*]

DESCRIPTION For each *name* that is a NIS+ directory, **nisls** lists the contents of the directory. For each *name* that is a NIS+ object other than a directory, **nisls** simply echos the name. If no *name* is specified, the first directory in the search path (see **nisdefaults(1)**) is listed.

OPTIONS The following options are supported:

- d Treat NIS+ directories like other NIS+ objects, rather than listing their contents.
- g Display group owner instead of owner when listing in long format.
- l List in long format. This option displays additional information about the objects such as their type, creation time, owner, and access rights.

The access rights are listed in the following order in long mode: nobody, owner, group owner, and world.
- L This option specifies that links are to be followed. If *name* actually points to a link, it is followed to the linked object.
- m Display modification time instead of creation time when listing in long format.
- M Master only. This specifies that information is to be returned from the master server of the named object. This guarantees that the most up to date information is seen at the possible expense that the master server may be busy.
- R List directories recursively. This option will reiterate the list for each subdirectory found in the process of listing each *name*.

ENVIRONMENT VARIABLES NIS_PATH If this variable is set, and the NIS+ name is not fully qualified, each directory specified will be searched until the object is found (see **nisdefaults(1)**).

EXIT STATUS The following exit values are returned:

- 0 Successful operation.
- 1 Operation failed.

ATTRIBUTES See **attributes(5)** for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

`nisls(1)`

SEE ALSO `nisdefaults(1)`, `nisgrpadm(1)`, `nismatch(1)`, `nistbladm(1)`,
`nis_objects(3NSL)`, `attributes(5)`

nismatch(1)

NAME	nismatch, nisgrep – utilities for searching NIS+ tables
SYNOPSIS	nismatch [-AchMoPv] [-s <i>sep</i>] <i>key tablename</i> nismatch [-AchMoPv] [-s <i>sep</i>] <i>colname = key... tablename</i> nismatch [-AchMoPv] [-s <i>sep</i>] <i>indexedname</i> nisgrep [-AchiMov] [-s <i>sep</i>] <i>keypat tablename</i> nisgrep [-AchiMov] [-s <i>sep</i>] <i>colname = keypat... tablename</i>
DESCRIPTION	<p>The utilities <code>nismatch</code> and <code>nisgrep</code> can be used to search NIS+ tables. The command <code>nisgrep</code> differs from the <code>nismatch</code> command in its ability to accept regular expressions <i>keypat</i> for the search criteria rather than simple text matches.</p> <p>Because <code>nisgrep</code> uses a callback function, it is not constrained to searching only those columns that are specifically made searchable at the time of table creation. This makes it more flexible, but slower, than <code>nismatch</code>.</p> <p>In <code>nismatch</code>, the server does the searching, whereas in <code>nisgrep</code> the server returns all the readable entries and then the client does the pattern-matching.</p> <p>In both commands, the parameter <i>tablename</i> is the NIS+ name of the table to be searched. If only one key or key pattern is specified without the column name, then it is applied searching the first column. Specific named columns can be searched by using the <i>colname=key</i> syntax. When multiple columns are searched, only entries that match in all columns are returned. This is the equivalent of a logical join operation.</p> <p><code>nismatch</code> accepts an additional form of search criteria, <i>indexedname</i>, which is a NIS+ indexed name of the form:</p> <pre>[<i>colname=value</i>, . . .] , <i>tablename</i></pre>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none">-A All data. Return the data within the table and all of the data in tables in the initial table's concatenation path.-c Print only a count of the number of entries that matched the search criteria.-h Display a header line before the matching entries that contains the names of the table's columns-i Ignore upper/lower case distinction during comparisons.-M Master server only. Send the lookup to the master server of the named data. This guarantees that the most up to date information is seen at the possible expense that the master server may be busy.-o Display the internal representation of the matching NIS+ object(s).

nismatch(1)

- P Follow concatenation path. Specify that the lookup should follow the concatenation path of a table if the initial search is unsuccessful.
- s *sep* This option specifies the character to use to separate the table columns. If no character is specified, the default separator for the table is used.
- v Verbose. Do not suppress the output of binary data when displaying matching entries. Without this option binary data is displayed as the string *BINARY*.

EXAMPLES **EXAMPLE 1** Searching a table for a username

This example searches a table named `passwd` in the `org_dir` subdirectory of the `zotz.com.` domain. It returns the entry that has the username of `skippy`. In this example, all the work is done on the server:

```
example% nismatch name=skippy passwd.org_dir.zotz.com.
```

EXAMPLE 2 Finding users using specific shells

This example is similar to the one above, except that it uses `nisgrep` to find all users in the table named `passwd` that are using either `ksh(1)` or `csh(1)`:

```
example% nisgrep 'shell=[ck]sh' passwd.org_dir.zotz.com.
```

ENVIRONMENT VARIABLES

NIS_PATH If this variable is set, and the NIS+ table name is not fully qualified, each directory specified will be searched until the table is found (see `nisdefaults(1)`).

EXIT STATUS

The following exit values are returned:

- 0 Successfully matches some entries.
- 1 Successfully searches the table and no matches are found.
- 2 An error condition occurs. An error message is also printed.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO

`niscat(1)`, `nisdefaults(1)`, `nisls(1)`, `nistbladm(1)`, `nis_objects(3NSL)`, `attributes(5)`

DIAGNOSTICS

No memory
An attempt to allocate some memory for the search failed.

nismatch(1)

tablename is not a table

The object with the name *tablename* was not a table object.

Can't compile regular expression

The regular expression in *keypat* was malformed.

column not found: *colname*

The column named *colname* does not exist in the table named *tablename*.

NAME	nismkdir – create NIS+ directories								
SYNOPSIS	nismkdir [-D <i>defaults</i>] [-m <i>hostname</i>] [-s <i>hostname</i>] <i>dirname</i>								
DESCRIPTION	<p>The <code>nismkdir</code> command creates new NIS+ subdirectories within an existing domain. It can also be used to create replicated directories. Without options, this command will create a subdirectory with the same master and the replicas as its parent directory.</p> <p>It is advisable to use <code>nisserver(1M)</code> to create an NIS+ domain which consists of the specified directory along with the <code>org_dir</code> and <code>groups_dir</code> subdirectories.</p> <p>The two primary aspects that are controlled when making a directory are its access rights, and its degree of replication.</p>								
OPTIONS	<p>The following options are supported:</p> <p><code>-D <i>defaults</i></code> Specify a different set of defaults to be used when creating new directories. The <i>defaults</i> string is a series of tokens separated by colons. These tokens represent the default values to be used for the generic object properties. All of the legal tokens are described below.</p> <table border="0" style="margin-left: 2em;"> <tr> <td style="vertical-align: top;"><code>t_{ttl}=<i>time</i></code></td> <td>This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12h (12 hours).</td> </tr> <tr> <td style="vertical-align: top;"><code>owner=<i>ownername</i></code></td> <td>This token specifies that the NIS+ principal <i>ownername</i> should own the created object. The default for this value is the principal who is executing the command.</td> </tr> <tr> <td style="vertical-align: top;"><code>group=<i>groupname</i></code></td> <td>This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.</td> </tr> <tr> <td style="vertical-align: top;"><code>access=<i>rights</i></code></td> <td>This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is specified in the format as defined by the <code>nischmod(1)</code> command. The default value is - - - -rmcdr- - -r- - -.</td> </tr> </table> <p><code>-m <i>hostname</i></code> If the directory named by <i>dirname</i> does not exist, then a new directory that is <i>not</i> replicated is created with host <i>hostname</i> as its master server.</p>	<code>t_{ttl}=<i>time</i></code>	This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12h (12 hours).	<code>owner=<i>ownername</i></code>	This token specifies that the NIS+ principal <i>ownername</i> should own the created object. The default for this value is the principal who is executing the command.	<code>group=<i>groupname</i></code>	This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.	<code>access=<i>rights</i></code>	This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is specified in the format as defined by the <code>nischmod(1)</code> command. The default value is - - - -rmcdr- - -r- - -.
<code>t_{ttl}=<i>time</i></code>	This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12h (12 hours).								
<code>owner=<i>ownername</i></code>	This token specifies that the NIS+ principal <i>ownername</i> should own the created object. The default for this value is the principal who is executing the command.								
<code>group=<i>groupname</i></code>	This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.								
<code>access=<i>rights</i></code>	This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is specified in the format as defined by the <code>nischmod(1)</code> command. The default value is - - - -rmcdr- - -r- - -.								

nismkdir(1)

		If the directory name by <i>dirname</i> does exist, then the host named by <i>hostname</i> is made its master server.				
	<i>-s hostname</i>	Specify that the host <i>hostname</i> will be a replica for an existing directory named <i>dirname</i> .				
OPERANDS	The following operand is supported:					
	<i>dirname</i>	The fully qualified NIS+ name of the directory that has to be created.				
EXAMPLES	EXAMPLE 1 Using the <i>nismkdir</i> Command					
	To create a new directory <i>bar</i> under the <i>foo.com.</i> domain that shares the same master and replicas as the <i>foo.com.</i> directory one would use the command:					
	<pre>example% nismkdir bar.foo.com.</pre>					
	To create a new directory <i>bar.foo.com.</i> that is not replicated under the <i>foo.com.</i> domain one would use the command:					
	<pre>example% nismkdir -m myhost.foo.com. bar.foo.com.</pre>					
	To add a replica server of the <i>bar.foo.com.</i> directory, one would use the command:					
	<pre>example% nismkdir -s replica.foo.com. bar.foo.com.</pre>					
ENVIRONMENT VARIABLES	<i>NIS_DEFAULTS</i>	This variable contains a defaults string that will override the NIS+ standard defaults. If the <i>-D</i> switch is used those values will then override both the <i>NIS_DEFAULTS</i> variable and the standard defaults.				
	<i>NIS_PATH</i>	If this variable is set, and the NIS+ directory name is not fully qualified, each directory specified will be searched until the directory is found (see <i>nisdefaults(1)</i>).				
EXIT STATUS	The following exit values are returned:					
	0	Successful operation.				
	1	Operation failed.				
ATTRIBUTES	See <i>attributes(5)</i> for descriptions of the following attributes:					
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Availability</td><td>SUNWnisu</td></tr></tbody></table>		ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWnisu
ATTRIBUTE TYPE	ATTRIBUTE VALUE					
Availability	SUNWnisu					
SEE ALSO	<i>nis+(1)</i> , <i>nischmod(1)</i> , <i>nischttl(1)</i> , <i>nisdefaults(1)</i> , <i>nisls(1)</i> , <i>nisopaccess(1)</i> , <i>nismkdir(1)</i> , <i>nissserver(1M)</i> , <i>attributes(5)</i>					

- NOTES** | A host that serves a NIS+ directory must be a NIS+ client in a directory above the one it is serving. The exceptions to this rule are the root NIS+ servers, which are both clients and servers of the same NIS+ directory.
- When the host's default domain is different from the default domain on the client where the command is executed, the hostname supplied as an argument to the `-s` or `-m` options must be fully qualified.
- Special per-server and per-directory access restrictions may apply when this command updates the serving lists of the affected NIS+ servers. See `nisopaccess(1)`.

nisopaccess(1)

NAME	nisopaccess – NIS+ operation access control administration command																		
SYNOPSIS	nisopaccess [-v] <i>directory operation rights</i> nisopaccess [-v] [-r] <i>directory operation</i> nisopaccess [-v] [-l] <i>directory [operation]</i>																		
DESCRIPTION	<p>Most NIS+ operations have implied access control through the permissions on the objects that they manipulate. For example, in order to read an entry in a table, you must have read permission on that entry. However, some NIS+ operations by default perform no access checking at all and are allowed to all:</p> <table><thead><tr><th><i>Operation</i></th><th><i>Example of commands that use the operation</i></th></tr></thead><tbody><tr><td>NIS_CHECKPOINT</td><td>nisping -C</td></tr><tr><td>NIS_CPTIME</td><td>nisping, rpc.nisd</td></tr><tr><td>NIS_MKDIR</td><td>nismkdir</td></tr><tr><td>NIS_PING</td><td>nisping, rpc.nisd</td></tr><tr><td>NIS_RMDIR</td><td>nisrmdir</td></tr><tr><td>NIS_SERVSTATE</td><td>nisbackup, nisrestore</td></tr><tr><td>NIS_STATUS</td><td>nisstat, rpc.nispasswd</td></tr></tbody></table> <p>The <code>nisopaccess</code> command can be used to enforce access control on these operations on a per NIS+ directory basis.</p> <p>The <i>directory</i> argument should be the fully qualified name, including the trailing dot, of the NIS+ directory to which <code>nisopaccess</code> will be applied. As a short-hand, if the directory name does not end in a trailing dot, for example “org_dir”, then the domain name is appended. The domain name is also appended to partial paths such as “org_dir.xyz”.</p> <p>You can use upper or lower case for the <i>operation</i> argument; however, you cannot mix cases. The “NIS_” prefix may be omitted. For example, NIS_PING can be specified as NIS_PING, nis_ping, PING, or ping.</p> <p>The <i>rights</i> argument is specified in the format defined by the <code>nischmod(1)</code> command. Since only the read (“r”) rights are used to determine who has the right to perform the operation, the modify and delete rights may be used to control who can change access to the operation.</p> <p>The access checking performed for each operation is as follows. When an operation requires access be checked on all directories served by its <code>rpc.nisd(1M)</code>, access is denied if even one of the directories prohibits the operation.</p> <table><tbody><tr><td>NIS_CHECKPOINT</td><td>Check specified directory, or all directories if there is no directory argument (as is the case when NIS_CHECKPOINT is</td></tr></tbody></table>	<i>Operation</i>	<i>Example of commands that use the operation</i>	NIS_CHECKPOINT	nisping -C	NIS_CPTIME	nisping, rpc.nisd	NIS_MKDIR	nismkdir	NIS_PING	nisping, rpc.nisd	NIS_RMDIR	nisrmdir	NIS_SERVSTATE	nisbackup, nisrestore	NIS_STATUS	nisstat, rpc.nispasswd	NIS_CHECKPOINT	Check specified directory, or all directories if there is no directory argument (as is the case when NIS_CHECKPOINT is
<i>Operation</i>	<i>Example of commands that use the operation</i>																		
NIS_CHECKPOINT	nisping -C																		
NIS_CPTIME	nisping, rpc.nisd																		
NIS_MKDIR	nismkdir																		
NIS_PING	nisping, rpc.nisd																		
NIS_RMDIR	nisrmdir																		
NIS_SERVSTATE	nisbackup, nisrestore																		
NIS_STATUS	nisstat, rpc.nispasswd																		
NIS_CHECKPOINT	Check specified directory, or all directories if there is no directory argument (as is the case when NIS_CHECKPOINT is																		

	issued by the "nisping -Ca" command).. Return NIS_PERMISSION when access is denied.
NIS_CPTIME	Check specified directory. It returns 0 when access is denied.
NIS_MKDIR	Check parent of specified directory. Returns NIS_PERMISSION when access is denied.
	If the parent directory is not available locally, that is, it is not served by this <code>rpc.nisd(1M)</code> , NIS_MKDIR access is allowed, though the operation will be executed only if this <code>rpc.nisd</code> is a known replica of the directory.
	You should note that the NIS_MKDIR operation does not create a NIS+ directory; it adds a directory to the serving list for this <code>rpc.nisd</code> , if appropriate.
NIS_PING	Check specified directory. No return value.
NIS_RMDIR	Check specified directory. NIS_PERMISSION is returned when access denied.
	The NIS_RMDIR operation does not remove a NIS+ directory; it deletes the directory from the serving list for this <code>rpc.nisd</code> , if appropriate.
NIS_SERVSTATE	Check access on all directories served by this <code>rpc.nisd</code> . If access is denied for a tag, "<permission denied>" is returned instead of the tag value.
NIS_STATUS	Same as for NIS_SERVSTATE.

Note that older clients may not supply authentication information for some of the operations listed above. These clients are treated as "nobody" when access checking is performed.

OPTIONS The following options are supported:

-l	List the access control for a single operation, or for all operations that have access control enabled.
-r	Remove access control for a certain operation on the specified directory.
-v	Verbose mode.

EXAMPLES **EXAMPLE 1** Enabling Access Control for the NIS_PING Operation

To enable access control for the NIS_PING operation on "org_dir. 'domainname' ." such that only the owner of the directory can perform a NIS_PING, or change the NIS_PING rights:

```
example% nisopaccess org_dir NIS_PING o=rmcd,g=,w=,n=
```

nisopaccess(1)

EXAMPLE 1 Enabling Access Control for the NIS_PING Operation (Continued)

EXAMPLE 2 Listing the Access to NIS_PING

To list the access to the NIS_PING operation for org_dir:

```
example% nisopaccess -l org_dir NIS_PING
```

```
NIS_PING    ----rmcd-----    owner.dom.ain.  group.dom.ain.
```

EXAMPLE 3 Removing Access Control for NIS_PING

To remove access control for NIS_PING on org_dir:

```
example% nisopaccess -r org_dir NIS_PING
```

EXIT STATUS The following exit values are returned:

0 Successful operation.

other Operation failed. The status is usually the return status from a NIS+ command such as nistbladm.

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO nis+(1), nischmod(1), nistbladm(1), rpc.nisd(1M), attributes(5)

NOTES The access control is implemented by creating a NIS+ table called "proto_op_access" in each NIS+ directory to which access control should be applied. The table can be manipulated using normal NIS+ commands. However, nisopaccess is the only supported interface for NIS+ operation access control.

NAME	nispaswd – change NIS+ password information
SYNOPSIS	<pre>nispaswd [-ghs] [-D domainname] [username] nispaswd -a nispaswd [-D domainname] [-d [username]] nispaswd [-l] [-f] [-n min] [-x max] [-w warn] [-D domainname] username</pre>
DESCRIPTION	<p>The <code>nispaswd</code> utility changes a password, <code>gecos</code> (<code>finger</code>) field (<code>-g</code> option), home directory (<code>-h</code> option), or login shell (<code>-s</code> option) associated with the <code>username</code> (invoker by default) in the NIS+ <code>passwd</code> table.</p> <p>Additionally, the command can be used to view or modify aging information associated with the user specified if the invoker has the right NIS+ privileges.</p> <p><code>nispaswd</code> uses secure RPC to communicate with the NIS+ server, and therefore, never sends unencrypted passwords over the communication medium.</p> <p><code>nispaswd</code> does not read or modify the local password information stored in the <code>/etc/passwd</code> and <code>/etc/shadow</code> files.</p> <p>When used to change a password, <code>nispaswd</code> prompts non-privileged users for their old password. It then prompts for the new password twice to forestall typing mistakes. When the old password is entered, <code>nispaswd</code> checks to see if it has “aged” sufficiently. If “aging” is insufficient, <code>nispaswd</code> terminates; see <code>getspnam(3C)</code>.</p> <p>The old password is used to decrypt the username’s secret key. If the password does not decrypt the secret key, <code>nispaswd</code> prompts for the old secure-RPC password. It uses this password to decrypt the secret key. If this fails, it gives the user one more chance. The old password is also used to ensure that the new password differs from the old by at least three characters. Assuming aging is sufficient, a check is made to ensure that the new password meets construction requirements described below. When the new password is entered a second time, the two copies of the new password are compared. If the two copies are not identical, the cycle of prompting for the new password is repeated twice. The new password is used to re-encrypt the user’s secret key. Hence, it also becomes their secure-RPC password. Therefore, the secure-RPC password is no longer a different password from the user’s password.</p> <p>Passwords must be constructed to meet the following requirements:</p> <ul style="list-style-type: none"> ■ Each password must have at least six characters. Only the first eight characters are significant. ■ Each password must contain at least two alphabetic characters and at least one numeric or special character. In this case, “alphabetic” refers to all upper or lower case letters. ■ Each password must differ from the user’s login <code>username</code> and any reverse or circular shift of that login <code>username</code>. For comparison purposes, an upper case letter

nispasswd(1)

and its corresponding lower case letter are equivalent.

- New passwords must differ from the old by at least three characters. For comparison purposes, an upper case letter and its corresponding lower case letter are equivalent.

Network administrators, who own the NIS+ password table, may change any password attributes if they establish their credentials (see `keylogin(1)`) before invoking `nispasswd`. Hence, `nispasswd` does not prompt these privileged-users for the old password and they are not forced to comply with password aging and password construction requirements.

Any user may use the `-d` option to display password attributes for his or her own login name. The format of the display will be:

```
username status mm/dd/yy min max warn
```

or, if password aging information is not present,

```
username status
```

where

<i>username</i>	The login ID of the user.
<i>status</i>	The password status of <i>username</i> : "PS" stands for password exists or locked, "LK" stands for locked, and "NP" stands for no password.
<i>mm/dd/yy</i>	The date password was last changed for <i>username</i> . (Note that all password aging dates are determined using Greenwich Mean Time (Universal Time) and, therefore, may differ by as much as a day in other time zones.)
<i>min</i>	The minimum number of days required between password changes for <i>username</i> .
<i>max</i>	The maximum number of days the password is valid for <i>username</i> .
<i>warn</i>	The number of days relative to <i>max</i> before the password expires that the <i>username</i> will be warned.

OPTIONS The following options are supported:

<code>-g</code>	Changes the <code>gecos</code> (finger) information.
<code>-h</code>	Changes the home directory.
<code>-s</code>	Changes the login shell. By default, only the NIS+ administrator can change the login shell. User will be prompted for the new login shell.

-a	Shows the password attributes for all entries. This will show only the entries in the NIS+ passwd table in the local domain that the invoker is authorized to "read".
-d [<i>username</i>]	Displays password attributes for the caller or the user specified if the invoker has the right privileges.
-l	Locks the password entry for <i>username</i> . Subsequently, <code>login(1)</code> would disallow logins with this NIS+ password entry.
-f	Forces the user to change password at the next login by expiring the password for <i>username</i> .
-n <i>min</i>	Sets minimum field for <i>username</i> . The <i>min</i> field contains the minimum number of days between password changes for <i>username</i> . If <i>min</i> is greater than <i>max</i> , the user may not change the password. Always use this option with the -x option, unless <i>max</i> is set to -1 (aging turned off). In that case, <i>min</i> need not be set.
-x <i>max</i>	Set maximum field for <i>username</i> . The <i>max</i> field contains the number of days that the password is valid for <i>username</i> . The aging for <i>username</i> will be turned off immediately if <i>max</i> is set to -1. If it is set to 0, then the user is forced to change the password at the next login session and aging is turned off.
-w <i>warn</i>	Sets <i>warn</i> field for <i>username</i> . The <i>warn</i> field contains the number of days before the password expires that the user will be warned whenever he or she attempts to login.
-D <i>domainname</i>	Consults the <code>passwd.org_dir</code> table in <i>domainname</i> . If this option is not specified, the default <i>domainname</i> returned by <code>nis_local_directory()</code> will be used. This <i>domainname</i> is the same as that returned by <code>domainname(1M)</code> .

EXIT STATUS The following exit values are returned:

0	Success.
1	Permission denied.
2	Invalid combination of options.
3	Unexpected failure. NIS+ passwd table unchanged.
4	NIS+ passwd table missing.
5	NIS+ is busy. Try again later.
6	Invalid argument to option.
7	Aging is disabled.

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

nispasswd(1)

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO `keylogin(1)`, `login(1)`, `nis+(1)`, `nistbladm(1)`, `passwd(1)`, `rlogin(1)`, `domainname(1M)`, `nissserver(1M)`, `getpwnam(3C)`, `getspnam(3C)`, `nis_local_directory(3NSL)`, `nsswitch.conf(4)`, `passwd(4)`, `shadow(4)`, `attributes(5)`

NOTES The use of `nispasswd` is **STRONGLY** discouraged. Even though it is a hardlink to `passwd(1)`, its operation is subtly different and not desirable in a modern NIS+ domain.

In particular, `nispasswd` will not attempt to contact the `rpc.nispaswdd` daemon running on the NIS+ master. It will instead attempt to do the updates by itself via the NIS+ API. For this to work, the permissions on the password data need to be modified from the default as set up by the `nissserver` setup script (see `nissserver(1M)`).

Using `passwd(1)` with the `-r nisplus` option will achieve the same result and will be consistent across all the different name services available. This is the recommended way to change the password in NIS+.

The login program, file access display programs (for example, `'ls -l'`), and network programs that require user passwords (for example, `rlogin(1)`, `ftp(1)`, and so on) use the standard `getpwnam(3C)` and `getspnam(3C)` interfaces to get password information. These programs will get the NIS+ password information, that is modified by `nispasswd`, only if the `passwd:` entry in the `/etc/nsswitch.conf` file includes `nisplus`. See `nsswitch.conf(4)` for more details.

nisrmdir(1)

NAME	<code>nisrmdir</code> – remove NIS+ directories
SYNOPSIS	<code>nisrmdir</code> [-if] [-s <i>hostname</i>] <i>dirname</i>
DESCRIPTION	<p><code>nisrmdir</code> deletes existing NIS+ subdirectories. It can remove a directory outright, or simply remove replicas from serving a directory.</p> <p>This command modifies the object that describes the directory <i>dirname</i>, and then notifies each replica to remove the directory named <i>dirname</i>. If the notification of any of the affected replicas fails, the directory object is returned to its original state unless the <code>-f</code> option is present.</p> <p>This command will fail if the NIS+ master server is not running.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"><code>-i</code> Interactive mode. Like the system <code>rm(1)</code> command the <code>nisrmdir</code> command will ask for confirmation prior to removing a directory. If the name specified by <i>dirname</i> is a non-fully qualified name this option is forced on. This prevents the removal of unexpected directories.<code>-f</code> Force the command to succeed even though it may not be able to contact the affected replicas. This option should be used when a replica is known to be down and will not be able to respond to the removal notification. When the replica is finally rebooted it will read the updated directory object, note that it is no longer a replica for that directory, and stop responding to lookups on that directory. Cleanup of the files that held the now removed directory can be accomplished manually by removing the appropriate files in the <code>/var/nis</code> directory (see <code>nisfiles(4)</code> for more information).<code>-s <i>hostname</i></code> Specify that the host <i>hostname</i> should be removed as a replica for the directory named <i>dirname</i>. If this option is not present <i>all</i> replicas and the master server for a directory are removed and the directory is removed from the namespace.
OPERANDS	<p>The following operand is supported:</p> <p><i>dirname</i> An existing NIS+ directory.</p>
EXAMPLES	<p>EXAMPLE 1 Using the <code>nisrmdir</code> Command</p> <p>To remove a directory <code>bar</code> under the <code>foo.com.</code> domain, one would use the command:</p> <pre>example% nisrmdir bar.foo.com.</pre> <p>To remove a replica that is serving directory <code>bar.foo.com.</code> one would use the command:</p>

EXAMPLE 1 Using the `nisrmdir` Command (Continued)

```
example% nisrmdir -s replica.foo.com. bar.foo.com.
```

To force the removal of directory `bar.foo.com.` from the namespace, one would use the command:

```
example% nisrmdir -f bar.foo.com.
```

ENVIRONMENT VARIABLES

NIS_PATH If this variable is set, and the NIS+ directory name is not fully qualified, each directory specified will be searched until the directory is found (see `nisdefaults(1)`).

EXIT STATUS

The following exit values are returned:

0 Successful operation.

1 Operation failed.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO

`nis+(1)`, `nisdefaults(1)`, `nisopaccess(1)`, `nisrm(1)`, `nisfiles(4)`, `attributes(5)`

NOTES

Special per-server and per-directory access restrictions may apply when this command updates the serving lists of the affected NIS+ servers. For more information, see `nisopaccess(1)`.

nistbladm(1)

NAME	nistbladm – NIS+ table administration command
SYNOPSIS	<pre>nistbladm -a -A [-D defaults] colname = value... tablename nistbladm -a -A [-D defaults] indexedname nistbladm -c [-D defaults] [-p path] [-s sep] type colname = [flags] [, access...] tablename nistbladm -d tablename nistbladm -e -E colname = value... indexedname nistbladm -m colname = value... indexedname nistbladm -r -R [colname = value...] tablename nistbladm -r -R indexedname nistbladm -u [-p path] [-s sep] [-t type] [colname = access...] tablename</pre>
DESCRIPTION	<p>The <code>nistbladm</code> command is used to administer NIS+ tables. There are five primary operations that it performs: creating and deleting tables, adding entries to, modifying entries within, and removing entries from tables.</p> <p>Though NIS+ does not place restrictions on the size of tables or entries, the size of data has an impact on the performance and the disk space requirements of the NIS+ server. NIS+ is not designed to store huge pieces of data, such as files; instead, pointers to files should be stored in NIS+.</p> <p>NIS+ design is optimized to support 10,000 objects with a total size of 10M bytes. If the requirements exceed the above, it is suggested that the domain hierarchy be created, or the data stored in the tables be pointers to the actual data, instead of the data itself.</p> <p>When creating tables, a table type, <code>type</code>, and a list of column definitions must be provided.</p> <p><code>type</code> is a string that is stored in the table and later used by the service to verify that entries being added to it are of the correct type.</p> <p>Syntax for column definitions is:</p> <pre>colname=[flags][,access]</pre> <p><code>flags</code> is a combination of:</p> <ul style="list-style-type: none">S Searchable. Specifies that searches can be done on the column's values (see <code>nismatch(1)</code>).I Case-insensitive (only makes sense in combination with S). Specifies that searches should ignore case.C Crypt. Specifies that the column's values should be encrypted.

B Binary data (does not make sense in combination with *S*). If not set, the column's values are expected to be null terminated ASCII strings.

X XDR encoded data (only makes sense in combination with *B*).

access is specified in the format as defined by the `nischmod(1)` command.

When manipulating entries, this command takes two forms of entry name. The first uses a series of space separated *colname=value* pairs that specify column values in the entry. The second is a NIS+ indexed name, *indexedname*, of the form:

```
[ colname=value, . . . ],tablename
```

OPTIONS

The following options are supported:

-a | A Add entries to a NIS+ table. The difference between the lowercase 'a' and the uppercase 'A' is in the treatment of preexisting entries. The entry's contents are specified by the *column=value* pairs on the command line. Note: Values for *all* columns must be specified when adding entries to a table.

Normally, NIS+ reports an error if an attempt is made to add an entry to a table that would overwrite an entry that already exists. This prevents multiple parties from adding duplicate entries and having one of them get overwritten. If you wish to force the add, the uppercase 'A' specifies that the entry is to be added, even if it already exists. This is analogous to a modify operation on the entry.

-c Create a table named *tablename* in the namespace. The table that is created must have at least one column and at least one column must be searchable.

-d *tablename* Destroy the table named *tablename*. The table that is being destroyed must be empty. The table's contents can be deleted with the `-R` option below.

-e | E Edit the entry in the table that is specified by *indexedname*. *indexedname* must uniquely identify a single entry. It is possible to edit the value in a column that would change the indexed name of an entry.

The change (*colname=value*) may affect other entries in the table if the change results in an entry whose indexed name is different from *indexedname* and which matches that of another existing entry. In this case, the `-e` option will fail and an error will be reported. The `-E` option will force the replacement of the existing entry by the new entry (effectively removing two old entries and adding a new one).

nistbladm(1)

-m	A synonym for -E. This option has been superseded by the -E option.								
-r R	Remove entries from a table. The entry is specified by either a series of <i>column=value</i> pairs on the command line, or an indexed name that is specified as <i>entryname</i> . The difference between the interpretation of the lowercase 'r' versus the uppercase 'R' is in the treatment of non-unique entry specifications. Normally the NIS+ server will disallow an attempt to remove an entry when the search criterion specified for that entry resolves to more than one entry in the table. However, it is sometimes desirable to remove more than one entry, as when you are attempting to remove all of the entries from a table. In this case, using the uppercase 'R' will force the NIS+ server to remove all entries matching the passed search criterion. If that criterion is null and no column values specified, then all entries in the table will be removed.								
-u	Update attributes of a table. This allows the concatenation path (-p), separation character (specified with the (-s)), column access rights, and table type string (-t) of a table to be changed. Neither the number of columns, nor the columns that are searchable may be changed.								
-D <i>defaults</i>	When creating objects, this option specifies a different set of defaults to be used during this operation. The <i>defaults</i> string is a series of tokens separated by colons. These tokens represent the default values to be used for the generic object properties. All of the legal tokens are described below. <table><tr><td><i>t</i><i>tl</i>=<i>time</i></td><td>This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12 hours.</td></tr><tr><td><i>owner</i>=<i>ownername</i></td><td>This token specifies that the NIS+ principal <i>ownername</i> should own the created object. Normally this value is the same as the principal who is executing the command.</td></tr><tr><td><i>group</i>=<i>groupname</i></td><td>This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.</td></tr><tr><td><i>access</i>=<i>rights</i></td><td>This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is</td></tr></table>	<i>t</i> <i>tl</i> = <i>time</i>	This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12 hours.	<i>owner</i> = <i>ownername</i>	This token specifies that the NIS+ principal <i>ownername</i> should own the created object. Normally this value is the same as the principal who is executing the command.	<i>group</i> = <i>groupname</i>	This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.	<i>access</i> = <i>rights</i>	This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is
<i>t</i> <i>tl</i> = <i>time</i>	This token sets the default time to live for objects that are created by this command. The value <i>time</i> is specified in the format as defined by the <code>nischttl(1)</code> command. The default value is 12 hours.								
<i>owner</i> = <i>ownername</i>	This token specifies that the NIS+ principal <i>ownername</i> should own the created object. Normally this value is the same as the principal who is executing the command.								
<i>group</i> = <i>groupname</i>	This token specifies that the group <i>groupname</i> should be the group owner for the object that is created. The default value is NULL.								
<i>access</i> = <i>rights</i>	This token specifies the set of access rights that are to be granted for the given object. The value <i>rights</i> is								

specified in the format as defined by the `nischmod(1)` command. The default value is

```
--rmcdr--r--.
```

- p *path*** When creating or updating a table, this option specifies the table's search path. When a `nis_list()` function is invoked, the user can specify the flag `FOLLOW_PATH` to tell the client library to continue searching tables in the table's path if the search criteria used does not yield any entries. The path consists of an ordered list of table names, separated by colons. The names in the path must be fully qualified.
- s *sep*** When creating or updating a table, this option specifies the table's separator character. The separator character is used by `niscat(1)` when displaying tables on the standard output. Its purpose is to separate column data when the table is in ASCII form. The default value is a space.
- t *type*** When updating a table, this option specifies the table's type string.

EXAMPLES

EXAMPLE 1 Creating an unmodifiable table

This example creates a table named `hobbies` in the directory `foo.com.` of the type `hobby_tbl` with two searchable columns, `name` and `hobby`.

```
example% nistbladm -c hobby_tbl name=S,\
          a+r,o+m hobby=S,a+r hobbies.foo.com.
```

The column `name` has read access for all (that is, owner, group, and world) and modify access for only the owner. The column `hobby` is readable by all, but not modifiable by anyone.

In this example, if the access rights had not been specified, the table's access rights would have come from either the standard defaults or the `NIS_DEFAULTS` variable (see below).

EXAMPLE 2 Adding entries to the table

To add entries to this table:

```
example% nistbladm -a name=bob hobby=skiing hobbies.foo.com.
example% nistbladm -a name=sue hobby=skiing hobbies.foo.com.
example% nistbladm -a name=ted hobby=swimming hobbies.foo.com.
```

EXAMPLE 3 Adding the concatenation path

To add the concatenation path:

```
example% nistbladm -u -p hobbies.bar.com.:hobbies.baz.com. hobbies
```

nistbladm(1)

EXAMPLE 4 Deleting skiers from the list

To delete the skiers from our list:

```
example% nistbladm -R hobby=skiing hobbies.foo.com.
```

Note: The use of the `-r` option would fail because there are two entries with the value of `skiing`.

EXAMPLE 5 Naming a column with no flags set

To create a table with a column that is named with no flags set, you supply only the name and the equals (=) sign as follows:

```
example% nistbladm -c notes_tbl name=S,a+r,o+m note= notes.foo.com.
```

This example created a table, named `notes.foo.com.`, of type `notes_tbl` with two columns `name` and `note`. The `note` column is not searchable.

EXAMPLE 6 Protecting terminal characters

When entering data for columns in the form of a *value* string, it is essential that terminal characters be protected by single or double quotes. These are the characters equals (=), comma (,), left bracket ([), right bracket (]), and space (). These characters are parsed by NIS+ within an indexed name. These characters are protected by enclosing the entire value in double quote (") characters as follows:

```
example% nistbladm -a fullname="Joe User" nickname=Joe nicknames
```

If there is any doubt about how the string will be parsed, it is better to enclose it in quotes.

**ENVIRONMENT
VARIABLES**

NIS_DEFAULTS

This variable contains a defaults string that will be override the NIS+ standard defaults. If the `-D` switch is used those values will then override both the `NIS_DEFAULTS` variable and the standard defaults.

NIS_PATH

If this variable is set, and the NIS+ table name is not fully qualified, each directory specified will be searched until the table is found (see `nisdefaults(1)`).

EXIT STATUS

The following exit values are returned:

```
0          Successful operation.
1          Operation failed.
```

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWnisu

SEE ALSO nis+(1), niscat(1), nischmod(1), nischown(1), nischttl(1), nisdefaults(1), nismatch(1), nissetup(1M), attributes(5)

WARNINGS To modify one of the entries, say, for example, from “bob” to “robert”:

```
example% nistbladm -m name=robert [name=bob],hobbies
```

Note that “[name=bob] ,hobbies” is an indexed name, and that the characters '[' (open bracket) and ']' (close bracket) are interpreted by the shell. When typing entry names in the form of NIS+ indexed names, the name must be protected by using single quotes.

It is possible to specify a set of defaults such that you cannot read or modify the table object later.

nistest(1)

NAME	nistest – return the state of the NIS+ namespace using a conditional expression
SYNOPSIS	nistest [-ALMP] [-a <i>rights</i> -t <i>type</i>] <i>object</i> nistest [-ALMP] [-a <i>rights</i>] <i>indexedname</i> nistest -c <i>dir1 op dir2</i>
DESCRIPTION	nistest provides a way for shell scripts and other programs to test for the existence, type, and access rights of objects and entries. Entries are named using indexed names. See nismatch(1). With the -c option, directory names can be compared to test where they lie in relation to each other in the namespace.
OPTIONS	The following options are supported: -a <i>rights</i> This option is used to verify that the current process has the desired or required access rights on the named object or entries. The access rights are specified in the same way as the nischmod(1) command. -A All data. This option specifies that the data within the table and all of the data in tables in the initial table's concatenation path be returned. This option is only valid when using indexed names or following links. -L Follow links. If the object named by <i>object</i> or the tablename component of <i>indexedname</i> names a LINK type object, the link is followed when this switch is present. -M Master server only. This option specifies that the lookup should be sent to the master server of the named data. This guarantees that the most up to date information is seen at the possible expense that the master server may be busy. -P Follow concatenation path. This option specifies that the lookup should follow the concatenation path of a table if the initial search is unsuccessful. This option is only valid when using indexed names or following links. -t <i>type</i> This option tests the type of <i>object</i> . The value of <i>type</i> can be one of the following: D Return true if the object is a directory object. G Return true if the object is a group object. L Return true if the object is a link object. P Return true if the object is a private object. T Return true if the object is a table object. -c Test whether or not two directory names have a certain relationship to each other, for example, higher than (ht) or lower than (lt). The complete list of values for <i>op</i> can be displayed by

using the `-c` option with no arguments.

EXAMPLES **EXAMPLE 1** Examples of the `nistest` command.

When testing for access rights, `nistest` returns success (0) if the specified rights are granted to the current user. Thus, testing for access rights:

```
example% nistest -a w=mr skippy.domain
```

Tests that all authenticated NIS+ clients have read and modify access to the object named `skippy.domain`.

Testing for access on a particular entry in a table can be accomplished using the indexed name syntax. The following example tests to see if an entry in the password table can be modified:

```
example% nistest -a o=m '[uid=99],passwd.org_dir'
```

To test if a directory lies higher in the namespace than another directory, use the `-c` option with an *op* of `ht` (higher than) as in the following example (which would return true):

```
example% nistest -c dom.com. ht lower.dom.com.
```

ENVIRONMENT VARIABLES

NIS_PATH If this variable is set, and the NIS+ name is not fully qualified, each directory specified will be searched until the object is found. See `nisdefaults(1)`.

EXIT STATUS

The following exit values are returned:

- 0 Successful operation.
- 1 Failure due to object not present, not of specified type, and/or no such access.
- 2 Failure due to illegal usage.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

nl(1)

NAME	nl – line numbering filter								
SYNOPSIS	<pre>/usr/bin/nl [-p] [-b [type]] [-d [delim]] [-f [type]] [-h [type]] [-i [incr]] [-l [num]] [-n [format]] [-s [sep]] [-w [width]] [-v [startnum]] [file]</pre> <pre>/usr/xpg4/bin/nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num] [-n format] [-s sep] [-w width] [-v startnum] [file]</pre>								
DESCRIPTION	<p>The nl command reads lines from the named file, or the standard input if no file is named, and reproduces the lines on the standard output. Lines are numbered on the left in accordance with the command options in effect.</p> <p>nl views the text it reads in terms of logical pages. Line numbering is reset at the start of each logical page. A logical page consists of a header, a body, and a footer section. Empty sections are valid. Different line numbering options are independently available for header, body, and footer. For example, -bt (the default) numbers non-blank lines in the body section and does not number any lines in the header and footer sections.</p> <p>The start of logical page sections are signaled by input lines containing nothing but the following delimiter character(s):</p> <table><thead><tr><th>Line contents</th><th>Start Of</th></tr></thead><tbody><tr><td>\ : \ : \ :</td><td>header</td></tr><tr><td>\ : \ :</td><td>body</td></tr><tr><td>\ :</td><td>footer</td></tr></tbody></table> <p>Unless optioned otherwise, nl assumes the text being read is in a single logical page body.</p>	Line contents	Start Of	\ : \ : \ :	header	\ : \ :	body	\ :	footer
Line contents	Start Of								
\ : \ : \ :	header								
\ : \ :	body								
\ :	footer								
OPTIONS	<p>Command options may appear in any order and may be intermingled with an optional file name. Only one file may be named. The specified default is used when the option is not entered on the command line. /usr/xpg4/bin/nl options require option arguments. A SPACE character <i>may</i> separate options from option arguments. /usr/bin/nl options <i>may</i> have option arguments. If option-arguments of /usr/bin/nl options are not specified, these options result in the default. The supported options are:</p> <table><tr><td>-btype</td><td>Specifies which logical page body lines are to be numbered. Recognized types and their meanings are:</td></tr><tr><td>a</td><td>number all lines</td></tr><tr><td>t</td><td>number all non-empty lines.</td></tr><tr><td>n</td><td>no line numbering</td></tr></table>	-btype	Specifies which logical page body lines are to be numbered. Recognized types and their meanings are:	a	number all lines	t	number all non-empty lines.	n	no line numbering
-btype	Specifies which logical page body lines are to be numbered. Recognized types and their meanings are:								
a	number all lines								
t	number all non-empty lines.								
n	no line numbering								

	<i>pexp</i>	number only lines that contain the regular expression specified in <i>exp</i> ; see NOTES below.
		Default <i>type</i> for logical page body is <i>t</i> (text lines numbered).
- <i>f</i>	<i>type</i>	Same as <i>-btype</i> except for footer. Default <i>type</i> for logical page footer is <i>n</i> (no lines numbered).
- <i>d</i>	<i>delim</i>	The two delimiter characters specifying the start of a logical page section may be changed from the default characters (<i>\ :</i>) to two user-specified characters. If only one character is entered, the second character remains the default character (<i>:</i>). No space should appear between the <i>-d</i> and the delimiter characters. To enter a backslash, use two backslashes.
- <i>h</i>	<i>type</i>	Same as <i>-btype</i> except for header. Default <i>type</i> for logical page header is <i>n</i> (no lines numbered).
- <i>i</i>	<i>incr</i>	<i>incr</i> is the increment value used to number logical page lines. Default <i>incr</i> is 1.
- <i>l</i>	<i>num</i>	<i>num</i> is the number of blank lines to be considered as one. For example, <i>-l2</i> results in only the second adjacent blank being numbered (if the appropriate <i>-ha</i> , <i>-ba</i> , and/or <i>-fa</i> option is set). Default <i>num</i> is 1.
- <i>n</i>	<i>format</i>	<i>format</i> is the line numbering format. Recognized values are: <i>ln</i> left justified, leading zeroes suppressed <i>rn</i> right justified, leading zeroes suppressed <i>rz</i> right justified, leading zeroes kept Default <i>format</i> is <i>rn</i> (right justified).
- <i>p</i>		Do not restart numbering at logical page delimiters.
- <i>s</i>	<i>sep</i>	<i>sep</i> is the character(s) used in separating the line number and the corresponding text line. Default <i>sep</i> is a TAB.
- <i>v</i>	<i>startnum</i>	<i>startnum</i> is the initial value used to number logical page lines. Default <i>startnum</i> is 1.
- <i>w</i>	<i>width</i>	<i>width</i> is the number of characters to be used for the line number. Default <i>width</i> is 6.

OPERANDS The following operand is supported:

file A path name of a text file to be line-numbered.

nl(1)

EXAMPLES **EXAMPLE 1** An example of the nl command.

The command:

```
example% nl -v10 -i10 -d!+ filename1
```

will cause the first line of the page body to be numbered 10, the second line of the page body to be numbered 20, the third 30, and so forth. The logical page delimiters are !+.

ENVIRONMENT VARIABLES See environ(5) for descriptions of the following environment variables that affect the execution of nl: LC_COLLATE, LC_CTYPE, LC_MESSAGES, and NLSPATH.

EXIT STATUS The following exit values are returned:

0 Successful completion.
>0 An error occurred.

FILES /usr/lib/locale/locale/LC_COLLATE/CollTable
collation table generated by localedef
/usr/lib/locale/locale/LC_COLLATE/coll.so
shared object containing string transformation library routines

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

/usr/bin/nl

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWesu

/usr/xpg4/bin/nl

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWxcu4

SEE ALSO pr(1), attributes(5), environ(5), regex(5), regexp(5)

NOTES Internationalized Regular Expressions are used in the POSIX and "C" locales. In other locales, Internationalized Regular Expressions are used if the following two conditions are met:

- /usr/lib/locale/locale/LC_COLLATE/CollTable is present
- /usr/lib/locale/locale/LC_COLLATE/coll.so is not present;

otherwise, Simple Regular Expressions are used.

Internationalized Regular Expressions are explained on regex(5). Simple Regular Expressions are explained on regexp(5).

NAME	nm – print name list of an object file
SYNOPSIS	<pre>/usr/ccs/bin/nm [-ACDhlnPprRsTuVv] [-efox] [-g -u] [-t <i>format</i>] <i>file...</i> /usr/xpg4/bin/nm [-ACDhlnPprRsTuVv] [-efox] [-g -u] [-t <i>format</i>] <i>file...</i></pre>
DESCRIPTION	<p>The nm utility displays the symbol table of each ELF object file that is specified by <i>file</i>.</p> <p>If no symbolic information is available for a valid input file, the nm utility will report that fact, but not consider it an error condition.</p>
OPTIONS	<p>The output of nm may be controlled using the following options:</p> <ul style="list-style-type: none"> -A Write the full path name or library name of an object on each line. -C Demangle C++ symbol names before printing them out. -D Display the SHT_DYNSYM symbol information. This is the symbol table used by ld.so.1 and is present even in stripped dynamic executables. By default the SHT_SYMTAB symbol table is displayed. -e See NOTES below. -f See NOTES below. -g Write only external (global) symbol information. -h Do not display the output heading data. -l Distinguish between WEAK and GLOBAL symbols by appending a * to the key letter for WEAK symbols. -n Sort external symbols by name before they are printed. -o Print the value and size of a symbol in octal instead of decimal (equivalent to -t o). -p Produce easy to parse, terse output. Each symbol name is preceded by its value (blanks if undefined) and one of the letters: <ul style="list-style-type: none"> A absolute symbol B bss (uninitialized data space) symbol D data object symbol F file symbol. N symbol has no type S section symbol T text symbol U undefined

nm(1)

		If the symbol's binding attribute is:
		LOCAL the key letter is lower case
		WEAK the key letter is upper case; if the -l modifier is specified, the upper case key letter is followed by a *
		GLOBAL the key letter is upper case.
-P		Write information in a portable output format, as specified in Standard Output.
-r		Prepend the name of the object file or archive to each output line.
-R		Print the archive name (if present), followed by the object file and symbol name. If the -r option is also specified, this option is ignored.
-s		Print section name instead of section index.
-t <i>format</i>		Write each numeric value in the specified format. The format is dependent on the single character used as the <i>format</i> option-argument:
	d	The offset is written in decimal (default).
	o	The offset is written in octal.
	x	The offset is written in hexadecimal.
-T		See NOTES below.
/usr/ccs/bin/nm	-u	Print undefined symbols only.
/usr/xpg4/bin/nm	-u	Print long listing for each undefined symbol. See OUTPUT below.
	-v	Sort external symbols by value before they are printed.
	-V	Print the version of the nm command executing on the standard error output.
	-x	Print the value and size of a symbol in hexadecimal instead of decimal (equivalent to -t x).
		Options may be used in any order, either singly or in combination, and may appear anywhere in the command line. When conflicting options are specified (such as -v and -n, or -o and -x) the first is taken and the second ignored with a warning message to the user. (See -R for exception.)
OPERANDS		The following operand is supported:
	<i>file</i>	A path name of an object file, executable file or object-file library.
Standard Output		For each symbol, the following information will be printed:
	Index	The index of the symbol. (The index appears in brackets.)

Value	The value of the symbol is one of the following:	
	<ul style="list-style-type: none"> ■ A section offset for defined symbols in a relocatable file. ■ Alignment constraints for symbols whose section index is SHN_COMMON. ■ A virtual address in executable and dynamic library files. 	
Size	The size in bytes of the associated object.	
Type	A symbol is of one of the following types:	
	NOTYPE	No type was specified.
	OBJECT	A data object such as an array or variable.
	FUNC	A function or other executable code.
	REGI	A register symbol (SPARC only).
	SECTION	A section symbol.
	FILE	Name of the source file.
Bind	The symbol's binding attributes.	
	LOCAL symbols	Have a scope limited to the object file containing their definition.
	GLOBAL asymbols	Are visible to all object files being combined.
	WEAK symbols	Are essentially global symbols with a lower precedence than GLOBAL.
Other	A field reserved for future use, currently containing 0.	
Shndx	Except for three special values, this is the section header table index in relation to which the symbol is defined. The following special values exist:	
	ABS	Indicates the symbol's value will not change through relocation.
	COMMON	Indicates an unallocated block and the value provides alignment constraints.
	UNDEF	Indicates an undefined symbol.
Name	The name of the symbol.	
Object Name	The name of the object or library if -A is specified.	

If the -P option is specified, the previous information is displayed using the following portable format. The three versions differ depending on whether -t d, -t o, or -t x was specified, respectively:

nm(1)

```
"%s%s %s %d %d\n", <library/object name>, name, type, value, size "%s%s %s
%o %o\n", <library/object name>, name, type, value, size "%s%s %s %x %x\n",
<library/object name>, name, type, value, size
```

where *<library/object name>* is formatted as follows:

- If *-A* is not specified, *<library/object name>* is an empty string.
- If *-A* is specified and the corresponding *file* operand does not name a library:

```
"%s: ", file
```
- If *-A* is specified and the corresponding *file* operand names a library. In this case, *<object file>* names the object file in the library containing the symbol being described:

```
"%s [%s] : ", file, <object file>
```

If *-A* is not specified, then if more than one *file* operand is specified or if only one *file* operand is specified and it names a library, *nm* will write a line identifying the object containing the following symbols before the lines containing those symbols, in the form:

- If the corresponding *file* operand does not name a library:

```
"%s:\n", file
```
- If the corresponding *file* operand names a library; in this case, *<object file>* is the name of the file in the library containing the following symbols:

```
"%s [%s] :\n", file, <object file>
```

If *-P* is specified, but *-t* is not, the format is as if *-t x* had been specified.

ENVIRONMENT VARIABLES

See *environ(5)* for descriptions of the following environment variables that affect the execution of *nm*: *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, and *NLSPATH*.

EXIT STATUS

The following exit values are returned:

- 0 Successful completion.
- >0 An error occurred.

ATTRIBUTES

See *attributes(5)* for descriptions of the following attributes:

/usr/ccs/bin/nm

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWbtool

/usr/xpg4/bin/nm

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWxcu4

SEE ALSO ar(1), as(1), dump(1), ld(1), ld.so.1(1), ar(3HEAD), a.out(4), attributes(5), environ(5), XPG4(5)

NOTES The following options are obsolete because of changes to the object file format and will be deleted in a future release.

- e Print only external and static symbols. The symbol table now contains only static and external symbols. Automatic symbols no longer appear in the symbol table. They do appear in the debugging information produced by `cc -g`, which may be examined using `dump(1)`.
- f Produce full output. Redundant symbols (such as `.text`, `.data`, and so forth), which existed previously, do not exist and producing full output will be identical to the default output.
- T By default, `nm` prints the entire name of the symbols listed. Since symbol names have been moved to the last column, the problem of overflow is removed and it is no longer necessary to truncate the symbol name.

nohup(1)

NAME	nohup – run a command immune to hangups				
SYNOPSIS	<code>/usr/bin/nohup</code> <i>command</i> [<i>argument...</i>] <code>/usr/xpg4/bin/nohup</code> <i>command</i> [<i>argument...</i>]				
DESCRIPTION	<p>The <code>nohup</code> utility invokes the named <i>command</i> with the arguments supplied. When the <i>command</i> is invoked, <code>nohup</code> arranges for the SIGHUP signal to be ignored by the process.</p> <p>The <code>nohup</code> utility can be used when it is known that <i>command</i> will take a long time to run and the user wants to logout of the terminal; when a shell exits, the system sends its children SIGHUP signals, which by default cause them to be killed. All stopped, running, and background jobs will ignore SIGHUP and continue running, if their invocation is preceded by the <code>nohup</code> command or if the process programmatically has chosen to ignore SIGHUP.</p>				
<code>/usr/bin/nohup</code>	Processes run by <code>/usr/bin/nohup</code> are immune to SIGHUP (hangup) and SIGQUIT (quit) signals.				
<code>/usr/xpg4/bin/nohup</code>	Processes run by <code>/usr/xpg4/bin/nohup</code> are immune to SIGHUP.				
	<p>The <code>nohup</code> utility does not arrange to make processes immune to a SIGTERM (terminate) signal, so unless they arrange to be immune to SIGTERM or the shell makes them immune to SIGTERM, they will receive it.</p> <p>If <code>nohup.out</code> is not writable in the current directory, output is redirected to <code>\$HOME/nohup.out</code>. If a file is created, the file will have read and write permission (600, see <code>chmod(1)</code>). If the standard error is a terminal, it is redirected to the standard output, otherwise it is not redirected. The priority of the process run by <code>nohup</code> is not altered.</p>				
OPERANDS	<p>The following operands are supported:</p> <table><tr><td><i>command</i></td><td>The name of a command that is to be invoked. If the <i>command</i> operand names any of the special <code>shell_builtins(1)</code> utilities, the results are undefined.</td></tr><tr><td><i>argument</i></td><td>Any string to be supplied as an argument when invoking the <i>command</i> operand.</td></tr></table>	<i>command</i>	The name of a command that is to be invoked. If the <i>command</i> operand names any of the special <code>shell_builtins(1)</code> utilities, the results are undefined.	<i>argument</i>	Any string to be supplied as an argument when invoking the <i>command</i> operand.
<i>command</i>	The name of a command that is to be invoked. If the <i>command</i> operand names any of the special <code>shell_builtins(1)</code> utilities, the results are undefined.				
<i>argument</i>	Any string to be supplied as an argument when invoking the <i>command</i> operand.				
EXAMPLES	<p>EXAMPLE 1 Applying <code>nohup</code> to pipelines or command lists</p> <p>It is frequently desirable to apply <code>nohup</code> to pipelines or lists of commands. This can be done only by placing pipelines and command lists in a single file, called a shell script. One can then issue:</p> <pre>example\$ nohup sh file</pre> <p>and the <code>nohup</code> applies to everything in <i>file</i>. If the shell script <i>file</i> is to be executed often, then the need to type <code>sh</code> can be eliminated by giving <i>file</i> execute permission.</p>				

EXAMPLE 1 Applying nohup to pipelines or command lists (Continued)

Add an ampersand and the contents of *file* are run in the background with interrupts also ignored (see `sh(1)`):

```
example$ nohup file &
```

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of nohup: `LC_CTYPE`, `LC_MESSAGES`, `PATH`, and `NLSPATH`.

`HOME` Determine the path name of the user's home directory: if the output file `nohup.out` cannot be created in the current directory, the nohup command will use the directory named by `HOME` to create the file.

EXIT STATUS

The following exit values are returned:

126 *command* was found but could not be invoked.

127 An error occurred in nohup, or *command* could not be found

Otherwise, the exit values of nohup will be that of the *command* operand.

FILES

`nohup.out` the output file of the nohup execution if standard output is a terminal and if the current directory is writable.

`$HOME/nohup.out` the output file of the nohup execution if standard output is a terminal and if the current directory is not writable.

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

/usr/bin/nohup

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu
CSI	enabled

/usr/xpg4/bin/nohup

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWxcu4
CSI	enabled

SEE ALSO

`batch(1)`, `chmod(1)`, `csh(1)`, `ksh(1)`, `nice(1)`, `sh(1)`, `shell_builtins(1)`, `signal(3C)`, `attributes(5)`, `environ(5)`, `XPG4(5)`

nohup(1)

WARNINGS If you are running the Korn shell (`ksh(1)`) as your login shell, and have `nohup`'ed jobs running when you attempt to logout, you will be warned with the message

```
You have jobs running.
```

You will then need to logout a second time to actually logout; however, your background jobs will continue to run.

NOTES The C-shell (`csh(1)`) has a built-in command `nohup` that provides immunity from `SIGHUP`, but does not redirect output to `nohup.out`. Commands executed with `'&'` are automatically immune to `HUP` signals while in the background.

`nohup` does not recognize command sequences. In the case of the following command,

```
example$ nohup command1; command2
```

the `nohup` utility applies only to `command1`. The command,

```
example$ nohup (command1; command2)
```

is syntactically incorrect.

NAME	nroff – format documents for display or line-printer
SYNOPSIS	nroff [-ehiq] [-mname] [-nN] [-opagelist] [-raN] [-sN] [-Tname]
DESCRIPTION	nroff formats text in the named <i>files</i> for typewriter-like devices. See also troff(1). If no <i>file</i> argument is present, nroff reads the standard input. An argument consisting of a '-' is taken to be a file name corresponding to the standard input.
OPTIONS	The following options are supported. Options may appear in any order so long as they appear <i>before</i> the files.
-e	Produce equally-spaced words in adjusted lines, using full terminal resolution.
-h	Use output TAB characters during horizontal spacing to speed output and reduce output character count. TAB settings are assumed to be every 8 nominal character widths.
-i	Read the standard input after the input files are exhausted.
-q	Invoke the simultaneous input-output mode of the rd(9F) request.
-mname	Prepend the macro file /usr/share/lib/tmac/tmac.name to the input files.
-nN	Number first generated page <i>N</i> .
-opagelist	Print only pages whose page numbers appear in the comma-separated <i>list</i> of numbers and ranges. A range <i>N-M</i> means pages <i>N</i> through <i>M</i> ; an initial - <i>N</i> means from the beginning to page <i>N</i> ; and a final <i>N-</i> means from <i>N</i> to the end.
-raN	Set register <i>a</i> (one-character) to <i>N</i> .
-sN	Stop every <i>N</i> pages. nroff will halt prior to every <i>N</i> pages (default <i>N</i> =1) to allow paper loading or changing, and will resume upon receipt of a NEWLINE.
-Tname	Prepare output for a device of the specified <i>name</i> . Known <i>names</i> are:
	37 Teletype Corporation Model 37 terminal — this is the default.
	lp tn300 GE — any line printer or terminal without half-line capability.
	300 DASI-300.
	300-12 DASI-300 — 12-pitch.
	300S DASI-300S.
	300S-12 DASI-300S.

nroff(1)

382	DASI-382 (fancy DTC 382).
450	DASI-450 (Diablo Hyterm).
450-12	DASI-450 (Diablo Hyterm) — 12-pitch.
832	AJ 832.

EXAMPLES **EXAMPLE 1** Formatting with a macro package

The following command formats `users.guide` using the `-me` macro package, and stopping every 4 pages:

```
example% nroff -s4 -me users.guide
```

ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `nroff`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

FILES

<code>/usr/tmp/trtmp*</code>	temporary file (see <code>NOTES</code>)
<code>/usr/share/lib/tmac/tmac.*</code>	standard macro files
<code>/usr/share/lib/nterm/*</code>	terminal driving tables for <code>nroff</code>
<code>/usr/share/lib/nterm/README</code>	index to terminal description files

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdoc
CSI	Enabled

SEE ALSO

`checknr(1)`, `col(1)`, `eqn(1)`, `man(1)`, `tbl(1)`, `troff(1)`, `attributes(5)`, `environ(5)`, `me(5)`, `ms(5)`, `term(5)`, `rd(9F)`

NOTES

`/usr/tmp` is currently a symbolic link to `/var/tmp`.

Previous documentation incorrectly described the numeric register `yr` as being the "Last two digits of current year". `yr` is in actuality the number of years since 1900. To correctly obtain the last two digits of the current year through the year 2099, the definition given below of string register `yy` may be included in a document and subsequently used to display a two-digit year. Note that any other available one- or two-character register name may be substituted for `yy`.

```
.\" definition of new string register yy--last two digits of year
.\" use yr (# of years since 1900) if it is < 100
.ie \n(yr<100) .ds yy \n(yr
.el \{
.\" else, subtract 100 from yr, store in ny
.nr ny \n(yr-100
.ie \n(ny>9 \{
.\" use ny if it is two digits
```

```
.ds yy \n(ny
.\" remove temporary number register ny
.rr ny \}
.el \{.ds yy 0
.\" if ny is one digit, append it to 0
.as yy \n(ny
.rr ny \} \}
```

od(1)

NAME	od – octal dump																
SYNOPSIS	<pre>/usr/bin/od [-bcCDdFfOoSsvXx] [-] [file] [offset_string] /usr/bin/od [-bcCDdFfOoSsvXx] [-A address_base] [-j skip] [-N count] [-t type_string...] [-] [file...] /usr/xpg4/bin/od [-bcCDdFfOoSsvXx] [-] [file] [offset_string] /usr/xpg4/bin/od [-bcCDdFfOoSsvXx] [-A address_base] [-j skip] [-N count] [-t type_string...] [-] [file...]</pre>																
DESCRIPTION	<p>The <code>od</code> command copies sequentially each input file to standard output and transforms the input data according to the output types specified by the <code>-t</code> or <code>-bcCDdFfOoSsvXx</code> options. If no output type is specified, the default output is as if <code>-t o2</code> had been specified. Multiple types can be specified by using multiple <code>-bcCDdFfOoSsvXx</code> options. Output lines are written for each type specified in the order in which the types are specified. If no <i>file</i> is specified, the standard input is used. The <i>[offset_string]</i> operand is mutually exclusive from the <code>-A</code>, <code>-j</code>, <code>-N</code>, and <code>-t</code> options. For the purposes of this description, the following terms are used:</p> <table><tr><td>word</td><td>Refers to a 16-bit unit, independent of the word size of the machine.</td></tr><tr><td>long word</td><td>Refers to a 32-bit unit.</td></tr><tr><td>double long word</td><td>Refers to a 64-bit unit.</td></tr></table>	word	Refers to a 16-bit unit, independent of the word size of the machine.	long word	Refers to a 32-bit unit.	double long word	Refers to a 64-bit unit.										
word	Refers to a 16-bit unit, independent of the word size of the machine.																
long word	Refers to a 32-bit unit.																
double long word	Refers to a 64-bit unit.																
OPTIONS	<p>The following options are supported:</p> <table><tr><td><code>-A address_base</code></td><td>Specify the input offset base. The <i>address_base</i> option-argument must be a character. The characters <code>d</code>, <code>o</code> and <code>x</code> specify that the offset base will be written in decimal, octal or hexadecimal, respectively. The character <code>n</code> specifies that the offset will not be written. Unless <code>-A n</code> is specified, the output line will be preceded by the input offset, cumulative across input files, of the next byte to be written. In addition, the offset of the byte following the last byte written will be displayed after all the input data has been processed. Without the <code>-A address_base</code> option and the <i>[offset_string]</i> operand, the input offset base is displayed in octal.</td></tr><tr><td><code>-b</code></td><td>Interpret bytes in octal. This is equivalent to <code>-t o1</code>.</td></tr></table>	<code>-A address_base</code>	Specify the input offset base. The <i>address_base</i> option-argument must be a character. The characters <code>d</code> , <code>o</code> and <code>x</code> specify that the offset base will be written in decimal, octal or hexadecimal, respectively. The character <code>n</code> specifies that the offset will not be written. Unless <code>-A n</code> is specified, the output line will be preceded by the input offset, cumulative across input files, of the next byte to be written. In addition, the offset of the byte following the last byte written will be displayed after all the input data has been processed. Without the <code>-A address_base</code> option and the <i>[offset_string]</i> operand, the input offset base is displayed in octal.	<code>-b</code>	Interpret bytes in octal. This is equivalent to <code>-t o1</code> .												
<code>-A address_base</code>	Specify the input offset base. The <i>address_base</i> option-argument must be a character. The characters <code>d</code> , <code>o</code> and <code>x</code> specify that the offset base will be written in decimal, octal or hexadecimal, respectively. The character <code>n</code> specifies that the offset will not be written. Unless <code>-A n</code> is specified, the output line will be preceded by the input offset, cumulative across input files, of the next byte to be written. In addition, the offset of the byte following the last byte written will be displayed after all the input data has been processed. Without the <code>-A address_base</code> option and the <i>[offset_string]</i> operand, the input offset base is displayed in octal.																
<code>-b</code>	Interpret bytes in octal. This is equivalent to <code>-t o1</code> .																
/usr/bin/od	<table><tr><td><code>-c</code></td><td>Display single-byte characters. /usr/xpg4/bin/od

- ```
echo "hello world" | od -c
0000000 h e l l o w o r l d \n
0000014
```
- c** Interpret bytes as single-byte or multibyte characters according to the current setting of the LC\_CTYPE locale category. Printable multibyte characters are written in the area corresponding to the first byte of the character; the two character sequence \*\* is written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. Non-graphic characters appear the same as they would using the -C option.
- C** Interpret bytes as single-byte or multibyte characters according to the current setting of the LC\_CTYPE locale category. Printable multibyte characters are written in the area corresponding to the first byte of the character; two character sequence \*\* are written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. Certain non-graphic characters appear as C escapes:
- |           |    |
|-----------|----|
| null      | \0 |
| backspace | \b |
| form-feed | \f |
| new-line  | \n |
| return    | \r |
| tab       | \t |
- Other non-printable characters appear as one three-digit octal number for each byte in the character.
- d** Interpret words in unsigned decimal. This is equivalent to -t u2.
- D** Interpret long words in unsigned decimal. This is equivalent to -t u4.
- f** Interpret long words in floating point. This is equivalent to -t f4.
- F** Interpret double long words in extended precision. This is equivalent to -t f8.
- j skip** Jump over *skip* bytes from the beginning of the input. The od command will read or seek past the first *skip* bytes in the concatenated input files. If the combined input is not at least *skip* bytes long, the od command will write a diagnostic message to standard error and exit with a non-zero exit status.
- By default, the *skip* option-argument is interpreted as a decimal number. With a leading 0x or 0X, the offset is interpreted as a hexadecimal number; otherwise, with a leading 0, the offset will be interpreted as an octal number. Appending the character b, k, or m to offset will cause it to be interpreted as a multiple of 512, 1024 or 1 048 576 bytes, respectively. If the *skip* number is

od(1)

- hexadecimal, any appended *b* is considered to be the final hexadecimal digit. The address is displayed starting at 0000000, and its base is not implied by the base of the *skip* option-argument.
- N count* Format no more than *count* bytes of input. By default, *count* is interpreted as a decimal number. With a leading 0x or 0X, *count* is interpreted as a hexadecimal number; otherwise, with a leading 0, it is interpreted as an octal number. If *count* bytes of input (after successfully skipping, if *-j skip* is specified) are not available, it will not be considered an error; the *od* command will format the input that is available. The base of the address displayed is not implied by the base of the *count* option-argument.
- o* Interpret words in octal. This is equivalent to *-t o2*.
- O* Interpret long words in unsigned octal. This is equivalent to *-t o4*.
- s* Interpret words in signed decimal. This is equivalent to *-t d2*.
- S* Interpret long words in signed decimal. This is equivalent to *-t d4*.
- t type\_string* Specify one or more output types. The *type\_string* option-argument must be a string specifying the types to be used when writing the input data. The string must consist of the type specification characters:
- a *Named character*. Interpret bytes as named characters. Only the least significant seven bits of each byte will be used for this type specification. Bytes with the values listed in the following table will be written using the corresponding names for those characters.

Named Characters in od

| Value | Name | Value | Name | Value | Name | Value | Name |
|-------|------|-------|------|-------|------|-------|------|
| \000  | nul  | \001  | soh  | \002  | stx  | \003  | etx  |
| \004  | eot  | \005  | eng  | \006  | ack  | \007  | bel  |
| \010  | bs   | \011  | ht   | \012  | lf   | \013  | vt   |
| \014  | ff   | \015  | cr   | \016  | so   | \017  | si   |
| \020  | dle  | \021  | dc1  | \022  | dc2  | \023  | dc3  |
| \024  | dc4  | \025  | nak  | \026  | syn  | \027  | etb  |
| \030  | can  | \031  | em   | \032  | sub  | \033  | esc  |
| \034  | fs   | \035  | gs   | \036  | rs   | \037  | us   |

| Value | Name | Value | Name | Value | Name | Value | Name |
|-------|------|-------|------|-------|------|-------|------|
| \040  | sp   | \177  | del  |       |      |       |      |

- c** *Character*. Interpret bytes as single-byte or multibyte characters specified by the current setting of the LC\_CTYPE locale category. Printable multibyte characters are written in the area corresponding to the first byte of the character; the two character sequence \*\* is written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. Certain non-graphic characters appear as C escapes: \0, \a, \b, \f, \n, \r, \t, \v. Other non-printable characters appear as one three-digit octal number for each byte in the character.

The type specification characters d, f, o, u, and x can be followed by an optional unsigned decimal integer that specifies the number of bytes to be transformed by each instance of the output type.

- f** *Floating point*. Can be followed by an optional F, D, or L indicating that the conversion should be applied to an item of type float, double, or long double, respectively.

- d, o, u, and x** *Signed decimal, octal, unsigned decimal, and hexadecimal*, respectively. Can be followed by an optional C, S, I, or L indicating that the conversion should be applied to an item of type char, short, int, or long, respectively.

Multiple types can be concatenated within the same *type\_string* and multiple -t options can be specified. Output lines are written for each type specified in the order in which the type specification characters are specified.

- v** Show all input data (verbose). Without the -v option, all groups of output lines that would be identical to the immediately preceding output line (except for byte offsets), will be replaced with a line containing only an asterisk (\*).
- x** Interpret words in hex. This is equivalent to -t x2.
- X** Interpret long words in hex. This is equivalent to -t x4.

**OPERANDS** The following operands are supported for both /usr/bin/od and /usr/xpg4/bin/od:

- Use the standard input in addition to any files specified. When this operand is not given, the standard input is used only if no *file*

od(1)

operands are specified.

**/usr/bin/od**

The following operands are supported for `/usr/bin/od` only:

*file*

A path name of a file to be read. If no *file* operands are specified, the standard input will be used. If there are no more than two operands, none of the `-A`, `-j`, `-N`, or `-t` options is specified, and *any* of the following are true:

1. the first character of the last operand is a plus sign (+)
2. the first character of the second operand is numeric
3. the first character of the second operand is `x` and the second character of the second operand is a lower-case hexadecimal character or digit
4. the second operand is named "`x`"
5. the second operand is named "."

then the corresponding operand is assumed to be an offset operand rather than a file operand.

Without the `-N` count option, the display continues until an end-of-file is reached.

[+] [0] *offset* [.] [b|B]

[+] [0] [*offset*] [.]

[+] [0x|x] [*offset*]

[+] [0x|x] *offset* [B]

The *offset\_string* operand specifies the byte offset in the file where dumping is to commence. The offset is interpreted in octal bytes by default. If *offset* begins with "0", it is interpreted in octal. If *offset* begins with "x" or "0x", it is interpreted in hexadecimal and any appended "b" is considered to be the final hexadecimal digit. If "." is appended, the offset is interpreted in decimal. If "b" or "B" is appended, the offset is interpreted in units of 512 bytes. If the *file* argument is omitted, the *offset* argument must be preceded by a plus sign (+). The address is displayed starting at the given offset. The radix of the address will be the same as the radix of the offset, if specified, otherwise it will be octal. Decimal overrides octal, and it is an error to specify both hexadecimal and decimal conversions in the same offset operand.

**/usr/xpg4/bin/od**

The following operands are supported for `/usr/xpg4/bin/od` only:

*file*

Same as `/usr/bin/od`, except only one of the first two conditions must be true.

[+] [0] *offset* [.] [b|B]  
 + [*offset*] [.]  
 [+] [0x] [*offset*]  
 [+] [0x] *offset* [B]  
 +x [*offset*]  
 +x*offset* [B]

Description of *offset\_string* is the same as for  
 /usr/bin/od.

## ENVIRONMENT VARIABLES

See [environ\(5\)](#) for descriptions of the following environment variables that affect the execution of od: LC\_CTYPE, LC\_MESSAGES, LC\_NUMERIC, and NLSPATH.

## EXIT STATUS

The following exit values are returned:

0 Successful completion.  
 >0 An error occurred.

## ATTRIBUTES

See [attributes\(5\)](#) for descriptions of the following attributes:

### /usr/bin/od

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWtoo         |
| CSI            | enabled         |

### /usr/xpg4/bin/od

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4        |
| CSI            | enabled         |

| <b>SYNOPSIS</b>           | <b>on</b> [-i] [-d] [-n] <i>host command [argument] ...</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                      |                          |                                      |            |                                        |                          |                                      |                           |                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b>        | <p>The <b>on</b> program is used to execute commands on another system, in an environment similar to that invoking the program. All environment variables are passed, and the current working directory is preserved. To preserve the working directory, the working file system must be either already mounted on the host or be exported to it. Relative path names will only work if they are within the current file system; absolute path names may cause problems.</p> <p>The standard input is connected to the standard input of the remote command, and the standard output and the standard error from the remote command are sent to the corresponding files for the <b>on</b> command.</p> |                |                      |                          |                                      |            |                                        |                          |                                      |                           |                                                                                                                                                                                                                 |
| <b>OPTIONS</b>            | <p>-i Interactive mode. Use remote echoing and special character processing. This option is needed for programs that expect to be talking to a terminal. All terminal modes and window size changes are propagated.</p> <p>-d Debug mode. Print out some messages as work is being done.</p> <p>-n No Input. This option causes the remote program to get EOF when it reads from the standard input, instead of passing the standard input from the standard input of the <b>on</b> program. For example, -n is necessary when running commands in the background with job control.</p>                                                                                                                |                |                      |                          |                                      |            |                                        |                          |                                      |                           |                                                                                                                                                                                                                 |

| RPC: Authentication error | The server requires DES authentication and you do not have a secret key registered with keysevr. Perhaps you logged in without a password. Try to keylogin. If that fails try to set your publickey with chkey.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                      |                          |                                      |            |                                        |                          |                                      |                           |                                                                                                                                                                                                                 |

**BUGS** When the working directory is remote mounted over NFS, a CTRL-Z hangs the window.

Root cannot use on.

optisa(1)

**NAME** optisa – determine which variant instruction set is optimal to use

**SYNOPSIS** **optisa** *instruction\_set...*

**DESCRIPTION** optisa prints which *instruction\_set* out of the ones specified in the command will perform best on this machine. In this case, “best” is defined by the order in which instruction set names are returned by *isalist(1)*. Possible values for *instruction\_set* are given in *isalist(5)*.

**ATTRIBUTES** See *attributes(5)* for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**EXIT STATUS** The following exit values are returned:

0 One of the *instruction\_set* values you specified is printed by this command.

1 There is no output; that is, this machine cannot use any *instruction\_set* that you specified with the *optisa* command.

**SEE ALSO** *isalist(1)*, *uname(1)*, *attributes(5)*, *isalist(5)*

**NOTES** *optisa* is preferable to *uname -p* or *uname -m* (see *uname(1)*) in determining which of several binary versions of a given program should be used on the given machine.

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>NAME</b>     | pack, pcat, unpack – compress and expand files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>SYNOPSIS</b> | <p><b>pack</b> [-f] [-] file...</p> <p><b>pcat</b> file...</p> <p><b>unpack</b> file...</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>pack</b>     | <p>The <b>pack</b> command attempts to store the specified files in a compressed form. Wherever possible (and useful), each input file <i>file</i> is replaced by a packed file <i>file.z</i> with the same access modes, access and modified dates, and owner as those of <i>file</i>. If <b>pack</b> is successful, <i>file</i> will be removed.</p> <p>The amount of compression obtained depends on the size of the input file and the character frequency distribution. Because a decoding tree forms the first part of each <i>.z</i> file, it is usually not worthwhile to pack files smaller than three blocks, unless the character frequency distribution is very skewed, which may occur with printer plots or pictures.</p> <p>Typically, text files are reduced to 60-75% of their original size. Load modules, which use a larger character set and have a more uniform distribution of characters, show little compression, the packed versions being about 90% of the original size.</p> <p><b>pack</b> returns a value that is the number of files that it failed to compress.</p> <p>No packing will occur if:</p> <ul style="list-style-type: none"> <li>■ the file appears to be already packed</li> <li>■ the file name has more than 14 – 2 bytes</li> <li>■ the file has links</li> <li>■ the file is a directory</li> <li>■ the file cannot be opened</li> <li>■ the file is empty</li> <li>■ no disk storage blocks will be saved by packing</li> <li>■ a file called <i>file.z</i> already exists</li> <li>■ the <i>.z</i> file cannot be created</li> <li>■ an I/O error occurred during processing.</li> </ul> <p>The last segment of the file name must contain no more than 14 – 2 bytes to allow space for the appended <i>.z</i> extension. Directories cannot be compressed.</p> |
| <b>pcat</b>     | <p>The <b>pcat</b> command does for packed files what <b>cat</b>(1) does for ordinary files, except that <b>pcat</b> cannot be used as a filter. The specified files are unpacked and written to the standard output.</p> <p><b>pcat</b> returns the number of files it was unable to unpack. Failure may occur if:</p> <ul style="list-style-type: none"> <li>■ the file cannot be opened;</li> <li>■ the file does not appear to be the output of <b>pack</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## pack(1)

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>unpack</b>   | <p>The <code>unpack</code> command expands files created by <code>pack</code>. For each <code>file</code> specified in the command, a search is made for a file called <code>file.z</code> (or just <code>file</code>, if <code>file</code> ends in <code>.z</code>). If this file appears to be a packed file, it is replaced by its expanded version. The new file has the <code>.z</code> suffix stripped from its name, and has the same access modes, access and modification dates, and owner as those of the packed file.</p> <p><code>unpack</code> returns a value that is the number of files it was unable to unpack. Failure may occur for the same reasons that it may in <code>pcat</code>, as well as for the following:</p> <ul style="list-style-type: none"><li>■ a file with the “unpacked” name already exists;</li><li>■ the unpacked file cannot be created.</li><li>■ the filename (excluding the <code>.z</code> extension) has more than 14 bytes.</li></ul> |
| <b>OPTIONS</b>  | <p>The following options are supported by <code>pack</code>:</p> <p><code>-f</code> Forces packing of <code>file</code>. This is useful for causing an entire directory to be packed even if some of the files will not benefit. Packed files can be restored to their original form using <code>unpack</code> or <code>pcat</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>OPERANDS</b> | <p>The following operands are supported:</p> <p><code>file</code> A path name of a file to be packed, unpacked, or <code>pcat</code>ed; <code>file</code> can include or omit the <code>.z</code> suffix.</p> <p><code>-</code> <code>pack</code> uses Huffman (minimum redundancy) codes on a byte-by-byte basis. If the <code>-</code> argument is used, an internal flag is set that causes the number of times each byte is used, its relative frequency, and the code for the byte to be printed on the standard output. Additional occurrences of <code>-</code> in place of <code>file</code> will cause the internal flag to be set and reset.</p>                                                                                                                                                                                                                                                                                                                            |
| <b>USAGE</b>    | <p>See <code>largefile(5)</code> for the description of the behavior of <code>pack</code>, <code>pcat</code>, and <code>unpack</code> when encountering files greater than or equal to 2 Gbyte ( <math>2^{31}</math> bytes).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>EXAMPLES</b> | <p><b>EXAMPLE 1</b> Viewing a Packed File</p> <p>To view a packed file named <code>file.z</code> use:</p> <pre>example% pcat file.z</pre> <p>or just:</p> <pre>example% pcat file</pre> <p><b>EXAMPLE 2</b> Making and Unpacked Copy:</p> <p>To make an unpacked copy, say <code>nnn</code>, of a packed file named <code>file.z</code> (without destroying <code>file.z</code>) use the command:</p> <pre>example% pcat file &gt;nnn</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

pack(1)

**ENVIRONMENT VARIABLES** See `environ(5)` for descriptions of the following environment variables that affect the execution of `pack`, `pcat`, and `unpack`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred. The number of files the command failed to pack/unpack is returned.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWesu         |
| CSI            | Enabled         |

**SEE ALSO** `cat(1)`, `compress(1)`, `zcat(1)`, `attributes(5)`, `environ(5)`, `largefile(5)`

pagesize(1)

**NAME** pagesize – display the size of a page of memory

**SYNOPSIS** `/usr/bin/pagesize`

**DESCRIPTION** pagesize prints the size of a page of memory in bytes, as returned by `getpagesize(3C)`. This program is useful in constructing portable shell scripts.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `getpagesize(3C)`, `attributes(5)`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>DESCRIPTION</b> | <p>The <code>passwd</code> command changes the password or lists password attributes associated with the user's login <i>name</i>. Additionally, privileged users may use <code>passwd</code> to install or change passwords and attributes associated with any login <i>name</i>.</p> <p>When used to change a password, <code>passwd</code> prompts everyone for their old password, if any. It then prompts for the new password twice. When the old password is entered, <code>passwd</code> checks to see if it has "aged" sufficiently. If "aging" is insufficient, <code>passwd</code> terminates; see <code>pwconv(1M)</code>, <code>nistbladm(1)</code>, and <code>shadow(4)</code> for additional information.</p> <p>When LDAP, NIS, or NIS+ is in effect on a system, <code>passwd</code> changes the NIS or NIS+ database. The NIS or NIS+ password may be different from the password on the local machine. If NIS or NIS+ is running, use <code>passwd -r</code> to change password information on the local machine.</p> <p>The <code>pwconv</code> command creates and updates <code>/etc/shadow</code> with information from <code>/etc/passwd</code>. <code>pwconv</code> relies on a special value of 'x' in the password field of <code>/etc/passwd</code>. This value of 'x' indicates that the password for the user is already in <code>/etc/shadow</code> and should not be modified.</p> <p>If aging is sufficient, a check is made to ensure that the new password meets construction requirements. When the new password is entered a second time, the two copies of the new password are compared. If the two copies are not identical, the cycle of prompting for the new password is repeated for, at most, two more times.</p> <p>Passwords must be constructed to meet the following requirements:</p> <ul style="list-style-type: none"> <li>■ Each password must have <code>PASSLENGTH</code> characters, where <code>PASSLENGTH</code> is defined in <code>/etc/default/passwd</code> and is set to 6. Only the first eight characters are</li> </ul> |

## passwd(1)

significant.

- Each password must contain at least two alphabetic characters and at least one numeric or special character. In this case, "alphabetic" refers to all upper or lower case letters.
- Each password must differ from the user's login *name* and any reverse or circular shift of that login *name*. For comparison purposes, an upper case letter and its corresponding lower case letter are equivalent.
- New passwords must differ from the old by at least three characters. For comparison purposes, an upper case letter and its corresponding lower case letter are equivalent.

If all requirements are met, by default, the `passwd` command will consult `/etc/nsswitch.conf` to determine in which repositories to perform password update. It searches the `passwd` and `passwd_compat` entries. The sources (repositories) associated with these entries will be updated. However, the password update configurations supported are limited to the following cases. Failure to comply with the configurations will prevent users from logging onto the system. The password update configurations are:

- `passwd: files`
- `passwd: files ldap`
- `passwd: files nis`
- `passwd: files nisplus`
- `passwd: compat (==> files nis)`
- `passwd: compat (==> files ldap)`  
`passwd_compat: ldap`
- `passwd: compat (==> files nisplus)`  
`passwd_compat: nisplus`

Network administrators, who own the NIS+ password table, may change any password attributes.

In the `files` case, superusers (for instance, real and effective uid equal to 0, see `id(1M)` and `su(1M)`) may change any password; hence, `passwd` does not prompt privileged users for the old password. Privileged users are not forced to comply with password aging and password construction requirements. A privileged user can create a null password by entering a carriage return in response to the prompt for a new password. (This differs from `passwd -d` because the "password" prompt will still be displayed.) If NIS is in effect, superuser on the root master can change any password without being prompted for the old NIS `passwd`, and is not forced to comply with password construction requirements.

Normally, `passwd` entered with no arguments will change the password of the current user. When a user logs in and then invokes `su(1M)` to become super-user or another

user, `passwd` will change the original user's password, not the password of the super-user or the new user.

Any user may use the `-s` option to show password attributes for his or her own login *name*, provided they are using the `-r nisplus` argument. Otherwise, the `-s` argument is restricted to the superuser.

The format of the display will be:

```
name status mm/dd/yy min max warn
```

or, if password aging information is not present,

```
name status
```

|                 |                                                                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>name</i>     | The login ID of the user.                                                                                                                                                                                             |
| <i>status</i>   | The password status of <i>name</i> : PS stands for passworded or locked, LK stands for locked, and NP stands for no password.                                                                                         |
| <i>mm/dd/yy</i> | The date password was last changed for <i>name</i> . (Note that all password aging dates are determined using Greenwich Mean Time (Universal Time) and therefore may differ by as much as a day in other time zones.) |
| <i>min</i>      | The minimum number of days required between password changes for <i>name</i> . MINWEEKS is found in <code>/etc/default/passwd</code> and is set to NULL.                                                              |
| <i>max</i>      | The maximum number of days the password is valid for <i>name</i> . MAXWEEKS is found in <code>/etc/default/passwd</code> and is set to NULL.                                                                          |
| <i>warn</i>     | The number of days relative to <i>max</i> before the password expires and the <i>name</i> will be warned.                                                                                                             |

**Security** `passwd` uses `pam(3PAM)` for password management. The PAM configuration policy, listed through `/etc/pam.conf`, specifies the password modules to be used for `passwd`. Here is a partial `pam.conf` file with entries for the `passwd` command using the UNIX password module:

```
passwd required password /usr/lib/security/pam_unix.so.1
```

If there are no entries for the `passwd` service, then the entries for the "other" service will be used. If multiple password modules are listed, then the user may be prompted for multiple passwords.

**OPTIONS** The following options are supported:

## passwd(1)

- r Specifies the repository to which an operation is applied. The supported repositories are *files*, *ldap*, *nis*, or *nisplus*.
- e Changes the login shell. For the *files* repository, this only works for the super-user. Normal users may change the *ldap*, *nis*, or *nisplus* repositories. The choice of shell is limited by the requirements of *getusershell*(3C). If the user currently has a shell that is not allowed by *getusershell*, only root may change it.
- g Changes the gecons (finger) information. For the *files* repository, this only works for the superuser. Normal users may change the *ldap*, *nis*, or *nisplus* repositories.
- h Changes the home directory.
- D *domainname* Consults the *passwd.org\_dir* table in *domainname*. If this option is not specified, the default *domainname* returned by *nis\_local\_directory*(3NSL) will be used. This domain name is the same as that returned by *domainname*(1M).
- s *name* Shows password attributes for the login *name*. For the *nisplus* repository, this works for everyone. However for the *files* repository, this only works for the superuser. It does not work at all for the *nis* repository which does not support password aging.
- a Shows password attributes for all entries. Use only with the *-s* option; *name* must not be provided. For the *nisplus* repository, this will show only the entries in the NIS+ password table in the local domain that the invoker is authorized to "read". For the *files* repository, this is restricted to the superuser.

### Privileged User Options

Only a privileged user can use the following options:

- f Forces the user to change password at the next login by expiring the password for *name*.
- l Locks password entry for *name*.
- n *min* Sets minimum field for *name*. The *min* field contains the minimum number of days between password changes for *name*. If *min* is greater than *max*, the user may not change the password. Always use this option with the *-x* option, unless *max* is set to *-1* (aging turned off). In that case, *min* need not be set.
- w *warn* Set warn field for *name*. The *warn* field contains the number of days before the password expires and the user is warned. This option is not valid if password aging is disabled.
- x *max* Sets maximum field for *name*. The *max* field contains the number of days that the password is valid for *name*. The aging for *name* will be turned off immediately if *max* is set to *-1*. If it is set to *0*, then

|                              |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                              |                           | the user is forced to change the password at the next login session and aging is turned off.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                              | -d                        | Deletes password for <i>name</i> . The login <i>name</i> will not be prompted for password. It is only applicable to the <code>files</code> repository.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>OPERANDS</b>              | <i>name</i>               | User login name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ENVIRONMENT VARIABLES</b> |                           | If any of the <code>LC_*</code> variables, that is, <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , <code>LC_TIME</code> , <code>LC_COLLATE</code> , <code>LC_NUMERIC</code> , and <code>LC_MONETARY</code> (see <code>environ(5)</code> ), are not set in the environment, the operational behavior of <code>passwd</code> for each corresponding locale category is determined by the value of the <code>LANG</code> environment variable. If <code>LC_ALL</code> is set, its contents are used to override both the <code>LANG</code> and the other <code>LC_*</code> variables. If none of the above variables is set in the environment, the "C" (U.S. style) locale determines how <code>passwd</code> behaves. |
|                              | <code>LC_CTYPE</code>     | Determines how <code>passwd</code> handles characters. When <code>LC_CTYPE</code> is set to a valid value, <code>passwd</code> can display and handle text and filenames containing valid characters for that locale. <code>passwd</code> can display and handle Extended Unix Code (EUC) characters where any individual character can be 1, 2, or 3 bytes wide. <code>passwd</code> can also handle EUC characters of 1, 2, or more column widths. In the "C" locale, only characters from ISO 8859-1 are valid.                                                                                                                                                                                                       |
|                              | <code>LC_MESSAGES</code>  | Determines how diagnostic and informative messages are presented. This includes the language and style of the messages, and the correct form of affirmative and negative responses. In the "C" locale, the messages are presented in the default form found in the program itself (in most cases, U.S. English).                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>EXIT STATUS</b>           |                           | The <code>passwd</code> command exits with one of the following values:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                              | 0                         | Success.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## passwd(1)

/etc/default/passwd      Default values can be set for the following flags in /etc/default/passwd. For example: MAXWEEKS=26

|            |                                                                     |
|------------|---------------------------------------------------------------------|
| MAXWEEKS   | Maximum time period that password is valid.                         |
| MINWEEKS   | Minimum time period before the password can be changed.             |
| PASSLENGTH | Minimum length of password, in characters.                          |
| WARNWEEKS  | Time period until warning of date of password's ensuing expiration. |

**ATTRIBUTES**      See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | Enabled         |

**SEE ALSO**      finger(1), login(1), nispasswd(1), nistbladm(1), yppasswd(1), domainname(1M), eeprom(1M), id(1M), passmgmt(1M), pwconv(1M), su(1M), useradd(1M), userdel(1M), usermod(1M), crypt(3C), getpwnam(3C), getsppnam(3C), getusershell(3C), nis\_local\_directory(3NSL), pam(3PAM), loginlog(4), nsswitch.conf(4), pam.conf(4), passwd(4), shadow(4), attributes(5), environ(5), pam\_unix(5), pam\_ldap(5)

**NOTES**      The passwd command replaces the nispasswd and yppasswd commands and should be used in their place.

| <b>SYNOPSIS</b>    | <b>paste</b> [-s] [-d <i>list</i> ] <i>file</i> ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                 |                    |                 |                |                 |                      |                 |                                                                                                                                                         |
| <b>DESCRIPTION</b> | <p>The <code>paste</code> utility will concatenate the corresponding lines of the given input files, and write the resulting lines to standard output.</p> <p>The default operation of <code>paste</code> will concatenate the corresponding lines of the input files. The NEWLINE character of every line except the line from the last input file will be replaced with a TAB character.</p> <p>If an EOF (end-of-file) condition is detected on one or more input files, but not all input files, <code>paste</code> will behave as though empty lines were read from the files on which EOF was detected, unless the <code>-s</code> option is specified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                 |                    |                 |                |                 |                      |                 |                                                                                                                                                         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-d <i>list</i></code> Unless a backslash character ( <code>\</code> ) appears in <i>list</i>, each character in <i>list</i> is an element specifying a delimiter character. If a backslash character appears in <i>list</i>, the backslash character and one or more characters following it are an element specifying a delimiter character as described below. These elements specify one or more delimiters to use, instead of the default TAB character, to replace the NEWLINE character of the input lines. The elements in <i>list</i> are used circularly; that is, when the list is exhausted the first element from the list is reused.</p> <p>When the <code>-s</code> option is specified:</p> <ul style="list-style-type: none"> <li>■ The last newline character in a file will not be modified.</li> <li>■ The delimiter will be reset to the first element of <i>list</i> after each <code>file</code> operand is processed.</li> </ul> <p>When the option is not specified:</p> <ul style="list-style-type: none"> <li>■ The NEWLINE characters in the file specified by the last <code>file</code> will not be modified.</li> <li>■ The delimiter will be reset to the first element of <i>list</i> each time a line is processed from each file.</li> </ul> <p>If a backslash character appears in <i>list</i>, it and the character following it will be used to represent the following delimiter characters:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 10px;"><code>\n</code></td> <td>Newline character.</td> </tr> <tr> <td style="padding-right: 10px;"><code>\t</code></td> <td>Tab character.</td> </tr> <tr> <td style="padding-right: 10px;"><code>\\</code></td> <td>Backslash character.</td> </tr> <tr> <td style="padding-right: 10px;"><code>\0</code></td> <td>Empty string (not a null character). If <code>\0</code> is immediately followed by the character <code>x</code>, the character <code>X</code>, or any</td> </tr> </table> | <code>\n</code> | Newline character. | <code>\t</code> | Tab character. | <code>\\</code> | Backslash character. | <code>\0</code> | Empty string (not a null character). If <code>\0</code> is immediately followed by the character <code>x</code> , the character <code>X</code> , or any |
| <code>\n</code>    | Newline character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                 |                    |                 |                |                 |                      |                 |                                                                                                                                                         |

| <code>\\</code>    | Backslash character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                 |                    |                 |                |                 |                      |                 |                                                                                                                                                         |
| <code>\0</code>    | Empty string (not a null character). If <code>\0</code> is immediately followed by the character <code>x</code> , the character <code>X</code> , or any                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                 |                    |                 |                |                 |                      |                 |                                                                                                                                                         |

paste(1)

character defined by the LC\_CTYPE digit keyword, the results are unspecified.

If any other characters follow the backslash, the results are unspecified.

**-s** Concatenate all of the lines of each separate input file in command line order. The NEWLINE character of every line except the last line in each input file will be replaced with the TAB character, unless otherwise specified by the **-d** option.

**OPERANDS** The following operand is supported:

**file** A path name of an input file. If **-** is specified for one or more of the files, the standard input will be used; the standard input will be read one line at a time, circularly, for each instance of **-**. Implementations support pasting of at least 12 file operands.

**USAGE** See largefile(5) for the description of the behavior of paste when encountering files greater than or equal to 2 Gbyte (2<sup>31</sup> bytes).

**EXAMPLES** **EXAMPLE 1** List a directory in one column.

```
ls | paste -d" " -
```

**EXAMPLE 2** List a directory in four columns.

```
ls | paste - - - -
```

**EXAMPLE 3** Combine pairs of lines from a file into single lines.

```
paste -s -d"\ t\ n" file
```

**ENVIRONMENT VARIABLES** See environ(5) for descriptions of the following environment variables that affect the execution of paste: LC\_CTYPE and LC\_MESSAGES.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWesu         |
| CSI            | Enabled         |

**SEE ALSO** cut(1), grep(1), pr(1), attributes(5), environ(5), largefile(5)

|                    |                    |                                                                     |
|--------------------|--------------------|---------------------------------------------------------------------|
| <b>DIAGNOSTICS</b> | "line too long"    | Output lines are restricted to 511 characters.                      |
|                    | "too many files"   | Except for -s option, no more than 12 input files may be specified. |
|                    | "no delimiters"    | The -d option was specified with an empty list.                     |
|                    | "cannot open file" | The specified file cannot be opened.                                |

## patch(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>NAME</b>        | patch – apply changes to files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <b>patch</b> [-b1NR] [-c   -e   -n] [-d <i>dir</i> ] [-D <i>define</i> ] [-i <i>patchfile</i> ]<br>[-o <i>outfile</i> ] [-p <i>num</i> ] [-r <i>rejectfile</i> ] [ <i>file</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DESCRIPTION</b> | <p>The <code>patch</code> command reads a source (patch) file containing any of the three forms of difference (diff) listings produced by the <code>diff(1)</code> command (normal, context or in the style of <code>ed(1)</code>) and apply those differences to a file. By default, <code>patch</code> reads from the standard input.</p> <p><code>patch</code> attempts to determine the type of the <code>diff</code> listing, unless overruled by a <code>-c</code>, <code>-e</code> or <code>-n</code> option.</p> <p>If the patch file contains more than one patch, <code>patch</code> will attempt to apply each of them as if they came from separate patch files. (In this case the name of the patch file must be determinable for each <code>diff</code> listing.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li>-b            Save a copy of the original contents of each modified file, before the differences are applied, in a file of the same name with the suffix <code>.orig</code> appended to it. If the file already exists, it will be overwritten; if multiple patches are applied to the same file, the <code>.orig</code> file will be written only for the first patch. When the <code>-ooutfile</code> option is also specified, <code>file.orig</code> will not be created but, if <code>outfile</code> already exists, <code>outfile.orig</code> will be created.</li><li>-c            Interpret the patch file as a context difference (the output of the command <code>diff</code> when the <code>-c</code> or <code>-C</code> options are specified).</li><li>-d<i>dir</i>        Change the current directory to <i>dir</i> before processing as described in EXTENDED DESCRIPTION.</li><li>-D<i>define</i>    Mark changes with the C preprocessor construct:<br/><pre>#ifdef <i>define</i> . . #endif</pre></li></ul> <p>The option-argument <i>define</i> will be used as the differentiating symbol.</p> <ul style="list-style-type: none"><li>-e            Interpret the patch file as an <code>ed</code> script, rather than a <code>diff</code> script.</li><li>-i<i>patchfile</i>    Read the patch information from the file named by the path name <i>patchfile</i>, rather than the standard input.</li><li>-l            (The letter ell.) Cause any sequence of blank characters in the difference script to match any sequence of blank characters in the input file. Other characters will be matched exactly.</li><li>-n            Interpret the script as a normal difference.</li></ul> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| -N                   | Ignore patches where the differences have already been applied to the file; by default, already-applied patches are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| -o <i>outfile</i>    | Instead of modifying the files (specified by the <i>file</i> operand or the difference listings) directly, write a copy of the file referenced by each patch, with the appropriate differences applied, to <i>outfile</i> . Multiple patches for a single file will be applied to the intermediate versions of the file created by any previous patches, and will result in multiple, concatenated versions of the file being written to <i>outfile</i> .                                                                                                                                                                         |
| -p <i>num</i>        | For all path names in the patch file that indicate the names of files to be patched, delete <i>num</i> path name components from the beginning of each path name. If the path name in the patch file is absolute, any leading slashes are considered the first component (that is, -p 1 removes the leading slashes). Specifying -p 0 causes the full path name to be used. If -p is not specified, only the basename (the final path name component) is used.                                                                                                                                                                    |
| -R                   | Reverse the sense of the patch script; that is, assume that the difference script was created from the new version to the old version. The -R option cannot be used with ed scripts. <i>patch</i> attempts to reverse each portion of the script before applying it. Rejected differences will be saved in swapped format. If this option is not specified, and until a portion of the patch file is successfully applied, <i>patch</i> attempts to apply each portion in its reversed sense as well as in its normal sense. If the attempt is successful, the user will be prompted to determine if the -R option should be set. |
| -r <i>rejectfile</i> | Override the default reject filename. In the default case, the reject file will have the same name as the output file, with the suffix <i>.rej</i> appended to it. See Patch Application.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**OPERANDS** The following operand is supported:

*file*     A path name of a file to patch.

**USAGE** The -R option will not work with ed scripts because there is too little information to reconstruct the reverse operation.

The -p option makes it possible to customise a patchfile to local user directory structures without manually editing the patchfile. For example, if the filename in the patch file was:

```
/curds/whey/src/blurfl/blurfl.c
```

Setting -p 0 gives the entire path name unmodified; -p 1 gives:

```
curds/whey/src/blurfl/blurfl.c
```

## patch(1)

without the leading slash, `-p 4` gives:

```
blurfl/blurfl.c
```

and not specifying `-p` at all gives:

```
blurfl.c.
```

When using `-b` in some file system implementations, the saving of a `.orig` file may produce unwanted results. In the case of 12, 13 or 14-character filenames, on file systems supporting 14-character maximum filenames, the `.orig` file will overwrite the new file.

### ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `patch`: `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, and `NLSPATH`.

### OUTPUT FILES

The output of `patch` the save files (`.orig` suffixes) and the reject files (`.rej` suffixes) will be text files.

### EXTENDED DESCRIPTION

A patchfile may contain patching instructions for more than one file; filenames are determined as specified in `Patch Determination`. When the `-b` option is specified, for each patched file, the original will be saved in a file of the same name with the suffix `.orig` appended to it.

For each patched file, a reject file may also be created as noted in `Patch Application`. In the absence of a `-r` option, the name of this file will be formed by appending the suffix `.rej` to the original filename.

### Patchfile Format

The patch file must contain zero or more lines of header information followed by one or more patches. Each patch must contain zero or more lines of filename identification in the format produced by `diff -c`, and one or more sets of `diff` output, which are customarily called hunks.

`patch` recognizes the following expression in the header information:

`Index: pathname`                      The file to be patched is named *pathname*.

If all lines (including headers) within a patch begin with the same leading sequence of blank characters, `patch` will remove this sequence before proceeding. Within each patch, if the type of difference is context, `patch` recognizes the following expressions:

`* * * filename timestamp`  
    The patches arose from *filename*.

`- - - filename timestamp`  
    The patches should be applied to *filename*.

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                      | <p>Each hunk within a patch must be the <code>diff</code> output to change a line range within the original file. The line numbers for successive hunks within a patch must occur in ascending order.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>Filename Determination</b></p> | <p>If no <code>file</code> operand is specified, <code>patch</code> performs the following steps to obtain a path name:</p> <ol style="list-style-type: none"> <li>1. If the patch contains the strings <code>***</code> and <code>--</code>, <code>patch</code> strips components from the beginning of each path name (depending on the presence or value of the <code>-p</code> option), then tests for the existence of both files in the current directory (or directory specified with the <code>-d</code> option).</li> <li>2. If both files exist, <code>patch</code> assumes that no path name can be obtained from this step. If the header information contains a line with the string <code>Index:</code>, <code>patch</code> strips components from the beginning of the path name (depending on <code>-p</code>), then tests for the existence of this file in the current directory (or directory specified with the <code>-d</code> option).</li> <li>3. If an <code>SCCS</code> directory exists in the current directory, <code>patch</code> will attempt to perform a <code>get -e SCCS/s .filename</code> command to retrieve an editable version of the file.</li> <li>4. If no path name can be obtained by applying the previous steps, or if the path names obtained do not exist, <code>patch</code> will write a prompt to standard output and request a filename interactively from standard input.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>Patch Application</b></p>      | <p>If the <code>-c</code>, <code>-e</code> or <code>-n</code> option is present, <code>patch</code> will interpret information within each hunk as a context difference, an <code>ed</code> difference or a normal difference, respectively. In the absence of any of these options, <code>patch</code> determines the type of difference based on the format of information within the hunk.</p> <p>For each hunk, <code>patch</code> begins to search for the place to apply the patch at the line number at the beginning of the hunk, plus or minus any offset used in applying the previous hunk. If lines matching the hunk context are not found, <code>patch</code> scans both forwards and backwards at least 1000 bytes for a set of lines that match the hunk context.</p> <p>If no such place is found and it is a context difference, then another scan will take place, ignoring the first and last line of context. If that fails, the first two and last two lines of context will be ignored and another scan will be made. Implementations may search more extensively for installation locations.</p> <p>If no location can be found, <code>patch</code> will append the hunk to the reject file. The rejected hunk will be written in context-difference format regardless of the format of the patch file. If the input was a normal or <code>ed -style</code> difference, the reject file may contain differences with zero lines of context. The line numbers on the hunks in the reject file may be different from the line numbers in the patch file since they will reflect the approximate locations for the failed hunks in the new file rather than the old one.</p> <p>If the type of patch is an <code>ed</code> diff, the implementation may accomplish the patching by invoking the <code>ed</code> command.</p> |

patch(1)

**EXIT STATUS** The following exit values are returned:

- 0 Successful completion.
- 1 One or more lines were written to a reject file.
- >1 An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|

| <b>NAME</b>        | pathchk – check path names                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <b>pathchk</b> [-p] <i>path...</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>DESCRIPTION</b> | <p>The <code>pathchk</code> command will check that one or more path names are valid (that is, they could be used to access or create a file without causing syntax errors) and portable (that is, no filename truncation will result). More extensive portability checks are provided by the <code>-p</code> option.</p> <p>By default, <code>pathchk</code> will check each component of each <i>path</i> operand based on the underlying file system. A diagnostic will be written for each <i>path</i> operand that:</p> <ul style="list-style-type: none"> <li>■ is longer than <code>PATH_MAX</code> bytes.</li> <li>■ contains any component longer than <code>NAME_MAX</code> bytes in its containing directory</li> <li>■ contains any component in a directory that is not searchable</li> <li>■ contains any character in any component that is not valid in its containing directory.</li> </ul> <p>The format of the diagnostic message is not specified, but will indicate the error detected and the corresponding <i>path</i> operand.</p> <p>It will not be considered an error if one or more components of a <i>path</i> operand do not exist as long as a file matching the path name specified by the missing components could be created that does not violate any of the checks specified above.</p> |
| <b>OPTIONS</b>     | <p>The following option is supported:</p> <p><code>-p</code>        Instead of performing checks based on the underlying file system, write a diagnostic for each <i>path</i> operand that:</p> <ul style="list-style-type: none"> <li>■ is longer than <code>_POSIX_PATH_MAX</code> bytes</li> <li>■ contains any component longer than <code>_POSIX_NAME_MAX</code> bytes</li> <li>■ contains any character in any component that is not in the portable filename character set.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>OPERANDS</b>    | <p>The following operand is supported:</p> <p><i>path</i>        A path to be checked.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>USAGE</b>       | See <code>largefile(5)</code> for the description of the behavior of <code>pathchk</code> when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Examples of the <code>pathchk</code> command.</p> <p>To verify that all paths in an imported data interchange archive are legitimate and unambiguous on the current system:</p> <pre>pax -f archive   sed -e '/ == ./s///'   xargs pathchk if [ \$? -eq 0 ] then     pax -r -f archive</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## pathchk(1)

**EXAMPLE 1** Examples of the pathchk command. (Continued)

```
else
 echo Investigate problems before importing files.
 exit 1
fi
```

To verify that all files in the current directory hierarchy could be moved to any system conforming to the X/Open specification that also supports the pax(1) command:

```
find . -print | xargs pathchk -p
if [$? -eq 0]
then
 pax -w -f archive .
else
 echo Portable archive cannot be created.
 exit 1
fi
```

To verify that a user-supplied path names a readable file and that the application can create a file extending the given path without truncation and without overwriting any existing file:

```
case $- in
 C) reset="";;
 *) reset="set +C"
 set -C;;
esac
test -r "$path" && pathchk "$path.out" &&
rm "$path.out" > "$path.out"
if [$? -ne 0]; then
 printf "%s: %s not found or %s.out fails \
creation checks.\n" $0 "$path" "$path"
 $reset # reset the noclobber option in case a trap
 # on EXIT depends on it
 exit 1
fi
$reset
PROCESSING < "$path" > "$path.out"
```

The following assumptions are made in this example:

1. PROCESSING represents the code that will be used by the application to use \$path once it is verified that \$path.out will work as intended.
2. The state of the noclobber option is unknown when this code is invoked and should be set on exit to the state it was in when this code was invoked. (The reset variable is used in this example to restore the initial state.)
3. Note the usage of:

```
rm "$path.out" > "$path.out"
```

- a. The pathchk command has already verified, at this point, that \$path.out will not be truncated.

**EXAMPLE 1** Examples of the pathchk command. (Continued)

- b. With the `noclobber` option set, the shell will verify that `$path.out` does not already exist before invoking `rm`.
- c. If the shell succeeded in creating `$path.out`, `rm` will remove it so that the application can create the file again in the `PROCESSING` step.
- d. If the `PROCESSING` step wants the file to exist already when it is invoked, the:

```
rm "$path.out" > "$path.out"
```

should be replaced with:

```
> "$path.out"
```

which will verify that the file did not already exist, but leave `$path.out` in place for use by `PROCESSING`.

**ENVIRONMENT VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `pathchk`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS**

The following exit values are returned:

- 0 All *path* operands passed all of the checks.
- >0 An error occurred.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

| <b>NAME</b>        | pathconv – search FMLI criteria for filename                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <b>pathconv</b> [-f] [-v <i>alias</i> ]<br><b>pathconv</b> [-t] [-l] [-nnum] [-v <i>string</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b> | The <code>pathconv</code> function converts an alias to its pathname. By default, it takes the alias as a string from the standard input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>OPTIONS</b>     | <p>-f            If -f is specified, the full path will be returned (this is the default).</p> <p>-t            If -t is specified, <code>pathconv</code> will truncate a pathname specified in <i>string</i> in a format suitable for display as a frame title. This format is a shortened version of the full pathname, created by deleting components of the path from the middle of the string until it is under <code>DISPLAYW</code> — 6 characters in length, and then inserting ellipses ( . . . ) between the remaining pieces. Ellipses are also used to show truncation at the ends of the strings if necessary, unless the -l option is given.</p> <p>-l            If -l is specified, &lt; and &gt; will be used instead of ellipses ( . . . ) to indicate truncation at the ends of the string generated by the -t option. Using -l allows display of the longest possible string while still notifying users it has been truncated.</p> <p>-nnum        If -n is specified, <i>num</i> is the maximum length of the string (in characters) generated by the -t option. The argument <i>num</i> can be any integer from 1 to 255.</p> <p>-valias   <i>string</i> If the -v option is used, then <i>alias</i> or <i>string</i> can be specified when <code>pathconv</code> is called. The argument <i>alias</i> must be an alias defined in the <i>alias_file</i> named when <code>fml</code> was invoked. The argument <i>string</i> can only be used with the -t option and must be a pathname.</p> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> A sample that uses <code>pathconv</code> to construct the menu title. It searches for <code>MYPATH</code> in the <i>alias_file</i> named when <code>fml</code> command.</p> <p>Here is a menu descriptor that uses <code>pathconv</code> to construct the menu title. It searches for <code>MYPATH</code> in the <i>alias_file</i> named when <code>fml</code> was invoked:</p> <pre>menu='pathconv -v MYPATH/ls`<br/>.<br/>.<br/>.'</pre> <p>where there is a line in <i>alias_file</i> that defines <code>MYPATH</code>. For example,<br/><code>MYPATH=\$HOME/bin:/usr/bin.</code></p> <p>Here is a menu descriptor that takes <i>alias</i> from the standard input.</p> <pre>menu='echo MYPATH/ls   pathconv`<br/>.<br/>.<br/>.'</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**EXAMPLE 1** A sample that uses pathconv to construct the menu title. It searches for MYPATH in the *alias\_file* named when fml i command. (Continued)

| <b>DESCRIPTION</b>         | The pax command reads, writes and writes lists of the members of archive files and copy directory hierarchies. A variety of archive formats are supported; see the -xformat option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Modes of Operations</b> | <p>The action to be taken depends on the presence of the -r and -w options. The four combinations of -r and -w are referred to as the four modes of operation: list, read, write, and copy modes, corresponding respectively to the four forms shown in the SYNOPSIS.</p> <p><b>list</b>      In list mode (when neither -r nor -w are specified), pax writes the names of the members of the archive file read from the standard input, with path names matching the specified patterns, to standard output. If a named file is of type directory, the file hierarchy rooted at that file will be written out as well.</p> <p><b>read</b>      In read mode (when -r is specified, but -w is not), pax extracts the members of the archive file read from the standard input, with path names matching the specified patterns. If an extracted file is of type directory, the file hierarchy rooted at that file will be extracted as well. The extracted files is created relative to the current file hierarchy.</p> <p style="padding-left: 40px;">The ownership, access and modification times, and file mode of the restored files are discussed under the -p option.</p> <p><b>write</b>      In write mode (when -w is specified, but -r is not), pax writes the contents of the file operands to the standard output in an archive format. If no <i>file</i> operands are specified, a list of files to copy, one per line, will be read from the standard input. A file of type directory will include all of the files in the file hierarchy rooted at the file.</p> <p><b>copy</b>      In copy mode (when both -r and -w are specified), pax copies the file operands to the destination directory.</p> <p style="padding-left: 40px;">If no <i>file</i> operands are specified, a list of files to copy, one per line, will be read from the standard input. A file of type directory will include all of the files in the file hierarchy rooted at the file.</p> <p style="padding-left: 40px;">The effect of the copy is as if the copied files were written to an archive file and then subsequently extracted, except that there may be hard links between the original and the copied files. If the destination directory is a</p> |

subdirectory of one of the files to be copied, the results are unspecified. It is an error if *directory* doesn't exist, is not writable by the user, or is not a directory.

In read or copy modes, if intermediate directories are necessary to extract an archive member, `pax` will perform actions equivalent to the `mkdir(2)` function, called with the following arguments:

- the intermediate directory used as the *path* argument
- the octal value of 777 or `rxw` (read, write, and execute permissions) as the *mode* argument (see `chmod(1)`).

If any specified *pattern* or *file* operands are not matched by at least one file or archive member, `pax` will write a diagnostic message to standard error for each one that did not match and exit with a non-zero exit status.

The supported archive formats are automatically detected on input. The default output archive format is `tar(1)`.

If the selected archive format supports the specification of linked files, it is an error if these files cannot be linked when the archive is extracted. Any of the various names in the archive that represent a file can be used to select the file for extraction.

#### OPTIONS

The following options are supported:

- r Read an archive file from standard input.
- w Write files to the standard output in the specified archive format.
- a Append files to the end of the archive. This option will not work for some archive devices, such as 1/4-inch streaming tapes and 8mm tapes.
- b**blocksize* Block the output at a positive decimal integer number of bytes per write to the archive file. Devices and archive formats may impose restrictions on blocking. Blocking is automatically determined on input. Portable applications must not specify a *blocksize* value larger than 32256. Default blocking when creating archives depends on the archive format. (See the `-x` option below.)
- c Match all file or archive members except those specified by the *pattern* or *file* operands.
- d Cause files of type directory being copied or archived or archive members of type directory being extracted to match only the file or archive member itself and not the file hierarchy rooted at the file.
- f**archive* Specify the path name of the input or output archive, overriding the default standard input (in list or read modes) or standard output (write mode).

## pax(1)

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -i                | Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt will be written to the file <code>/dev/tty</code> . The prompt will contain the name of the file or archive member. A line will then be read from <code>/dev/tty</code> . If this line is blank, the file or archive member will be skipped. If this line consists of a single period, the file or archive member will be processed with no modification to its name. Otherwise, its name will be replaced with the contents of the line. The <code>pax</code> command will immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <code>/dev/tty</code> cannot be opened for reading and writing.                                                                                                                                                                                                                                                                                                     |
| -k                | Prevent the overwriting of existing files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -l                | Link files. In copy mode, hard links will be made between the source and destination file hierarchies whenever possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -n                | Select the first archive member that matches each <i>pattern</i> operand. No more than one archive member will be matched for each pattern (although members of type directory will still match the file hierarchy rooted at that file).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -o <i>options</i> | Reserved for special format-specific options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -p <i>string</i>  | Specify one or more file characteristic options (privileges). The <i>string</i> option-argument must be a string specifying file characteristics to be retained or discarded on extraction. The string consists of the specification characters a, e, m, o and p. Multiple characteristics can be concatenated within the same string and multiple -p options can be specified. The meaning of the specification characters are as follows:<br><br>a            Do not preserve file access times.<br>e            Preserve the user ID, group ID, file mode bits, access time, and modification time.<br>m            Do not preserve file modification times.<br>o            Preserve the user ID and group ID.<br>p            Preserve the file mode bits. Other, implementation-dependent file-mode attributes may be preserved.<br><br>In the preceding list, "preserve" indicates that an attribute stored in the archive will be given to the extracted file, subject to the permissions of the invoking process; otherwise, the attribute will be determined as part of the normal file creation action. |

If neither the `e` nor the `o` specification character is specified, or the user ID and group ID are not preserved for any reason, `pax` will not set the `setuid` and `setgid` bits of the file mode.

If the preservation of any of these items fails for any reason, `pax` will write a diagnostic message to standard error. Failure to preserve these items will affect the final exit status, but will not cause the extracted file to be deleted.

If file-characteristic letters in any of the *string* option-arguments are duplicated or conflict with each other, the ones given last will take precedence. For example, if `-p eme` is specified, file modification times will be preserved.

`-sreplstr`

Modify file or archive member names named by *pattern* or *file* operands according to the substitution expression *replstr*, which is based on the `ed(1) s` (substitution) command, using the regular expression syntax on the `regex(5)` manual page. The concepts of “address” and “line” are meaningless in the context of the `pax` command, and must not be supplied. The format is:

```
-s / old/new/ [gp]
```

where, as in `ed`, *old* is a basic regular expression and *new* can contain an ampersand (`&`) or a `\n` backreference, where *n* is a digit. The *old* string also is permitted to contain newline characters.

Any non-null character can be used as a delimiter ( / shown here). Multiple `-s` expressions can be specified; the expressions will be applied in the order specified, terminating with the first successful substitution. The optional trailing `g` is as defined in the `ed` command. The optional trailing `p` causes successful substitutions to be written to standard error. File or archive member names that substitute to the empty string are ignored when reading and writing archives.

`-t`

Cause the access times of the archived files to be the same as they were before being read by `pax`.

`-u`

Ignore files that are older (having a less recent file modification time) than a pre-existing file or archive member with the same name.

read mode            an archive member with the same name as a file in the file system will be extracted if the archive member is newer than the file.

write mode           an archive file member with the same name as a file in the file system will be superseded if the file is newer than the archive member.

## pax(1)

|          |           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|          | copy mode | the file in the destination hierarchy will be replaced by the file in the source hierarchy or by a link to the file in the source hierarchy if the file in the source hierarchy is newer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| -v       |           | In list mode, produce a verbose table of contents (see Standard Output). Otherwise, write archive member path names to standard error (see Standard Error).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| -xformat |           | Specify the output archive format. The pax command recognizes the following formats:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|          | cpio      | <p>The extended cpio interchange format; see the IEEE 1003.1(1990) specifications. The default <i>blocksize</i> for this format for character special archive files is 5120. Implementations support all <i>blocksize</i> values less than or equal to 32256 that are multiples of 512.</p> <p>This archive format allows files with UIDs and GIDs up to 262143 to be stored in the archive. Files with UIDs and GIDs greater than this value will be archived with the UID and GID of 60001.</p>                                                                                                                                                                         |
|          | ustar     | <p>The extended tar interchange format; see the IEEE 1003.1(1990) specifications. The default <i>blocksize</i> for this format for character special archive files is 10240. Implementations support all <i>blocksize</i> values less than or equal to 32256 that are multiples of 512.</p> <p>Any attempt to append to an archive file in a format different from the existing archive format will cause pax to exit immediately with a non-zero exit status.</p> <p>This archive format allows files with UIDs and GIDs up to 2097151 to be stored in the archive. Files with UIDs and GIDs greater than this value will be archived with the UID and GID of 60001.</p> |
| -X       |           | When traversing the file hierarchy specified by a path name, pax will not descend into directories that have a different device ID ( <i>st_dev</i> , see <i>stat(2)</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

The options that operate on the names of files or archive members (*-c*, *-i*, *-n*, *-s*, *-u* and *-v*) interact as follows. In read mode, the archive members are selected based on the user-specified *pattern* operands as modified by the *-c*, *-n* and *-u* options. Then,

any `-s` and `-i` options will modify, in that order, the names of the selected files. The `-v` option will write names resulting from these modifications.

In write mode, the files are selected based on the user-specified path names as modified by the `-n` and `-u` options. Then, any `-s` and `-i` options will, in that order, modify the names of these selected files. The `-v` option will write names resulting from these modifications.

If both the `-u` and `-n` options are specified, `pax` does not consider a file selected unless it is newer than the file to which it is compared.

**OPERANDS** The following operands are supported:

|                  |                                                                                                                                                                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>directory</i> | The destination directory path name for copy mode.                                                                                                                                                                                                               |
| <i>file</i>      | A path name of a file to be copied or archived.                                                                                                                                                                                                                  |
| <i>pattern</i>   | A pattern matching one or more path names of archive members. A pattern must conform to the pattern matching notation found on the <code>fnmatch(5)</code> manual page. The default, if no <i>pattern</i> is specified, is to select all members in the archive. |

**Standard Output** In write mode, if `-f` is not specified, the standard output will be the archive formatted according to `cpio` or `ustar`. (See `-x` format.)

In list mode, the table of contents of the selected archive members will be written to standard output using the following format:

```
"%s\n" <pathname>
```

If the `-v` option is specified in list mode, the table of contents of the selected archive members will be written to standard output using the following formats:

For path names representing hard links to previous members of the archive:

```
"%s==%s\n" <ls -l listing>, linkname
```

For all other path names:

```
<pathname> "%s\n" <ls -l listing>
```

where `<ls -l listing>` is the format specified by the `ls` command with the `-l` option. When writing path names in this format, it is unspecified what is written for fields for which the underlying archive format does not have the correct information, although the correct number of blank-character-separated fields will be written.

In list mode, standard output will not be buffered more than a line at a time.

## pax(1)

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Standard Error</b> | <p>If <code>-v</code> is specified in read, write or copy modes, <code>pax</code> will write the path names it processes to the standard error output using the following format:</p> <pre>"%s\n" &lt;pathname&gt;</pre> <p>These path names will be written as soon as processing is begun on the file or archive member, and will be flushed to standard error. The trailing newline character, which will not be buffered, will be written when the file has been read or written.</p> <p>If the <code>-s</code> option is specified, and the replacement string has a trailing <code>p</code>, substitutions will be written to standard error in the following format:</p> <pre>"%s&gt;&gt;%s\n" &lt;original pathname&gt;, &lt;new pathname&gt;</pre> <p>In all operating modes of <code>pax</code>, optional messages of unspecified format concerning the input archive format and volume number, the number of files, blocks, volumes and media parts as well as other diagnostic messages may be written to standard error.</p> <p>In all formats, for both standard output and standard error, it is unspecified how non-printable characters in path names or linknames are written.</p> |
| <b>ERRORS</b>         | <p>If <code>pax</code> cannot create a file or a link when reading an archive or cannot find a file when writing an archive, or cannot preserve the user ID, group ID or file mode when the <code>-p</code> option is specified, a diagnostic message will be written to standard error and a non-zero exit status will be returned, but processing will continue. In the case where <code>pax</code> cannot create a link to a file, <code>pax</code> will not, by default, create a second copy of the file.</p> <p>If the extraction of a file from an archive is prematurely terminated by a signal or error, <code>pax</code> may have only partially extracted the file or (if the <code>-n</code> option was not specified) may have extracted a file of the same name as that specified by the user, but which is not the file the user wanted. Additionally, the file modes of extracted directories may have additional bits from the read, write, execute mask set as well as incorrect modification and access times.</p>                                                                                                                                                                |
| <b>USAGE</b>          | <p>The <code>-p</code> (privileges) option was invented to reconcile differences between historical <code>tar(1)</code> and <code>cpio(1)</code> implementations. In particular, the two utilities use <code>-m</code> in diametrically opposed ways. The <code>-p</code> option also provides a consistent means of extending the ways in which future file attributes can be addressed, such as for enhanced security systems or high-performance files. Although it may seem complex, there are really two modes that will be most commonly used:</p> <p><code>-p e</code>      "Preserve everything". This would be used by the historical superuser, someone with all the appropriate privileges, to preserve all aspects of the files as they are recorded in the archive. The <code>e</code> flag is the sum of <code>o</code> and <code>p</code>, and other implementation-dependent attributes.</p>                                                                                                                                                                                                                                                                                         |

`-p p` "Preserve" the file mode bits. This would be used by the user with regular privileges who wished to preserve aspects of the file other than the ownership. The file times are preserved by default, but two other flags are offered to disable these and use the time of extraction.

See `largefile(5)` for the description of the behavior of `pax` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

#### EXAMPLES **EXAMPLE 1** Examples of the `pax` command.

The following command:

```
example pax -w -f /dev/rmt/1m .
```

copies the contents of the current directory to tape drive 1, medium density (assuming historical System V device naming procedures. The historical BSD device name would be `/dev/rmt9`).

The following commands:

```
example% mkdir newdir
example% pax -rw olddir newdir
```

copy the `olddir` directory hierarchy to `newdir`.

```
example pax -r -s ',^//*usr//*,,' -f a.pax
```

reads the archive `a.pax`, with all files rooted in `/usr` in the archive extracted relative to the current directory.

#### ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `pax`: `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, and `NLSPATH`.

`LC_COLLATE` Determine the locale for the behaviour of ranges, equivalence classes, and multi-character collating elements used in the pattern matching expressions for the *pattern* operand, the basic regular expression for the `-s` option, and the extended regular expression defined for the `yesexpr` locale keyword in the `LC_MESSAGES` category.

#### EXIT STATUS

The following exit values are returned:

0 All files were processed successfully.  
>0 An error occurred.

#### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

| <b>DESCRIPTION</b> | <p>The Perl manual pages are provided with the programming modules. To view the manual pages for the Perl modules with the man command, add /usr/perl5/man to the MANPATH environment variable. See man(1) for more information. Running catman(1M) on the Perl manual pages is not supported.</p> <p>For ease of access, the Perl manual has been split up into a number of sections:</p> <table border="0"> <tr><td>perl</td><td>Perl overview (this section)</td></tr> <tr><td>perldelta</td><td>Perl changes since previous version</td></tr> <tr><td>perl5004delta</td><td>Perl changes in version 5.004</td></tr> <tr><td>perlfqa</td><td>Perl frequently asked questions</td></tr> <tr><td>perltoc</td><td>Perl documentation table of contents</td></tr> <tr><td>perldata</td><td>Perl data structures</td></tr> <tr><td>perlsyn</td><td>Perl syntax</td></tr> <tr><td>perlop</td><td>Perl operators and precedence</td></tr> <tr><td>perlre</td><td>Perl regular expressions</td></tr> <tr><td>perlrun</td><td>Perl execution and options</td></tr> <tr><td>perlfunc</td><td>Perl builtin functions</td></tr> <tr><td>perlopentut</td><td>Perl open() tutorial</td></tr> <tr><td>perlvar</td><td>Perl predefined variables</td></tr> <tr><td>perlsub</td><td>Perl subroutines</td></tr> <tr><td>perlmod</td><td>Perl modules: how they work</td></tr> <tr><td>perlmodlib</td><td>Perl modules: how to write and use</td></tr> <tr><td>perlmodinstall</td><td>Perl modules: how to install from CPAN</td></tr> <tr><td>perlform</td><td>Perl formats</td></tr> <tr><td>perllocale</td><td>Perl locale support</td></tr> <tr><td colspan="2"> </td></tr> <tr><td>perlref</td><td>Perl references</td></tr> <tr><td>perlreftut</td><td>Perl references short introduction</td></tr> <tr><td>perldsc</td><td>Perl data structures intro</td></tr> <tr><td>perllol</td><td>Perl data structures: lists of lists</td></tr> <tr><td>perltoot</td><td>Perl OO tutorial</td></tr> <tr><td>perlobj</td><td>Perl objects</td></tr> <tr><td>perltie</td><td>Perl objects hidden behind simple variables</td></tr> <tr><td>perlbot</td><td>Perl OO tricks and examples</td></tr> <tr><td>perlipc</td><td>Perl interprocess communication</td></tr> <tr><td>perlthrtut</td><td>Perl threads tutorial</td></tr> <tr><td colspan="2"> </td></tr> <tr><td>perldebug</td><td>Perl debugging</td></tr> <tr><td>perldiag</td><td>Perl diagnostic messages</td></tr> <tr><td>perlsec</td><td>Perl security</td></tr> <tr><td>perltrap</td><td>Perl traps for the unwary</td></tr> <tr><td>perlport</td><td>Perl portability guide</td></tr> <tr><td>perlstyle</td><td>Perl style guide</td></tr> <tr><td colspan="2"> </td></tr> <tr><td>perlpod</td><td>Perl plain old documentation</td></tr> <tr><td>perlbook</td><td>Perl book information</td></tr> <tr><td colspan="2"> </td></tr> <tr><td>perlembed</td><td>Perl ways to embed perl in your C or C++ application</td></tr> </table> | perl | Perl overview (this section) | perldelta | Perl changes since previous version | perl5004delta | Perl changes in version 5.004 | perlfqa | Perl frequently asked questions | perltoc | Perl documentation table of contents | perldata | Perl data structures | perlsyn | Perl syntax | perlop | Perl operators and precedence | perlre | Perl regular expressions | perlrun | Perl execution and options | perlfunc | Perl builtin functions | perlopentut | Perl open() tutorial | perlvar | Perl predefined variables | perlsub | Perl subroutines | perlmod | Perl modules: how they work | perlmodlib | Perl modules: how to write and use | perlmodinstall | Perl modules: how to install from CPAN | perlform | Perl formats | perllocale | Perl locale support |  |  | perlref | Perl references | perlreftut | Perl references short introduction | perldsc | Perl data structures intro | perllol | Perl data structures: lists of lists | perltoot | Perl OO tutorial | perlobj | Perl objects | perltie | Perl objects hidden behind simple variables | perlbot | Perl OO tricks and examples | perlipc | Perl interprocess communication | perlthrtut | Perl threads tutorial |  |  | perldebug | Perl debugging | perldiag | Perl diagnostic messages | perlsec | Perl security | perltrap | Perl traps for the unwary | perlport | Perl portability guide | perlstyle | Perl style guide |  |  | perlpod | Perl plain old documentation | perlbook | Perl book information |  |  | perlembed | Perl ways to embed perl in your C or C++ application |

| perlembed          | Perl ways to embed perl in your C or C++ application                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |      |                              |           |                                     |               |                               |         |                                 |         |                                      |          |                      |         |             |        |                               |        |                          |         |                            |          |                        |             |                      |         |                           |         |                  |         |                             |            |                                    |                |                                        |          |              |            |                     |  |  |         |                 |            |                                    |         |                            |         |                                      |          |                  |         |              |         |                                             |         |                             |         |                                 |            |                       |  |  |           |                |          |                          |         |               |          |                           |          |                        |           |                  |  |  |         |                              |          |                       |  |  |           |                                                      |

## perl(1)

|                       |                                                    |
|-----------------------|----------------------------------------------------|
| <code>perlapi</code>  | Perl internal IO abstraction interface             |
| <code>perlxs</code>   | Perl XS application programming interface          |
| <code>perlxsut</code> | Perl XS tutorial                                   |
| <code>perlguts</code> | Perl internal functions for those doing extensions |
| <code>perlcall</code> | Perl calling conventions from C                    |
| <br>                  |                                                    |
| <code>perlhst</code>  | Perl history records                               |

(If you're intending to read these straight through for the first time, the suggested order will tend to reduce the number of forward references.)

By default, all of the above manpages are installed in the `/usr/local/man/` directory.

Extensive additional documentation for Perl modules is available. The default configuration for `perl` will place this additional documentation in the `/usr/local/lib/perl5/man` directory (or else in the `man` subdirectory of the Perl library directory). Some of this additional documentation is distributed standard with Perl, but you'll also find documentation for third-party modules there.

You should be able to view Perl's documentation with your `man(1)` program by including the proper directories in the appropriate start-up files, or in the `MANPATH` environment variable. To find out where the configuration has installed the manpages, type:

```
perl -V:man.dir
```

If the directories have a common stem, such as `/usr/local/man/man1` and `/usr/local/man/man3`, you need only to add that stem (`/usr/local/man`) to your `man(1)` configuration files or your `MANPATH` environment variable. If they do not share a stem, you'll have to add both stems.

If that doesn't work for some reason, you can still use the supplied `perldoc` script to view module information. You might also look into getting a replacement `man` program.

If something strange has gone wrong with your program and you're not sure where you should look for help, try the `-w` switch first. It will often point out exactly where the trouble is.

Perl is a language optimized for scanning arbitrary text files, extracting information from those text files, and printing reports based on that information. It's also a good language for many system management tasks. The language is intended to be practical (easy to use, efficient, complete) rather than beautiful (tiny, elegant, minimal).

Perl combines (in the author's opinion, anyway) some of the best features of `C`, `sed`, `awk`, and `sh`, so people familiar with those languages should have little difficulty with it. (Language historians will also note some vestiges of `csh`, Pascal, and even BASIC-PLUS.) Expression syntax corresponds quite closely to C expression syntax. Unlike most Unix utilities, Perl does not arbitrarily limit the size of your data--if you've got the memory, Perl can slurp in your whole file as a single string. Recursion

is of unlimited depth. And the tables used by hashes (sometimes called "associative arrays") grow as necessary to prevent degraded performance. Perl can use sophisticated pattern matching techniques to scan large amounts of data very quickly. Although optimized for scanning text, Perl can also deal with binary data, and can make dbm files look like hashes. Setuid Perl scripts are safer than C programs through a dataflow tracing mechanism which prevents many stupid security holes.

If you have a problem that would ordinarily use `sed` or `awk` or `sh`, but it exceeds their capabilities or must run a little faster, and you don't want to write the silly thing in C, then Perl may be for you. There are also translators to turn your `sed` and `awk` scripts into Perl scripts.

But wait, there's more...

Perl version 5 is nearly a complete rewrite, and provides the following additional benefits:

- Many usability enhancements  
It is now possible to write much more readable Perl code (even within regular expressions). Formerly cryptic variable names can be replaced by mnemonic identifiers. Error messages are more informative, and the optional warnings will catch many of the mistakes a novice might make. This cannot be stressed enough. Whenever you get mysterious behavior, try the `-w` switch!!! Whenever you don't get mysterious behavior, try using `-w` anyway.
- Simplified grammar  
The new yacc grammar is one half the size of the old one. Many of the arbitrary grammar rules have been regularized. The number of reserved words has been cut by 2/3. Despite this, nearly all old Perl scripts will continue to work unchanged.
- Lexical scoping  
Perl variables may now be declared within a lexical scope, like "auto" variables in C. Not only is this more efficient, but it contributes to better privacy for "programming in the large". Anonymous subroutines exhibit deep binding of lexical variables (closures).
- Arbitrarily nested data structures  
Any scalar value, including any array element, may now contain a reference to any other variable or subroutine. You can easily create anonymous variables and subroutines. Perl manages your reference counts for you.
- Modularity and reusability  
The Perl library is now defined in terms of modules which can be easily shared among various packages. A package may choose to import all or a portion of a module's published interface. Pragmas (that is, compiler directives) are defined and used by the same mechanism.

perl(1)

- **Object-oriented programming**  
A package can function as a class. Dynamic multiple inheritance and virtual methods are supported in a straightforward manner and with very little new syntax. Filehandles may now be treated as objects.
- **Embeddable and Extensible**  
Perl may now be embedded easily in your C or C++ application, and can either call or be called by your routines through a documented interface. The XS preprocessor is provided to make it easy to glue your C or C++ routines into Perl. Dynamic loading of modules is supported, and Perl itself can be made into a dynamic library.
- **POSIX compliant**  
A major new module is the POSIX module, which provides access to all available POSIX routines and definitions, via object classes where appropriate.
- **Package constructors and destructors**  
The new BEGIN and END blocks provide means to capture control as a package is being compiled, and after the program exits. As a degenerate case they work just like AWK's BEGIN and END when you use the -p or -n switches.
- **Multiple simultaneous DBM implementations**  
A Perl program may now access DBM, NDBM, SDBM, GDBM, and Berkeley DB files from the same script simultaneously. In fact, the old dbmopen interface has been generalized to allow any variable to be tied to an object class which defines its access methods.
- **Subroutine definitions may now be autoloading**  
In fact, the AUTOLOAD mechanism also allows you to define any arbitrary semantics for undefined subroutine calls. It's not for just autoloading.
- **Regular expression enhancements**  
You can now specify nongreedy quantifiers. You can now do grouping without creating a backreference. You can now write regular expressions with embedded whitespace and comments for readability. A consistent extensibility mechanism has been added that is upwardly compatible with all old regular expressions.
- **Innumerable Unbundled Modules**  
The Comprehensive Perl Archive Network described in the perlmodlib manpage contains hundreds of plug-and-play modules full of reusable code. See <http://www.perl.com/CPAN> for a site near you.
- **Compilability**  
While not yet in full production mode, a working perl-to-C compiler does exist. It can generate portable byte code, simple C, or optimized C code.

Okay, that's *definitely* enough hype.

#### AVAILABILITY

Perl is available for the vast majority of operating system platforms, including most Unix-like platforms. The following situation is as of February 1999 and Perl 5.005\_03.

The following platforms are able to build Perl from the standard source code distribution available at <http://www.perl.com/CPAN/src/index.html>:

|                        |                    |                          |
|------------------------|--------------------|--------------------------|
| AIX                    | Linux              | SCO ODT/OSR              |
| A/UX                   | MachTen            | Solaris                  |
| BeOS                   | MPE/iX             | SunOS                    |
| BSD/OS                 | NetBSD             | SVR4                     |
| DG/UX                  | NextSTEP           | Tru64 UNIX <sup>1</sup>  |
| DomainOS               | OpenBSD            | Ultrix                   |
| DOS DJGPP <sup>2</sup> | OpenSTEP           | UNICOS                   |
| DYNIX/ptx              | OS/2               | VMS                      |
| FreeBSD                | OS390 <sup>3</sup> | VOS                      |
| HP-UX                  | PowerMAX           | Windows 3.1 <sup>2</sup> |
| Hurd                   | QNX                | Windows 95 <sup>24</sup> |
| IRIX                   |                    | Windows 98 <sup>24</sup> |
|                        |                    | Windows NT <sup>24</sup> |

1. formerly known as Digital UNIX and before that DEC OSF/1
2. in DOS mode either the DOS or OS/2 ports can be used
3. formerly known as MVS
4. compilers; Borland, Cygwin32, Mingw32 EGCS/GCC, VC++

The following platforms have been known to build Perl from the source but for the Perl release 5.005\_03 we haven't been able to verify them, either because the hardware/software platforms are rather rare or because we don't have an active champion on these platforms, or both.

|          |             |           |
|----------|-------------|-----------|
| 3bl      | FPS         | Plan 9    |
| AmigaOS  | GENIX       | PowerUX   |
| ConvexOS | Greenhills  | RISC/os   |
| CX/UX    | ISC         | Stellar   |
| DC/OSx   | MachTen 68k | SVR2      |
| DDE SMES | MiNT        | TII500    |
| DOS EMX  | MPC         | TitanOS   |
| DYNIX    | NEWS-OS     | UNICOS/mk |

perl(1)

|       |      |              |
|-------|------|--------------|
| EP/IX | Opus | Unisys Dynix |
| Esix  |      | Unixware     |

The following platforms are planned to be supported in the standard source code distribution of the Perl release 5.006 but are not supported in the Perl release 5.005\_03:

BS2000  
Netware  
Rhapsody  
VM/ESA

The following platforms have their own source code distributions and binaries available via <http://www.perl.com/CPAN/ports/index.html>:

|                 | <b>Perl release</b> |
|-----------------|---------------------|
| AS/400          | 5.003               |
| MacOS           | 5.004               |
| Netware         | 5.003_07            |
| Tandem Guardian | 5.004               |

The following platforms have only binaries available via <http://www.perl.com/CPAN/ports/index.html>:

|              | <b>Perl release</b> |
|--------------|---------------------|
| Acorn RISCOS | 5.005_02            |
| AOS          | 5.002               |
| LynxOS       | 5.004_02            |

**ENVIRONMENT** See the `perlrun` manpage.

**AUTHOR** Larry Wall <[larry@wall.org](mailto:larry@wall.org)>, with the help of oodles of other folks.

If your Perl success stories and testimonials may be of help to others who wish to advocate the use of Perl in their applications, or if you wish to simply express your gratitude to Larry and the Perl developers, please write to <[perl-thanks@perl.org](mailto:perl-thanks@perl.org)>.

**DIAGNOSTICS** The `-w` switch produces some lovely diagnostics.

See the `perldiag` manpage for explanations of all Perl's diagnostics. The use `diagnostics` pragma automatically turns Perl's normally terse warnings and errors into these longer forms.

Compilation errors will tell you the line number of the error, with an indication of the next token or token type that was to be examined. (In the case of a script passed to Perl via `-e` switches, each `-e` is counted as one line.)

Setuid scripts have additional constraints that can produce error messages such as "Insecure dependency". See the `perlsec` manpage.

Did we mention that you should definitely consider using the `-w` switch?

**NOTES** The Perl motto is "There's more than one way to do it." Divining how many more is left as an exercise to the reader.

The three principal virtues of a programmer are Laziness, Impatience, and Hubris. See the Camel Book for why.

**BUGS** The `-w` switch is not mandatory.

Perl is at the mercy of your machine's definitions of various operations such as type casting, `atof()`, and floating-point output with `sprintf()`.

If your `stdio` requires a seek or eof between reads and writes on a particular stream, so does Perl. (This doesn't apply to `sysread()` and `syswrite()`.)

While none of the built-in data types have any arbitrary size limits (apart from memory size), there are still a few arbitrary limits: a given variable name may not be longer than 251 characters. Line numbers displayed by diagnostics are internally stored as short integers, so they are limited to a maximum of 65535 (higher numbers usually being affected by wraparound).

You may mail your bug reports (be sure to include full configuration information as output by the `myconfig` program in the perl source tree, or by `perl -v`) to

perl(1)

`<perlbug@perl.com>`. If you've succeeded in compiling perl, the perlbug script in the `utils/` subdirectory can be used to help mail in a bug report.

Perl actually stands for Pathologically Eclectic Rubbish Lister, but don't tell anyone I said that.

| <b>NAME</b>        | pfexec, pfsh, pfcsh, pfksh – execute a command in a profile                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| <b>SYNOPSIS</b>    | <pre> /usr/bin/pfexec <i>command</i> /usr/bin/pfsh [ <i>options</i> ] [ <i>argument</i> ...] /usr/bin/pfcsh [ <i>options</i> ] [ <i>argument</i> ...] /usr/bin/pfksh [ <i>options</i> ] [ <i>argument</i> ...] </pre>                                                                                                                                                                                                                                                                          |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The pfexec program is used to execute commands with the attributes specified by the user's profiles in the exec_attr(4) database. It is invoked by the profile shells, pfsh, pfcsh, and pfksh which are linked to the Bourne shell, C shell, and Korn shell, respectively.</p> <p>Profiles are searched in the order specified in the user's entry in the user_attr(4) database. If the same command appears in more than one profile, the profile shell uses the first matching entry.</p> |                |                 |              |         |
| <b>USAGE</b>       | <p>pfexec is used to execute commands with predefined process attributes, such as specific user or group IDs.</p> <p>Refer to the sh(1), csh(1), and ksh(1) man pages for complete usage descriptions of the profile shells.</p>                                                                                                                                                                                                                                                               |                |                 |              |         |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0           Successful completion.</p> <p>1           An error occurred.</p>                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |         |
| <b>ATTRIBUTES</b>  | <p>See attributes(5) for descriptions of the following attributes:</p> <table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWcsu</td> </tr> </tbody> </table>                                                                                                                                                                                                                                             | ATTRIBUTE TYPE | ATTRIBUTE VALUE | Availability | SUNWcsu |

| <b>NAME</b>        | pg – files perusal filter for CRTs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>SYNOPSIS</b>    | <b>pg</b> [- <i>number</i> ] [-p <i>string</i> ] [-cefnrs] [+ <i>linenumber</i> ] [+/ <i>pattern</i> /]<br>[ <i>filename...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>The <b>pg</b> command is a filter that allows the examination of <i>filenames</i> one screenful at a time on a CRT. If the user types a RETURN, another page is displayed; other possibilities are listed below.</p> <p>This command is different from previous paginators in that it allows you to back up and review something that has already passed. The method for doing this is explained below.</p> <p>To determine terminal attributes, <b>pg</b> scans the <code>terminfo(4)</code> data base for the terminal type specified by the environment variable <code>TERM</code>. If <code>TERM</code> is not defined, the terminal type <code>dumb</code> is assumed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>OPTIONS</b>     | <p>-<i>number</i>            An integer specifying the size (in lines) of the window that <b>pg</b> is to use instead of the default. (On a terminal containing 24 lines, the default window size is 23).</p> <p>-p <i>string</i>           <b>pg</b> uses <i>string</i> as the prompt. If the prompt string contains a %d, the first occurrence of %d in the prompt will be replaced by the current page number when the prompt is issued. The default prompt string is " :".</p> <p>-c                    Home the cursor and clear the screen before displaying each page. This option is ignored if <code>clear_screen</code> is not defined for this terminal type in the <code>terminfo(4)</code> data base.</p> <p>-e                    <b>pg</b> does <i>not</i> pause at the end of each file.</p> <p>-f                    Normally, <b>pg</b> splits lines longer than the screen width, but some sequences of characters in the text being displayed (for instance, escape sequences for underlining) generate undesirable results. The -f option inhibits <b>pg</b> from splitting lines.</p> <p>-n                    Normally, commands must be terminated by a &lt;<i>newline</i>&gt; character. This option causes an automatic end of command as soon as a command letter is entered.</p> <p>-r                    Restricted mode. The shell escape is disallowed. <b>pg</b> prints an error message but does not exit.</p> <p>-s                    <b>pg</b> prints all messages and prompts in the standard output mode (usually inverse video).</p> <p>+<i>linenumber</i>        Start up at <i>linenumber</i>.</p> <p>+/<i>pattern</i>/         Start up at the first line containing the regular expression pattern.</p> |
| <b>OPERANDS</b>    | The following operands are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

*filename* A path name of a text file to be displayed. If no *filename* is given, or if it is `-`, the standard input is read.

**Commands** The responses that may be typed when `pg` pauses can be divided into three categories: those causing further perusal, those that search, and those that modify the perusal environment.

Commands that cause further perusal normally take a preceding *address*, an optionally signed number indicating the point from which further text should be displayed. This *address* is interpreted in either pages or lines depending on the command. A signed *address* specifies a point relative to the current page or line, and an unsigned *address* specifies an address relative to the beginning of the file. Each command has a default address that is used if none is provided.

The perusal commands and their defaults are as follows:

|                                                                |                                                                                                                                                                                                                                     |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>(+1)&lt;newline&gt;</code> or <code>&lt;blank&gt;</code> | This causes one page to be displayed. The address is specified in pages.                                                                                                                                                            |
| <code>(+1) 1</code>                                            | With a relative address this causes <code>pg</code> to simulate scrolling the screen, forward or backward, the number of lines specified. With an absolute address this command prints a screenful beginning at the specified line. |
| <code>(+1) d</code> or <code>^D</code>                         | Simulates scrolling half a screen forward or backward.                                                                                                                                                                              |
| <code>iF</code>                                                | Skip <i>i</i> screens of text.                                                                                                                                                                                                      |
| <code>iz</code>                                                | Same as <code>&lt;newline&gt;</code> except that <i>i</i> , if present, becomes the new default number of lines per screenful.                                                                                                      |

The following perusal commands take no *address*.

|                                   |                                                                                     |
|-----------------------------------|-------------------------------------------------------------------------------------|
| <code>.</code> or <code>^L</code> | Typing a single period causes the current page of text to be redisplayed.           |
| <code>\$</code>                   | Displays the last windowful in the file. Use with caution when the input is a pipe. |

The following commands are available for searching for text patterns in the text. The regular expressions are described on the `regex(5)` manual page. They must always be terminated by a `<newline>`, even if the `-n` option is specified.

|                         |                                                                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>i/pattern/</code> | Search forward for the <i>ith</i> (default <i>i</i> =1) occurrence of <i>pattern</i> . Searching begins immediately after the current page and continues to the end of the current file, without wrap-around. |
| <code>i^pattern^</code> |                                                                                                                                                                                                               |
| <code>i?pattern?</code> | Search backwards for the <i>ith</i> (default <i>i</i> =1) occurrence of <i>pattern</i> . Searching begins immediately before the current page and continues to the beginning of the current file, without     |

pg(1)

wrap-around. The ^ notation is useful for Adds 100 terminals which will not properly handle the ?.

After searching, pg will normally display the line found at the top of the screen. This can be modified by appending m or b to the search command to leave the line found in the middle or at the bottom of the window from now on. The suffix t can be used to restore the original situation.

The user of pg can modify the environment of perusal with the following commands:

|                      |                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>in</i>            | Begin perusing the <i>i</i> th next file in the command line. The <i>i</i> is an unsigned number, default value is 1.                                                                                                                                          |
| <i>ip</i>            | Begin perusing the <i>i</i> th previous file in the command line. <i>i</i> is an unsigned number, default is 1.                                                                                                                                                |
| <i>iw</i>            | Display another window of text. If <i>i</i> is present, set the window size to <i>i</i> .                                                                                                                                                                      |
| <i>s filename</i>    | Save the input in the named file. Only the current file being perused is saved. The white space between the <i>s</i> and <i>filename</i> is optional. This command must always be terminated by a <i>&lt;newline&gt;</i> , even if the -n option is specified. |
| <i>h</i>             | Help by displaying an abbreviated summary of available commands.                                                                                                                                                                                               |
| <i>q</i> or <i>Q</i> | Quit pg.                                                                                                                                                                                                                                                       |
| <i>!command</i>      | <i>Command</i> is passed to the shell, whose name is taken from the SHELL environment variable. If this is not available, the default shell is used. This command must always be terminated by a <i>&lt;newline&gt;</i> , even if the -n option is specified.  |

At any time when output is being sent to the terminal, the user can hit the quit key (normally CTRL-\) or the interrupt (break) key. This causes pg to stop sending output, and display the prompt. The user may then enter one of the above commands in the normal manner. Unfortunately, some output is lost when this is done, because any characters waiting in the terminal's output queue are flushed when the quit signal occurs.

If the standard output is not a terminal, then pg acts just like cat(1), except that a header is printed before each file (if there is more than one).

**Large File Behavior**

See largefile(5) for the description of the behavior of pg when encountering files greater than or equal to 2 Gbyte ( 2<sup>31</sup> bytes).

**EXAMPLES**

**EXAMPLE 1** An example of the pg command.

The following command line uses pg to read the system news:

```
example% news | pg -p "(Page %d) :"
```

**ENVIRONMENT VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `pg`: `LC_CTYPE`, `LC_MESSAGES`, and `NLS_PATH`.

The following environment variables affect the execution of `pg`:

|                      |                                                                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>COLUMNS</code> | Determine the horizontal screen size. If unset or <code>NULL</code> , use the value of <code>TERM</code> , the window size, baud rate, or some combination of these, to indicate the terminal type for the screen size calculation.                        |
| <code>LINES</code>   | Determine the number of lines to be displayed on the screen. If unset or <code>NULL</code> , use the value of <code>TERM</code> , the window size, baud rate, or some combination of these, to indicate the terminal type for the screen size calculation. |
| <code>SHELL</code>   | Determine the name of the command interpreter executed for a <code>!command</code> .                                                                                                                                                                       |
| <code>TERM</code>    | Determine terminal attributes. Optionally attempt to search a system-dependent database, keyed on the value of the <code>TERM</code> environment variable. If no information is available, a terminal incapable of cursor-addressable movement is assumed. |

**EXIT STATUS**

The following exit values are returned:

|    |                        |
|----|------------------------|
| 0  | Successful completion. |
| >0 | An error occurred.     |

**FILES**

|                                          |                                          |
|------------------------------------------|------------------------------------------|
| <code>/tmp/pg*</code>                    | temporary file when input is from a pipe |
| <code>/usr/share/lib/terminfo/?/*</code> | terminal information database            |

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | enabled         |

**SEE ALSO**

`cat(1)`, `grep(1)`, `more(1)`, `terminfo(4)`, `attributes(5)`, `environ(5)`, `largefile(5)`, `regex(5)`

**NOTES**

While waiting for terminal input, `pg` responds to `BREAK`, `CTRL-C`, and `CTRL-\` by terminating execution. Between prompts, however, these signals interrupt `pg`'s current task and place the user in prompt mode. These should be used with caution when input is being read from a pipe, since an interrupt is likely to terminate the other commands in the pipeline.

The terminal `/`, `^`, or `?` may be omitted from the searching commands.

pg(1)

If terminal tabs are not set every eight positions, undesirable results may occur.

When using `pg` as a filter with another command that changes the terminal I/O options, terminal settings may not be restored correctly.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>DESCRIPTION</b> | <p>The <code>pgrep</code> utility examines the active processes on the system and reports the process IDs of the processes whose attributes match the criteria specified on the command line. Each process ID is printed as a decimal value and is separated from the next ID by a delimiter string, which defaults to a newline. For each attribute option, the user can specify a set of possible values separated by commas on the command line. For example,</p> <pre>pgrep -G other, daemon</pre> <p>matches processes whose real group ID is <code>other</code> OR <code>daemon</code>. If multiple criteria options are specified, <code>pgrep</code> matches processes whose attributes match the logical AND of the criteria options. For example,</p> <pre>pgrep -G other, daemon -U root, daemon</pre> <p>matches processes whose attributes are:</p> <pre>(real group ID is other OR daemon) AND (real user ID is root OR daemon)</pre> <p><code>pkill</code> functions identically to <code>pgrep</code>, except that each matching process is signaled as if by <code>kill(1)</code> instead of having its process ID printed. A signal name or number may be specified as the first command line option to <code>pkill</code>.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>- d <i>delim</i>      Specifies the output delimiter string to be printed between each matching process ID. If no <code>-d</code> option is specified, the default is a newline character. The <code>-d</code> option is only valid when specified as an option to <code>pgrep</code>.</li> <li>- f              The regular expression <i>pattern</i> should be matched against the full process argument string (obtained from the <code>pr_psargs</code> field of the <code>/proc/<i>nnnnn</i>/psinfo</code> file). If no <code>-f</code> option is specified, the expression is matched only against the name of the executable file (obtained from the <code>pr_fname</code> field of the <code>/proc/<i>nnnnn</i>/psinfo</code> file).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                        |

## pgrep(1)

|                                   |                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-g <i>pgprlist</i></code>   | Matches only processes whose process group ID is in the given list. If group 0 is included in the list, this is interpreted as the process group ID of the <code>pgrep</code> or <code>pskill</code> process.                                                                                                                                                        |
| <code>-G <i>gidlist</i></code>    | Matches only processes whose real group ID is in the given list. Each group ID may be specified as either a group name or a numerical group ID.                                                                                                                                                                                                                      |
| <code>-J <i>projidlist</i></code> | Matches only processes whose project ID is in the given list. Each project ID may be specified as either a project name or a numerical project ID.                                                                                                                                                                                                                   |
| <code>-l</code>                   | Long output format. Prints the process name along with the process ID of each matching process. The process name is obtained from the <code>pr_psargs</code> or <code>pr_fname</code> field, depending on whether the <code>-f</code> option was specified (see above). The <code>-l</code> option is only valid when specified as an option to <code>pgrep</code> . |
| <code>-n</code>                   | Matches only the newest (most recently created) process which meets all other specified matching criteria.                                                                                                                                                                                                                                                           |
| <code>-P <i>ppidlist</i></code>   | Matches only processes whose parent process ID is in the given list.                                                                                                                                                                                                                                                                                                 |
| <code>-s <i>sidlist</i></code>    | Matches only processes whose process session ID is in the given list. If ID 0 is included in the list, this is interpreted as the session ID of the <code>pgrep</code> or <code>pskill</code> process.                                                                                                                                                               |
| <code>-t <i>termlist</i></code>   | Matches only processes which are associated with a terminal in the given list. Each terminal is specified as the suffix following <code>"/dev/"</code> of the terminal's device path name in <code>/dev</code> . For example, <code>term/a</code> or <code>pts/0</code> .                                                                                            |
| <code>-T <i>taskidlist</i></code> | Matches only processes whose task ID is in the given list. If ID 0 is included in the list, this is interpreted as the task ID of the <code>pgrep</code> or <code>pskill</code> process.                                                                                                                                                                             |
| <code>-u <i>euidlist</i></code>   | Matches only processes whose effective user ID is in the given list. Each user ID may be specified as either a login name or a numerical user ID.                                                                                                                                                                                                                    |
| <code>-U <i>uidlist</i></code>    | Matches only processes whose real user ID is in the given list. Each user ID may be specified as either a login name or a numerical user ID.                                                                                                                                                                                                                         |
| <code>-v</code>                   | Reverses the sense of the matching. Matches all processes <i>except</i> those which meet the specified matching criteria.                                                                                                                                                                                                                                            |
| <code>-x</code>                   | Considers only processes whose argument string or executable file name <i>exactly</i> matches the specified <i>pattern</i> to be matching processes. The pattern match is considered to be exact when all characters in the process argument string or executable file name match the pattern.                                                                       |

| <b>-signal</b>     | Specifies the signal to send to each matched process. If no signal is specified, SIGTERM is sent by default. The value of <i>signal</i> can be one of the symbolic names defined in <code>signal(3HEAD)</code> without the SIG prefix, or the corresponding signal number as a decimal value. The <i>-signal</i> option is only valid when specified as the first option to <code>kill</code> . |                |                 |              |         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| <b>OPERANDS</b>    | The following operand is supported:<br><br><i>pattern</i> Specifies an Extended Regular Expression (ERE) pattern to match against either the executable file name or full process argument string. See <code>regex(5)</code> for a complete description of the ERE syntax.                                                                                                                      |                |                 |              |         |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Obtaining a process ID</p> <p>Obtain the process ID of <code>sendmail</code>:</p> <pre>example% pgrep -x -u root sendmail 283</pre> <p><b>EXAMPLE 2</b> Terminating a process</p> <p>Terminate the most recently created <code>xterm</code>:</p> <pre>example% pkill -n xterm</pre>                                                                                         |                |                 |              |         |
| <b>EXIT STATUS</b> | The following exit values are returned:<br><br>0 One or more processes were matched.<br>1 No processes were matched.<br>2 Invalid command line options were specified.<br>3 A fatal error occurred.                                                                                                                                                                                             |                |                 |              |         |
| <b>FILES</b>       | <code>/proc/nnnnn/psinfo</code> process information files                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |

| <b>SEE ALSO</b>    | <code>kill(1)</code> , <code>proc(1)</code> , <code>ps(1)</code> , <code>truss(1)</code> , <code>kill(2)</code> , <code>signal(3HEAD)</code> , <code>proc(4)</code> , <code>attributes(5)</code> , <code>regex(5)</code>                                                                                                                                                                        |                |                 |              |         |
| <b>NOTES</b>       | Both utilities match the ERE <i>pattern</i> argument against either the <code>pr_fname</code> or <code>pr_psargs</code> fields of the <code>/proc/nnnnn/psinfo</code> files. The lengths of these strings are                                                                                                                                                                                   |                |                 |              |         |

## pgrep(1)

limited according to definitions in `<sys/procfs.h>`. Patterns which can match strings longer than the current limits may fail to match the intended set of processes.

If the *pattern* argument contains ERE meta-characters which are also shell meta-characters, it may be necessary to enclose the pattern with appropriate shell quotes.

Defunct processes are never matched by either `pgrep` or `pkill`.

The current `pgrep` or `pkill` process will never consider itself a potential match.

| <b>SYNOPSIS</b>    | <pre>pkginfo [-q   -x   -l] [-p   -i] [-r] [-a arch] [-v version]         [-c category...] [pkginst...]  pkginfo [-d device] [-R root_path] [-q   -x   -l] [-a arch] [-v version]         [-c category...] [pkginst...]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>pkginfo displays information about software packages that are installed on the system (with the first synopsis) or that reside on a particular device or directory (with the second synopsis).</p> <p>Without options, pkginfo lists the primary category, package instance, and the names of all completely installed and partially installed packages. It displays one line for each package selected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>OPTIONS</b>     | <p>The <code>-p</code> and <code>-i</code> options are meaningless if used in conjunction with the <code>-d</code> option.</p> <p>The options <code>-q</code>, <code>-x</code>, and <code>-l</code> are mutually exclusive.</p> <p><code>-a arch</code>           Specify the architecture of the package as <i>arch</i>.</p> <p><code>-c category</code>       Display packages that match <i>category</i>. Categories are defined with the CATEGORY parameter in the pkginfo(4) file. If more than one category is supplied, the package needs to match only one category in the list. The match is not case specific.</p> <p><code>-d device</code>         Defines a device, <i>device</i>, on which the software resides. <i>device</i> can be an absolute directory pathname or the identifiers for tape, floppy disk, removable disk, and so forth. The special token <code>spool</code> may be used to indicate the default installation spool directory (<code>/var/spool/pkg</code>).</p> <p><code>-i</code>                 Display information for fully installed packages only.</p> <p><code>-l</code>                 Specify long format, which includes all available information about the designated package(s).</p> <p><code>-p</code>                 Display information for partially installed packages only.</p> <p><code>-q</code>                 Do not list any information. Used from a program to check whether or not a package has been installed.</p> <p><code>-r</code>                 List the installation base for relocatable packages.</p> <p><code>-R root_path</code>      Defines the full path name of a directory to use as the <i>root_path</i>. All files, including package system information files, are relocated to a directory tree starting in the specified <i>root_path</i>.</p> <p><code>-v version</code>       Specify the version of the package as <i>version</i>. The version is defined with the VERSION parameter in the pkginfo(4) file. All compatible versions can be requested by preceding the version name with a tilde (<code>≈</code>). Multiple white spaces are replaced with a single white space during version comparison.</p> |

pkginfo(1)

- OPERANDS**    `-x`                    Designate an extracted listing of package information. The listing contains the package abbreviation, package name, package architecture (if available) and package version (if available).
- `pkginst`                    A package designation by its instance. An instance can be the package abbreviation or a specific instance (for example, `inst . 1` or `inst . 2`). All instances of a package can be requested by `inst . *`. The asterisk character (\*) is a special character to some shells and may need to be escaped. In the C-Shell, "\*" must be surrounded by single quotes (') or preceded by a backslash (\).
- EXIT STATUS**    `0`                    Successful completion.
- `>0`                    An error occurred.
- FILES**            `/var/spool/pkg`                    default installation spool directory
- ATTRIBUTES**    See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

| <b>DESCRIPTION</b> | <p>pkgmk produces an installable package to be used as input to the pkgadd(1M) command. The package contents will be in directory structure format.</p> <p>The command uses the package <i>prototype</i>(4) file as input and creates a <i>pkgmap</i>(4) file. The contents for each entry in the <i>prototype</i> file is copied to the appropriate output location. Information concerning the contents (checksum, file size, modification date) is computed and stored in the <i>pkgmap</i> file, along with attribute information specified in the <i>prototype</i> file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-o Overwrite the same instance; package instance will be overwritten if it already exists.</li> <li>-a <i>arch</i> Override the architecture information provided in the <i>pkginfo</i>(4) file with <i>arch</i>.</li> <li>-b <i>base_src_dir</i> Prepend the indicated <i>base_src_dir</i> to locate relocatable objects on the source machine.</li> <li>-d <i>device</i> Create the package on <i>device</i>. <i>device</i> can be an absolute directory pathname or the identifiers for a floppy disk or removable disk (for example, /dev/diskette). The default device is the installation spool directory (/var/spool/pkg).</li> <li>-f <i>prototype</i> Use the file <i>prototype</i> as input to the command. The default <i>prototype</i> filename is [Pp]prototype.</li> <li>-l <i>limit</i> Specify the maximum size in 512 byte blocks of the output device as <i>limit</i>. By default, if the output file is a directory or a mountable device, pkgmk will employ the <i>df</i>(1M) command to dynamically calculate the amount of available space on the output device. This option is useful in conjunction with <i>pkgtrans</i>(1) to create a package with a datastream format.</li> <li>-p <i>pstamp</i> Override the production stamp definition in the <i>pkginfo</i>(4) file with <i>pstamp</i>.</li> <li>-r <i>root_path</i> Ignore destination paths in the <i>prototype</i>(4) file. Instead, use the indicated <i>root_path</i> with the source pathname appended to locate objects on the source machine, using a comma (,) as the separator for the path elements.</li> </ul> |

## pkgmk(1)

*-v version* Override the version information provided in the `pkginfo(4)` file with *version*.

*variable=value* Place the indicated variable in the packaging environment. (See `prototype(4)` for definitions of variable specifications.)

**OPERANDS** The following operand is supported:

*pkginst* A package designation by its instance. An instance can be the package abbreviation or a specific instance (for example, `inst . 1` or `inst . 2`). All instances of a package can be requested by `inst . *`. The asterisk character (\*) is a special character to some shells and may need to be escaped. In the C-Shell, "\*" must be surrounded by single quotes (') or preceded by a backslash (\).

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `pkgparam(1)`, `pkgproto(1)`, `pkgtrans(1)`, `uname(1)`, `df(1M)`, `pkgadd(1M)`, `pkginfo(4)`, `pkgmap(4)`, `prototype(4)`, `attributes(5)`

*Application Packaging Developer's Guide*

**NOTES** Architecture information is provided on the command line with the `-a` option or in the `prototype(4)` file. If no architecture information is supplied, `pkgmk` uses the output of `uname -m` (see `uname(1)`).

Version information is provided on the command line with the `-v` option or in the `pkginfo(4)` file. If no version information is supplied, a default based on the current date will be provided.

Command line definitions for both architecture and version override the `prototype(4)` definitions.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>DESCRIPTION</b> | <p>pkgparam displays the value associated with the parameter or parameters requested on the command line. The values are located in either the pkginfo(4) file for <i>pkginst</i> or from the specific file named with the -f option.</p> <p>One parameter value is shown per line. Only the value of a parameter is given unless the -v option is used. With this option, the output of the command is in this format:</p> <pre>parameter1='value1' parameter2='value2' parameter3='value3'</pre> <p>If no parameters are specified on the command line, values for all parameters associated with the package are shown.</p>                                                                                                                                                                                                                      |
| <b>OPTIONS</b>     | <p>Options and arguments for this command are:</p> <p>-d <i>device</i>           Specify the <i>device</i> on which a <i>pkginst</i> is stored. It can be a directory pathname or the identifiers for tape, floppy disk, or removable disk (for example, /var/tmp, /dev/diskette, and /dev/dsk/c1d0s0). The special token spool may be used to represent the default installation spool directory (/var/spool/pkg).</p> <p>-f <i>filename</i>           Read <i>filename</i> for parameter values.</p> <p>-R <i>root_path</i>           Defines the full path name of a subdirectory to use as the <i>root_path</i>. All files, including package system information files, are relocated to a directory tree starting in the specified <i>root_path</i>.</p> <p>-v                      Verbose mode. Display name of parameter and its value.</p> |
| <b>OPERANDS</b>    | <p><i>pkginst</i>                Defines a specific package instance for which parameter values should be displayed.</p> <p><i>param</i>                 Defines a specific parameter whose value should be displayed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ERRORS</b>      | If parameter information is not available for the indicated package, the command exits with a non-zero status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

*Application Packaging Developer's Guide*

**NOTES** With the `-f` option, you can specify the file from which parameter values should be extracted. This file should be in the same format as a `pkginfo(4)` file. For example, such a file might be created during package development and used while testing software during this stage.

| <b>DESCRIPTION</b> | pkgproto scans the indicated paths and generates prototype(4) file entries that may be used as input to the pkgmk(1) command.<br><br>If no paths are specified on the command line, standard input is assumed to be a list of paths. If the pathname listed on the command line is a directory, the contents of the directory is searched. However, if input is read from <code>stdin</code> , a directory specified as a pathname will not be searched.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>OPTIONS</b>     | -i                    Ignores symbolic links and records the paths as <code>f</code> type= <code>f</code> (a file) versus <code>f</code> type= <code>s</code> (symbolic link).<br><br>-c <i>class</i> Maps the class of all paths to <i>class</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>OPERANDS</b>    | <i>path1</i> Pathname where objects are located.<br><br><i>path2</i> Pathname which should be substituted on output for <i>path1</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

*Application Packaging Developer's Guide*

**NOTES** By default, pkgproto creates symbolic link entries for any symbolic link encountered (ftype=s). When you use the -i option, pkgproto creates a file entry for symbolic links (ftype=f). The prototype(4) file would have to be edited to assign such file types as v (volatile), e (editable), or x (exclusive directory). pkgproto detects linked files. If multiple files are linked together, the first path encountered is considered the source of the link.

By default, pkgproto prints prototype entries on the standard output. However, the output should be saved in a file (named Prototype or prototype, for convenience) to be used as input to the pkgmk(1) command.

| <b>NAME</b>        | pkgtrans – translate package format                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SYNOPSIS</b>    | <b>pkgtrans</b> [-inos] <i>device1 device2</i> [ <i>pkginst...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DESCRIPTION</b> | <p>pkgtrans translates an installable package from one format to another. It translates:</p> <ul style="list-style-type: none"> <li>■ a file system format to a datastream</li> <li>■ a datastream to a file system format</li> <li>■ one file system format to another file system format</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b>     | <p>The options and arguments for this command are:</p> <ul style="list-style-type: none"> <li>-i Copy only the <code>pkginfo(4)</code> and <code>pkgmap(4)</code> files.</li> <li>-n Create a new instance of the package on the destination device if any instance of this package already exists, up to the number specified by the <code>MAXINST</code> variable in the <code>pkginfo(4)</code> file.</li> <li>-o Overwrite the same instance on the destination device; package instance will be overwritten if it already exists.</li> <li>-s Indicates that the package should be written to <i>device2</i> as a datastream rather than as a file system. The default behavior is to write a file system format on devices that support both formats.</li> </ul>                                           |
| <b>OPERANDS</b>    | <p><i>device1</i> Indicates the source device. The package or packages on this device will be translated and placed on <i>device2</i>.</p> <p><i>device2</i> Indicates the destination device. Translated packages will be placed on this device.</p> <p><i>pkginst</i> Specifies which package instance or instances on <i>device1</i> should be translated. The token <code>all</code> may be used to indicate all packages. <code>pkginst.*</code> can be used to indicate all instances of a package. If no packages are defined, a prompt shows all packages on the device and asks which to translate.</p> <p>The asterisk character (*) is a special character to some shells and may need to be escaped. In the C-Shell, "*" must be surrounded by single quotes (') or preceded by a backslash (\).</p> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Examples of the <code>pkgtrans</code> command.</p> <p>The following example translates all packages on the floppy drive <code>/dev/diskette</code> and places the translations on <code>/tmp</code>:</p> <pre>example% pkgtrans /dev/diskette /tmp all</pre> <p>The next example translates packages <code>pkg1</code> and <code>pkg2</code> on <code>/tmp</code> and places their translations (that is, a datastream) on the <code>9track1</code> output device:</p> <pre>example% pkgtrans /tmp 9track1 pkg1 pkg2</pre>                                                                                                                                                                                                                                                                   |

## pkgtrans(1)

**EXAMPLE 1** Examples of the `pkgtrans` command. (Continued)

The next example translates `pkg1` and `pkg2` on `/tmp` and places them on the diskette in a datastream format:

```
example% pkgtrans -s /tmp /dev/diskette pkg1 pkg2
```

### ENVIRONMENT VARIABLES

The `MAXINST` variable is set in the `pkginfo(4)` file and declares the maximum number of package instances.

### EXIT STATUS

0 Successful completion.

>0 An error occurred.

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

### NOTES

Device specifications can be either the special node name (for example, `/dev/diskette`) or a device alias (for example, `diskette1`). The device `spool` indicates the default spool directory. Source and destination devices cannot be the same.

By default, `pkgtrans` will not translate any instance of a package if any instance of that package already exists on the destination device. Using the `-n` option creates a new instance if an instance of this package already exists. Using the `-o` option overwrites an instance of this package if it already exists. Neither of these options are useful if the destination device is a datastream.

| <b>NAME</b>        | p-limit – get or set the resource limits of running processes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <p><b>p-limit</b> [-km] <i>pid...</i></p> <p><b>p-limit</b> {-cdfnstv} <i>soft,hard...</i> <i>pid...</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DESCRIPTION</b> | <p>If one or more of the <i>cdfnstv</i> options is specified, <b>p-limit</b> sets the soft (current) limit and/or the hard (maximum) limit of the indicated resource(s) in the processes identified by the process-ID list, <i>pid</i>. Otherwise <b>p-limit</b> reports the resource limits of the processes identified by the process-ID list, <i>pid</i>.</p> <p>Only the owner of a process or the super-user is permitted either to get or to set the resource limits of a process. Only the super-user can increase the hard limit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-k            On output, show file sizes in kilobytes (1024 bytes) rather than in 512-byte blocks.</li> <li>-m            On output, show file and memory sizes in megabytes (1024*1024 bytes).</li> </ul> <p>The remainder of the options are used to change specified resource limits. They each accept an argument of the form:</p> <p><i>soft,hard</i></p> <p>where <i>soft</i> specifies the soft (current) limit and <i>hard</i> specifies the hard (maximum) limit. If the hard limit is not specified, the comma may be omitted. If the soft limit is an empty string, only the hard limit is set. Each limit is either the literal string <i>unlimited</i>, or a number, with an optional scaling factor, as follows:</p> <ul style="list-style-type: none"> <li><i>nk</i>            <i>n</i> kilobytes</li> <li><i>nm</i>            <i>n</i> megabytes (minutes for CPU time)</li> <li><i>nh</i>            <i>n</i> hours (for CPU time only)</li> <li><i>mm:ss</i>        minutes and seconds (for CPU time only)</li> </ul> <p>The soft limit cannot exceed the hard limit.</p> <ul style="list-style-type: none"> <li>-c <i>soft,hard</i>    Set core file size limits (default unit is 512-byte blocks).</li> <li>-d <i>soft,hard</i>    Set data segment (heap) size limits (default unit is kilobytes).</li> <li>-f <i>soft,hard</i>    Set file size limits (default unit is 512-byte blocks).</li> <li>-n <i>soft,hard</i>    Set file descriptor limits (no default unit).</li> <li>-s <i>soft,hard</i>    Set stack segment size limits (default unit is kilobytes).</li> <li>-t <i>soft,hard</i>    Set CPU time limits (default unit is seconds).</li> <li>-v <i>soft,hard</i>    Set virtual memory size limits (default unit is kilobytes).</li> </ul> |

plimit(1)

**OPERANDS** The following operands are supported.

pid Process ID list.

**EXIT STATUS** plimit returns the exit value zero on success, non-zero on failure (such as no such process, permission denied, or invalid option).

**FILES** /proc/pid/\* process information and control files

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|

## plot(1B)

var

Benson Varian printer-plotter

ver

Versatec D1200A printer-plotter. The output is scan-converted and suitable input to 'lpr -v'.

| <b>DESCRIPTION</b> | The <code>postdaisy</code> filter translates Diablo 630 daisy-wheel <i>files</i> into PostScript and writes the results on the standard output. If no <i>files</i> are specified, or if <code>-</code> is one of the input <i>files</i> , the standard input is read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>OPTIONS</b>     | <p><code>-c <i>num</i></code> Print <i>num</i> copies of each page. By default only one copy is printed.</p> <p><code>-f <i>name</i></code> Print <i>files</i> using font <i>name</i>. Any PostScript font can be used, although the best results will be obtained only with constant-width fonts. The default font is Courier.</p> <p><code>-h <i>num</i></code> Set the initial horizontal motion index to <i>num</i>. Determines the character advance and the default point size, unless the <code>-s</code> option is used. The default is 12.</p> <p><code>-m <i>num</i></code> Magnify each logical page by the factor <i>num</i>. Pages are scaled uniformly about the origin, which is located near the upper left corner of each page. The default magnification is 1.0.</p> <p><code>-n <i>num</i></code> Print <i>num</i> logical pages on each piece of paper, where <i>num</i> can be any positive integer. By default, <i>num</i> is set to 1.</p> <p><code>-o <i>list</i></code> Print pages whose numbers are given in the comma-separated <i>list</i>. The list contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest. The page range is an expression of logical pages rather than physical sheets of paper. For example, if you are printing two logical pages to a sheet, and you specified a range of 4, then two sheets of paper would print, containing four page layouts. If you specified a page range of 3-4, when requesting two logical pages to a sheet; then <i>only</i> page 3 and page 4 layouts would print, and they would appear on one physical sheet of paper.</p> <p><code>-p <i>mode</i></code> Print <i>files</i> in either portrait or landscape <i>mode</i>. Only the first character of <i>mode</i> is significant. The default <i>mode</i> is portrait.</p> <p><code>-r <i>num</i></code> Selects carriage return and line feed behavior. If <i>num</i> is 1, a line feed generates a carriage return. If <i>num</i> is 2, a carriage return generates a line feed. Setting <i>num</i> to 3 enables both modes.</p> <p><code>-s <i>num</i></code> Use point size <i>num</i> instead of the default value set by the initial horizontal motion index.</p> <p><code>-v <i>num</i></code> Set the initial vertical motion index to <i>num</i>. The default is 8.</p> <p><code>-x <i>num</i></code> Translate the origin <i>num</i> inches along the positive x axis. The default coordinate system has the origin fixed near the upper left corner of the</p> |

postdaisy(1)

page, with positive *x* to the right and positive *y* down the page. Positive *num* moves everything right. The default offset is 0.25 inches.

*-y num* Translate the origin *num* inches along the positive *y* axis. Positive *num* moves text up the page. The default offset is -0.25 inches.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

non-zero An error occurred.

| NAME        | postdmd – PostScript translator for DMD bitmap files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SYNOPSIS    | <pre>postdmd [-b num] [-c num] [-f] [-m num] [-n num] [-o list] [-p mode]         [-x num] [-y num] [file...]</pre> <p><code>/usr/lib/lp/postscript/postdmd</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DESCRIPTION | <p>postdmd translates DMD bitmap <i>files</i>, as produced by <i>dmdps</i>, or <i>files</i> written in the Ninth Edition <i>bitfile</i>(9.5) format into PostScript and writes the results on the standard output. If no <i>files</i> are specified, or if <code>-</code> is one of the input <i>files</i>, the standard input is read.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OPTIONS     | <p><code>-b num</code> Pack the bitmap in the output file using <i>num</i> byte patterns. A value of 0 turns off all packing of the output file. By default, <i>num</i> is 6.</p> <p><code>-c num</code> Print <i>num</i> copies of each page. By default only one copy is printed.</p> <p><code>-f</code> Flip the sense of the bits in <i>files</i> before printing the bitmaps.</p> <p><code>-m num</code> Magnify each logical page by the factor <i>num</i>. Pages are scaled uniformly about the origin, which by default is located at the center of each page. The default magnification is 1.0.</p> <p><code>-n num</code> Print <i>num</i> logical pages on each piece of paper, where <i>num</i> can be any positive integer. By default <i>num</i> is set to 1.</p> <p><code>-o list</code> Print pages whose numbers are given in the comma-separated <i>list</i>. The list contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest. The page range is an expression of logical pages rather than physical sheets of paper. For example, if you are printing two logical pages to a sheet, and you specified a range of 4, then two sheets of paper would print, containing four page layouts. If you specified a page range of 3-4, when requesting two logical pages to a sheet; then <i>only</i> page 3 and page 4 layouts would print, and they would appear on one physical sheet of paper.</p> <p><code>-p mode</code> Print <i>files</i> in either portrait or landscape <i>mode</i>. Only the first character of <i>mode</i> is significant. The default <i>mode</i> is portrait.</p> <p><code>-x num</code> Translate the origin <i>num</i> inches along the positive x axis. The default coordinate system has the origin fixed at the center of the page, with positive x to the right and positive y up the page. Positive <i>num</i> moves everything right. The default offset is 0 inches.</p> <p><code>-y num</code> Translate the origin <i>num</i> inches along the positive y axis. Positive <i>num</i> moves everything up the page. The default offset is 0.</p> <p>Only one bitmap is printed on each logical page, and each of the input <i>files</i> must contain complete descriptions of at least one bitmap. Decreasing the pattern size using the <code>-b</code> option may help throughput on printers with fast processors (such as PS-810s), while increasing the pattern size will often be the right move on older models (such as PS-800s).</p> |

| <b>SYNOPSIS</b>    | <pre>postio -l line [-D] [-i] [-q] [-t] [-S] [-b speed] [-B num] [-L file]         [-P string] [-R num] [file...]</pre> <p><b>/usr/lib/lp/postscript/postio</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | postio sends <i>files</i> to the PostScript printer attached to <i>line</i> . If no <i>files</i> are specified the standard input is sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>OPTIONS</b>     | <p>The first group of <i>options</i> should be sufficient for most applications:</p> <ul style="list-style-type: none"> <li>-D            Enable debug mode. Guarantees that everything read on <i>line</i> will be added to the log file (standard error by default).</li> <li>-q            Prevents status queries while <i>files</i> are being sent to the printer. When status queries are disabled a dummy message is appended to the log file before each block is transmitted.</li> <li>-b <i>speed</i>    Transmit data over <i>line</i> at baud rate <i>speed</i>. Recognized baud rates are 1200, 2400, 4800, 9600, and 19200. The default <i>speed</i> is 9600 baud.</li> <li>-B <i>num</i>       Set the internal buffer size for reading and writing <i>files</i> to <i>num</i> bytes. By default <i>num</i> is 2048 bytes.</li> <li>-l <i>line</i>       Connect to the printer attached to <i>line</i>. In most cases there is no default and postio must be able to read and write <i>line</i>. If the <i>line</i> does not begin with a / it may be treated as a Datakit destination.</li> <li>-L <i>file</i>       Data received on <i>line</i> gets put in <i>file</i>. The default log file is standard error. Printer or status messages that don't show a change in state are not normally written to <i>file</i> but can be forced out using the -D option.</li> <li>-P <i>string</i>     Send <i>string</i> to the printer before any of the input files. The default <i>string</i> is simple PostScript code that disables timeouts.</li> <li>-R <i>num</i>       Run postio as a single process if <i>num</i> is 1 or as separate read and write processes if <i>num</i> is 2. By default postio runs as a single process.</li> </ul> <p>The next two <i>options</i> are provided for users who expect to run postio on their own. Neither is suitable for use in spooler interface programs:</p> <ul style="list-style-type: none"> <li>-i            Run the program in interactive mode. Any <i>files</i> are sent first and followed by the standard input. Forces separate read and write processes and overrides many other options. To exit interactive mode use your interrupt or quit character. To get a friendly interactive connection with the printer type <code>executive</code> on a line by itself.</li> </ul> |

postio(1)

-t Data received on `line` and not recognized as printer or status information is written to the standard output. Forces separate read and write processes. Convenient if you have a PostScript program that will be returning useful data to the host.

The last option is not generally recommended and should only be used if all else fails to provide a reliable connection:

-S Slow the transmission of data to the printer. Severely limits throughput, runs as a single process, disables the `-q` option, limits the internal buffer size to 1024 bytes, can use an excessive amount of CPU time, and does nothing in interactive mode.

The best performance will usually be obtained by using a large internal buffer (the `-B` option) and by running the program as separate read and write processes (the `-R 2` option). Inability to fork the additional process causes `postio` to continue as a single read/write process. When one process is used, only data sent to the printer is flow controlled.

The *options* are not all mutually exclusive. The `-i` option always wins, selecting its own settings for whatever is needed to run interactive mode, independent of anything else found on the command line. Interactive mode runs as separate read and write processes and few of the other *options* accomplish anything in the presence of the `-i` option. The `-t` option needs a reliable two way connection to the printer and therefore tries to force separate read and write processes. The `-S` option relies on the status query mechanism, so `-q` is disabled and the program runs as a single process.

In most cases `postio` starts by making a connection to `line` and then attempts to force the printer into the IDLE state by sending an appropriate sequence of `^T` (status query), `^C` (interrupt), and `^D` (end of job) characters. When the printer goes IDLE, *files* are transmitted along with an occasional `^T` (unless the `-q` option was used). After all the *files* are sent the program waits until it's reasonably sure the job is complete. Printer generated error messages received at any time except while establishing the initial connection (or when running interactive mode) cause `postio` to exit with a non-zero status. In addition to being added to the log file, printer error messages are also echoed to standard error.

#### EXAMPLES **EXAMPLE 1** Examples of the `postio` command.

Run as a single process at 9600 baud and send *file1* and *file2* to the printer attached to `/dev/tty01`:

```
example% postio -l /dev/tty01 file1 file2
```

Same as above except two processes are used, the internal buffer is set to 4096 bytes, and data returned by the printer gets put in file *log*:

```
example% postio -R 2 -B 4096 -l/dev/tty01 -L log file1 file2
```

Establish an interactive connection with the printer at Datakit destination *my/prINTER*:

**EXAMPLE 1** Examples of the `postio` command. (Continued)

```
example% postio -i -l my/printer
```

Send file `program` to the printer connected to `/dev/tty22`, recover any data in file `results`, and put log messages in file `log`:

```
example% postio -t -l /dev/tty22 -L log program >results
```

**EXIT STATUS** The following exit values are returned:

0 Successful completion.  
non-zero An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWpsf         |

**SEE ALSO** `download(1)`, `dpost(1)`, `postdaisy(1)`, `postdmd(1)`, `postmd(1)`, `postprint(1)`, `postreverse(1)`, `posttek(1)`, `attributes(5)`

**NOTES** The input *files* are handled as a single PostScript job. Sending several different jobs, each with their own internal end of job mark (^D) is not guaranteed to work properly. `postio` may quit before all the jobs have completed and could be restarted before the last one finishes.

All the capabilities described above may not be available on every machine or even across the different versions of the UNIX system that are currently supported by the program.

There may be no default `line`, so using the `-l` option is strongly recommended. If omitted, `postio` may attempt to connect to the printer using the standard output. If Datakit is involved, the `-b` option may be ineffective and attempts by `postio` to impose flow control over data in both directions may not work. The `-q` option can help if the printer is connected to RADIANT. The `-S` option is not generally recommended and should be used only if all other attempts to establish a reliable connection fail.

| <b>DESCRIPTION</b> | <p>The <code>postmd</code> filter reads a series of floating point numbers from <i>files</i>, translates them into a PostScript gray scale image, and writes the results on the standard output. In a typical application the numbers might be the elements of a large matrix, written in row major order, while the printed image could help locate patterns in the matrix. If no <i>files</i> are specified, or if <code>-</code> is one of the input <i>files</i>, the standard input is read.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>OPTIONS</b>     | <p><code>-b <i>num</i></code>           Pack the bitmap in the output file using <i>num</i> byte patterns. A value of 0 turns off all packing of the output file. By default, <i>num</i> is 6.</p> <p><code>-c <i>num</i></code>           Print <i>num</i> copies of each page. By default, only one copy is printed.</p> <p><code>-d <i>dimen</i></code>         Sets the default matrix dimensions for all input <i>files</i> to <i>dimen</i>. The <i>dimen</i> string can be given as rows or rowsxcolumns. If <i>columns</i> is omitted it will be set to rows. By default, <code>postmd</code> assumes each matrix is square and sets the number of rows and columns to the square root of the number of elements in each input file.</p> <p><code>-g <i>list</i></code>           <i>list</i> is a comma or space separated string of integers, each lying between 0 and 255 inclusive, that assigns PostScript gray scales to the regions of the real line selected by the <code>-i</code> option. 255 corresponds to white, and 0, to black. The <code>postmd</code> filter assigns a default gray scale that omits white (that is, 255) and gets darker as the regions move from left to right along the real line.</p> <p><code>-i <i>list</i></code>           <i>list</i> is a comma, space or slash(/) separated string of <i>N</i> floating point numbers that partition the real line into <math>2N+1</math> regions. The <i>list</i> must be given in increasing numerical order. The partitions are used to map floating point numbers read from the input <i>files</i> into gray scale integers that are either assigned automatically by <code>postmd</code> or arbitrarily selected using the <code>-g</code> option. The default interval <i>list</i> is <code>-1, 0, 1</code>, which partitions the real line into seven regions.</p> <p><code>-m <i>num</i></code>           Magnify each logical page by the factor <i>num</i>. Pages are scaled uniformly about the origin which, by default, is located at the center of each page. The default magnification is <code>1.0</code>.</p> <p><code>-n <i>num</i></code>           Print <i>num</i> logical pages on each piece of paper, where <i>num</i> can be any positive integer. By default, <i>num</i> is set to 1.</p> <p><code>-o <i>list</i></code>           Print pages whose numbers are given in the comma separated <i>list</i>. The list contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest. The page range is an expression of logical pages rather</p> |

than physical sheets of paper. For example, if you are printing two logical pages to a sheet, and you specified a range of 4, then two sheets of paper would print, containing four page layouts. If you specified a page range of 3-4, when requesting two logical pages to a sheet; then *only* page 3 and page 4 layouts would print, and they would appear on one physical sheet of paper.

- p *mode*      Print *files* in either portrait or landscape *mode*. Only the first character of *mode* is significant. The default *mode* is portrait.
- w *window*      *Window* is a comma or space separated list of four positive integers that select the upper left and lower right corners of a submatrix from each of the input *files*. Row and column indices start at 1 in the upper left corner and the numbers in the input *files* are assumed to be written in row major order. By default, the entire matrix is displayed.
- x *num*      Translate the origin *num* inches along the positive x axis. The default coordinate system has the origin fixed at the center of the page, with positive x to the right and positive y up the page. Positive *num* moves everything right. The default offset is 0 inches.
- y *num*      Translate the origin *num* inches along the positive y axis. Positive *num* moves everything up the page. The default offset is 0.

Only one matrix is displayed on each logical page, and each of the input *files* must contain complete descriptions of exactly one matrix. Matrix elements are floating point numbers arranged in row major order in each input file. White space, including newlines, is not used to determine matrix dimensions. By default, `postmd` assumes each matrix is square and sets the number of rows and columns to the square root of the number of elements in the input file. Supplying default dimensions on the command line with the `-d` option overrides this default behavior, and in that case the dimensions apply to all input *files*.

An optional header can be supplied with each input file and is used to set the matrix dimensions, the partition of the real line, the gray scale map, and a window into the matrix. The header consists of keyword/value pairs, each on a separate line. It begins on the first line of each input file and ends with the first unrecognized string, which should be the first matrix element. Values set in the header take precedence, but apply only to the current input file. Recognized header keywords are `dimension`, `interval`, `grayscale`, and `window`. The syntax of the value string that follows each keyword parallels what is accepted by the `-d`, `-i`, `-g`, and `-w` options.

## EXAMPLES

**EXAMPLE 1** For example, suppose file initially contains the 1000 numbers in a 20x50 matrix. Then you can produce exactly the same output by completing three steps. First, issue the following command line:

```
example% postmd -d20x50 -i"-100 100" -g0,128,254,128,0 file
```

## postmd(1)

**EXAMPLE 2** Second, prepend the following header to file:

```
example% postmd -d20x50 -i"-100 100" -g0,128,254,128,0 file
```

**EXAMPLE 3** Third, issue the following command line:

```
example% postmd file
```

**EXAMPLE 4** The interval list partitions the real line into five regions and the gray scale list maps numbers less than -100 or greater than 100 into 0 (that is, black), numbers equal to -100 or 100 into 128 (that is, 50 percent black), and numbers between -100 and 100 into 254 (that is, almost white).

**FILES** /usr/lib/lp/postscript/forms.ps  
/usr/lib/lp/postscript/ps.requests

**EXIT STATUS** The following exit values are returned:

0 Successful completion.  
non-zero An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWpsf         |

**SEE ALSO** `dpost(1)`, `postdaisy(1)`, `postdmd(1)`, `postio(1)`, `postprint(1)`, `postreverse(1)`, `posttek(1)`, `attributes(5)`

**NOTES** The largest matrix that can be adequately displayed is a function of the interval and gray scale lists, the printer resolution, and the paper size. A 600 by 600 matrix is an optimistic upper bound for a two element interval list (that is, five regions) using 8.5 by 11 inch paper on a 300 dpi printer.

Using white (that is, 255) in a gray scale list is not recommended and won't show up in the legend and bar graph that `postmd` displays below each image.

| <b>DESCRIPTION</b> | The <code>postplot</code> filter translates <code>plot(1B)</code> graphics <i>filenames</i> into PostScript and writes the results on the standard output. If no <i>filenames</i> are specified, or if <code>-</code> is one of the input <i>filenames</i> , the standard input is read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>OPTIONS</b>     | The following options are supported: <ul style="list-style-type: none"> <li>-c <i>num</i>    Print <i>num</i> copies of each page. By default, only one copy is printed.</li> <li>-f <i>name</i>    Print text using font <i>name</i>. Any PostScript font can be used, although the best results will be obtained only with constant width fonts. The default font is Courier.</li> <li>-m <i>num</i>    Magnify each logical page by the factor <i>num</i>. Pages are scaled uniformly about the origin which, by default, is located at the center of each page. The default magnification is 1.0.</li> <li>-n <i>num</i>    Print <i>num</i> logical pages on each piece of paper, where <i>num</i> can be any positive integer. By default, <i>num</i> is set to 1.</li> <li>-o <i>list</i>    Print pages whose numbers are given in the comma-separated <i>list</i>. The list contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest.</li> <li>-p <i>mode</i>    Print <i>filenames</i> in either portrait or landscape <i>mode</i>. Only the first character of <i>mode</i> is significant. The default <i>mode</i> is landscape.</li> <li>-w <i>num</i>    Set the line width used for graphics to <i>num</i> points, where a point is approximately 1/72 of an inch. By default, <i>num</i> is set to 0 points, which forces lines to be one pixel wide.</li> <li>-x <i>num</i>    Translate the origin <i>num</i> inches along the positive x axis. The default coordinate system has the origin fixed at the center of the page, with positive x to the right and positive y up the page. Positive <i>num</i> moves everything right. The default offset is 0.0 inches.</li> <li>-y <i>num</i>    Translate the origin <i>num</i> inches along the positive y axis. Positive <i>num</i> moves everything up the page. The default offset is 0.0.</li> </ul> |
| <b>OPERANDS</b>    | The following operand is supported: <ul style="list-style-type: none"> <li><i>filename</i>            The graphics filename to be translated</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| DESCRIPTION | The <code>postprint</code> filter translates text <i>files</i> into PostScript and writes the results on the standard output. If no <i>files</i> are specified, or if <code>-</code> is one of the input <i>files</i> , the standard input is read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OPTIONS     | <p><code>-c <i>num</i></code> Print <i>num</i> copies of each page. By default, only one copy is printed.</p> <p><code>-f <i>name</i></code> Print <i>files</i> using font <i>name</i>. Any PostScript font can be used, although the best results will be obtained only with constant width fonts. The default font is Courier.</p> <p><code>-l <i>num</i></code> Set the length of a page to <i>num</i> lines. By default, <i>num</i> is 66. Setting <i>num</i> to 0 is allowed, and will cause <code>postprint</code> to guess a value, based on the point size that's being used.</p> <p><code>-m <i>num</i></code> Magnify each logical page by the factor <i>num</i>. Pages are scaled uniformly about the origin, which is located near the upper left corner of each page. The default magnification is 1.0.</p> <p><code>-n <i>num</i></code> Print <i>num</i> logical pages on each piece of paper, where <i>num</i> can be any positive integer. By default, <i>num</i> is set to 1.</p> <p><code>-o <i>list</i></code> Print pages whose numbers are given in the comma-separated <i>list</i>. The <i>list</i> contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest. The page range is an expression of logical pages rather than physical sheets of paper. For example, if you are printing two logical pages to a sheet, and you specified a range of 4, then two sheets of paper would print, containing four page layouts. If you specified a page range of 3-4, when requesting two logical pages to a sheet; then <i>only</i> page 3 and page 4 layouts would print, and they would appear on one physical sheet of paper.</p> <p><code>-p <i>mode</i></code> Print <i>files</i> in either portrait or landscape <i>mode</i>. Only the first character of <i>mode</i> is significant. The default <i>mode</i> is portrait.</p> <p><code>-r <i>num</i></code> Selects carriage return behavior. Carriage returns are ignored if <i>num</i> is 0, cause a return to column 1 if <i>num</i> is 1, and generate a newline if <i>num</i> is 2. The default <i>num</i> is 0.</p> <p><code>-s <i>num</i></code> Print <i>files</i> using point size <i>num</i>. When printing in landscape mode <i>num</i> is scaled by a factor that depends on the imaging area of the device. The default size for portrait mode is 10. Note that increasing point size increases virtual image size, so you either need to load larger paper, or use the <code>-l0</code> option to scale the number of lines per page.</p> <p><code>-t <i>num</i></code> Assume tabs are set every <i>num</i> columns, starting with the first column. By default, tabs are set every 8 columns.</p> |

## postprint(1)

- `-x num` Translate the origin *num* inches along the positive x axis. The default coordinate system has the origin fixed near the upper left corner of the page, with positive x to the right and positive y down the page. Positive *num* moves everything to the right. The default offset is 0.25 inches.
- `-y num` Translate the origin *num* inches along the positive y axis. Positive *num* moves text up the page. The default offset is -0.25 inches.

A new logical page is started after 66 lines have been printed on the current page, or whenever an ASCII form feed character is read. The number of lines per page can be changed using the `-l` option. Unprintable ASCII characters are ignored, and lines that are too long are silently truncated by the printer.

**EXAMPLES** **EXAMPLE 1** Examples of `postprint`.

To print *file1* and *file2* in landscape mode, issue the following command:

```
example% postprint -pland file1 file2
```

To print three logical pages on each physical page in portrait mode:

```
example% postprint -n3 file
```

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

non-zero An error occurred.

**FILES** /usr/lib/lp/postscript/forms.ps

/usr/lib/lp/postscript/ps.requests

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| <b>NAME</b>        | postreverse – reverse the page order in a PostScript file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | <b>postreverse</b> [-o <i>list</i> ] [-r] [ <i>file</i> ]<br><br><b>/usr/lib/lp/postscript/postreverse</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>The <code>postreverse</code> filter reverses the page order in files that conform to Adobe’s Version 1.0 or Version 2.0 file structuring conventions, and writes the results on the standard output. Only one input <code>file</code> is allowed and if no <code>file</code> is specified, the standard input is read.</p> <p>The <code>postreverse</code> filter can handle a limited class of files that violate page independence, provided all global definitions are bracketed by <code>%%BeginGlobal</code> and <code>%%EndGlobal</code> comments. In addition, files that mark the end of each page with <code>%%EndPage: label ordinal</code> comments will also reverse properly, provided the prologue and trailer sections can be located. If <code>postreverse</code> fails to find an <code>%%EndProlog</code> or <code>%%EndSetup</code> comment, the entire <code>file</code> is copied, unmodified, to the standard output.</p> <p>Because global definitions are extracted from individual pages and put in the prologue, the output file can be minimally conforming, even if the input <code>file</code> was not.</p> |
| <b>OPTIONS</b>     | <p><code>-o list</code>     Select pages whose numbers are given in the comma-separated <i>list</i>. The <i>list</i> contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest. The page range is an expression of logical pages rather than physical sheets of paper. For example, if you are printing two logical pages to a sheet, and you specified a range of 4, then two sheets of paper would print, containing four page layouts. If you specified a page range of 3-4, when requesting two logical pages to a sheet; then <i>only</i> page 3 and page 4 layouts would print, and they would appear on one physical sheet of paper.</p> <p><code>-r</code>            Do not reverse the pages in <i>file</i>.</p>                                                                                                                                                                                                                                                                                                               |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Examples of <code>postreverse</code>.</p> <p>o select pages 1 to 100 from <i>file</i> and reverse the pages:</p> <pre>example% postreverse -o1-100 file</pre> <p>To print four logical pages on each physical page and reverse all the pages:</p> <pre>example% postprint -n4 file   postreverse</pre> <p>To produce a minimally conforming file from output generated by <code>dpost</code> without reversing the pages:</p> <pre>example% dpost file   postreverse -r</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>EXIT STATUS</b> | The following exit values are returned:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

postreverse(1)

0 Successful completion.  
non-zero An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWpsf         |

| <b>DESCRIPTION</b> | The <code>posttek</code> filter translates Tektronix 4014 graphics <i>files</i> into PostScript and writes the results on the standard output. If no <i>files</i> are specified, or if <code>-</code> is one of the input <i>files</i> , the standard input is read.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>OPTIONS</b>     | <p><code>-c <i>num</i></code> Print <i>num</i> copies of each page. By default, only one copy is printed.</p> <p><code>-f <i>name</i></code> Print text using font <i>name</i>. Any PostScript font can be used, although the best results will be obtained only with constant width fonts. The default font is Courier.</p> <p><code>-m <i>num</i></code> Magnify each logical page by the factor <i>num</i>. Pages are scaled uniformly about the origin which, by default, is located at the center of each page. The default magnification is 1.0.</p> <p><code>-n <i>num</i></code> Print <i>num</i> logical pages on each piece of paper, where <i>num</i> can be any positive integer. By default, <i>num</i> is set to 1.</p> <p><code>-o <i>list</i></code> Print pages whose numbers are given in the comma-separated <i>list</i>. The <i>list</i> contains single numbers <i>N</i> and ranges <i>N1</i> – <i>N2</i>. A missing <i>N1</i> means the lowest numbered page, a missing <i>N2</i> means the highest. The page range is an expression of logical pages rather than physical sheets of paper. For example, if you are printing two logical pages to a sheet, and you specified a range of 4, then two sheets of paper would print, containing four page layouts. If you specified a page range of 3-4, when requesting two logical pages to a sheet; then <i>only</i> page 3 and page 4 layouts would print, and they would appear on one physical sheet of paper.</p> <p><code>-p <i>mode</i></code> Print <i>files</i> in either portrait or landscape <i>mode</i>. Only the first character of <i>mode</i> is significant. The default <i>mode</i> is landscape.</p> <p><code>-w <i>num</i></code> Set the line width used for graphics to <i>num</i> points, where a point is approximately 1/72 of an inch. By default, <i>num</i> is set to 0 points, which forces lines to be one pixel wide.</p> <p><code>-x <i>num</i></code> Translate the origin <i>num</i> inches along the positive x axis. The default coordinate system has the origin fixed at the center of the page, with positive x to the right and positive y up the page. Positive <i>num</i> moves everything right. The default offset is 0.0 inches.</p> <p><code>-y <i>num</i></code> Translate the origin <i>num</i> inches along the positive y axis. Positive <i>num</i> moves everything up the page. The default offset is 0.0.</p> |
| <b>EXIT STATUS</b> | The following exit values are returned:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>DESCRIPTION</b>   | <p>The <code>pr</code> utility is a printing and pagination filter. If multiple input files are specified, each is read, formatted, and written to standard output. By default, the input is separated into 66-line pages, each with:</p> <ul style="list-style-type: none"> <li>■ a 5-line header that includes the page number, date, time and the path name of the file</li> <li>■ a 5-line trailer consisting of blank lines</li> </ul> <p>If standard output is associated with a terminal, diagnostic messages will be deferred until the <code>pr</code> utility has completed processing.</p> <p>When options specifying multi-column output are specified, output text columns will be of equal width; input lines that do not fit into a text column will be truncated. By default, text columns are separated with at least one blank character.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                    |                                                                 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>OPTIONS</b>       | <p>The following options are supported. In the following option descriptions, <i>column</i>, <i>lines</i>, <i>offset</i>, <i>page</i>, and <i>width</i> are positive decimal integers; <i>gap</i> is a non-negative decimal integer. Some of the option-arguments are optional, and some of the option-arguments cannot be specified as separate arguments from the preceding option letter. In particular, the <code>-s</code> option does not allow the option letter to be separated from its argument, and the options <code>-e</code>, <code>-i</code>, and <code>-n</code> require that both arguments, if present, not be separated from the option letter.</p> <p>The following options are supported for both <code>/usr/bin/pr</code> and <code>/usr/xpg4/bin/pr</code>:</p> <table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 20px;"><code>+page</code></td> <td>Begin output at page number <i>page</i> of the formatted input.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;"><code>-column</code></td> <td>Produce multi-column output that is arranged in <i>column</i> columns (default is 1) and is written down each column in the order in which the text is received from the input file. This option should not be used with <code>-m</code>. The <code>-e</code> and <code>-i</code> options will be assumed for multiple text-column output. Whether or not text columns are produced with identical vertical lengths is unspecified, but a text column will never exceed the length of the page (see the <code>-l</code> option). When used with <code>-t</code>, use the minimum number of lines to write the output.</td> </tr> </table> | <code>+page</code> | Begin output at page number <i>page</i> of the formatted input. | <code>-column</code> | Produce multi-column output that is arranged in <i>column</i> columns (default is 1) and is written down each column in the order in which the text is received from the input file. This option should not be used with <code>-m</code> . The <code>-e</code> and <code>-i</code> options will be assumed for multiple text-column output. Whether or not text columns are produced with identical vertical lengths is unspecified, but a text column will never exceed the length of the page (see the <code>-l</code> option). When used with <code>-t</code> , use the minimum number of lines to write the output. |
| <code>+page</code>   | Begin output at page number <i>page</i> of the formatted input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                    |                                                                 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>-column</code> | Produce multi-column output that is arranged in <i>column</i> columns (default is 1) and is written down each column in the order in which the text is received from the input file. This option should not be used with <code>-m</code> . The <code>-e</code> and <code>-i</code> options will be assumed for multiple text-column output. Whether or not text columns are produced with identical vertical lengths is unspecified, but a text column will never exceed the length of the page (see the <code>-l</code> option). When used with <code>-t</code> , use the minimum number of lines to write the output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                    |                                                                 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

pr(1)

|                                     |                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -a                                  | Modify the effect of the <i>-column</i> option so that the columns are filled across the page in a round-robin order (for example, when <i>column</i> is 2, the first input line heads column 1, the second heads column 2, the third is the second line in column 1, and so forth).                                                                                                                   |
| -d                                  | Produce output that is double-spaced; append an extra NEWLINE character following every NEWLINE character found in the input.                                                                                                                                                                                                                                                                          |
| -e [ <i>char</i> ] [ <i>gap</i> ]   | Expand each input TAB character to the next greater column position specified by the formula $n * gap + 1$ , where $n$ is an integer $> 0$ . If <i>gap</i> is 0 or is omitted, it defaults to 8. All TAB characters in the input will be expanded into the appropriate number of SPACE characters. If any non-digit character, <i>char</i> , is specified, it will be used as the input tab character. |
| -f                                  | Use a FORMFEED character for new pages, instead of the default behavior that uses a sequence of NEWLINE characters. Pause before beginning the first page if the standard output is associated with a terminal.                                                                                                                                                                                        |
| -h <i>header</i>                    | Use the string <i>header</i> to replace the contents of the <i>file</i> operand in the page header.                                                                                                                                                                                                                                                                                                    |
| -l <i>lines</i>                     | Override the 66-line default and reset the page length to <i>lines</i> . If <i>lines</i> is not greater than the sum of both the header and trailer depths (in lines), <i>pr</i> will suppress both the header and trailer, as if the <i>-t</i> option were in effect.                                                                                                                                 |
| -m                                  | Merge files. Standard output will be formatted so <i>pr</i> writes one line from each file specified by <i>file</i> , side by side into text columns of equal fixed widths, in terms of the number of column positions. Implementations support merging of at least nine files.                                                                                                                        |
| -n [ <i>char</i> ] [ <i>width</i> ] | Provide <i>width</i> -digit line numbering (default for <i>width</i> is 5). The number will occupy the first <i>width</i> column positions of each text column of default output or each line of <i>-m</i> output. If <i>char</i> (any non-digit character) is given, it will be appended to the line number to separate it from whatever follows (default for <i>char</i> is a TAB character).        |
| -o <i>offset</i>                    | Each line of output will be preceded by <i>offset</i> <code>&lt;space&gt;s</code> . If the <i>-o</i> option is not specified, the default offset is 0. The space taken will be in addition to the output line width (see <i>-w</i> option below).                                                                                                                                                      |

|                    |                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -p                 | Pause before beginning each page if the standard output is directed to a terminal (pr will write an ALERT character to standard error and wait for a carriage-return character to be read on /dev/tty).                                                                                                                                                         |
| -r                 | Write no diagnostic reports on failure to open files.                                                                                                                                                                                                                                                                                                           |
| -s [ <i>char</i> ] | Separate text columns by the single character <i>char</i> instead of by the appropriate number of SPACE characters (default for <i>char</i> is the TAB character).                                                                                                                                                                                              |
| -t                 | Write neither the five-line identifying header nor the five-line trailer usually supplied for each page. Quit writing after the last line of each file without spacing to the end of the page.                                                                                                                                                                  |
| -w <i>width</i>    | Set the width of the line to <i>width</i> column positions for multiple text-column output only. If the -w option is not specified and the -s option is not specified, the default width is 72. If the -w option is not specified and the -s option is specified, the default width is 512.<br><br>For single column output, input lines will not be truncated. |

**/usr/bin/pr** The following options are supported for /usr/bin/pr only:

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -F                                | Fold the lines of the input file. When used in multi-column mode (with the -a or -m options), lines will be folded to fit the current column's width; otherwise, they will be folded to fit the current line width (80 columns).                                                                                                                                                                                |
| -i [ <i>char</i> ] [ <i>gap</i> ] | <b>I</b> n output, replace SPACE characters with TAB characters wherever one or more adjacent SPACE characters reach column positions <i>gap</i> +1, 2* <i>gap</i> +1, 3* <i>gap</i> +1, and so forth. If <i>gap</i> is 0 or is omitted, default TAB settings at every eighth column position are assumed. If any non-digit character, <i>char</i> , is specified, it will be used as the output TAB character. |

**/usr/xpg4/bin/pr** The following options are supported for /usr/xpg4/bin/pr only:

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -F                                | Use a FORMFEED character for new pages, instead of the default behavior that uses a sequence of NEWLINE characters.                                                                                                                                                                                                                                                                                                      |
| -i [ <i>char</i> ] [ <i>gap</i> ] | <b>I</b> n output, replace multiple SPACE characters with TAB characters wherever two or more adjacent SPACE characters reach column positions <i>gap</i> +1, 2* <i>gap</i> +1, 3* <i>gap</i> +1, and so forth. If <i>gap</i> is 0 or is omitted, default TAB settings at every eighth column position are assumed. If any non-digit character, <i>char</i> , is specified, it will be used as the output TAB character. |

**OPERANDS** The following operand is supported:

pr(1)

**file** A path name of a file to be written. If no **file** operands are specified, or if a **file** operand is **-**, the standard input will be used.

**EXAMPLES** **EXAMPLE 1** Print a numbered list of all files in the current directory:

```
ls -a | pr -n -h "Files in $(pwd) ."
```

**EXAMPLE 2** Print **file1** and **file2** as a double-spaced, three-column listing headed by "file list":

```
pr -3d -h "file list" file1 file2
```

**EXAMPLE 3** Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:

```
pr -e9 -t <file1 >file2
```

**ENVIRONMENT VARIABLES** See **environ(5)** for descriptions of the following environment variables that affect the execution of **pr**: **LC\_CTYPE**, **LC\_MESSAGES**, **LC\_TIME**, **TZ**, and **NLSPATH**.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES** See **attributes(5)** for descriptions of the following attributes:

**/usr/bin/pr**

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | enabled         |

**/usr/xpg4/bin/pr**

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4        |
| CSI            | enabled         |

**SEE ALSO** **expand(1)**, **lp(1)**, **attributes(5)**, **environ(5)**, **XPG4(5)**

**NAME** praliases – display system mail aliases

**SYNOPSIS** **praliases** [-c *configfile*] [-f *aliasfile*] [*key*]

**DESCRIPTION** The `praliases` utility displays system mail aliases. When no key is given, `praliases` displays the current system aliases, one per line, in no particular order. The form is `key:value`. If a key is given, only that key is looked up and the appropriate `key:value` is displayed if found.

**OPTIONS** The following options are supported:

- c *configfile* Specifies a `sendmail` configuration file.
- f *aliasfile* Reads the specified file *aliasfile* instead of the default `sendmail` system aliases file.

**OPERANDS** *key* A specific alias key to look up.

**EXIT STATUS** The following exit values are returned:

- 0 Successful operation.
- >0 An error occurred.

**FILES**

- `/etc/mail/sendmail.cf` The default `sendmail` configuration file.
- `/etc/mail/aliases` The default `sendmail` system aliases file.
- `/etc/mail/aliases.dir`
- `/etc/mail/aliases.pag` The database versions of the `/etc/mail/aliases` file.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWsndmu       |

**SEE ALSO** `mailq(1)`, `newaliases(1)`, `sendmail(1M)`, `attributes(5)`

## prex(1)

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>NAME</b>                                     | <code>prex</code> – control tracing and manipulate probe points in a process or the kernel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SYNOPSIS</b>                                 | <pre><b>prex</b> [-o <i>trace_file_name</i>] [-l <i>libraries</i>] [-s <i>kbytes_size</i>] <i>cmd</i> [<i>cmd-args...</i>]<br/><b>prex</b> [-o <i>trace_file_name</i>] [-l <i>libraries</i>] [-s <i>kbytes_size</i>] -p <i>pid</i><br/><b>prex</b> -k [-s <i>kbytes_size</i>]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b>                              | <p>The <code>prex</code> command is the part of the Solaris tracing architecture that controls probes in a process or the kernel. See <code>tracing(3TNF)</code> for an overview of this tracing architecture, including example source code using it.</p> <p><code>prex</code> is the application used for external control of probes. It automatically preloads the <code>libtnfprobe</code> library. <code>prex</code> locates all the probes in a target executable or the kernel and provides an interface for the user to manipulate them. It allows a probe to be turned on for tracing, debugging, or both. Tracing generates a TNF (Trace Normal Form) trace file that can be converted to ASCII by <code>tnfdump(1)</code> and used for performance analysis. Debugging generates a line to standard error whenever the probe is hit at run time.</p> <p><code>prex</code> does not work on static executables. It only works on dynamic executables.</p>                                                                                                                                                                                                                                                                       |
| <b>Invoking prex</b>                            | <p>There are three ways to invoke <code>prex</code>:</p> <ol style="list-style-type: none"><li>1. Use <code>prex</code> to start the target application <i>cmd</i>. In this case, the target application need not be built with a dependency on <code>libtnfprobe</code>. See <code>TNF_PROBE(3TNF)</code>. <code>prex</code> sets the environment variable <code>LD_PRELOAD</code> to load <code>libtnfprobe</code> into the target process. See <code>ld(1)</code>. <code>prex</code> then uses the environment variable <code>PATH</code> to find the target application.</li><li>2. Attach <code>prex</code> to a running application. In this case, the running target application should have <code>libtnfprobe</code> already linked in. Alternatively, the user may manually set <code>LD_PRELOAD</code> to include <code>libtnfprobe.so.1</code> prior to invoking the target.</li><li>3. Use <code>prex</code> with the <code>-k</code> option to set <code>prex</code> to kernel mode. <code>prex</code> can then be used to control probes in the Solaris kernel. In kernel mode, additional commands are defined, and some commands that are valid in other modes are invalid. See <code>Kernel Mode</code> below.</li></ol> |
| <b>Control File Format and Command Language</b> | <p>In a future release of <code>prex</code>, the command language may be moved to a syntax that is supported by an existing scripting language like <code>ksh(1)</code>. In the mean time, the interface to <code>prex</code> is uncommitted.</p> <ul style="list-style-type: none"><li>■ Commands should be in ASCII.</li><li>■ Each command is terminated with the NEWLINE character.</li><li>■ A command can be continued onto the next line by ending the previous line with the backslash (<code>\</code>) character.</li><li>■ Tokens in a command must be separated by whitespace (one or more spaces or tabs).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Basic prex  
Commands**

- The "#" character implies that the rest of the line is a comment.

| Command                   | Result                                                                    |
|---------------------------|---------------------------------------------------------------------------|
| % <b>prex a.out</b>       | Attaches <code>prex</code> to your program and starts <code>prex</code> . |
| prex> <b>enable \$all</b> | Enables all the probes.                                                   |
| prex> <b>quit resume</b>  | Quits <code>prex</code> and resumes execution of program.                 |

**Control File Search  
Path**

There are two different methods of communicating with `prex`:

- By specifications in a control file. During start-up, `prex` searches for a file named `.prexrc` in the directories specified below. `prex` does not stop at the first one it finds. This way a user can override any defaults that are set up. The search order is:

```
$HOME/
./
```

- By typing commands at the `prex` prompt.

The command language for both methods is the same and is specified in `USAGE`. The commands that return output will not make sense in a control file. The output will go to standard output.

When using `prex` on a target process, the target will be in one of two states, running or stopped. This can be detected by the presence or absence of the `prex>` prompt. If the prompt is absent, it means that the target process is running. Typing CTRL-C will stop the target process and return the user to the prompt. There is no guarantee that CTRL-C will return to a `prex` prompt immediately. For example, if the target process is stopped on a job control stop (`SIGSTOP`), then CTRL-C in `prex` will wait until the target has been continued (`SIGCONT`). See `Signals to Target Program` below for more information on signals and the target process.

**OPTIONS**

The following options are supported:

- k                   kernel mode: `prex` is used to control probes in the Solaris kernel. In kernel mode, additional commands are defined, and some commands valid in other modes are invalid. See `Kernel Mode` below.
- l *libraries*       The *libraries* mentioned are linked in to the target application using `LD_PRELOAD` (see `ld(1)`). This option cannot be used when attaching to a running process. The argument to the `-l` option should be a space-separated string enclosed in double quotes. Each token in the string is a library name. It follows the

## prex(1)

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                           | LD_PRELOAD rules on how libraries should be specified and where they will be found.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| -o <i>trace_file_name</i> | File to be used for the trace output. <i>trace_file_name</i> is assumed to be relative to the current working directory of <i>prex</i> (that is, the directory that the user was in when <i>prex</i> was started).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                           | If <i>prex</i> attaches to a process that is already tracing, the new <i>trace_file_name</i> (if provided) will not be used. If no <i>trace_file_name</i> is specified, the default is <code>/\${TMPDIR}/trace-pid</code> where <i>pid</i> is the process id of the target program. If <code>TMPDIR</code> is not set, <code>/tmp</code> is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| -s <i>kbytes_size</i>     | Maximum size of the output trace file in Kbytes. The default size of the trace <i>kbytes_size</i> is 4096 (2 <sup>10</sup> ) bytes or 4 Mbytes for normal usage, and 384 or 384 kbytes in kernel mode. The minimum size that can be specified is 128 Kbytes. The trace file can be thought of as a least recently used circular buffer. Once the file has been filled, newer events will overwrite the older ones.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Grammar</b>            | Probes are specified by a list of space-separated selectors. Selectors are of the form:<br><i>attribute=value</i><br><br>(see <code>TNF_PROBE(3TNF)</code> ). The " <i>attribute=</i> " is optional. If it is not specified, it defaults to " <i>keys=</i> ".<br><br>The <i>attribute</i> or <i>value</i> (generically called " <i>spec</i> ") can be any of the following:<br><br>IDENT            Any sequence of letters, digits, <code>_</code> , <code>\</code> , <code>.</code> , <code>%</code> not beginning with a digit. IDENT implies an exact match.<br><br>QUOTED_STR      Usually used to escape reserved words (any commands in the command language). QUOTED_STR implies an exact match and has to be enclosed in single quotes ( <code>' '</code> ).<br><br>REGEXP          An <code>ed(1)</code> regular expression pattern match. REGEXP has to be enclosed in slashes ( <code>/ /</code> ), A <code>/</code> can be included in a REGEXP by escaping it with a backslash <code>\</code> .<br><br>The following grammar explains the syntax.<br><br>selector_list ::=   /* empty */<br>selector_list selector<br>selector ::= spec=spec   /* whitespace around '=' opt */<br>spec<br>spec ::= IDENT  <br>QUOTED_STR  <br>REGEXP |

The terminals in the above grammar are:

```
IDENT = [a-zA-Z_\.\%]{[a-zA-Z0-9_\.\%]}+
QUOTED_STR = '[^\n']*' /* any string in single quotes */
REGEXP = /[^\n]*/ /* regexp's have to be in / / */
```

This is a list of the remaining grammar that is needed to understand the syntax of the command language (defined in next subsection):

```
filename ::= QUOTED_STR /* QUOTED_STR defined above */
spec_list ::= /* empty */ |
 spec_list spec /* spec defined above */
fcn_handle ::= &IDENT /* IDENT defined above */
set_name ::= $IDENT /* IDENT defined above */
```

## Command Language

### 1. Set Creation and Set Listing

```
create $set_name selector_list
list sets # list the defined sets
```

`create` can be used to define a set which contains probes that match the `selector_list`. The set `$all` is pre-defined as `/*` and it matches all the probes.

### 2. Function Listing

```
list fcns # list the available fcn_handle
```

The user can list the different functions that can be connected to probe points. Currently, only the debug function called `&debug` is available.

### 3. Commands to Connect and Disconnect Probe Functions

```
connect &fcn_handle $set_name
connect &fcn_handle selector_list
clear $set_name
clear selector_list
```

The `connect` command is used to connect probe functions (which must be prefixed by `&`) to probes. The probes are specified either as a single set (with a `$`), or by explicitly listing the probe selectors in the command. The probe function has to be one that is listed by the `list fcns` command. This command does not enable the probes.

The `clear` command is used to disconnect all connected probe functions from the specified probes.

### 4. Commands to Toggle the Tracing Mode

```
trace $set_name
trace selector_list
untrace $set_name
untrace selector_list
```

The `trace` and `untrace` commands are used to toggle the tracing action of a probe point (that is, whether a probe will emit a trace record or not if it is hit). This

prex(1)

command does not enable the probes specified. Probes have tracing on by default. The most efficient way to turn off tracing is by using the `disable` command. `untrace` is useful if you want debug output but no tracing. If so, set the state of the probe to enabled, untraced, and the debug function connected.

#### 5. Commands to Enable and Disable Probes

```
enable $set_name
enable selector_list
disable $set_name
disable selector_list
```

The `enable` and `disable` commands are used to control whether the probes perform the action that they have been set up for. To trace a probe, it has to be both enabled and traced (using the `trace` command). Probes are disabled by default. The `list history` command is used to list the probe control commands issued: `connect`, `clear`, `trace`, `untrace`, `enable`, and `disable`. These are the commands that are executed whenever a new shared object is brought in to the target program by `dlopen(3DL)`. See the subsection, `dlopen'ed Libraries`, below for more information.

The following table shows the actions that result from specific combinations of tracing, enabling, and connecting:

| Enabled or Disabled | Tracing State (On/Off) | Debug State (Connected/Cleared) | Results In            |
|---------------------|------------------------|---------------------------------|-----------------------|
| Enabled             | On                     | Connected                       | Tracing and Debugging |
| Enabled             | On                     | Cleared                         | Tracing only          |
| Enabled             | Off                    | Connected                       | Debugging only        |
| Enabled             | Off                    | Cleared                         | Nothing               |
| Disabled            | On                     | Connected                       | Nothing               |
| Disabled            | On                     | Cleared                         | Nothing               |
| Disabled            | Off                    | Connected                       | Nothing               |
| Disabled            | Off                    | Cleared                         | Nothing               |

#### 6. List History

```
list history # lists probe control command history
```

The `list history` command displays a list of the probe control commands previously issued in the tracing session, for example, `connect`, `clear`, `trace`,

disable. Commands in the history list are executed wherever a new shared object is brought into the target program by `dlopen(3DL)`.

#### 7. Commands to List Probes or List Values

```
list spec_list probes $set_name # that is, list probes $all
list spec_list probes selector_list # that is, list name probes\
 # file=test.c
list values spec_list # that is, list values keys
```

The first two commands list the selected attributes and values of the specified probes. They can be used to check the state of a probe. The third command lists the various values associated with the selected attributes.

#### 8. Help Command

```
help topic
```

To get a list of the help topics that are available, invoke the `help` command with no arguments. If a *topic* argument is specified, help is printed for that topic.

#### 9. Source a File

```
source filename
```

The `source` command can be used to source a file of `prex` commands. `source` can be nested (that is, a file can source another file). *filename* is a quoted string.

#### 10. Process Control

```
continue # resumes the target process
quit kill # quit prex, kill target
quit resume # quit prex, continue target
quit suspend # quit prex, leave target suspended
quit # quit prex (continue or kill target)
```

The default `quit` will continue the target process if `prex` attached to it. Instead, if `prex` had started the target program, `quit` will kill the target process.

### **dlopen'ed Libraries**

Probes in shared objects that are brought in by `dlopen(3DL)` are automatically set up according to the command history of `prex`. When a shared object is removed by a `dlclose(3DL)`, `prex` again needs to refresh its understanding of the probes in the target program. This implies that there is more work to do for `dlopen(3DL)` and `dlclose(3DL)`—so they will take slightly longer. If a user is not interested in this feature and doesn't want to interfere with `dlopen(3DL)` and `dlclose(3DL)`, detach `prex` from the target to inhibit this feature.

### **Signals to Target Program**

`prex` does not interfere with signals that are delivered directly to the target program. However, `prex` receives all signals normally generated from the terminal, for example, CTRL-C (`SIGINT`), and CTRL-Z (`SIGSTOP`), and does not forward them to the target program. To signal the target program, use the `kill(1)` command from a shell.

prex(1)

**Interactions with Other Applications**

Process managing applications like `dbx`, `truss(1)`, and `prex` cannot operate on the same target program simultaneously. `prex` will not be able to attach to a target which is being controlled by another application. A user can trace and debug a program serially by the following method: first attach `prex` to target (or start target through `prex`), set up the probes using the command language, and then type `quit` suspend. The user can then attach `dbx` to the suspended process and debug it. A user can also suspend the target by sending it a `SIGSTOP` signal, and then by typing `quit` resume to `prex`. In this case, the user should also send a `SIGCONT` signal after invoking `dbx` on the stopped process (else `dbx` will be hung).

**Failure of Event Writing Operations**

There are a few failure points that are possible when writing out events to a trace file, for example, system call failures. These failures result in a failure code being set in the target process. The target process continues normally, but no trace records are written. Whenever a user types `CTRL-C` to `prex` to get to a `prex` prompt, `prex` will check the failure code in the target and inform the user if there was a tracing failure.

**Target Executing a Fork or exec**

If the target program does a `fork(2)`, any probes that the child encounters will cause events to be logged to the same trace file. Events are annotated with a process id, so it will be possible to determine which process a particular event came from. In multi-threaded programs, there is a race condition with a thread doing a `fork` while the other threads are still running. For the trace file not to get corrupted, the user should either use `fork1(2)`, or make sure that all other threads are quiescent when doing a `fork(2)`,

If the target program itself (not any children it may `fork(2)`) does an `exec(2)`, `prex` detaches from the target and exits. The user can reconnect `prex` with `prex -p pid`.

A `vfork(2)` is generally followed quickly by an `exec(2)` in the child, and in the interim, the child borrows the parent's process while the parent waits for the `exec(2)`. Any events logged by the child from the parent process will appear to have been logged by the parent.

**Kernel Mode**

Invoking `prex` with the `-k` flag causes `prex` to run in kernel mode. In kernel mode, `prex` controls probes in the Solaris kernel. See `tnf_kernel_probes(4)` for a list of available probes in the Solaris kernel. A few `prex` commands are unavailable in kernel mode; many other commands are valid in kernel mode only.

The `-l`, `-o`, and `-p` command-line options are not valid in kernel mode (that is, they may not be combined with the `-k` flag).

The rest of this section describes the differences in the `prex` command language when running `prex` in kernel mode.

1. `prex` will not stop the kernel

When `prex` attaches to a running user program, it stops the user program.

Obviously, it cannot do this when attaching to the kernel. Instead, `prex` provides a "tracing master switch": no probes will have any effect unless the tracing master switch is on. This allows the user to iteratively select probes to enable, then enable them all at once by turning on the master switch.

The command

```
ktrace [on | off]
```

is used to inspect and set the value of the master switch. Without an argument, `prex` reports the current state of the master switch.

Since `prex` will not stop or kill the kernel, the

```
quit resume
```

and

```
quit kill
```

commands are not valid in kernel mode.

2. No functions may be attached to probes in the kernel  
In particular, the debug function is unavailable in kernel mode.
3. Trace output is written to an in-core buffer  
In kernel mode, a trace output file is not generated directly, in order to allow probes to be placed in time-critical code. Instead, trace output is written to an in-core buffer, and copied out by a separate program, `tnfextract(1)`.

The in-core buffer is not automatically created. The following `prex` command controls buffer allocation and deallocation:

```
buffer [alloc [size] | dealloc]
```

Without an argument, the `buffer` command reports the size of the currently allocated buffer, if any. With an argument of `alloc [size]`, `prex` allocates a buffer of the given size. *size* is in bytes, with an optional suffix of 'k' or 'm' specifying a multiplier of 1024 or 1048576, respectively. If no *size* is specified, the *size* specified on the command line with the `-s` option is used as a default. If the `-s` command line option was not used, the "default default" is 384 kilobytes.

With an argument of `dealloc`, `prex` deallocates the trace buffer in the kernel.

`prex` will reject attempts to turn the tracing master switch on when no buffer is allocated, and to deallocate the buffer when the tracing master switch is on. `prex` will refuse to allocate a buffer when one is already allocated; use `buffer dealloc` first.

`prex` will not allocate a buffer larger than one-half of a machine's physical memory.

4. `Prex` supports per-process probe enabling in the kernel  
In kernel mode, it is possible to select a set of processes for which probes are enabled. No trace output will be written when other processes traverse these probe points. This is called "process filter mode." By default, process filter mode is off, and all processes cause the generation of trace records when they hit an enabled probe.

prex(1)

Some kernel events such as interrupts cannot be associated with a particular user process. By convention, these events are considered to be generated by process id 0.

prex provides commands to turn process filter mode on and off, to get the current status of the process filter mode switch, to add and delete processes (by process id) from the process filter set, and to list the current process filter set.

The process filter set is maintained even when process filter mode is off, but has no effect unless process filter mode is on.

When a process in the process filter set exits, its process id is automatically deleted from the process filter set.

The command:

```
pfilter [on | off | addpidlist | deletepidlist]
```

controls the process filter switch, and process filter set membership. With no arguments, `pfilter` prints the current process filter set and the state of the process filter mode switch.

`on` or `off` set the state of the process filter mode switch.

`add pidlist`

`delete pidlist` add or delete processes from the process filter set. *pidlist* is a comma-separated list of one or more process ids.

**EXAMPLES** See `tracing(3TNF)` for complete examples showing, among other things, the use of `prex` to do simple probe control.

When either the process or kernel is started, all probes are disabled.

**EXAMPLE 1** Set creation and set listing

```
create $out name=/out/ # $out = probes with "out" in
 # value of "name" attribute
create $foo /page/ name=biodone # $foo = union of
 # probes with "page" in value of keys attribute
 # probes with "biodone" as value of "name" attribute
list sets # list the defined sets
list fcns # list the defined probe fcns
```

**EXAMPLE 2** Commands to trace and connect probe functions

```
trace foobar='on' # exact match on foobar attribute
trace $all # trace all probes (predefined set $all)
connect &debug $foo # connect debug func to probes in $foo
```

**EXAMPLE 3** Commands to enable and disable probes

```
enable $all # enable all probes
enable /vm/ name=alloc # enable the specified probes
```

**EXAMPLE 3** Commands to enable and disable probes *(Continued)*

```
disable $foo # disable probes in set $foo
list history # list probe control commands issued
```

**EXAMPLE 4** Process control

```
continue # resumes the target process
^C # stop target; give control to prex
quit resume # exit prex, leave process running and resume execution of program
```

**EXAMPLE 5** Kernel mode

```
buffer alloc 2m # allocate a 2 Megabyte buffer
enable $all # enable all probes
trace $all # trace all probes
ktrace on # turn tracing on
ktrace off # turn tracing back off
pfilter on # turn process filter mode on
pfilter add 1379 # add pid 1379 to process filter
ktrace on # turn tracing on
 # (only pid 1379 will be traced)
```

**FILES** .prexrc local prex initialization file  
 ~/ .prexrc user's prex initialization file  
 /proc/*nnnnn* process files

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE                         |
|----------------|-----------------------------------------|
| Availability   | SUNWtnfc (32-bit)<br>SUNWtnfcx (64-bit) |

**SEE ALSO** ed(1), kill(1), ksh(1), ld(1), tnfdump(1), tnfxtract(1), truss(1), exec(2), fork(2), fork1(2), vfork(2), TNF\_DECLARE\_RECORD(3TNF), TNF\_PROBE(3TNF), dlclose(3DL), dlopen(3DL), gethrtime(3C), libtnfctl(3TNF), tnf\_process\_disable(3TNF), tracing(3TNF), tnf\_kernel\_probes(4), attributes(5)

**NOTES** Currently, the only probe function that is available is the &debug function. When this function is executed, it prints out the arguments sent in to the probe as well as the value associated with the sunw%debug attribute in the detail field (if any) to stderr.

For example, for the following probe point:

prex(1)

```
TNF_PROBE_2(input_values, "testapp main",
 "sunw%debug 'have read input values successfully'",
 tnf_long, int_input, x,
 tnf_string, string_input, input);
```

If *x* was 100 and *input* was the string "success", then the output of the debug probe function would be:

```
probe input_values; sunw%debug "have read input values successfully";
int_input=100; string_input="success";
```

Some non-SPARC hardware lacks a true high-resolution timer, causing `gethrtime()` to return the same value multiple times in succession. This can lead to problems in how some tools interpret the trace file. This situation can be improved by interposing a version of `gethrtime()`, which causes these successive values to be artificially incremented by one nanosecond:

```
hrtime_t
gethrtime()
{
 static mutex_t lock;
 static hrtime_t (*real_gethrtime)(void) = NULL;
 static hrtime_t last_time = 0;

 hrtime_t this_time;

 if (real_gethrtime == NULL) {
 real_gethrtime =
 (hrtime_t (*)(void)) dlsym(RTLD_NEXT, "gethrtime");
 }
 this_time = real_gethrtime();

 mutex_lock(&lock);
 if (this_time <= last_time)
 this_time = ++last_time;
 else
 last_time = this_time;
 mutex_unlock(&lock);

 return (this_time);
}
```

Of course, this does not increase the resolution of the timer, so timestamps for individual events are still relatively inaccurate. But this technique maintains ordering, so that if event A causes event B, B never appears to happen before or at the same time as A.

dbx is available with the Sun Workshop Products.

**BUGS** prex should issue a notification when a process id has been automatically deleted from the filter set.

There is a known bug in prex which can result in this message:

Tracing shut down in target program due to an internal error - Please restart prex and target

When `prex` runs as root, and the target process is not root, and the tracefile is placed in a directory where it cannot be removed and re-created (a directory with the sticky bit on, like `/tmp`), then the target process will not be able to open the tracefile when it needs to. This results in tracing being disabled.

Changing any of the circumstances listed above should fix the problem. Either don't run `prex` as root, or run the target process as root, or specify the tracefile in a directory other than `/tmp`.

## print(1)

| <b>NAME</b>        | print – shell built-in function to output characters to the screen or window                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                 |              |         |

| <b>NAME</b>        | printenv – display environment variables currently set                                                                                                                |                |                 |              |          |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|----------|
| <b>SYNOPSIS</b>    | <code>/usr/ucb/printenv</code> [ <i>variable</i> ]                                                                                                                    |                |                 |              |          |
| <b>DESCRIPTION</b> | printenv prints out the values of the variables in the environment. If a <i>variable</i> is specified, only its value is printed.                                     |                |                 |              |          |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                          |                |                 |              |          |

| <b>SYNOPSIS</b>    | <b>printf</b> <i>format</i> [ <i>argument...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b> | The <code>printf</code> command writes formatted operands to the standard output. The <i>argument</i> operands are formatted under control of the <i>format</i> operand.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>format</i>            A string describing the format to use to write the remaining operands. The <i>format</i> operand is used as the <i>format</i> string described on the <code>formats(5)</code> manual page, with the following exceptions:</p> <ul style="list-style-type: none"><li>■ A SPACE character in the format string, in any context other than a flag of a conversion specification, is treated as an ordinary character that is copied to the output.</li><li>■ A character in the format string is treated as a character, not as a SPACE character.</li><li>■ In addition to the escape sequences described on the <code>formats(5)</code> manual page (<code>\</code>, <code>\a</code>, <code>\b</code>, <code>\f</code>, <code>\n</code>, <code>\r</code>, <code>\t</code>, <code>\v</code>), <code>\ddd</code>, where <i>ddd</i> is a one-, two- or three-digit octal number, is written as a byte with the numeric value specified by the octal number.</li><li>■ The program does not precede or follow output from the <code>d</code> or <code>u</code> conversion specifications with blank characters not specified by the <i>format</i> operand.</li><li>■ The program does not precede output from the <code>o</code> conversion specification with zeros not specified by the <i>format</i> operand.</li><li>■ An additional conversion character, <code>b</code>, is supported as follows. The argument is taken to be a string that may contain backslash-escape sequences. The following backslash-escape sequences are supported:<ul style="list-style-type: none"><li>– the escape sequences listed on the <code>formats(5)</code> manual page (<code>\</code>, <code>\a</code>, <code>\b</code>, <code>\f</code>, <code>\n</code>, <code>\r</code>, <code>\t</code>, <code>\v</code>), which are converted to the characters they represent</li><li>– <code>\0ddd</code>, where <i>ddd</i> is a zero-, one-, two- or three-digit octal number that is converted to a byte with the numeric value specified by the octal number</li><li>– <code>\c</code>, which is written and causes <code>printf</code> to ignore any remaining characters in the string operand containing it, any remaining string operands and any additional characters in the <i>format</i> operand.</li></ul></li></ul> <p>The interpretation of a backslash followed by any other sequence of characters is unspecified.</p> <p>Bytes from the converted string are written until the end of the string or the number of bytes indicated by the precision</p> |

specification is reached. If the precision is omitted, it is taken to be infinite, so all bytes up to the end of the converted string are written. For each specification that consumes an argument, the next argument operand is evaluated and converted to the appropriate type for the conversion as specified below. The `format` operand is reused as often as necessary to satisfy the argument operands. Any extra `c` or `s` conversion specifications are evaluated as if a null string argument were supplied; other extra conversion specifications are evaluated as if a zero argument were supplied. If the `format` operand contains no conversion specifications and `argument` operands are present, the results are unspecified. If a character sequence in the `format` operand begins with a `%` character, but does not form a valid conversion specification, the behavior is unspecified.

*argument*

The strings to be written to standard output, under the control of `format`. The *argument* operands are treated as strings if the corresponding conversion character is `b`, `c` or `s`; otherwise, it is evaluated as a C constant, as described by the ISO C standard, with the following extensions:

- A leading plus or minus sign is allowed.
- If the leading character is a single- or double-quote, the value is the numeric value in the underlying codeset of the character following the single- or double-quote.

If an argument operand cannot be completely converted into an internal value appropriate to the corresponding conversion specification, a diagnostic message is written to standard error and the utility does not exit with a zero exit status, but continues processing any remaining operands and writes the value accumulated at the time the error was detected to standard output.

**USAGE** Note that this `printf` utility, like the `printf(3C)` function on which it is based, makes no special provision for dealing with multi-byte characters when using the `%c` conversion specification or when a precision is specified in a `%b` or `%s` conversion specification. Applications should be extremely cautious using either of these features when there are multi-byte characters in the character set.

Field widths and precisions cannot be specified as `*`.

For compatibility with previous versions of SunOS 5.x, the `§` format specifier is supported for formats containing *only* `%s` specifiers.

The `%b` conversion specification is not part of the ISO C standard; it has been added here as a portable way to process backslash escapes expanded in string operands as provided by the `echo` utility. See also the **USAGE** section of the `echo(1)` manual page for ways to use `printf` as a replacement for all of the traditional versions of the `echo` utility.

printf(1)

If an argument cannot be parsed correctly for the corresponding conversion specification, the `printf` utility reports an error. Thus, overflow and extraneous characters at the end of an argument being used for a numeric conversion are to be reported as errors.

It is not considered an error if an argument operand is not completely used for a `c` or `s` conversion or if a string operand's first or second character is used to get the numeric value of a character.

## EXAMPLES

### EXAMPLE 1 Printing a series of prompts

To alert the user and then print and read a series of prompts:

```
printf "\aPlease fill in the following: \nName: "
read name
printf "Phone number: "
read phone
```

### EXAMPLE 2 Printing a table of calculations

To read out a list of right and wrong answers from a file, calculate the percentage correctly, and print them out. The numbers are right-justified and separated by a single tab character. The percentage is written to one decimal place of accuracy:

```
while read right wrong ; do
 percent=$(echo "scale=1; ($right*100)/($right+$wrong)" | bc)
 printf "%2d right\t%2d wrong\t(%%s%%)\n" \
 $right $wrong $percent
done < database_file
```

### EXAMPLE 3 Printing number strings

The command:

```
printf "%5d%4d\n" 1 21 321 4321 54321
```

produces:

```
 1 21
 3214321
54321 0
```

Note that the `format` operand is used three times to print all of the given strings and that a `0` was supplied by `printf` to satisfy the last `%4d` conversion specification.

### EXAMPLE 4 Tabulating conversion errors

The `printf` utility tells the user when conversion errors are detected while producing numeric output; thus, the following results would be expected on an implementation with 32-bit twos-complement integers when `%d` is specified as the `format` operand:

**EXAMPLE 4** Tabulating conversion errors *(Continued)*

| Arguments  | Standard    | Diagnostic                            |
|------------|-------------|---------------------------------------|
| 5a         | 5           | printf: 5a not completely converted   |
| 999999999  | 2147483647  | printf: 999999999: Results too large  |
| -999999999 | -2147483648 | printf: -999999999: Results too large |
| ABC        | 0           | printf: ABC expected numeric value    |

Note that the value shown on standard output is what would be expected as the return value from the function `strtol(3C)`. A similar correspondence exists between `%u` and `strtoul(3C)`, and `%e`, `%f` and `%g` and `strtod(3C)`.

**EXAMPLE 5** Printing output for a specific locale

In a locale using the ISO/IEC 646:1991 standard as the underlying codeset, the command:

```
printf "%d\n" 3 +3 -3 \'3 \"+3 "'-3"
```

produces:

|    |                                                                             |
|----|-----------------------------------------------------------------------------|
| 3  | Numeric value of constant 3                                                 |
| 3  | Numeric value of constant 3                                                 |
| -3 | Numeric value of constant -3                                                |
| 51 | Numeric value of the character '3' in the ISO/IEC 646:1991 standard codeset |
| 43 | Numeric value of the character '+' in the ISO/IEC 646:1991 standard codeset |
| 45 | Numeric value of the character '-' in the SO/IEC 646:1991 standard codeset  |

Note that in a locale with multi-byte characters, the value of a character is intended to be the value of the equivalent of the `wchar_t` representation of the character.

If an argument operand cannot be completely converted into an internal value appropriate to the corresponding conversion specification, a diagnostic message is written to standard error and the utility does exit with a zero exit status, but continues processing any remaining operands and writes the value accumulated at the time the error was detected to standard output.

**ENVIRONMENT  
VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `printf`: `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, `TZ`, and `NLSPATH`.

## printf(1)

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWloc         |
| CSI            | enabled         |

| <b>SYNOPSIS</b>    | <pre>prioctl -l prioctl -d [-i <i>idtype</i>] [<i>idlist</i>] prioctl -s [-c <i>class</i>] [<i>class-specific options</i>] [-i <i>idtype</i>] [<i>idlist</i>] prioctl -e [-c <i>class</i>] [<i>class-specific options</i>] <i>command</i> [<i>argument(s)</i>]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b> | <p>The <code>prioctl</code> command displays or sets scheduling parameters of the specified process(es). It can also be used to display the current configuration information for the system's process scheduler or execute a command with specified scheduling parameters.</p> <p>Processes fall into distinct classes with a separate scheduling policy applied to each class. The process classes currently supported are the real-time class, time-sharing class, and the interactive class. The characteristics of these classes and the class-specific options they accept are described below in the <b>USAGE</b> section under the headings <b>Real-Time Class</b>, <b>Time-Sharing Class</b>, and <b>Inter-Active Class</b>. With appropriate permissions, the <code>prioctl</code> command can change the class and other scheduling parameters associated with a running process.</p> <p>In the default configuration, a runnable real-time process runs before any other process. Therefore, inappropriate use of real-time processes can have a dramatic negative impact on system performance.</p> <p>If an <i>idlist</i> is present, it must appear last on the command line and the elements of the list must be separated by white space. If no <i>idlist</i> is present, an <i>idtype</i> argument of <code>pid</code>, <code>ppid</code>, <code>pgid</code>, <code>sid</code>, <code>taskid</code>, <code>class</code>, <code>uid</code>, <code>gid</code>, or <code>projid</code> specifies the process ID, parent process ID, process group ID, session ID, task ID, class, user ID, group ID, or project ID, respectively, of the <code>prioctl</code> command itself.</p> <p>The command</p> <pre>prioctl -d [-i <i>idtype</i>] [<i>idlist</i>]</pre> <p>displays the class and class-specific scheduling parameters of the process(es) specified by <i>idtype</i> and <i>idlist</i>.</p> <p>The command</p> <pre>prioctl -s [-c <i>class</i>] [<i>class-specific options</i>] [-i <i>idtype</i>] [<i>idlist</i>]</pre> <p>sets the class and class-specific parameters of the specified processes to the values given on the command line. The <code>-c class</code> option specifies the class to be set. (The valid <i>class</i> arguments are <code>RT</code> for real-time <code>TS</code> for time-sharing or <code>IA</code> for inter-active.)</p> <p>The class-specific parameters to be set are specified by the class-specific options as explained under the appropriate heading below. If the <code>-c class</code> option is omitted, <i>idtype</i> and <i>idlist</i> must specify a set of processes which are all in the same class, otherwise an error results. If no class-specific options are specified, the process's class-specific</p> |

## priocntl(1)

parameters are set to the default values for the class specified by `-c class` (or to the default parameter values for the process's current class if the `-c class` option is also omitted).

In order to change the scheduling parameters of a process using `priocntl` the real or effective user ID (respectively, groupID) of the user invoking `priocntl` must match the real or effective user ID (respectively, groupID) of the receiving process or the effective user ID of the user must be super-user. These are the minimum permission requirements enforced for all classes. An individual class may impose additional permissions requirements when setting processes to that class or when setting class-specific scheduling parameters.

When `idtype` and `idlist` specify a set of processes, `priocntl` acts on the processes in the set in an implementation-specific order. If `priocntl` encounters an error for one or more of the target processes, it may or may not continue through the set of processes, depending on the nature of the error.

If the error is related to permissions, `priocntl` prints an error message and then continues through the process set, resetting the parameters for all target processes for which the user has appropriate permissions. If `priocntl` encounters an error other than permissions, it does not continue through the process set but prints an error message and exits immediately.

A special `sys` scheduling class exists for the purpose of scheduling the execution of certain special system processes (such as the swapper process). It is not possible to change the class of any process to `sys`. In addition, any processes in the `sys` class that are included in the set of processes specified by `idtype` and `idlist` are disregarded by `priocntl`. For example, if `idtype` were `uid`, an `idlist` consisting of a zero would specify all processes with a UID of 0, except processes in the `sys` class and (if changing the parameters using the `-s` option) the `init` process.

The `init` process (process ID 1) is a special case. In order for the `priocntl` command to change the class or other scheduling parameters of the `init` process, `idtype` must be `pid` and `idlist` must be consist of only a 1. The `init` process may be assigned to any class configured on the system, but the time-sharing class is almost always the appropriate choice. (Other choices may be highly undesirable; see the *System Administration Guide, Volume 1* for more information.)

The command

```
priocntl -e [-c class] [class-specific options] command [argument ...] executes the specified command with the class and scheduling parameters specified on the command line (arguments are the arguments to the command). If the -c class option is omitted the command is run in the user's current class.
```

**OPTIONS** The following options are supported:

- *c class* Specifies the *class* to be set. (The valid *class* arguments are RT for real-time or TS for time-sharing or IA for inter-active.) If the specified class is not already configured, it will automatically be configured.
- d Displays the scheduling parameters associated with a set of processes.
- e Executes a specified command with the class and scheduling parameters associated with a set of processes.
- i *idtype* This option, together with the *idlist* arguments (if any), specifies one or more processes to which the *prioctl* command is to apply. The interpretation of *idlist* depends on the value of *idtype*. The valid *idtype* arguments and corresponding interpretations of *idlist* are as follows:
  - i pid *idlist* is a list of process IDs. The *prioctl* command applies to the specified processes.
  - i ppid *idlist* is a list of parent process IDs. The *prioctl* command applies to all processes whose parent process ID is in the list.
  - i pgid *idlist* is a list of process group IDs. The *prioctl* command applies to all processes in the specified process groups.
  - i sid *idlist* is a list of session IDs. The *prioctl* command applies to all processes in the specified sessions.
  - i taskid *idlist* is a list of task IDs. The *prioctl* command applies to all processes in the specified tasks.
  - i class *idlist* consists of a single class name (RT for real-time or TS for time-sharing or IA for inter-active). The *prioctl* command applies to all processes in the specified class.
  - i uid *idlist* is a list of user IDs. The *prioctl* command applies to all processes with an effective user ID equal to an ID from the list.
  - i gid *idlist* is a list of group IDs. The *prioctl* command applies to all processes with an effective group ID equal to an ID from the list.
  - i projid *idlist* is a list of project IDs. The *prioctl* command applies to all processes with an effective project ID equal to an ID from the list.

## prionctl(1)

**-i all** The `prionctl` command applies to all existing processes. No *idlist* should be specified (if one is specified, it is ignored). The permission restrictions described below still apply.

If the `-i idtype` option is omitted when using the `-d` or `-s` options the default *idtype* of `pid` is assumed.

**-l** Displays a list of the classes currently configured in the system along with class-specific information about each class. The format of the class-specific information displayed is described under **USAGE**.

**-s** Sets the scheduling parameters associated with a set of processes.

The valid class-specific options for setting real-time parameters are:

**-p rtpri** Sets the real-time priority of the specified process(es) to *rtpri*.

**-t tqntm [-r res]** Sets the time quantum of the specified process(es) to *tqntm*. You may optionally specify a resolution as explained below.

The valid class-specific options for setting time-sharing parameters are:

**-m tsuprilim** Sets the user priority limit of the specified process(es) to *tsuprilim*.

**-p tsupri** Sets the user priority of the specified process(es) to *tsupri*.

The valid class-specific options for setting inter-active parameters are:

**-m iauprilim** Sets the user priority limit of the specified process(es) to *iauprilim*.

**-p iaupri** Sets the user priority of the specified process(es) to *iaupri*.

### Real-Time Class

The real-time class provides a fixed priority preemptive scheduling policy for those processes requiring fast and deterministic response and absolute user/application control of scheduling priorities. If the real-time class is configured in the system, it should have exclusive control of the highest range of scheduling priorities on the system. This ensures that a runnable real-time process is given CPU service before any process belonging to any other class.

The real-time class has a range of real-time priority (*rtpri*) values that may be assigned to processes within the class. Real-time priorities range from 0 to *x*, where the value of *x* is configurable and can be displayed for a specific installation that has already configured a real-time scheduler, by using the command

`prionctl -l` The real-time scheduling policy is a fixed priority policy. The scheduling priority of a real-time process never changes except as the result of an explicit request by the user/application to change the *rtpri* value of the process.

For processes in the real-time class, the *rtpri* value is, for all practical purposes, equivalent to the scheduling priority of the process. The *rtpri* value completely determines the scheduling priority of a real-time process relative to other processes within its class. Numerically higher *rtpri* values represent higher priorities. Since the real-time class controls the highest range of scheduling priorities in the system, it is guaranteed that the runnable real-time process with the highest *rtpri* value is always selected to run before any other process in the system.

In addition to providing control over priority, `prioctl` provides for control over the length of the time quantum allotted to processes in the real-time class. The time quantum value specifies the maximum amount of time a process may run, assuming that it does not complete or enter a resource or event wait state (`sleep`). Notice that if another process becomes runnable at a higher priority, the currently running process may be preempted before receiving its full time quantum.

The command

```
prioctl -d [-i idtype] [idlist] displays the real-time priority and time quantum (in millisecond resolution) for each real-time process in the set specified by idtype and idlist.
```

Any combination of the `-p` and `-t` options may be used with `prioctl -s` or `prioctl -e` for the real-time class. If an option is omitted and the process is currently real-time, the associated parameter is unaffected. If an option is omitted when changing the class of a process to real-time from some other class, the associated parameter is set to a default value. The default value for *rtpri* is 0 and the default for time quantum is dependent on the value of *rtpri* and on the system configuration; see `rt_dptbl(4)`.

When using the `-t tqntm` option, you may optionally specify a resolution using the `-r res` option. (If no resolution is specified, millisecond resolution is assumed.) If *res* is specified, it must be a positive integer between 1 and 1,000,000,000 inclusively and the resolution used is the reciprocal of *res* in seconds. For example, specifying `-t 10 -r 100` would set the resolution to hundredths of a second and the resulting time quantum length would be 10/100 seconds (one tenth of a second). Although very fine (nanosecond) resolution may be specified, the time quantum length is rounded up by the system to the next integral multiple of the system clock's resolution. Requests for time quantum of zero or quantum greater than the (typically very large) implementation-specific maximum quantum result in an error.

In order to change the class of a process to real-time (from any other class), the user invoking `prioctl` must have super-user privilege. In order to change the *rtpri* value or time quantum of a real-time process, the user invoking `prioctl` must either be super-user, or must currently be in the real-time class (shell running as a real-time process) with a real or effective user ID matching the real or effective user ID of the target process.

prionctl(1)

**Time-Sharing Class**

The real-time priority and time quantum are inherited across the `fork(2)` and `exec(2)` system calls.

The time-sharing scheduling policy provides for a fair and effective allocation of the CPU resource among processes with varying CPU consumption characteristics. The objectives of the time-sharing policy are to provide good response time to interactive processes and good throughput to CPU-bound jobs, while providing a degree of user/application control over scheduling.

The time-sharing class has a range of time-sharing user priority (*tsupri*) values that may be assigned to processes within the class. User priorities range from  $-x$  to  $+x$ , where the value of  $x$  is configurable. The range for a specific installation can be displayed by using the command

`prionctl -l` The purpose of the user priority is to provide some degree of user/application control over the scheduling of processes in the time-sharing class. Raising or lowering the *tsupri* value of a process in the time-sharing class raises or lowers the scheduling priority of the process. It is not guaranteed, however, that a time-sharing process with a higher *tsupri* value will run before one with a lower *tsupri* value. This is because the *tsupri* value is just one factor used to determine the scheduling priority of a time-sharing process. The system may dynamically adjust the internal scheduling priority of a time-sharing process based on other factors such as recent CPU usage.

In addition to the system-wide limits on user priority (displayed with `prionctl -l`), there is a per process user priority limit (*tsuprilim*), which specifies the maximum *tsupri* value that may be set for a given process.

The command

`prionctl -d [-i idtype] [idlist]` displays the user priority and user priority limit for each time-sharing process in the set specified by *idtype* and *idlist*.

Any time-sharing process may lower its own *tsuprilim* (or that of another process with the same user ID). Only a time-sharing process with super-user privilege may raise a *tsuprilim*. When changing the class of a process to time-sharing from some other class, super-user privilege is required in order to set the initial *tsuprilim* to a value greater than zero.

Any time-sharing process may set its own *tsupri* (or that of another process with the same user ID) to any value less than or equal to the process's *tsuprilim*. Attempts to set the *tsupri* above the *tsuprilim* (and/or set the *tsuprilim* below the *tsupri*) result in the *tsupri* being set equal to the *tsuprilim*.

Any combination of the `-m` and `-p` options may be used with `prionctl -s` or `prionctl -e` for the time-sharing class. If an option is omitted and the process is currently time-sharing, the associated parameter is normally unaffected. The exception is when the `-p` option is omitted and `-m` is used to set a *tsuprilim* below the current

prctl(1)

*tsupri*. In this case, the *tsupri* is set equal to the *tsuprilim* which is being set. If an option is omitted when changing the class of a process to time-sharing from some other class, the associated parameter is set to a default value. The default value for *tsuprilim* is 0 and the default for *tsupri* is to set it equal to the *tsuprilim* value which is being set.

The time-sharing user priority and user priority limit are inherited across the `fork(2)` and `exec(2)` system calls.

### Inter-Active Class

The inter-active scheduling policy provides for a fair and effective allocation of the CPU resource among processes with varying CPU consumption characteristics while providing good responsiveness for user interaction. The objectives of the inter-active policy are to provide good response time to interactive processes and good throughput to CPU-bound jobs. The priorities of processes in the inter-active class can be changed in the same manner as those in the time-sharing class, though the modified priorities will continue to be adjusted to provide good responsiveness for user interaction.

### EXAMPLES

Real-Time Class examples follow:

#### EXAMPLE 1 Setting the class of any non-real-time processes

This example sets the class of any non-real-time processes selected by *idtype* and *idlist* to real-time and sets their real-time priority to the default value of 0. The real-time priorities of any processes currently in the real-time class are unaffected. The time quantum of all of the specified processes are set to 1/10 seconds

```
example% prctl -s -c RT -t 1 -r 10 -i idtype idlist
```

#### EXAMPLE 2 Executing a command in real-time

This example executes *command* in the real-time class with a real-time priority of 15 and a time quantum of 20 milliseconds:

```
example% prctl -e -c RT -p 15 -t 20 command
```

Time-Sharing Class examples follow:

#### EXAMPLE 3 Setting the class of non-time-sharing processes

This example sets the class of any non-time-sharing processes selected by *idtype* and *idlist* to time-sharing and sets both their user priority limit and user priority to 0. Processes already in the time-sharing class are unaffected.

```
example% prctl -s -c TS -i idtype idlist
```

#### EXAMPLE 4 Executing a command in the time-sharing class

This example executes *command* with the arguments *arguments* in the time-sharing class with a user priority limit of 0 and a user priority of -15:

## priocntl(1)

**EXAMPLE 4** Executing a command in the time-sharing class *(Continued)*

```
example% priocntl -e -c TS -m 0 -p -15 command [arguments]
```

**EXIT STATUS** The following exit values are returned:

For options `-d`, `-l`, and `-s`:

0 Successful operation.

1 Error condition.

For option `-e`:

Return of the Exit Status of the executed command denotes successful operation. Otherwise,

1 Command could not be executed at the specified priority.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | Enabled         |

**SEE ALSO** `nice(1)`, `ps(1)`, `exec(2)`, `fork(2)`, `priocntl(2)`, `rt_dptbl(4)`, `attributes(5)`

*System Administration Guide, Volume 1*

**DIAGNOSTICS** `priocntl` prints the following error messages:

Process(es) not found  
None of the specified processes exists.

Specified processes from different classes

The `-s` option is being used to set parameters, the `-c class` option is not present, and processes from more than one class are specified.

Invalid option or argument

An unrecognized or invalid option or option argument is used.

| <b>DESCRIPTION</b> | <p>The proc tools are utilities that exercise features of /proc (see proc(4)). Most of them take a list of process-ids (<i>pid</i>); those that do also accept /proc/<i>nmn</i> as a process-id, so the shell expansion /proc/* can be used to specify all processes in the system. Some of the proc tools can also be applied to core files (see core(4)); those that do accept a list of either process IDs or names of core files or both.</p> <p><i>pflags</i>            Print the /proc tracing flags, the pending and held signals, and other /proc status information for each lwp in each process.</p> <p><i>pcred</i>            Print the credentials (effective, real, saved UIDs and GIDs) of each process.</p> <p><i>pmap</i>            Print the address space map of each process.</p> <p><i>pldd</i>            List the dynamic libraries linked into each process, including shared objects explicitly attached using dlopen(3DL). See also ldd(1).</p> <p><i>psig</i>            List the signal actions of each process. See signal(3HEAD).</p> <p><i>pstack</i>          Print a hex+symbolic stack trace for each lwp in each process.</p> <p><i>pfiles</i>          Report fstat(2) and fcntl(2) information for all open files in each process.</p> <p><i>pwdx</i>            Print the current working directory of each process.</p> <p><i>pstop</i>          Stop each process (PR_REQUESTED stop).</p> |

## proc(1)

|       |                                                                                                                                                                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| prun  | Set each process running (inverse of <code>pstop</code> ).                                                                                                                                                                                                                             |
| pwait | Wait for all of the specified processes to terminate.                                                                                                                                                                                                                                  |
| ptree | Print the process trees containing the specified <i>pids</i> or <i>users</i> , with child processes indented from their respective parent processes. An argument of all digits is taken to be a process-id, otherwise it is assumed to be a user login name. Default is all processes. |
| ptime | Time the <i>command</i> , like <code>time(1)</code> , but using microstate accounting for reproducible precision. Unlike <code>time(1)</code> , children of the command are not timed.                                                                                                 |

**OPTIONS** The following options are supported:

|    |                                                                                       |
|----|---------------------------------------------------------------------------------------|
| -r | ( <code>pflags</code> only) If the process is stopped, display its machine registers. |
| -r | ( <code>pmap</code> only) Print the process's reserved addresses.                     |
| -x | ( <code>pmap</code> only) Print resident/shared/private mapping details.              |
| -l | ( <code>pmap</code> only) Print unresolved dynamic linker map names.                  |
| -a | ( <code>ptree</code> only) All; include children of process 0.                        |
| -v | ( <code>pwait</code> only) Verbose; report terminations to standard output.           |
| -F | Force; grab the target process even if another process has control.                   |

**USAGE** These `proc` tools stop their target processes while inspecting them and reporting the results: `pfiles`, `pldd`, `pmap`, and `pstack`. A process can do nothing while it is stopped. Thus, for example, if the X server is inspected by one of these `proc` tools running in a window under the X server's control, the whole window system can become deadlocked because the `proc` tool would be attempting to print its results to a window that cannot be refreshed. Logging in from another system using `rlogin(1)` and killing the offending `proc` tool would clear up the deadlock in this case.

Caution should be exercised when using the `-F` flag. Imposing two controlling processes on one victim process can lead to chaos. Safety is assured only if the primary controlling process, typically a debugger, has stopped the victim process and the primary controlling process is doing nothing at the moment of application of the `proc` tool in question.

Some of the `proc` tools can also be applied to core files, as shown by the synopsis above. A core file is a snapshot of a process's state and is produced by the kernel prior to terminating a process with a signal or by the `gcore(1)` utility. Some of the `proc` tools may need to derive the name of the executable corresponding to the process which dumped core or the names of shared libraries associated with the process. These files are needed, for example, to provide symbol table information for `pstack(1)`. If the `proc` tool in question is unable to locate the needed executable or shared library, some symbol information will be unavailable for display. Similarly, if a core file from one operating system release is examined on a different operating

system release, the run-time link-editor debugging interface (`librtld_db`) may not be able to initialize. In this case, symbol information for shared libraries will not be available.

**EXIT STATUS** The following exit values are returned:

0 Successful operation.

non-zero An error has occurred.

**FILES** `/proc/*` process files

`/usr/proc/lib/*` proc tools supporting files

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE                       |
|----------------|---------------------------------------|
| Availability   | SUNWesu (32-bit)<br>SUNWesxu (64-bit) |

| <b>DESCRIPTION</b> | The <code>prof</code> command interprets a profile file produced by the <code>monitor</code> function. The symbol table in the object file <i>prog</i> (a <code>.out</code> by default) is read and correlated with a profile file ( <code>mon.out</code> by default). For each external text symbol the percentage of time spent executing between the address of that symbol and the address of the next is printed, together with the number of times that function was called and the average number of milliseconds per call.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b>     | <p>The mutually exclusive options <code>-a</code>, <code>-c</code>, <code>-n</code>, and <code>-t</code> determine the type of sorting of the output lines:</p> <ul style="list-style-type: none"><li><code>-a</code>        Sort by increasing symbol address.</li><li><code>-c</code>        Sort by decreasing number of calls.</li><li><code>-n</code>        Sort lexically by symbol name.</li><li><code>-t</code>        Sort by decreasing percentage of total time (default).</li></ul> <p>The mutually exclusive options <code>-o</code> and <code>-x</code> specify the printing of the address of each symbol monitored:</p> <ul style="list-style-type: none"><li><code>-o</code>        Print each symbol address (in octal) along with the symbol name.</li><li><code>-x</code>        Print each symbol address (in hexadecimal) along with the symbol name.</li></ul> <p>The mutually exclusive options <code>-g</code> and <code>-l</code> control the type of symbols to be reported. The <code>-l</code> option must be used with care; it applies the time spent in a static function to the preceding (in memory) global function, instead of giving the static function a separate entry in the report. If all static functions are properly located, this feature can be very useful. If not, the resulting report may be misleading.</p> <p>Assume that <code>A</code> and <code>B</code> are global functions and only <code>A</code> calls static function <code>S</code>. If <code>S</code> is located immediately after <code>A</code> in the source code (that is, if <code>S</code> is properly located), then, with the <code>-l</code> option, the amount of time spent in <code>A</code> can easily be determined, including the time spent in <code>S</code>. If, however, both <code>A</code> and <code>B</code> call <code>S</code>, then, if the <code>-l</code> option is used, the report will be misleading; the time spent during <code>B</code>'s call to <code>S</code> will be attributed to <code>A</code>, making it appear as if more time had been spent in <code>A</code> than really had. In this case, function <code>S</code> cannot be properly located.</p> <ul style="list-style-type: none"><li><code>-g</code>        List the time spent in static (non-global) functions separately. The <code>-g</code> option function is the opposite of the <code>-l</code> function.</li><li><code>-l</code>        Suppress printing statically declared functions. If this option is given, time spent executing in a static function is allocated to the closest global function loaded before the static function in the executable. This option is the default. It is the opposite of the <code>-g</code> function and should be used with care.</li></ul> <p>The following options may be used in any combination:</p> |

- C Demangle C++ symbol names before printing them out.
- h Suppress the heading normally printed on the report. This is useful if the report is to be processed further.
- m *mdata* Use file *mdata* instead of *mon.out* as the input profile file.
- s Print a summary of several of the monitoring parameters and statistics on the standard error output.
- V Print *prof* version information on the standard error output.
- z Include all symbols in the profile range, even if associated with zero number of calls and zero time.

A program creates a profile file if it has been link edited with the `-p` option of `cc(1B)`. This option to the `cc(1B)` command arranges for calls to `monitor` at the beginning and end of execution. It is the call to `monitor` at the end of execution that causes the system to write a profile file. The number of calls to a function is tallied if the `-p` option was used when the file containing the function was compiled.

A single function may be split into subfunctions for profiling by means of the `MARK` macro. See `prof(5)`.

#### ENVIRONMENT VARIABLES

`PROFDIR` The name of the file created by a profiled program is controlled by the environment variable `PROFDIR`. If `PROFDIR` is not set, *mon.out* is produced in the directory current when the program terminates. If `PROFDIR=string, string/pid.progname` is produced, where *progname* consists of `argv[0]` with any path prefix removed, and *pid* is the process ID of the program. If `PROFDIR` is set, but null, no profiling output is produced.

#### FILES

*mon.out* default profile file  
*a.out* default namelist (object) file

#### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWbtool       |

#### SEE ALSO

#### NOTES

The times reported in successive identical runs may show variances because of varying cache-hit ratios that result from sharing the cache with other processes. Even if a program seems to be the only one using the machine, hidden background or asynchronous processes may blur the data. In rare cases, the clock ticks initiating recording of the program counter may "beat" with loops in a program, grossly distorting measurements. Call counts are always recorded precisely, however.

prof(1)

Only programs that call `exit` or return from `main` are guaranteed to produce a profile file, unless a final call to `monitor` is explicitly coded.

The times for static functions are attributed to the preceding external text symbol if the `-g` option is not used. However, the call counts for the preceding function are still correct; that is, the static function call counts are not added to the call counts of the external function.

If more than one of the options `-t`, `-c`, `-a`, and `-n` is specified, the last option specified is used and the user is warned.

`LD_LIBRARY_PATH` must not contain `/usr/lib` as a component when compiling a program for profiling. If `LD_LIBRARY_PATH` contains `/usr/lib`, the program will not be linked correctly with the profiling versions of the system libraries in `/usr/lib/libp`. See `gprof(1)`.

Functions such as `mcount()`, `_mcount()`, `moncontrol()`, `_moncontrol()`, `monitor()`, and `_monitor()` may appear in the `prof` report. These functions are part of the profiling implementation and thus account for some amount of the runtime overhead. Since these functions are not present in an unprofiled application, time accumulated and call counts for these functions may be ignored when evaluating the performance of an application.

#### 64-bit profiling

64-bit profiling may be used freely with dynamically linked executables, and profiling information is collected for the shared objects if the objects are compiled for profiling. Care must be applied to interpret the profile output, since it is possible for symbols from different shared objects to have the same name. If duplicate names are seen in the profile output, it is better to use the `-s` (summary) option, which prefixes a module id before each symbol that is duplicated. The symbols can then be mapped to appropriate modules by looking at the modules information in the summary.

If the `-a` option is used with a dynamically linked executable, the sorting occurs on a per-shared-object basis. Since there is a high likelihood of symbols from different shared objects to have the same value, this results in an output that is more understandable. A blank line separates the symbols from different shared objects, if the `-s` option is given.

#### 32-bit profiling

32-bit profiling may be used with dynamically linked executables, but care must be applied. In 32-bit profiling, shared objects cannot be profiled with `prof`. Thus, when a profiled, dynamically linked program is executed, only the "main" portion of the image is sampled. This means that all time spent outside of the "main" object, that is, time spent in a shared object, will not be included in the profile summary; the total time reported for the program may be less than the total time used by the program.

Because the time spent in a shared object cannot be accounted for, the use of shared objects should be minimized whenever a program is profiled with `prof`. If desired, the program should be linked to the profiled version of a library (or to the standard archive version if no profiling version is available), instead of the shared object to get profile information on the functions of a library. Versions of profiled libraries may be

supplied with the system in the `/usr/lib/libp` directory. Refer to compiler driver documentation on profiling.

Consider an extreme case. A profiled program dynamically linked with the shared C library spends 100 units of time in some `libc` routine, say, `malloc()`. Suppose `malloc()` is called only from routine B and B consumes only 1 unit of time. Suppose further that routine A consumes 10 units of time, more than any other routine in the "main" (profiled) portion of the image. In this case, `prof` will conclude that most of the time is being spent in A and almost no time is being spent in B. From this it will be almost impossible to tell that the greatest improvement can be made by looking at routine B and not routine A. The value of the profiler in this case is severely degraded; the solution is to use archives as much as possible for profiling.

| <b>NAME</b>        | profiles – print execution profiles for a user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>SYNOPSIS</b>    | <b>profiles</b> [-1] [ <i>user</i> ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>DESCRIPTION</b> | <p>The <code>profiles</code> command prints on standard output the names of the execution profiles that have been assigned to you or to the optionally-specified user or role name. Profiles are a bundling mechanism used to enumerate the commands and authorizations needed to perform a specific function. Along with each listed executable are the process attributes, such as the effective user and group IDs, with which the process runs when started by a privileged command interpreter. The profile shells are <code>pf<sub>c</sub>sh</code>, <code>pf<sub>k</sub>sh</code>, and <code>pf<sub>e</sub>exec</code>. See the <code>pf<sub>e</sub>exec(1)</code> man page.</p> <p>Multiple profiles can be combined to construct the appropriate access control. When profiles are assigned, the authorizations are added to the existing set. If the same command appears in multiple profiles, the first occurrence, as determined by the ordering of the profiles, is used for process-attribute settings. For convenience, a wild card can be specified to match all commands.</p> <p>When profiles are interpreted, the profile list is loaded from <code>user_attr(4)</code>. Matching entries in <code>prof_attr(4)</code> provide the authorizations list, and matching entries in <code>exec_attr(4)</code> provide the commands list.</p> |
| <b>OPTIONS</b>     | -1           Lists the commands in each profile followed by the special process attributes such as user and group IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Sample output</p> <p>The output of the <code>profiles</code> command has the following form:</p> <pre>example% profiles tester01 tester02 tester01 : Audit Management, All Commands tester02 : Device Management, All Commands example%</pre> <p><b>EXAMPLE 2</b> Using the list option</p> <pre>example% profiles -1 tester01 tester02 tester01 :   Audit Management:     /usr/sbin/audit          euid=root     /usr/sbin/auditconfig   euid=root   egid=sys   All Commands:     * tester02 :   Device Management:     /usr/bin/allocate:      euid=root     /usr/bin/deallocate:    euid=root   All Commands     * example%</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0           Successful completion.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

profiles(1)

1 An error occurred.

**FILES** /etc/security/exec\_attr  
/etc/security/prof\_attr  
/etc/user\_attr

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** auths(1), pfexec(1), roles(1), getprofattr(3SECDB), exec\_attr(4), prof\_attr(4), user\_attr(4), attributes(5)

projects(1)

**NAME** projects – print project membership of user

**SYNOPSIS** **projects** [-v] [ *user*]

**DESCRIPTION** The `projects` command prints on standard output the projects to which the invoking user or an optionally specified user belongs. Each user belongs to some set of projects specified in the `project(4)` file and possibly in the associated NIS maps and LDAP databases for project information.

**OPTIONS** The following option is supported:

-v Prints project descriptions along with project names.

**OPERANDS** The following operand is supported:

*user* Displays project memberships for the specified user.

**EXAMPLES** **EXAMPLE 1** Displaying membership for a specified user

```
example$ projects paul
default beatles wings
example$ projects ringo
default beatles
```

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

1 A fatal error occurred during execution.

2 Invalid command line options were specified.

**FILES** `/etc/project` Local database containing valid project definitions for this machine.

**ATTRIBUTES** See `attributes(5)` for a description of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `getprojent(3EXACCT)`, `project(4)`, `attributes(5)`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>NAME</b>        | ps – report process status                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>    | <b>ps</b> [-aAcdefjLLPy] [-g <i>grplist</i> ] [-n <i>namelist</i> ] [-o <i>format</i> ]... [-p <i>proclist</i> ]<br>[-s <i>sidlist</i> ] [-t <i>term</i> ] [-u <i>uidlist</i> ] [-U <i>uidlist</i> ] [-G <i>gidlist</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | <p>The <b>ps</b> command prints information about active processes. Without options, <b>ps</b> prints information about processes that have the same effective user ID and the same controlling terminal as the invoker. The output contains only the process ID, terminal identifier, cumulative execution time, and the command name. Otherwise, the information that is displayed is controlled by the options.</p> <p>Some options accept lists as arguments. Items in a list can be either separated by commas or else enclosed in quotes and separated by commas or spaces. Values for <i>proclist</i> and <i>grplist</i> must be numeric.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>- a Lists information about all processes most frequently requested: all those except process group leaders and processes not associated with a terminal.</li> <li>-A Lists information for all processes. Identical to -e, below.</li> <li>-c Prints information in a format that reflects scheduler properties as described in <code>pricntl(1)</code>. The -c option affects the output of the -f and -l options, as described below.</li> <li>-d Lists information about all processes except session leaders.</li> <li>-e Lists information about every process now running.</li> <li>-f Generates a full listing. (See below for significance of columns in a full listing.)</li> <li>-g <i>grplist</i> Lists only process data whose group leader's ID number(s) appears in <i>grplist</i>. (A group leader is a process whose process ID number is identical to its process group ID number.)</li> <li>-G <i>gidlist</i> Lists information for processes whose real group ID numbers are given in <i>gidlist</i>. The <i>gidlist</i> must be a single argument in the form of a blank- or comma-separated list.</li> <li>-j Prints session ID and process group ID.</li> <li>-l Generates a long listing. (See below.)</li> <li>-L Prints information about each light weight process (<i>lwp</i>) in each selected process. (See below.)</li> <li>-n <i>namelist</i> Specifies the name of an alternative system <i>namelist</i> file in place of the default. This option is accepted for compatibility, but is ignored.</li> </ul> |

ps(1)

|                     |                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -o <i>format</i>    | Prints information according to the format specification given in <i>format</i> . This is fully described in DISPLAY FORMATS. Multiple -o options can be specified; the format specification will be interpreted as the space-character-separated concatenation of all the <i>format</i> option-arguments. |
| -ps <i>proclist</i> | Lists only process data whose process ID numbers are given in <i>proclist</i> .                                                                                                                                                                                                                            |
| -P                  | Prints the number of the processor to which the process or lwp is bound, if any, under an additional column header, PSR.                                                                                                                                                                                   |
| -s <i>sidlist</i>   | Lists information on all session leaders whose IDs appear in <i>sidlist</i> .                                                                                                                                                                                                                              |
| -t <i>term</i>      | Lists only process data associated with <i>term</i> . Terminal identifiers are specified as a device file name, and an identifier. For example, <i>term/a</i> , or <i>pts/0</i> .                                                                                                                          |
| -u <i>uidlist</i>   | Lists only process data whose effective user ID number or login name is given in <i>uidlist</i> . In the listing, the numerical user ID will be printed unless you give the -f option, which prints the login name.                                                                                        |
| -U <i>uidlist</i>   | Lists information for processes whose real user ID numbers or login names are given in <i>uidlist</i> . The <i>uidlist</i> must be a single argument in the form of a blank- or comma-separated list.                                                                                                      |
| -y                  | Under a long listing (-l), omits the obsolete F and ADDR columns and includes an RSS column to report the resident set size of the process. Under the -y option, both RSS and SZ (see below) will be reported in units of kilobytes instead of pages.                                                      |

Many of the options shown are used to select processes to list. If any are specified, the default list will be ignored and ps will select the processes represented by the inclusive OR of all the selection-criteria options.

## DISPLAY FORMATS

Under the -f option, ps tries to determine the command name and arguments given when the process was created by examining the user block. Failing this, the command name is printed, as it would have appeared without the -f option, in square brackets.

The column headings and the meaning of the columns in a ps listing are given below; the letters f and l indicate the option (full or long, respectively) that causes the corresponding heading to appear; all means that the heading always appears. Note: These two options determine only what information is provided for a process; they do not determine which processes will be listed.

F (l)            Flags (hexadecimal and additive) associated with the process. These flags are available for historical purposes; no meaning should be currently ascribed to them.

S (l)            The state of the process:

|                                                                                                |   |                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                | O | Process is running on a processor.                                                                                                                                                                |
|                                                                                                | S | Sleeping: process is waiting for an event to complete.                                                                                                                                            |
|                                                                                                | R | Runnable: process is on run queue.                                                                                                                                                                |
|                                                                                                | Z | Zombie state: process terminated and parent not waiting.                                                                                                                                          |
|                                                                                                | T | Process is stopped, either by a job control signal or because it is being traced.                                                                                                                 |
| UID (f,l)                                                                                      |   | The effective user ID number of the process (the login name is printed under the <code>-f</code> option).                                                                                         |
| PID (all)                                                                                      |   | The process ID of the process (this datum is necessary in order to kill a process).                                                                                                               |
| PPID (f,l)                                                                                     |   | The process ID of the parent process.                                                                                                                                                             |
| C (f,l)                                                                                        |   | Processor utilization for scheduling (obsolete). Not printed when the <code>-c</code> option is used.                                                                                             |
| CLS (f,l)                                                                                      |   | Scheduling class. Printed only when the <code>-c</code> option is used.                                                                                                                           |
| PRI (l)                                                                                        |   | The priority of the process. Without the <code>-c</code> option, higher numbers mean lower priority. With the <code>-c</code> option, higher numbers mean higher priority.                        |
| NI (l)                                                                                         |   | Nice value, used in priority computation. Not printed when the <code>-c</code> option is used. Only processes in the certain scheduling classes have a nice value.                                |
| ADDR (l)                                                                                       |   | The memory address of the process.                                                                                                                                                                |
| SZ (l)                                                                                         |   | The total size of the process in virtual memory, including all mapped files and devices, in pages. See <code>pagesize(1)</code> .                                                                 |
| WCHAN (l)                                                                                      |   | The address of an event for which the process is sleeping (if blank, the process is running).                                                                                                     |
| STIME (f)                                                                                      |   | The starting time of the process, given in hours, minutes, and seconds. (A process begun more than twenty-four hours before the <code>ps</code> inquiry is executed is given in months and days.) |
| TTY (all)                                                                                      |   | The controlling terminal for the process (the message, <code>?</code> , is printed when there is no controlling terminal).                                                                        |
| TIME (all)                                                                                     |   | The cumulative execution time for the process.                                                                                                                                                    |
| CMD (all)                                                                                      |   | The command name (the full command name and its arguments, up to a limit of 80 characters, are printed under the <code>-f</code> option).                                                         |
| The following two additional columns are printed when the <code>-j</code> option is specified: |   |                                                                                                                                                                                                   |
| PGID                                                                                           |   | The process ID of the process group leader.                                                                                                                                                       |

ps(1)

SID           The process ID of the session leader.

The following two additional columns are printed when the `-L` option is specified:

LWP           The lwp ID of the lwp being reported.

NLWP          The number of lwps in the process (if `-f` is also specified).

Under the `-L` option, one line is printed for each lwp in the process and the time-reporting fields `STIME` and `TIME` show the values for the lwp, not the process. A traditional single-threaded process contains only one lwp.

A process that has exited and has a parent, but has not yet been waited for by the parent, is marked `<defunct>`.

`-o format`    The `-o` option allows the output format to be specified under user control.

The format specification must be a list of names presented as a single argument, blank- or comma-separated. Each variable has a default header. The default header can be overridden by appending an equals sign and the new text of the header. The rest of the characters in the argument will be used as the header text. The fields specified will be written in the order specified on the command line, and should be arranged in columns in the output. The field widths will be selected by the system to be at least as wide as the header text (default or overridden value). If the header text is null, such as `-o user=`, the field width will be at least as wide as the default header text. If all header text fields are null, no header line will be written.

The following names are recognized in the POSIX locale:

user           The effective user ID of the process. This will be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.

ruser          The real user ID of the process. This will be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.

group          The effective group ID of the process. This will be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.

rgroup         The real group ID of the process. This will be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.

pid            The decimal value of the process ID.

ppid           The decimal value of the parent process ID.

pgid           The decimal value of the process group ID.

pcpu           The ratio of CPU time used recently to CPU time available in the same period, expressed as a percentage. The meaning of “recently”

in this context is unspecified. The CPU time available is determined in an unspecified manner.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>vsz</code>   | The total size of the process in virtual memory, in kilobytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>nice</code>  | The decimal value of the system scheduling priority of the process. See <code>nice(1)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <code>etime</code> | In the POSIX locale, the elapsed time since the process was started, in the form:<br><br><code>[ [dd-] hh:] mm:ss</code><br><br>where<br><code>dd</code> is the number of days<br><code>hh</code> is the number of hours<br><code>mm</code> is the number of minutes<br><code>ss</code> is the number of seconds<br><br>The <code>dd</code> field will be a decimal integer. The <code>hh</code> , <code>mm</code> and <code>ss</code> fields will be two-digit decimal integers padded on the left with zeros.                                                                                                                                                                                                            |
| <code>time</code>  | In the POSIX locale, the cumulative CPU time of the process in the form:<br><br><code>[dd-] hh:mm:ss</code><br><br>The <code>dd</code> , <code>hh</code> , <code>mm</code> , and <code>ss</code> fields will be as described in the <code>etime</code> specifier.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>tty</code>   | The name of the controlling terminal of the process (if any) in the same format used by the <code>who(1)</code> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>comm</code>  | The name of the command being executed ( <code>argv[0]</code> value) as a string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>args</code>  | The command with all its arguments as a string. The implementation may truncate this value to the field width; it is implementation-dependent whether any further truncation occurs. It is unspecified whether the string represented is a version of the argument list as it was passed to the command when it started, or is a version of the arguments as they may have been modified by the application. Applications cannot depend on being able to modify their argument list and having that modification be reflected in the output of <code>ps</code> . The Solaris implementation limits the string to 80 bytes; the string is the version of the argument list as it was passed to the command when it started. |

The following names are recognized in the Solaris implementation:

ps(1)

|         |                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------|
| f       | Flags (hexadecimal and additive) associated with the process.                                                                 |
| s       | The state of the process.                                                                                                     |
| c       | Processor utilization for scheduling (obsolete).                                                                              |
| uid     | The effective user ID number of the process as a decimal integer.                                                             |
| ruid    | The real user ID number of the process as a decimal integer.                                                                  |
| gid     | The effective group ID number of the process as a decimal integer.                                                            |
| rgid    | The real group ID number of the process as a decimal integer.                                                                 |
| projid  | The project ID number of the process as a decimal integer.                                                                    |
| project | The project ID of the process as a textual value if that value can be obtained; otherwise as a decimal integer.               |
| sid     | The process ID of the session leader.                                                                                         |
| taskid  | The task ID of the process.                                                                                                   |
| class   | The scheduling class of the process.                                                                                          |
| pri     | The priority of the process. Higher numbers mean higher priority.                                                             |
| opri    | The obsolete priority of the process. Lower numbers mean higher priority.                                                     |
| lwp     | The decimal value of the lwp ID. Requesting this formatting option causes one line to be printed for each lwp in the process. |
| nlwp    | The number of lwps in the process.                                                                                            |
| psr     | The number of the processor to which the process or lwp is bound.                                                             |
| addr    | The memory address of the process.                                                                                            |
| osz     | The total size of the process in virtual memory, in pages.                                                                    |
| wchan   | The address of an event for which the process is sleeping (if -, the process is running).                                     |
| stime   | The starting time or date of the process, printed with no blanks.                                                             |
| rss     | The resident set size of the process, in kilobytes.                                                                           |
| pmem    | The ratio of the process's resident set size to the physical memory on the machine, expressed as a percentage.                |
| fname   | The first 8 bytes of the base name of the process's executable file.                                                          |

Only `comm` and `args` are allowed to contain blank characters; all others, including the Solaris implementation variables, are not.

The following table specifies the default header to be used in the POSIX locale corresponding to each format specifier.

| <b>Format Specifier</b> | <b>Default Header</b> | <b>Format Specifier</b> | <b>Default Header</b> |
|-------------------------|-----------------------|-------------------------|-----------------------|
| args                    | COMMAND               | ppid                    | PPID                  |
| comm                    | COMMAND               | rgroup                  | RGROUP                |
| etime                   | ELAPSED               | ruser                   | RUSER                 |
| group                   | GROUP                 | time                    | TIME                  |
| nice                    | NI                    | tty                     | TT                    |
| pcpu                    | %CPU                  | user                    | USER                  |
| pgid                    | PGID                  | vsz                     | VSZ                   |
| pid                     | PID                   |                         |                       |

The following table lists the Solaris implementation format specifiers and the default header used with each.

| <b>Format Specifier</b> | <b>Default Header</b> | <b>Format Specifier</b> | <b>Default Header</b> |
|-------------------------|-----------------------|-------------------------|-----------------------|
| addr                    | ADDR                  | projid                  | PROJID                |
| c                       | C                     | project                 | PROJECT               |
| class                   | CLS                   | psr                     | PSR                   |
| f                       | F                     | rgid                    | RGID                  |
| fname                   | COMMAND               | rss                     | RSS                   |
| gid                     | GID                   | ruid                    | RUID                  |
| lwp                     | LWP                   | s                       | S                     |
| nlwp                    | NLWP                  | sid                     | SID                   |
| opri                    | PRI                   | stime                   | STIME                 |
| osz                     | SZ                    | taskid                  | TASKID                |
| pmem                    | %MEM                  | uid                     | UID                   |
| pri                     | PRI                   | wchan                   | WCHAN                 |

ps(1)

**EXAMPLES**

**EXAMPLE 1** An example of the ps command

The command:

```
example% ps -o user,pid,ppid=MOM -o args
```

writes the following in the POSIX locale:

```
USER PID MOM COMMAND
```

```
helene 34 12 ps -o uid,pid,ppid=MOM -o args
```

The contents of the COMMAND field need not be the same due to possible truncation.

**ENVIRONMENT VARIABLES**

See [environ\(5\)](#) for descriptions of the following environment variables that affect the execution of ps: LC\_CTYPE, LC\_MESSAGES, LC\_TIME, and NLSPATH.

**COLUMNS** Override the system-selected horizontal screen size, used to determine the number of text columns to display.

**EXIT STATUS**

The following exit values are returned:

0 Successful completion.  
>0 An error occurred.

**FILES**

/dev/pts/\*  
/dev/term/\* terminal (“tty”) names searcher files  
/etc/passwd UID information supplier  
/proc/\* process control files  
/tmp/ps\_data internal data structure

**ATTRIBUTES**

See [attributes\(5\)](#) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE     |
|----------------|---------------------|
| Availability   | SUNWcsu             |
| CSI            | Enabled (see NOTES) |

**SEE ALSO**

[kill\(1\)](#), [nice\(1\)](#), [pagesize\(1\)](#), [pgrep\(1\)](#), [priosctl\(1\)](#), [who\(1\)](#), [getty\(1M\)](#), [proc\(4\)](#), [ttypsrch\(4\)](#), [attributes\(5\)](#), [environ\(5\)](#)

**NOTES**

Things can change while ps is running; the snap-shot it gives is true only for a split-second, and it may not be accurate by the time you see it. Some data printed for defunct processes is irrelevant.

If no options to select processes are specified, `ps` will report all processes associated with the controlling terminal. If there is no controlling terminal, there will be no report other than the header.

`ps -ef` or `ps -o stime` may not report the actual start of a tty login session, but rather an earlier time, when a `getty` was last respawned on the tty line.

`ps` is CSI-enabled except for login names (usernames).

ps(1B)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>NAME</b>        | ps – display the status of current processes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>    | <code>/usr/ucb/ps [-aceglnrSuUvwx] [-t <i>term</i>] [<i>num</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>DESCRIPTION</b> | <p>The <code>ps</code> command displays information about processes. Normally, only those processes that are running with your effective user ID and are attached to a controlling terminal (see <code>termio(7I)</code>) are shown. Additional categories of processes can be added to the display using various options. In particular, the <code>-a</code> option allows you to include processes that are not owned by you (that do not have your user ID), and the <code>-x</code> option allows you to include processes without controlling terminals. When you specify both <code>-a</code> and <code>-x</code>, you get processes owned by anyone, with or without a controlling terminal. The <code>-r</code> option restricts the list of processes printed to running and runnable processes.</p> <p><code>ps</code> displays in tabular form the process ID, under <code>PID</code>; the controlling terminal (if any), under <code>TT</code>; the cpu time used by the process so far, including both user and system time, under <code>TIME</code>; the state of the process, under <code>S</code>; and finally, an indication of the <code>COMMAND</code> that is running.</p> <p>The state is given by a single letter from the following:</p> <ul style="list-style-type: none"><li><code>O</code> Process is running on a processor.</li><li><code>S</code> Sleeping. Process is waiting for an event to complete.</li><li><code>R</code> Runnable. Process is on run queue.</li><li><code>Z</code> Zombie state. Process terminated and parent not waiting.</li><li><code>T</code> Traced. Process stopped by a signal because parent is tracing it.</li></ul> |
| <b>OPTIONS</b>     | <p>The following options must all be combined to form the first argument:</p> <ul style="list-style-type: none"><li><code>-a</code> Include information about processes owned by others.</li><li><code>-c</code> Display the command name rather than the command arguments.</li><li><code>-e</code> Display the environment as well as the arguments to the command.</li><li><code>-g</code> Display all processes. Without this option, <code>ps</code> only prints interesting processes. Processes are deemed to be uninteresting if they are process group leaders. This normally eliminates top-level command interpreters and processes waiting for users to login on free terminals.</li><li><code>-l</code> Display a long listing, with fields <code>F</code>, <code>PPID</code>, <code>CP</code>, <code>PRI</code>, <code>NI</code>, <code>SZ</code>, <code>RSS</code> and <code>WCHAN</code> as described below.</li><li><code>-n</code> Produce numerical output for some fields. In a user listing, the <code>USER</code> field is replaced by a <code>UID</code> field.</li><li><code>-r</code> Restrict output to running and runnable processes.</li><li><code>-s</code> Display accumulated CPU time used by this process and all of its reaped children.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                              |

- u Display user-oriented output. This includes fields `USER`, `%CPU`, `%MEM`, `SZ`, `RSS` and `START` as described below.
- U Update a private database where `ps` keeps system information.
- v Display a version of the output containing virtual memory. This includes fields `SIZE`, `%CPU`, `%MEM`, and `RSS`, described below.
- w Use a wide output format (132 columns rather than 80); if repeated, that is, `-ww`, use arbitrarily wide output. This information is used to decide how much of long commands to print.
- x Include processes with no controlling terminal.
- t *term* List only process data associated with the terminal, *term*. Terminal identifiers may be specified in one of two forms: the device's file name (for example, `tty04` or `term/14`) or, if the device's file name starts with `tty`, just the digit identifier (for example, `04`).
- num* A process number may be given, in which case the output is restricted to that process. This option must be supplied last.

**DISPLAY FORMATS**

Fields that are not common to all output formats:

|                    |                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>USER</code>  | Name of the owner of the process.                                                                                                                                                      |
| <code>%CPU</code>  | CPU use of the process; this is a decaying average over up to a minute of previous (real) time.                                                                                        |
| <code>NI</code>    | Process scheduling increment (see <code>getpriority(3C)</code> and <code>nice(3UCB)</code> ).                                                                                          |
| <code>SIZE</code>  | The total size of the process in virtual memory, including all mapped files and devices, in kilobyte units.                                                                            |
| <code>SZ</code>    | Same as <code>SIZE</code> .                                                                                                                                                            |
| <code>RSS</code>   | Real memory (resident set) size of the process, in kilobyte units.                                                                                                                     |
| <code>UID</code>   | Numerical user-ID of process owner.                                                                                                                                                    |
| <code>PPID</code>  | Numerical ID of parent of process.                                                                                                                                                     |
| <code>CP</code>    | Short-term CPU utilization factor (used in scheduling).                                                                                                                                |
| <code>PRI</code>   | The priority of the process (higher numbers mean lower priority).                                                                                                                      |
| <code>START</code> | The starting time of the process, given in hours, minutes, and seconds. A process begun more than 24 hours before the <code>ps</code> inquiry is executed is given in months and days. |
| <code>WCHAN</code> | The address of an event for which the process is sleeping (if blank, the process is running).                                                                                          |
| <code>%MEM</code>  | The ratio of the process's resident set size to the physical memory on the machine, expressed as a percentage.                                                                         |

ps(1B)

F Flags (hexadecimal and additive) associated with the process. These flags are available for historical purposes; no meaning should be currently ascribed to them.

A process that has exited and has a parent, but has not yet been waited for by the parent is marked <defunct> ; otherwise, ps tries to determine the command name and arguments given when the process was created by examining the user block.

**FILES**

- /dev
- /dev/kmem kernel virtual memory
- /dev/mem memory
- /dev/swap default swap device
- /dev/sxt/\*
- /dev/tty\*
- /dev/xt/\* terminal ( tty ) names searcher files
- /etc/passwd UID information supplier
- /etc/ps\_data internal data structure

**ATTRIBUTES**

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWscpu        |

**SEE ALSO**

kill(1), ps(1), whodo(1M), getpriority(3C), nice(3UCB), proc(4), attributes(5), termio(7I)

**NOTES**

Things can change while ps is running; the picture it gives is only a close approximation to the current state. Some data printed for defunct processes is irrelevant.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>NAME</b>        | pvs – display the internal version information of dynamic objects                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SYNOPSIS</b>    | <b>pvs</b> [-Cdlnorsv] [-N <i>name</i> ] <i>file</i> ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | <p>The <code>pvs</code> utility displays any internal version information contained within an ELF file. Commonly, these files are dynamic executables and shared objects, and possibly relocatable objects. This version information can fall into one of two categories:</p> <ul style="list-style-type: none"> <li>■ version definitions</li> <li>■ version dependencies</li> </ul> <p>Version <i>definitions</i> describe the interfaces made available by an ELF file. Each version definition is associated to a set of global symbols provided by the file. Version definitions may be assigned to a file during its creation by the link-editor using the <code>-M</code> option and the associated <i>mapfile</i> directives (see the <i>Linker and Libraries Guide</i> for more details).</p> <p>Version <i>dependencies</i> describe the binding requirements of dynamic objects on the version definitions of any shared object dependencies. When a dynamic object is built with a shared object, the link-editor records information within the dynamic object indicating that the shared object is a dependency. This dependency must be satisfied at runtime. If the shared object also contains version <i>definitions</i>, then those version definitions that satisfy the global symbol requirements of the dynamic object will also be recorded in the dynamic object being created. At process initialization, the runtime linker will use any version <i>dependencies</i> as a means of validating the interface requirements of the dynamic objects used to construct the process.</p>   |
| <b>OPTIONS</b>     | <p>The following options are supported. If neither the <code>-d</code> or <code>-r</code> options are specified, both will be enabled.</p> <ul style="list-style-type: none"> <li><code>-C</code>        Demangles C++ symbol names.</li> <li><code>-d</code>        Prints version definition information.</li> <li><code>-l</code>        When used with the <code>-s</code> option, prints any symbols that have been reduced from global to local binding due to versioning. By convention, these symbol entries are located in the <i>.symtab</i> section, and fall between the <i>FILE</i> symbol representing the output file, and the <i>FILE</i> symbol representing the first input file used to generate the output file. These reduced symbol entries are assigned the fabricated version definition <code>_REDUCED_</code>. No reduced symbols will be printed if the file has been stripped (see <code>strip(1)</code>), or if the symbol entry convention cannot be determined.</li> <li><code>-n</code>        Normalizes version definition information. By default, all version definitions within the object are displayed. However, version definitions may inherit other version definitions, and under normalization only the head of each inheritance list is displayed.</li> <li><code>-N <i>name</i></code>   Prints only the information for the given version definition <i>name</i> and any of its inherited version definitions (when used with the <code>-d</code> option), or for the given dependency file <i>name</i> (when used with the <code>-r</code> option).</li> </ul> |

pvs(1)

- o Creates one-line version definition output. By default, file, version definitions, and any symbol output is indented to ease human inspection. This option prefixes each output line with the file and version definition name and may be more useful for analysis with automated tools.
- r Prints version dependency (requirements) information.
- s Prints the symbols associated with each version definition. Any data symbols are accompanied with the size, in bytes, of the data item.
- v Verbose output. Indicates any weak version definitions, and any version definition inheritance. When used with the -N and -d options, the inheritance of the base version definition is also shown. When used with the -s option, the version symbol definition is also shown.

**OPERANDS** The following operands are supported.

*file* The ELF file about which internal version information is displayed.

**EXAMPLES** **EXAMPLE 1** Displaying version definitions

The following example displays the version definitions of `libelf.so.1`:

```
% pvs -d /usr/lib/libelf.so.1
libelf.so.1;
SUNW_1.1
```

**EXAMPLE 2** Creating a one-liner display

A normalized, one-liner display, suitable for creating a *mapfile* version control directive, can be created using the -n and -o options:

```
% pvs -don /usr/lib/libelf.so.1
/usr/lib/libelf.so.1 - SUNW_1.1;
```

**EXAMPLE 3** Displaying version requirements

The following example displays the version requirements of `ldd` and `pvs`:

```
% pvs -r /usr/bin/ldd /usr/bin/pvs
/usr/bin/ldd:
libelf.so.1 (SUNW_1.1);
libc.so.1 (SUNW_1.1);
/usr/bin/pvs:
libelf.so.1 (SUNW_1.1);
libc.so.1 (SUNW_1.1);
```

**EXIT STATUS** If the requested version information is not found, a non-zero value is returned; otherwise a 0 value is returned.

Version information is determined not found when any of the following is true:

- the -d option is specified and no version definitions are found;

pvs(1)

- the `-r` option is specified and no version requirements are found;
- neither the `-d` nor `-r` option is specified and no version definitions or version requirements are found.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWtoo         |

**SEE ALSO** `ld(1)`, `ldd(1)`, `strip(1)`, `elf(3ELF)`, `attributes(5)`

*Linker and Libraries Guide*

pwd(1)

**NAME** pwd – return working directory name

**SYNOPSIS** /usr/bin/pwd

**DESCRIPTION** pwd writes an absolute path name of the current working directory to standard output.

Both the Bourne shell, sh(1), and the Korn shell, ksh(1), also have a built-in pwd command.

**ENVIRONMENT VARIABLES** See environ(5) for descriptions of the following environment variables that affect the execution of pwd: LC\_MESSAGES and NLS\_PATH.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

If an error is detected, output will not be written to standard output, a diagnostic message will be written to standard error, and the exit status will not be 0.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | enabled         |

**SEE ALSO** cd(1), ksh(1), sh(1), shell\_builtins(1), attributes(5), environ(5)

**DIAGNOSTICS** “Cannot open . .” and “Read error in . .” indicate possible file system trouble and should be referred to a UNIX system administrator.

**NOTES** If you move the current directory or one above it, pwd may not give the correct response. Use the cd(1) command with a full path name to correct this situation.

| <b>NAME</b>        | ranlib – convert archives to random libraries                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|-----------|
| <b>SYNOPSIS</b>    | <code>/usr/ccs/bin/ranlib archive</code>                                                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |           |
| <b>DESCRIPTION</b> | <p>ranlib was used in SunOS 4.x to add a table of contents to archive libraries, which converted each archive to a form that could be linked more rapidly. This is no longer needed as the ar(1) command automatically provides all the functionality ranlib used to provide.</p> <p>This script is provided as a convenience for software developers who need to maintain Makefiles that are portable across a variety of operating systems.</p> |                |                 |              |           |
| <b>EXIT STATUS</b> | ranlib has exit status 0.                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |           |

| <b>NAME</b>        | <code>rcp</code> – remote file copy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>SYNOPSIS</b>    | <code>rcp [-p] filename1 filename2</code><br><code>rcp [-pr] filename... directory</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | <p>The <code>rcp</code> command copies files between machines. Each <i>filename</i> or <i>directory</i> argument is either a remote file name of the form:</p> <p><i>hostname: path</i> or a local file name (containing no ":" (colon) characters, or "/" (backslash) before any ":" (colon) characters).</p> <p>The <i>hostname</i> can be an IPv4 or IPv6 address string. See <code>inet(7P)</code> and <code>inet6(7P)</code>. Since IPv6 addresses already contain colons, the <i>hostname</i> should be enclosed in a pair of square brackets. when an IPv6 address is used. Otherwise the first occurrence of a colon can be interpreted as the separator between <i>hostname</i> and <i>path</i>. For example,</p> <pre>[1080::8:800:200C:417A]:tmp/file</pre> <p>If a <i>filename</i> is not a full path name, it is interpreted relative to your home directory on <i>hostname</i>. A <i>path</i> on a remote host may be quoted using <code>\</code>, <code>"</code>, or <code>'</code>, so that the metacharacters are interpreted remotely.</p> <p><code>rcp</code> does not prompt for passwords; your current local user name must exist on <i>hostname</i> and allow remote command execution by <code>rsh(1)</code>.</p> <p><code>rcp</code> handles third party copies, where neither source nor target files are on the current machine. Hostnames may also take the form</p> <p><i>username@hostname:filename</i> to use <i>username</i> rather than your current local user name as the user name on the remote host. <code>rcp</code> also supports Internet domain addressing of the remote host, so that:</p> <p><i>username@host.domain:filename</i> specifies the username to be used, the hostname, and the domain in which that host resides. File names that are not full path names will be interpreted relative to the home directory of the user named <i>username</i>, on the remote host.</p> |
| <b>OPTIONS</b>     | <p><code>-p</code> Attempt to give each copy the same modification times, access times, modes, and ACLs if applicable as the original file.</p> <p><code>-r</code> Copy each subtree rooted at <i>filename</i>; in this case the destination must be a directory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>USAGE</b>       | <p>See <code>largefile(5)</code> for the description of the behavior of <code>rcp</code> when encountering files greater than or equal to 2 Gbyte ( <math>2^{31}</math> bytes).</p> <p>The <code>rcp</code> command is IPv6-enabled. See <code>ip6(7P)</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**FILES** \$HOME/.profile

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | Enabled         |

**SEE ALSO** `cpio(1)`, `ftp(1)`, `rlogin(1)`, `rsh(1)`, `setfacl(1)`, `tar(1)`, `hosts.equiv(4)`, `attributes(5)`, `largefile(5)`, `inet(7P)`, `inet6(7P)`, `ip6(7P)`

**NOTES** `rcp` is meant to copy between different hosts; attempting to `rcp` a file onto itself, as with:

```
example% rcp tmp/file myhost:/tmp/file results in a severely corrupted file.
```

`rcp` may not correctly fail when the target of a copy is a file instead of a directory.

`rcp` can become confused by output generated by commands in a `$HOME/.profile` on the remote host.

`rcp` requires that the source host have permission to execute commands on the remote host when doing third-party copies.

`rcp` does not properly handle symbolic links. Use `tar` or `cpio` piped to `rsh` to obtain remote copies of directories containing symbolic links or named pipes. See `tar(1)` and `cpio(1)`

If you forget to quote metacharacters intended for the remote host, you will get an incomprehensible error message.

`rcp` will fail if you copy ACLs to a file system that does not support ACLs.

`rcp` is CSI-enabled except for the handling of username, hostname, and domain.

| <b>NAME</b>        | <code>rdist</code> – remote file distribution program                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>SYNOPSIS</b>    | <pre><b>rdist</b> [-b] [-D] [-h] [-i] [-n] [-q] [-R] [-v] [-w] [-y] [-d <i>macro</i> =<br/>value] [-f <i>distfile</i>] [-m <i>host</i>]...<br/><br/><b>rdist</b> [-b] [-D] [-h] [-i] [-n] [-q] [-R] [-v] [-w] [-y] -c <i>pathname</i>...<br/>[<i>login</i> @] <i>hostname</i> [: <i>destpath</i>]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>DESCRIPTION</b> | <p>The <code>rdist</code> utility maintains copies of files on multiple hosts. It preserves the owner, group, mode, and modification time of the master copies, and can update programs that are executing. (Note: <code>rdist</code> does not propagate ownership or mode changes when the file contents have not changed.) Normally, a copy on a remote host is updated if its size or modification time differs from the original on the local host.</p> <p>There are two forms of the <code>rdist</code> command. In the first form shown in the <b>SYNOPSIS</b> section above, <code>rdist</code> reads the indicated <i>distfile</i> for instructions on updating files and/or directories. If <i>distfile</i> is <code>'-'</code>, the standard input is used. If no <code>-f</code> option is present, <code>rdist</code> first looks in its working directory for <i>distfile</i>, and then for <i>Distfile</i>, for instructions.</p> <p>The second form shown in <b>SYNOPSIS</b> uses the <code>-c</code> option and specifies paths as command line options.</p> <p>In order to be able to use <code>rdist</code> across machines, each host machine must have a <code>/etc/host.equiv</code> file, or the user must have an entry in the <code>.rhosts</code> file in the home directory. See <code>hosts.equiv(4)</code> for more information.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li><code>-b</code><br/>Binary comparison. Performs a binary comparison and updates files if they differ, rather than merely comparing dates and sizes.</li><li><code>-D</code><br/>Enables debugging.</li><li><code>-h</code><br/>Follows symbolic links. Copies the file that the link points to rather than the link itself.</li><li><code>-i</code><br/>Ignores unresolved links. <code>rdist</code> will normally try to maintain the link structure of files being transferred and warn the user if all the links cannot be found.</li><li><code>-n</code><br/>Prints the commands without executing them. This option is useful for debugging a <i>distfile</i>.</li><li><code>-q</code><br/>Quiet mode. Does not display the files being updated on the standard output.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -R                                                    | Removes extraneous files. If a directory is being updated, removes files on the remote host that do not correspond to those in the master (local) directory. This is useful for maintaining truly identical copies of directories.                                                                                                                                                                                                                                                                                                                                                                                                                                |
| -v                                                    | Verifies that the files are up to date on all the hosts. Any files that are out of date are displayed, but no files are updated, nor is any mail sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| -w                                                    | Whole mode. The whole file name is appended to the destination directory name. Normally, only the last component of a name is used when renaming files. This preserves the directory structure of the files being copied, instead of flattening the directory structure. For instance, renaming a list of files such as <code>dir1/dir2</code> to <code>dir3</code> would create files <code>dir3/dir1</code> and <code>dir3/dir2</code> instead of <code>dir3</code> and <code>dir3</code> . When the <code>-w</code> option is used with a filename that begins with <code>~</code> , everything except the home directory is appended to the destination name. |
| -Y                                                    | Younger mode. Does not update remote copies that are younger than the master copy, but issues a warning message instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| -d <i>macro=value</i>                                 | Defines <i>macro</i> to have <i>value</i> . This option is used to define or override macro definitions in the distfile. <i>value</i> can be the empty string, one name, or a list of names surrounded by parentheses and separated by white space.                                                                                                                                                                                                                                                                                                                                                                                                               |
| -c <i>pathname . . . [login @]hostname[:destpath]</i> | Copies each <i>pathname</i> to the named host; if <i>destpath</i> is specified, it will not update any <i>pathname</i> on the named host. (Relative filenames are taken as relative to your home directory.) If the ' <i>login @</i> ' prefix is given, the update is performed with the user ID of <i>login</i> . If the ' <i>:destpath</i> ' is given, the remote file is installed as that <i>pathname</i> .                                                                                                                                                                                                                                                   |
| -f <i>distfile</i>                                    | Uses the description file <i>distfile</i> . A '-' as the <i>distfile</i> argument denotes the standard input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| -m <i>host</i>                                        | Limits which machines are to be updated. Multiple <code>-m</code> arguments can be given to limit updates to a subset of the hosts listed in the distfile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>White Space Characters</b>                         | NEWLINE, TAB, and SPACE characters are all treated as white space; a mapping continues across input lines until the start of the next mapping: either a single <i>filename</i> followed by a '->' or the opening parenthesis of a filename list.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Comments</b>                                       | Comments begin with # and end with a NEWLINE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Distfiles</b>                                      | The distfile contains a sequence of entries that specify the files to be copied, the destination files to be copied, the destination hosts, and what operations to perform to do the updating. Each entry has one of the following formats:                                                                                                                                                                                                                                                                                                                                                                                                                       |

## rdist(1)

*variable\_name* '=' *name\_list*

[ *label*: ] *source\_list* '->' *destination\_list* *command\_list*

[ *label*: ] *source\_list* '::' *time\_stamp\_file* *command\_list*

The first format is used for defining variables. The second format is used for distributing files to other hosts. The third format is used for making lists of files that have been changed since some given date. The source list specifies a list of files and/or directories on the local host that are to be used as the master copy for distribution. The destination list is the list of hosts to which these files are to be copied. Each file in the source list is added to a list of changes if the file is out of date on the host that is being updated (second format) or if the file is newer than the time stamp file (third format). Labels are optional. They are used to identify a command for partial updates. The colon (:) is used after an optional label, while the double colon (: :) is used for making lists of files that have been changed since a certain date (specified by the date/time of the *time\_stamp* file). Typically, only `notify` is used with the '::' format of the command line.

**Macros** `rdist` has a limited macro facility. Macros are only expanded in filename or hostname lists, and in the argument lists of certain primitives. Macros cannot be used to stand for primitives or their options, or the '->' or '::' symbols.

A macro definition is a line of the form:

*macro* = *value*

A macro reference is a string of the form:

`#{macro}`

although (as with `make(1S)`) the braces can be omitted if the macro name consists of just one character.

**Metacharacters** The shell meta-characters: `[, ], {, }, *, *` and `?` are recognized and expanded (on the local host only) just as they are with `cs(1)`. Metacharacters can be escaped by prepending a backslash.

The `~` character is also expanded in the same way as with `cs(1)`; however, it is expanded separately on the local and destination hosts.

**Filenames** File names that do not begin with `/` or `~` are taken to be relative to user's home directory on each destination host; they are *not* relative to the current working directory. Multiple file names must be enclosed within parentheses.

**Primitives** The following primitives can be used to specify actions `rdist` is to take when updating remote copies of each file.

`install [-b] [-h] [-i] [-R] [-v] [-w] [-y] [newname]`

Copy out of date files and directories (recursively). If no *newname* operand is given, the name of the local file is given to the remote host's copy. If absent from the remote host, parent directories in a filename's path are created. To help prevent

disasters, a non-empty directory on a target host is not replaced with a regular file or a symbolic link by `rdist`. However, when using the `-R` option, a non-empty directory is removed if the corresponding filename is completely absent on the master host.

The options for `install` have the same semantics as their command line counterparts, but are limited in scope to a particular map. The login name used on the destination host is the same as the local host unless the destination name is of the format `login@host`. In that case, the update is performed under the username `login`.

`notify address . . .`

Send mail to the indicated email `address` of the form:

`user@host`

that lists the files updated and any errors that may have occurred. If an address does not contain a `'@host'` suffix, `rdist` uses the name of the destination host to complete the address.

`except filename . . .`

Omit from updates the files named as arguments.

`except_pat pattern . . .`

Omit from updates the filenames that match each regular-expression `pattern` (see `ed(1)` for more information on regular expressions). Note that `'\'` and `'$'` characters must be escaped in the distfile. Shell variables can also be used within a pattern, however shell filename expansion is not supported.

`special [filename] . . . "command-line "`

Specify a Bourne shell, `sh(1)` command line to execute on the remote host after each named file is updated. If no `filename` argument is present, the `command-line` is performed for every updated file, with the shell variable `FILE` set to the file's name on the local host. The quotation marks allow `command-line` to span input lines in the distfile; multiple shell commands must be separated by semicolons (`;`).

The default working directory for the shell executing each `command-line` is the user's home directory on the remote host.

**IPv6** The `ftp` command is IPv6-enabled. See `ip6(7P)`.

## EXAMPLES **EXAMPLE 1** A sample distfile

The following sample distfile instructs `rdist` to maintain identical copies of a shared library, a shared-library initialized data file, several include files, and a directory, on hosts named `hermes` and `magus`. On `magus`, commands are executed as `super-user`. `rdist` notifies `merlin@druid` whenever it discovers that a local file has changed relative to a timestamp file. (Parentheses are used when the source or destination list contains zero or more names separated by white-space.)

## rdist(1)

### EXAMPLE 1 A sample distfile *(Continued)*

```
HOSTS = (hermes root@magus)

FILES = (/usr/local/lib/libcant.so.1.1
 /usrlocal/lib/libcant.sa.1.1 /usr/local/include/{*.h}
 /usr/local/bin)

({FILES}) -> ({HOSTS})
 install -R ;
${FILES} :: /usr/local/lib/timestamp
 notify merlin@druid ;
```

**FILES** ~/ .rhosts user's trusted hosts and users  
/etc/host.equiv system trusted hosts and users  
/tmp/rdist\* temporary file for update lists

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `cs(1)`, `ed(1)`, `make(1S)`, `sh(1)`, `stat(2)`, `hosts.equiv(4)`, `attributes(5)`, `ip6(7P)`

**DIAGNOSTICS** A complaint about mismatch of `rdist` version numbers may really stem from some problem with starting your shell, for example, you are in too many groups.

**WARNINGS** The super-user does not have its accustomed access privileges on NFS mounted file systems. Using `rdist` to copy to such a file system may fail, or the copies may be owned by user "nobody".

**BUGS** Source files must reside or be mounted on the local host.

There is no easy way to have a special command executed only once after all files in a directory have been updated.

Variable expansion only works for name lists; there should be a general macro facility.

`rdist` aborts on files that have a negative modification time (before Jan 1, 1970).

There should be a "force" option to allow replacement of non-empty directories by regular files or symlinks. A means of updating file modes and owners of otherwise identical files is also needed.

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>/usr/bin/read</b> | <p>The read utility will read a single line from standard input.</p> <p>By default, unless the <code>-r</code> option is specified, backslash (<code>\</code>) acts as an escape character. If standard input is a terminal device and the invoking shell is interactive, read will prompt for a continuation line when:</p> <ul style="list-style-type: none"> <li>■ The shell reads an input line ending with a backslash, unless the <code>-r</code> option is specified.</li> <li>■ A here-document is not terminated after a newline character is entered.</li> </ul> <p>The line will be split into fields as in the shell; the first field will be assigned to the first variable <i>var</i>, the second field to the second variable <i>var</i>, and so forth. If there are fewer <i>var</i> operands specified than there are fields, the leftover fields and their intervening separators will be assigned to the last <i>var</i>. If there are fewer fields than <i>vars</i>, the remaining <i>vars</i> will be set to empty strings.</p> <p>The setting of variables specified by the <i>var</i> operands will affect the current shell execution environment. If it is called in a subshell or separate utility execution environment, such as one of the following:</p> <pre>(read foo) nohup read ... find . -exec read ... \;</pre> <p>it will not affect the shell variables in the caller's environment.</p> <p>The standard input must be a text file.</p> |
| <b>sh</b>            | <p>One line is read from the standard input and, using the internal field separator, <code>IFS</code> (normally space or tab), to delimit word boundaries, the first word is assigned to the first <i>name</i>, the second word to the second <i>name</i>, etc., with leftover words assigned to the last <i>name</i>. Lines can be continued using <code>\newline</code>. Characters other than <code>\newline</code> can be quoted by preceding them with a backslash. These backslashes are removed before words are assigned to <i>names</i>, and no interpretation is done on the character that follows the backslash. The return code is 0, unless an EOF is encountered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ksh</b>                   | The shell input mechanism. One line is read and is broken up into fields using the characters in IFS as separators. The escape character, (\), is used to remove any special meaning for the next character and for line continuation. In raw mode, -r, the \ character is not treated specially. The first field is assigned to the first <i>name</i> , the second field to the second <i>name</i> , etc., with leftover fields assigned to the last <i>name</i> . The -p option causes the input line to be taken from the input pipe of a process spawned by the shell using  &. If the -s flag is present, the input will be saved as a command in the history file. The flag -u can be used to specify a one digit file descriptor unit <i>n</i> to read from. The file descriptor can be opened with the <code>exec</code> special command. The default value of <i>n</i> is 0. If <i>name</i> is omitted then <code>REPLY</code> is used as the default <i>name</i> . The exit status is 0 unless the input file is not open for reading or an end-of-file is encountered. An end-of-file with the -p option causes cleanup for this process so that another can be spawned. If the first argument contains a ?, the remainder of this word is used as a <i>prompt</i> on standard error when the shell is interactive. The exit status is 0 unless an end-of-file is encountered. |
| <b>OPTIONS</b>               | The following option is supported:<br><br>-r            Do not treat a backslash character in any special way. Consider each backslash to be part of the input line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>OPERANDS</b>              | The following operand is supported:<br><br><i>var</i> The name of an existing or non-existing shell variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>EXAMPLES</b>              | <b>EXAMPLE 1</b> An example of the <code>read</code> command.<br><br>The following example for <code>/usr/bin/read</code> prints a file with the first field of each line moved to the end of the line.<br><br><pre>while read -r xx yy do     printf "%s %s\n" "\$yy" "\$xx" done &lt; input_file</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ENVIRONMENT VARIABLES</b> | See <code>environ(5)</code> for descriptions of the following environment variables that affect the execution of <code>read</code> : <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , and <code>NLSPATH</code> .<br><br>IFS            Determine the internal field separators used to delimit fields.<br><br>PS2            Provide the prompt string that an interactive shell will write to standard error when a line ending with a backslash is read and the -r option was not specified, or if a here-document is not terminated after a newline character is entered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>SYNOPSIS</b>    | <b>readfile</b> <i>filename</i><br><b>longline</b> [ <i>filename</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The <code>readfile</code> function reads <i>filename</i> and copies it to <i>stdout</i>. No translation of NEWLINE is done. It keeps track of the longest line it reads and if there is a subsequent call to <code>longline</code>, the length of that line, including the NEWLINE character, is returned.</p> <p>The <code>longline</code> function returns the length, including the NEWLINE character, of the longest line in <i>filename</i>. If <i>filename</i> is not specified, it uses the file named in the last call to <code>readfile</code>.</p> |                |                 |              |         |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Here is a typical use of <code>readfile</code> and <code>longline</code> in a text frame definition file:</p> <p>Here is a typical use of <code>readfile</code> and <code>longline</code> in a text frame definition file:</p> <pre>.<br/>. .<br/>text=`readfile myfile`<br/>columns=`longline`<br/>. .<br/>.</pre>                                                                                                                                                                                                                         |                |                 |              |         |

| Availability       | SUNWcsu                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |
| <b>SEE ALSO</b>    | <code>cat(1)</code> , <code>attributes(5)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |              |         |
| <b>DIAGNOSTICS</b> | <p>If <i>filename</i> does not exist, <code>readfile</code> will return <code>FALSE</code> (that is, the expression will have an error return).</p> <p><code>longline</code> returns 0 if a <code>readfile</code> has not previously been issued.</p>                                                                                                                                                                                                                                                                                                           |                |                 |              |         |
| <b>NOTES</b>       | More than one descriptor can call <code>readfile</code> in the same frame definition file. In text frames, if one of those calls is made from the <code>text</code> descriptor, then a subsequent use of <code>longline</code> will always get the longest line of the file read by the <code>readfile</code> associated with the <code>text</code> descriptor, even if it was not the most recent use of <code>readfile</code> .                                                                                                                               |                |                 |              |         |

**NAME** readonly – shell built-in function to protect the value of the given variable from reassignment

**sh** **readonly** [*name*...]

**ksh** **\*\*readonly** [*name* [= *value*] ...]

**sh** The given *names* are marked `readonly` and the values of these *names* may not be changed by subsequent assignment. If no arguments are given, a list of all `readonly` names is printed.

**ksh** The given *names* are marked `readonly` and these names cannot be changed by subsequent assignment.

On this man page, `ksh(1)` commands that are preceded by one or two `**` (asterisks) are treated specially in the following ways:

1. Variable assignment lists preceding the command remain in effect when the command completes.
2. I/O redirections are processed after variable assignments.
3. Errors cause a script that contains them to abort.
4. Words, following a command preceded by `**` that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the `=` sign and word splitting and file name generation are not performed.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| <b>NAME</b>        | refer – expand and insert references from a bibliographic database                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>    | <b>refer</b> [-ben] [-ar] [-cstring] [-kx] [-lm,n] [-p filename] [-skeys]<br>filename...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | <p>refer is a preprocessor for nroff(1), or troff(1), that finds and formats references. The input files (standard input by default) are copied to the standard output, except for lines between ‘. [’ and ‘. ]’ command lines, Such lines are assumed to contain keywords as for lookbib(1), and are replaced by information from a bibliographic data base. The user can avoid the search, override fields from it, or add new fields. The reference data, from whatever source, is assigned to a set of troff strings. Macro packages such as ms(5) print the finished reference text from these strings. A flag is placed in the text at the point of reference. By default, the references are indicated by numbers.</p> <p>When refer is used with eqn(1), neqn, or tbl(1), refer should be used first in the sequence, to minimize the volume of data passed through pipes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>OPTIONS</b>     | <p>-b                   Bare mode — do not put any flags in text (neither numbers or labels).</p> <p>-e                   Accumulate references instead of leaving the references where encountered, until a sequence of the form:</p> <pre style="margin-left: 40px;">. [   \$LIST\$ .]</pre> <p>                    is encountered, and then write out all references collected so far. Collapse references to the same source.</p> <p>-n                   Do not search the default file.</p> <p>-ar                  Reverse the first <i>r</i> author names (Jones, J. A. instead of J. A. Jones). If <i>r</i> is omitted, all author names are reversed.</p> <p>-cstring            Capitalize (with SMALL CAPS) the fields whose key-letters are in <i>string</i>.</p> <p>-kx                  Instead of numbering references, use labels as specified in a reference data line beginning with the characters %<i>x</i>; By default, <i>x</i> is L.</p> <p>-lm,n                Instead of numbering references, use labels from the senior author’s last name and the year of publication. Only the first <i>m</i> letters of the last name and the last <i>n</i> digits of the date are used. If either of <i>m</i> or <i>n</i> is omitted, the entire name or date, respectively, is used.</p> <p>-p filename         Take the next argument as a file of references to be searched. The default file is searched last.</p> |

refer(1)

*-skeys* Sort references by fields whose key-letters are in the *keys* string, and permute reference numbers in the text accordingly. Using this option implies the *-e* option. The key-letters in *keys* may be followed by a number indicating how many such fields are used, with a + sign taken as a very large number. The default is AD, which sorts on the senior author and date. To sort on all authors and then the date, for instance, use the options '*-sA+T*'.

| <b>NAME</b>                  | regcmp – regular expression compile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>              | <b>regcmp</b> [-] <i>filename</i> ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b>           | The <b>regcmp</b> command performs a function similar to <b>regcmp</b> and, in most cases, precludes the need for calling <b>regcmp</b> from C programs. Bypassing <b>regcmp</b> saves on both execution time and program size. The command <b>regcmp</b> compiles the regular expressions in <i>filename</i> and places the output in <i>filename.i</i> .                                                                                                                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b>               | – If the – option is used, the output is placed in <i>filename.c</i> . The format of entries in <i>filename</i> is a name (C variable) followed by one or more blanks followed by one or more regular expressions enclosed in double quotes. The output of <b>regcmp</b> is C source code. Compiled regular expressions are represented as <code>extern char</code> vectors. <i>filename.i</i> files may thus be <code>#included</code> in C programs, or <i>filename.c</i> files may be compiled and later loaded. In the C program that uses the <b>regcmp</b> output, <code>regex(abc, line)</code> applies the regular expression named <code>abc</code> to <code>line</code> . Diagnostics are self-explanatory. |
| <b>EXAMPLES</b>              | <p><b>EXAMPLE 1</b> Examples of the <b>regcmp</b> command.</p> <pre>name      " ([A-Za-z] [A-Za-z0-9_]*) \$0 "</pre> <pre>telno     " \({0,1} ([2-9] [01] [1-9]) \$0\) {0,1} * "</pre> <pre>          " ([2-9] [0-9] {2}) \$1 [ -] {0,1} "</pre> <pre>          " ([0-9] {4}) \$2 "</pre>                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                              | The three arguments to <code>telno</code> shown above must all be entered on one line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                              | In the C program that uses the <b>regcmp</b> output,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                              | <pre>    regex(telno, line, area, exch, rest)</pre> applies the regular expression named <code>telno</code> to <code>line</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ENVIRONMENT VARIABLES</b> | A general description of the usage of the <code>LC_*</code> environmental variables can be found in <a href="#">environ(5)</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                              | <b>LC_CTYPE</b> Determines how <b>regcmp</b> handles characters. When <code>LC_CTYPE</code> is set to a valid value, <b>regcmp</b> can display and handle text and filenames containing valid characters for that locale.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                              | <b>LC_MESSAGES</b> Determines how diagnostic and informative messages are presented. This includes the language and style of the messages, and the correct form of affirmative and negative responses. In the "C" locale, the messages are presented in the default form found in the program itself (in most cases, U.S. English).                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>ATTRIBUTES</b>            | See <a href="#">attributes(5)</a> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>NAME</b>        | regex – match patterns against a string                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | <b>regex</b> [-e] [-v " <i>string</i> "] [ <i>pattern template</i> ] ... <i>pattern</i> [ <i>template</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>The <code>regex</code> command takes a string from the standard input, and a list of <i>pattern</i> / <i>template</i> pairs, and runs <code>regex()</code> to compare the string against each <i>pattern</i> until there is a match. When a match occurs, <code>regex</code> writes the corresponding <i>template</i> to the standard output and returns <code>TRUE</code>. The last (or only) <i>pattern</i> does not need a <i>template</i>. If that is the pattern that matches the string, the function simply returns <code>TRUE</code>. If no match is found, <code>regex</code> returns <code>FALSE</code>.</p> <p>The argument <i>pattern</i> is a regular expression of the form described in <code>regex()</code>. In most cases, <i>pattern</i> should be enclosed in single quotes to turn off special meanings of characters. Note that only the final <i>pattern</i> in the list may lack a <i>template</i>.</p> <p>The argument <i>template</i> may contain the strings <code>\$m0</code> through <code>\$m9</code>, which will be expanded to the part of <i>pattern</i> enclosed in <code>( . . . )\$0</code> through <code>( . . . )\$9</code> constructs (see examples below). Note that if you use this feature, you must be sure to enclose <i>template</i> in single quotes so that <code>FMLI</code> does not expand <code>\$m0</code> through <code>\$m9</code> at parse time. This feature gives <code>regex</code> much of the power of <code>cut(1)</code>, <code>paste(1)</code>, and <code>grep(1)</code>, and some of the capabilities of <code>sed(1)</code>. If there is no <i>template</i>, the default is <code>\$m0\$m1\$m2\$m3\$m4\$m5\$m6\$m7\$m8\$m9</code>.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li><code>-e</code> Evaluates the corresponding template and writes the result to the standard output.</li><li><code>-v "<i>string</i>"</code> Uses <i>string</i> instead of the standard input to match against patterns.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Cutting letters out of a string</p> <p>To cut the 4th through 8th letters out of a string (this example will output <code>strin</code> and return <code>TRUE</code>):</p> <pre>`regex -v "my string is nice" '^.{3}(.{5})\$0' '\$m0'`</pre> <p><b>EXAMPLE 2</b> Validating input in a form</p> <p>In a form, to validate input to field 5 as an integer:</p> <pre>valid=`regex -v "\$F5" '^ [0-9]+\$'`</pre> <p><b>EXAMPLE 3</b> Translating an environment variable in a form</p> <p>In a form, to translate an environment variable which contains one of the numbers 1, 2, 3, 4, 5 to the letters a, b, c, d, e:</p> <pre>value=`regex -v "\$VAR1" 1 a 2 b 3 c 4 d 5 e '.*' 'Error'`</pre> <p>Note the use of the pattern <code>' .* '</code> to mean "anything else".</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**EXAMPLE 4** Using backquoted expressions

In the example below, all three lines constitute a single backquoted expression. This expression, by itself, could be put in a menu definition file. Since backquoted expressions are expanded as they are parsed, and output from a backquoted expression (the `cat` command, in this example) becomes part of the definition file being parsed, this expression would read `/etc/passwd` and make a dynamic menu of all the login ids on the system.

```
`cat /etc/passwd | regex '^([:]*)$0.*$' `
name=$m0
action='message "$m0 is a user"```
```

**DIAGNOSTICS**

If none of the patterns match, `regex` returns `FALSE`, otherwise `TRUE`.

**NOTES**

Patterns and templates must often be enclosed in single quotes to turn off the special meanings of characters. Especially if you use the `$m0` through `$m9` variables in the template, since `FMLI` will expand the variables (usually to `""`) before `regex` even sees them.

Single characters in character classes (inside `[ ]`) must be listed before character ranges, otherwise they will not be recognized. For example, `[a-zA-Z_/_]` will not find underscores (`_`) or slashes (`/`), but `[_/_a-zA-Z]` will.

The regular expressions accepted by `regcmp` differ slightly from other utilities (that is, `sed`, `grep`, `awk`, `ed`, and so forth).

`regex` with the `-e` option forces subsequent commands to be ignored. In other words, if a backquoted statement appears as follows:

```
`regex -e ...; command1; command2`
```

`command1` and `command2` would never be executed. However, dividing the expression into two:

```
`regex -e ...``command1; command2`
```

would yield the desired result.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

reinit(1F)

**NAME** | reinit – runs an initialization file

**SYNOPSIS** | **reinit** *filename*

**DESCRIPTION** | The **reinit** command is used to change the values of descriptors defined in the initialization file that was named when **fml**i was invoked and/or define additional descriptors. FMLI will parse and evaluate the descriptors in *filename*, and then continue running the current application. The argument *filename* must be the name of a valid FMLI initialization file.

| The **reinit** command does not re-display the introductory frame or change the layout of screen labels for function keys.

**ATTRIBUTES** | See **attributes**(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

| <b>DESCRIPTION</b>               | <p>The renice command alters the scheduling priority of one or more running processes. By default, the processes to be affected are specified by their process IDs.</p> <p>If the first operand is a number within the valid range of priorities (–20 to 20), renice will treat it as a <i>priority</i> (as in all but the first synopsis form); otherwise, renice will treat it as an <i>ID</i> (as in the first synopsis form).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |    |                                                                                                        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                                                                            |    |                                                                                                                                               |
| <b>Altering Process Priority</b> | <p>Users other than the privileged user may only alter the priority of processes they own, and can only monotonically increase their “nice value” within the range 0 to 19. This prevents overriding administrative fiats. The privileged user may alter the priority of any process and set the priority to any value in the range –20 to 19. Useful priorities are: 19 (the affected processes will run only when nothing else in the system wants to), 0 (the “base” scheduling priority) and any negative value (to make things go very fast). 20 is an acceptable nice value, but will be rounded down to 19.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |                                                                                                        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                                                                            |    |                                                                                                                                               |
| <b>OPTIONS</b>                   | <p>renice supports the following option features:</p> <ul style="list-style-type: none"> <li>■ The first operand, <i>priority</i>, must precede the options and can have the appearance of a multi-digit option.</li> <li>■ The -g, -p and -u options can each take multiple option-arguments.</li> <li>■ The <i>pid</i> option-argument can be used without its -p option.</li> </ul> <p>The following options are supported:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;">-g</td> <td>Interpret all operands or just the <i>gid</i> arguments as unsigned decimal integer process group IDs.</td> </tr> <tr> <td style="padding-right: 20px;">-n<i>increment</i></td> <td>Specify how the system scheduling priority of the specified process or processes is to be adjusted. The <i>increment</i> option-argument is a positive or negative decimal integer that will be used to modify the system scheduling priority of the specified process or processes. Positive <i>increment</i> values cause a lower system scheduling priority. Negative <i>increment</i> values may require appropriate privileges and will cause a higher system scheduling priority.</td> </tr> <tr> <td style="padding-right: 20px;">-p</td> <td>Interpret all operands or just the <i>pid</i> arguments as unsigned decimal integer process IDs. The -p option is the default if no options are specified.</td> </tr> <tr> <td style="padding-right: 20px;">-u</td> <td>Interpret all operands or just the <i>user</i> argument as users. If a user exists with a user name equal to the operand, then the user ID of</td> </tr> </table> | -g | Interpret all operands or just the <i>gid</i> arguments as unsigned decimal integer process group IDs. | -n <i>increment</i> | Specify how the system scheduling priority of the specified process or processes is to be adjusted. The <i>increment</i> option-argument is a positive or negative decimal integer that will be used to modify the system scheduling priority of the specified process or processes. Positive <i>increment</i> values cause a lower system scheduling priority. Negative <i>increment</i> values may require appropriate privileges and will cause a higher system scheduling priority. | -p | Interpret all operands or just the <i>pid</i> arguments as unsigned decimal integer process IDs. The -p option is the default if no options are specified. | -u | Interpret all operands or just the <i>user</i> argument as users. If a user exists with a user name equal to the operand, then the user ID of |
| -g                               | Interpret all operands or just the <i>gid</i> arguments as unsigned decimal integer process group IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |                                                                                                        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                                                                            |    |                                                                                                                                               |
| -n <i>increment</i>              | Specify how the system scheduling priority of the specified process or processes is to be adjusted. The <i>increment</i> option-argument is a positive or negative decimal integer that will be used to modify the system scheduling priority of the specified process or processes. Positive <i>increment</i> values cause a lower system scheduling priority. Negative <i>increment</i> values may require appropriate privileges and will cause a higher system scheduling priority.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |    |                                                                                                        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                                                                            |    |                                                                                                                                               |
| -p                               | Interpret all operands or just the <i>pid</i> arguments as unsigned decimal integer process IDs. The -p option is the default if no options are specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |    |                                                                                                        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                                                                            |    |                                                                                                                                               |
| -u                               | Interpret all operands or just the <i>user</i> argument as users. If a user exists with a user name equal to the operand, then the user ID of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                                                                                                                            |    |                                                                                                                                               |

renice(1)

that user will be used in further processing. Otherwise, if the operand represents an unsigned decimal integer, it will be used as the numeric user ID of the user.

**OPERANDS** The following operands are supported:

*ID* A process ID, process group ID or user name/user ID, depending on the option selected.

*priority* The value specified is taken as the actual system scheduling priority, rather than as an increment to the existing system scheduling priority. Specifying a scheduling priority higher than that of the existing process may require appropriate privileges.

**EXAMPLES** **EXAMPLE 1** Examples of *renice*.

Adjust the system scheduling priority so that process IDs 987 and 32 would have a lower scheduling priority:

```
example% renice -n 5 -p 987 32
```

Adjust the system scheduling priority so that group IDs 324 and 76 would have a higher scheduling priority, if the user has the appropriate privileges to do so:

```
example% renice -n -4 -g 324 76
```

Adjust the system scheduling priority so that numeric user ID 8 and user *sas* would have a lower scheduling priority:

```
example% renice -n 4 -u 8 sas
```

**ENVIRONMENT VARIABLES** See *environ(5)* for descriptions of the following environment variables that affect the execution of *renice*: *LC\_CTYPE*, *LC\_MESSAGES*, and *NLSPATH*.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**FILES** */etc/passwd* map user names to user ID's

**ATTRIBUTES** See *attributes(5)* for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** *nice(1)*, *passwd(1)*, *priocntl(1)*, *attributes(5)*, *environ(5)*

**NOTES** If you make the priority very negative, then the process cannot be interrupted.

renice(1)

To regain control you must make the priority greater than 0.

Users other than the privileged user cannot increase scheduling priorities of their own processes, even if they were the ones that decreased the priorities in the first place.

The `prionctl` command subsumes the function of `renice`.

reset(1F)

**NAME** reset – reset the current form field to its default values

**SYNOPSIS** **reset**

**DESCRIPTION** The `reset` function changes the entry in a field of a form to its default value; that is, the value displayed when the form was opened.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `attributes(5)`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>NAME</b>        | rlogin – remote login                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SYNOPSIS</b>    | <b>rlogin</b> [-8EL] [-ec ] [-l <i>username</i> ] <i>hostname</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>rlogin establishes a remote login session from your terminal to the remote machine named <i>hostname</i>.</p> <p>Hostnames are listed in the <i>hosts</i> database, which may be contained in the <i>/etc/hosts</i> and <i>/etc/inet/ipnodes</i> files, the Network Information Service (NIS) hosts map, the Internet domain name server, or a combination of these. Each host has one official name (the first name in the database entry), and optionally one or more nicknames. Either official hostnames or nicknames may be specified in <i>hostname</i>.</p> <p>Each remote machine may have a file named <i>/etc/hosts.equiv</i> containing a list of trusted hostnames with which it shares usernames. Users with the same username on both the local and remote machine may rlogin from the machines listed in the remote machine's <i>/etc/hosts.equiv</i> file without supplying a password. Individual users may set up a similar private equivalence list with the file <i>.rhosts</i> in their home directories. Each line in this file contains two names: a <i>hostname</i> and a <i>username</i> separated by a space. An entry in a remote user's <i>.rhosts</i> file permits the user named <i>username</i> who is logged into <i>hostname</i> to log in to the remote machine as the remote user without supplying a password. If the name of the local host is not found in the <i>/etc/hosts.equiv</i> file on the remote machine, and the local username and hostname are not found in the remote user's <i>.rhosts</i> file, then the remote machine will prompt for a password. Hostnames listed in <i>/etc/hosts.equiv</i> and <i>.rhosts</i> files must be the official hostnames listed in the hosts database; nicknames may not be used in either of these files.</p> <p>For security reasons, the <i>.rhosts</i> file must be owned by either the remote user or by root.</p> <p>The remote terminal type is the same as your local terminal type (as given in your environment <code>TERM</code> variable). The terminal or window size is also copied to the remote system if the server supports the option, and changes in size are reflected as well. All echoing takes place at the remote site, so that (except for delays) the remote login is transparent. Flow control using CTRL-S and CTRL-Q and flushing of input and output on interrupts are handled properly.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-8                    Pass eight-bit data across the net instead of seven-bit data.</li> <li>-ec                   Specify a different escape character, <i>c</i>, for the line used to disconnect from the remote host.</li> <li>-E                    Stop any character from being recognized as an escape character.</li> <li>-l <i>username</i>        Specify a different <i>username</i> for the remote login. If you do not use this option, the remote username used is the same as your local username.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## rlogin(1)

|                         | -L                       | Allow the <i>rlogin</i> session to be run in "litout" mode.                                                                                                                                                 |                |                 |              |         |
|-------------------------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| <b>Escape Sequences</b> |                          | Lines that you type which start with the tilde character are "escape sequences" (the escape character can be changed using the <i>-e</i> option):                                                           |                |                 |              |         |
|                         | ~.                       | Disconnect from the remote host. This is not the same as a logout, because the local host breaks the connection with no warning to the remote end.                                                          |                |                 |              |         |
|                         | ~susp                    | Suspend the login session (only if you are using a shell with Job Control). <i>susp</i> is your "suspend" character, usually CTRL-Z; see <i>tty(1)</i> .                                                    |                |                 |              |         |
|                         | ~dsusp                   | Suspend the input half of the login, but output will still be seen (only if you are using a shell with Job Control). <i>dsusp</i> is your "deferred suspend" character, usually CTRL-Y; see <i>tty(1)</i> . |                |                 |              |         |
| <b>OPERANDS</b>         | <i>hostname</i>          | The remote machine on which <i>rlogin</i> establishes the remote login session.                                                                                                                             |                |                 |              |         |
| <b>FILES</b>            | <i>/etc/passwd</i>       | contains information about users' accounts                                                                                                                                                                  |                |                 |              |         |
|                         | <i>/usr/hosts/*</i>      | for <i>hostname</i> version of the command                                                                                                                                                                  |                |                 |              |         |
|                         | <i>/etc/hosts.equiv</i>  | list of trusted hostnames with shared usernames                                                                                                                                                             |                |                 |              |         |
|                         | <i>/etc/nologin</i>      | message displayed to users attempting to login during machine shutdown                                                                                                                                      |                |                 |              |         |
|                         | <i>\$HOME/.rhosts</i>    | private list of trusted hostname/username combinations                                                                                                                                                      |                |                 |              |         |

| <b>DIAGNOSTICS</b>      |                          | The following message indicates that the machine is in the process of being shutdown and logins have been disabled:<br><br>NO LOGINS: System going down in N minutes                                        |                |                 |              |         |

**NOTES** | When a system is listed in `hosts.equiv`, its security must be as good as local security. One insecure system listed in `hosts.equiv` can compromise the security of the entire system.

The Network Information Service (NIS) was formerly known as Sun Yellow Pages (YP). The functionality of the two remains the same; only the name has changed.

This implementation can only use the TCP network service.

| <b>NAME</b>                                 | rm, rmdir – remove directory entries                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>                             | <pre>/usr/bin/rm [-f] [-i] file...<br/>/usr/bin/rm -rR [-f] [-i] dirname... [file...]<br/>/usr/xpg4/bin/rm [-fiRr] file...<br/>/usr/bin/rmdir [-ps] dirname...</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <pre>/usr/bin/rm<br/>/usr/xpg4/bin/rm</pre> | <p>The <code>rm</code> utility removes the directory entry specified by each <i>file</i> argument. If a file has no write permission and the standard input is a terminal, the full set of permissions (in octal) for the file are printed followed by a question mark. This is a prompt for confirmation. If the answer begins with <i>y</i> (for yes), the file is deleted, otherwise the file remains.</p> <p>If <i>file</i> is a symbolic link, the link will be removed, but the file or directory to which it refers will not be deleted. Users do not need write permission to remove a symbolic link, provided they have write permissions in the directory.</p> <p>If multiple <i>files</i> are specified and removal of a <i>file</i> fails for any reason, <code>rm</code> will write a diagnostic message to standard error, do nothing more to the current <i>file</i>, and go on to any remaining <i>files</i>.</p> <p>If the standard input is not a terminal, the utility will operate as if the <code>-f</code> option is in effect.</p> |
| <pre>/usr/bin/rmdir</pre>                   | <p>The <code>rmdir</code> utility will remove the directory entry specified by each <i>dirname</i> operand, which must refer to an empty directory.</p> <p>Directories will be processed in the order specified. If a directory and a subdirectory of that directory are specified in a single invocation of <code>rmdir</code>, the subdirectory must be specified before the parent directory so that the parent directory will be empty when <code>rmdir</code> tries to remove it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>OPTIONS</b>                              | <p>The following options are supported for <code>/usr/bin/rm</code> and <code>/usr/xpg4/bin/rm</code>:</p> <p><code>-r</code> Recursively remove directories and subdirectories in the argument list. The directory will be emptied of files and removed. The user is normally prompted for removal of any write-protected files which the directory contains. The write-protected files are removed without prompting, however, if the <code>-f</code> option is used, or if the standard input is not a terminal and the <code>-i</code> option is not used.</p> <p>Symbolic links that are encountered with this option will not be traversed.</p> <p>If the removal of a non-empty, write-protected directory is attempted, the utility will always fail (even if the <code>-f</code> option is used), resulting in an error message.</p> <p><code>-R</code> Same as <code>-r</code> option.</p>                                                                                                                                                      |

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>/usr/bin/rm</b>                            | <p>The following options are supported for <code>/usr/bin/rm</code> only:</p> <ul style="list-style-type: none"> <li>-f        Remove all files (whether write-protected or not) in a directory without prompting the user. In a write-protected directory, however, files are never removed (whatever their permissions are), but no messages are displayed. If the removal of a write-protected directory is attempted, this option will not suppress an error message.</li> <li>-i        Interactive. With this option, <code>rm</code> prompts for confirmation before removing any files. It overrides the <code>-f</code> option and remains in effect even if the standard input is not a terminal.</li> </ul> |
| <b>/usr/xpg4/bin/rm</b>                       | <p>The following options are supported for <code>/usr/xpg4/bin/rm</code> only:</p> <ul style="list-style-type: none"> <li>-f        Do not prompt for confirmation. Do not write diagnostic messages or modify the exit status in the case of non-existent operands. Any previous occurrences of the <code>-i</code> option will be ignored.</li> <li>-i        Prompt for confirmation. Any occurrences of the <code>-f</code> option will be ignored.</li> </ul>                                                                                                                                                                                                                                                     |
| <b>/usr/bin/rmdir</b>                         | <p>The following options are supported for <code>/usr/bin/rmdir</code> only:</p> <ul style="list-style-type: none"> <li>-p        Allow users to remove the directory <i>dirname</i> and its parent directories which become empty. A message is printed to standard error if all or part of the path could not be removed.</li> <li>-s        Suppress the message printed on the standard error when <code>-p</code> is in effect.</li> </ul>                                                                                                                                                                                                                                                                        |
| <b>OPERANDS</b>                               | <p>The following operands are supported:</p> <p><i>file</i>            A path name of a directory entry to be removed.</p> <p><i>dirname</i>        A path name of an empty directory to be removed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>USAGE</b>                                  | <p>See <code>largefile(5)</code> for the description of the behavior of <code>rm</code> and <code>rmdir</code> when encountering files greater than or equal to 2 Gbyte (<math>2^{31}</math> bytes).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>/usr/bin/rm</b><br><b>/usr/xpg4/bin/rm</b> | <p>The following command:</p> <pre>example% rm a.out core</pre> <p>removes the directory entries: <code>a.out</code> and <code>core</code>.</p> <p>The following command:</p> <pre>example% rm -rf junk</pre> <p>removes the directory <code>junk</code> and all its contents, without prompting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>/usr/bin/rmdir</b>                         | <p>If a directory <code>a</code> in the current directory is empty except that it contains a directory <code>b</code> and <code>a/b</code> is empty except that it contains a directory <code>c</code>,</p> <pre>example% rmdir -p a/b/c</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

rm(1)

will remove all three directories.

**ENVIRONMENT VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `rm` and `rmdir`: `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS**

The following exit values are returned:

- 0 If the `-f` option was not specified, all the named directory entries were removed; otherwise, all the existing named directory entries were removed.
- >0 An error occurred.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

`/usr/bin/rm`  
`/usr/bin/rmdir`

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | enabled         |

`/usr/xpg4/bin/rm`

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4        |
| CSI            | enabled         |

**SEE ALSO**

`rmdir(2)`, `unlink(2)`, `attributes(5)`, `environ(5)`, `largefile(5)`, `XPG4(5)`

**DIAGNOSTICS**

All messages are generally self-explanatory.

It is forbidden to remove the files `."` and `". ."` in order to avoid the consequences of inadvertently doing something like the following:

```
rm -r .*
```

**NOTES**

A `-` permits the user to mark explicitly the end of any command line options, allowing `rm` to recognize file arguments that begin with a `-`. As an aid to BSD migration, `rm` will accept `-` as a synonym for `-`. This migration aid may disappear in a future release. If a `-` and a `-` both appear on the same command line, the second will be interpreted as a file.

## rmformat(1)

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| -e                      | Eject the media when done. This feature may not be available if the drive does not support motorized eject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| -F quick   long   force | <p>Format the media.</p> <p>The <code>quick</code> option starts a format without certification or format with limited certification of certain tracks on the media.</p> <p>The <code>long</code> option starts a complete format. For some devices this might include the certification of the whole media by the drive itself.</p> <p>The <code>force</code> option to format is provided to start a long format without user confirmation before the format is started. For drives which have a password protection mechanism, it clears the password while formatting. This feature is useful when a password is no longer available. On those media which do not have such password protection on the media, <code>force</code> starts a long format.</p> <p>In legacy media such as floppy all options start a long format depending on the mode (Extended density mode or High density mode or Double Density mode) with which the floppy drive operates by default. On PCMCIA devices, all options start a long format.</p> |
| -H                      | Format a 1.44 MB (3.5 inch) high density diskette. This is the default for high density type drives. It is needed if the drive is the extended density type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -p                      | Print the protection status of the media. This option prints information whether the media is write, read, or password protected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -R enable   disable     | <p>Enable read/write protect with password or to disable the password read/write protect. This always works in interactive mode, as the password is requested from the user in an interactive manner maintaining the security required.</p> <p>A password length of 32 bytes (maximum) is allowed for the IOMEGA products which support this feature. This option is applicable only for IOMEGA products. IOMEGA products do not allow read/write protect without password. On the devices which do not have such software read/write protect facility, warnings indicating the non-availability of this feature are provided.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |

`-s filename`

Enable user to layout the partition information in the SUNOS label.

The user should provide a file as input with information about each slice in the form of byte offset, size required, tags and flags in a file. The format of representing each slice is given below.

```
slices: n = offset, size [, flags, tags]
```

where *n* is the slice number, *offset* is the byte offset at which the slice *n* starts and *size* is the required size for slice *n*. Both *offset* and *size* must be a multiple of 512 bytes. These numbers can be represented as decimal, hexadecimal or octal numbers. No floating point numbers shall be accepted. Details about maximum number of slices can be obtained from System Administration Guide, Volume 1.

To specify the *size* or *offset* in kilo bytes or mega bytes or giga bytes, add KB, MB, GB, respectively. A number without a suffix is assumed to be a byte offset. The flags are represented as follows: wm = read-write, mountable, wu = read-write, unmountable rm = read-only, mountable, ru = read-only, unmountable. The tags are represented as follows: unassigned, boot, root, swap, usr, backup, stand, var, home, alternates.

The tags and flags can be omitted from the four tuple when finer control on those values is not required. It is required to omit both or include both. If the tags and flags are omitted from the four tuple for a particular slice then a default value for each is assumed. The default value for flags is wm and the default value for tags is unassigned.

Either full tag names can be provided or an abbreviation for the tags can be used. The abbreviations can be first two or more letter from the standard tag names. rmformat is case insensitive in handling the defined tags & flags.

Slice specifications are separated by :

For example:

```
slices: 0 = 0, 30MB, "wm", "home" :
 1 = 30MB, 51MB :
 2 = 0, 100MB, "wm", "backup" :
 6 = 81MB, 19MB
```

## rmformat(1)

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                 | <p>rmformat does the necessary checking to detect any overlapping partitions or illegal request to address beyond the capacity of the media under consideration. There can be only one slice information for each slice <i>n</i>, if multiple slice information for the same slice <i>n</i> is provided an appropriate error message is displayed. The slice 2 be the backup slice covering the whole disk capacity. The character # can be used to describe a line of comments in the input file. If the line starts with character #, then rmformat ignores all the characters following # until the end of the line.</p> <p>Partitioning some of the media which has very small capacity works, but caution is recommended using this option on such devices.</p>                        |
| -U              | <p>Perform umount on any file systems and then formats. See mount(1M). This option unmounts all the mounted slices and issues a long format on the device requested.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| -V read   write | <p>Verify each block of media after format. The write verification is a destructive mechanism. The user is queried for confirmation before the verification is started. The output of this option is a list of block numbers, which are identified to be bad.</p> <p>The read verification only verifies the blocks and report the blocks which are prone to errors.</p> <p>The list of block numbers displayed can be used with the -c option for repairing.</p>                                                                                                                                                                                                                                                                                                                           |
| <b>OPERANDS</b> | <p>The following operands are supported:</p> <p><i>devname</i> <i>devname</i> can be provided as absolute device pathname or relative pathname for the device from the current working directory or the nickname as exported by System Volume manager. See vold(1M).</p> <p>For floppy device /dev/rdiskette0 (for system without volume management) or floppy0 (system with volume management) can be used. To use the first drive, specify /dev/rdiskette1 (for system without volume management), or floppy1 (system with volume management) to use the second drive.</p> <p>For system without volume management running, user can also provide the absolute device pathname as /dev/rdisk/c?t?d?s? or the appropriate relative device pathname from the current working directory.</p> |

## rmformat(1)

- SEE ALSO** cpio(1), eject(1), fdformat(1), tar(1), volcancel(1), volcheck(1), volmissing(1), volrmmount(1), format(1M), mkfs\_pcfs(1M), mount(1M), newfs(1M), prtvtoc(1M), rmmount(1M), vold(1M), rmmount.conf(4), vold.conf(4), attributes(5),
- NOTES** A rewritable media or PCMCIA memory card containing a ufs file system created on a SPARC based system ( using newfs(1M)) is not identical to a rewritable media or PCMCIA memory card containing a ufs file system created on an x86 based system. Do not interchange ufs diskettes or memory cards between these platforms; use cpio(1) or tar(1) to transfer files on diskettes or memory cards between them. For interchangeable filesystem refer pcfs(7FS) and udfs(7FS).
- BUGS** Currently, bad sector mapping is not supported on floppy diskettes or PCMCIA memory cards. Therefore, a diskette or memory cards is unusable if rmformat finds an error (bad sector).

| <b>DESCRIPTION</b> | roffbib prints out all records in a bibliographic database, in bibliography format rather than as footnotes or endnotes. Generally it is used in conjunction with sortbib(1):<br><br>example% sortbib database   roffbib                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |    |                                                                                |    |                                                                                                                                                               |                    |                                                                                                                                                                                                                           |     |                                        |        |                                                                                                                                                                                                                                                                               |    |                                                                     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                                                             |                |                                           |    |                                                            |
| <b>OPTIONS</b>     | roffbib accepts all options understood by nroff(1) except -i and -q.<br><br><table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 10px;">-e</td> <td>Produce equally-spaced words in adjusted lines using full terminal resolution.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-h</td> <td>Use output tabs during horizontal spacing to speed output and reduce output character count. TAB settings are assumed to be every 8 nominal character widths.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-m <i>filename</i></td> <td>Prepend the macro file /usr/share/lib/tmac/tmac.name to the input files. There should be a space between the -m and the macro filename. This set of macros will replace the ones defined in /usr/share/lib/tmac/tmac.bib.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-np</td> <td>Number first generated page <i>p</i>.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-olist</td> <td>Print only page numbers that appear in the comma-separated <i>list</i> of numbers and ranges. A range <i>N–M</i> means pages <i>N</i> through <i>M</i>; an initial -<i>N</i> means from the beginning to page <i>N</i>; a final <i>N–</i> means from page <i>N</i> to end.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-Q</td> <td>Queue output for the phototypesetter. Page offset is set to 1 inch.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-ra<i>N</i></td> <td>Set register <i>a</i> (one-character) to <i>N</i>. The command-line argument -r<i>N</i>1 will number the references starting at 1.<br/><br/>Four command-line registers control formatting style of the bibliography, much like the number registers of ms(5). The flag -rV2 will double space the bibliography, while -rV1 will double space references but single space annotation paragraphs. The line length can be changed from the default 6.5 inches to 6 inches with the -rL6i argument, and the page offset can be set from the default of 0 to one inch by specifying -rO1i (capital O, not zero).</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-s<i>N</i></td> <td>Halt prior to every <i>N</i> pages for paper loading or changing (default <i>N</i>=1). To resume, enter NEWLINE or RETURN.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-T<i>term</i></td> <td>Specify <i>term</i> as the terminal type.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 10px;">-V</td> <td>Send output to the Versatec. Page offset is set to 1 inch.</td> </tr> </table> | -e | Produce equally-spaced words in adjusted lines using full terminal resolution. | -h | Use output tabs during horizontal spacing to speed output and reduce output character count. TAB settings are assumed to be every 8 nominal character widths. | -m <i>filename</i> | Prepend the macro file /usr/share/lib/tmac/tmac.name to the input files. There should be a space between the -m and the macro filename. The line length can be changed from the default 6.5 inches to 6 inches with the -rL6i argument, and the page offset can be set from the default of 0 to one inch by specifying -rO1i (capital O, not zero). | -s <i>N</i> | Halt prior to every <i>N</i> pages for paper loading or changing (default <i>N</i> =1). To resume, enter NEWLINE or RETURN. | -T <i>term</i> | Specify <i>term</i> as the terminal type. | -V | Send output to the Versatec. Page offset is set to 1 inch. |
| -e                 | Produce equally-spaced words in adjusted lines using full terminal resolution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |    |                                                                                |    |                                                                                                                                                               |                    |                                                                                                                                                                                                                           |     |                                        |        |                                                                                                                                                                                                                                                                               |    |                                                                     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                                                             |                |                                           |    |                                                            |
| -h                 | Use output tabs during horizontal spacing to speed output and reduce output character count. TAB settings are assumed to be every 8 nominal character widths.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |                                                                                |    |                                                                                                                                                               |                    |                                                                                                                                                                                                                           |     |                                        |        |                                                                                                                                                                                                                                                                               |    |                                                                     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                                                             |                |                                           |    |                                                            |
| -m <i>filename</i> | Prepend the macro file /usr/share/lib/tmac/tmac.name to the input files. There should be a space between the -m and the macro filename. This set of macros will replace the ones defined in /usr/share/lib/tmac/tmac.bib.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |    |                                                                                |    |                                                                                                                                                               |                    |                                                                                                                                                                                                                           |     |                                        |        |                                                                                                                                                                                                                                                                               |    |                                                                     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                                                             |                |                                           |    |                                                            |

Page offset is set to 1 inch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |    |                                                                                |    |                                                                                                                                                               |                    |                                                                                                                                                                                                                           |     |                                        |        |                                                                                                                                                                                                                                                                               |    |                                                                     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                                                             |                |                                           |    |                                                            |
| -ra <i>N</i>       | Set register <i>a</i> (one-character) to <i>N</i> . The command-line argument -r <i>N</i> 1 will number the references starting at 1.<br><br>Four command-line registers control formatting style of the bibliography, much like the number registers of ms(5). The flag -rV2 will double space the bibliography, while -rV1 will double space references but single space annotation paragraphs. The line length can be changed from the default 6.5 inches to 6 inches with the -rL6i argument, and the page offset can be set from the default of 0 to one inch by specifying -rO1i (capital O, not zero).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |                                                                                |    |                                                                                                                                                               |                    |                                                                                                                                                                                                                           |     |                                        |        |                                                                                                                                                                                                                                                                               |    |                                                                     |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |             |                                                                                                                             |                |                                           |    |                                                            |

roffbib(1)

-x If abstracts or comments are entered following the %X field key, roffbib will format them into paragraphs for an annotated bibliography. Several %X fields may be given if several annotation paragraphs are desired.

**FILES** /usr/share/lib/tmac/tmac.bib file of macros used by nroff/troff

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWdoc         |

**SEE ALSO** addbib(1), indxbib(1), lookbib(1), nroff(1), refer(1), sortbib(1), troff(1), attributes(5)

**BUGS** Users have to rewrite macros to create customized formats.

| <b>NAME</b>        | roles – print roles granted to a user                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>    | <b>roles</b> [ <i>user</i> ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>DESCRIPTION</b> | <p>The command <code>roles</code> prints on standard output the roles that you or the optionally-specified user have been granted. Roles are special accounts that correspond to a functional responsibility rather than to an actual person (referred to as a normal user).</p> <p>Each user may have zero or more roles. Roles have most of the attributes of normal users and are identified like normal users in <code>passwd(4)</code> and <code>shadow(4)</code>. Each role must have an entry in the <code>user_attr(4)</code> file that identifies it as a role. Roles can have their own authorizations and profiles. See <code>auths(1)</code> and <code>profiles(1)</code>.</p> <p>Roles are not allowed to log into a system as a primary user. Instead, a user must log in as him or herself and assume the role. The actions of a role are attributable to the normal user. When auditing is enabled, the audited events of the role contain the audit ID of the original user who assumed the role.</p> <p>Roles must have valid passwords and one of the shells that interprets profiles: either <code>pfsh</code>, <code>pfksh</code>, or <code>pfsh</code>. See <code>pfexec(1)</code>.</p> <p>Role assumption may be performed using <code>su(1M)</code>, <code>rlogin(1)</code>, or some other service that supports the <code>PAM_RUSER</code> variable. Successful assumption requires knowledge of the role's password and membership in the role. Role assignments are specified in <code>user_attr(4)</code>.</p> |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Sample output</p> <p>The output of the <code>roles</code> command has the following form:</p> <pre>example% roles tester01 tester02 tester01 : admin tester02 : secadmin, root example%</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| DESCRIPTION | <p>rpcgen is a tool that generates C code to implement an RPC protocol. The input to rpcgen is a language similar to C known as RPC Language (Remote Procedure Call Language).</p> <p>The rpcgen utility is normally used as in the first synopsis where it takes an input file and generates three output files. If the <i>infile</i> is named <i>proto.x</i>, then rpcgen generates a header in <i>proto.h</i>, XDR routines in <i>proto_xdr.c</i>, server-side stubs in <i>proto_svc.c</i>, and client-side stubs in <i>proto_clnt.c</i>. With the <i>-T</i> option, it also generates the RPC dispatch table in <i>proto_tbl.i</i>.</p> <p>rpcgen can also generate sample client and server files that can be customized to suit a particular application. The <i>-Sc</i>, <i>-Ss</i>, and <i>-Sm</i> options generate sample client, server and makefile, respectively. The <i>-a</i> option generates all files, including sample files. If the <i>infile</i> is <i>proto.x</i>, then the client side sample file is written to <i>proto_client.c</i>, the server side sample file to <i>proto_server.c</i> and the sample makefile to <i>makefile.proto</i>.</p> <p>The server created can be started both by the port monitors (for example, <i>inetd</i> or <i>listen</i>) or by itself. When it is started by a port monitor, it creates servers only for the transport for which the file descriptor 0 was passed. The name of the transport must be specified by setting up the environment variable <i>PM_TRANSPORT</i>. When the server generated by rpcgen is executed, it creates server handles for all the transports specified in the <i>NETPATH</i> environment variable, or if it is unset, it creates server handles for all the visible transports from the <i>/etc/netconfig</i> file. Note: the transports are chosen at run time and not at compile time. When the server is self-started, it backgrounds itself by default. A special define symbol <i>RPC_SVC_FG</i> can be used to run the server process in foreground.</p> <p>The second synopsis provides special features which allow for the creation of more sophisticated RPC servers. These features include support for user-provided <i>#defines</i> and RPC dispatch tables. The entries in the RPC dispatch table contain:</p> <ul style="list-style-type: none"> <li>■ pointers to the service routine corresponding to that procedure</li> <li>■ a pointer to the input and output arguments</li> <li>■ the size of these routines</li> </ul> |

## rpcgen(1)

A server can use the dispatch table to check authorization and then to execute the service routine; a client library may use it to deal with the details of storage management and XDR data conversion.

The other three synopses shown above are used when one does not want to generate all the output files, but only a particular one. See the `EXAMPLES` section below for examples of `rpcgen` usage. When `rpcgen` is executed with the `-s` option, it creates servers for that particular class of transports. When executed with the `-n` option, it creates a server for the transport specified by *netid*. If *infile* is not specified, `rpcgen` accepts the standard input.

All the options mentioned in the second synopsis can be used with the other three synopses, but the changes will be made only to the specified output file.

The C preprocessor `cc -E` is run on the input file before it is actually interpreted by `rpcgen`. For each type of output file, `rpcgen` defines a special preprocessor symbol for use by the `rpcgen` programmer:

|                       |                                                 |
|-----------------------|-------------------------------------------------|
| <code>RPC_HDR</code>  | defined when compiling into headers             |
| <code>RPC_XDR</code>  | defined when compiling into XDR routines        |
| <code>RPC_SVC</code>  | defined when compiling into server-side stubs   |
| <code>RPC_CLNT</code> | defined when compiling into client-side stubs   |
| <code>RPC_TBL</code>  | defined when compiling into RPC dispatch tables |

Any line beginning with “`%`” is passed directly into the output file, uninterpreted by `rpcgen`, except that the leading “`%`” is stripped off. To specify the path name of the C preprocessor, use the `-Y` flag.

For every data type referred to in *infile*, `rpcgen` assumes that there exists a routine with the string `xdr_` prepended to the name of the data type. If this routine does not exist in the RPC/XDR library, it must be provided. Providing an undefined data type allows customization of XDR routines.

### OPTIONS

The following options are supported:

- `-a` Generate all files, including sample files.
- `-A` Enable the Automatic MT mode in the server main program. In this mode, the RPC library automatically creates threads to service client requests. This option generates multithread-safe stubs by implicitly turning on the `-M` option. Server multithreading modes and parameters can be set using the `rpc_control(3NSL)` call. `rpcgen` generated code does not change the default values for the Automatic MT mode.
- `-b` Backward compatibility mode. Generate transport-specific RPC code for older versions of the operating system.
- `-c` Compile into XDR routines.

- C           Generate header and stub files which can be used with ANSI C compilers. Headers generated with this flag can also be used with C++ programs.
- D*name* [=*value*]   Define a symbol *name*. Equivalent to the `#define` directive in the source. If no *value* is given, *value* is defined as 1. This option may be specified more than once.
- h           Compile into C data-definitions (a header). The `-T` option can be used in conjunction to produce a header which supports RPC dispatch tables.
- i *size*     Size at which to start generating inline code. This option is useful for optimization. The default *size* is 5.
- I           Compile support for `inetd(1M)` in the server side stubs. Such servers can be self-started or can be started by `inetd`. When the server is self-started, it backgrounds itself by default. A special define symbol `RPC_SVC_FG` can be used to run the server process in foreground, or the user may simply compile without the `-I` option.  
  
If there are no pending client requests, the `inetd` servers exit after 120 seconds (default). The default can be changed with the `-K` option. All of the error messages for `inetd` servers are always logged with `syslog(3C)`.  
  
Note: This option is supported for backward compatibility only. It should always be used in conjunction with the `-b` option which generates backward compatibility code. By default (that is, when `-b` is not specified), `rpcgen` generates servers that can be invoked through portmonitors.
- K *seconds*   By default, services created using `rpcgen` and invoked through port monitors wait 120 seconds after servicing a request before exiting. That interval can be changed using the `-K` flag. To create a server that exits immediately upon servicing a request, use `-K 0`. To create a server that never exits, the appropriate argument is `-K -1`.  
  
When monitoring for a server, some portmonitors, like `listen(1M)`, *always* spawn a new process in response to a service request. If it is known that a server will be used with such a monitor, the server should exit immediately on completion. For such servers, `rpcgen` should be used with `-K 0`.
- l           Compile into client-side stubs.
- L           When the servers are started in foreground, use `syslog(3C)` to log the server errors instead of printing them on the standard error.

## rpcgen(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -m                 | Compile into server-side stubs, but do not generate a “main” routine. This option is useful for doing callback-routines and for users who need to write their own “main” routine to do initialization.                                                                                                                                                                                                                                                                                                             |
| -M                 | Generate multithread-safe stubs for passing arguments and results between <code>rpcgen</code> -generated code and user written code. This option is useful for users who want to use threads in their code.                                                                                                                                                                                                                                                                                                        |
| -N                 | This option allows procedures to have multiple arguments. It also uses the style of parameter passing that closely resembles C. So, when passing an argument to a remote procedure, you do not have to pass a pointer to the argument, but can pass the argument itself. This behavior is different from the old style of <code>rpcgen</code> -generated code. To maintain backward compatibility, this option is not the default.                                                                                 |
| -n <i>netid</i>    | Compile into server-side stubs for the transport specified by <i>netid</i> . There should be an entry for <i>netid</i> in the <code>netconfig</code> database. This option may be specified more than once, so as to compile a server that serves multiple transports.                                                                                                                                                                                                                                             |
| -o <i>outfile</i>  | Specify the name of the output file. If none is specified, standard output is used ( <code>-c</code> , <code>-h</code> , <code>-l</code> , <code>-m</code> , <code>-n</code> , <code>-s</code> , <code>-Sc</code> , <code>-Sm</code> , <code>-Ss</code> , and <code>-t</code> modes only).                                                                                                                                                                                                                         |
| -s <i>nettype</i>  | Compile into server-side stubs for all the transports belonging to the class <i>nettype</i> . The supported classes are <code>netpath</code> , <code>visible</code> , <code>circuit_n</code> , <code>circuit_v</code> , <code>datagram_n</code> , <code>datagram_v</code> , <code>tcp</code> , and <code>udp</code> (see <code>rpc(3NSL)</code> for the meanings associated with these classes). This option may be specified more than once. Note: the transports are chosen at run time and not at compile time. |
| -Sc                | Generate sample client code that uses remote procedure calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -Sm                | Generate a sample Makefile which can be used for compiling the application.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| -Ss                | Generate sample server code that uses remote procedure calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -t                 | Compile into RPC dispatch table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -T                 | Generate the code to support RPC dispatch tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                    | The options <code>-c</code> , <code>-h</code> , <code>-l</code> , <code>-m</code> , <code>-s</code> , <code>-Sc</code> , <code>-Sm</code> , <code>-Ss</code> , and <code>-t</code> are used exclusively to generate a particular type of file, while the options <code>-D</code> and <code>-T</code> are global and can be used with the other options.                                                                                                                                                            |
| -v                 | Displays the version number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -Y <i>pathname</i> | Give the name of the directory where <code>rpcgen</code> will start looking for the C preprocessor.                                                                                                                                                                                                                                                                                                                                                                                                                |

**OPERANDS** The following operand is supported:

*infile*                   input file

**EXAMPLES** **EXAMPLE 1** Generating the output files and dispatch table

The following entry

```
example% rpcgen -T prot.x
```

generates all the five files: `prot.h`, `prot_clnt.c`, `prot_svc.c`, `prot_xdr.c`, and `prot_tbl.i`.

**EXAMPLE 2** Sending headers to standard output

The following example sends the C data-definitions (header) to the standard output:

```
example% rpcgen -h prot.x
```

**EXAMPLE 3** Sending a test version

To send the test version of the `-DTEST`, server side stubs for all the transport belonging to the class `datagram_n` to standard output, use:

```
example% rpcgen -s datagram_n -DTEST prot.x
```

**EXAMPLE 4** Creating server side stubs

To create the server side stubs for the transport indicated by `netid tcp`, use:

```
example% rpcgen -n tcp -o prot_svc.c prot.x
```

**EXIT STATUS** 0           Successful operation.

>0           An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `cc(1B)`, `inetd(1M)`, `listen(1M)`, `rpc(3NSL)`, `rpc_control(3NSL)`, `rpc_svc_calls(3NSL)`, `syslog(3C)`, `netconfig(4)`, `attributes(5)`

The `rpcgen` chapter in the *ONC+ Developer's Guide* manual.

## rsh(1)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>NAME</b>        | rsh, remsh, remote_shell – remote shell                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>    | <b>rsh</b> [-n] [-l <i>username</i> ] <i>hostname</i> <i>command</i><br><b>rsh</b> <i>hostname</i> [-n] [-l <i>username</i> ] <i>command</i><br><b>remsh</b> [-n] [-l <i>username</i> ] <i>hostname</i> <i>command</i><br><b>remsh</b> <i>hostname</i> [-n] [-l <i>username</i> ] <i>command</i><br><i>hostname</i> [-n] [-l <i>username</i> ] <i>command</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b> | <p>rsh connects to the specified <i>hostname</i> and executes the specified <i>command</i>. rsh copies its standard input to the remote command, the standard output of the remote command to its standard output, and the standard error of the remote command to its standard error. Interrupt, quit, and terminate signals are propagated to the remote command. rsh normally terminates when the remote command does.</p> <p>If you omit <i>command</i>, instead of executing a single command, rsh logs you in on the remote host using rlogin(1).</p> <p>rsh will not return the exit status code of <i>command</i>.</p> <p>Shell metacharacters which are not quoted are interpreted on the local machine, while quoted metacharacters are interpreted on the remote machine. See EXAMPLES.</p> <p>If there is no locale setting in the initialization file of the login shell (.cshrc, . . .) for a particular user, rsh always executes the command in the "C" locale instead of using the default locale of the remote machine.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p>-l <i>username</i>      Uses <i>username</i> as the remote username instead of your local username. In the absence of this option, the remote username is the same as your local username.</p> <p>-n                  Redirects the input of rsh to /dev/null. You sometimes need this option to avoid unfortunate interactions between rsh and the shell which invokes it. For example, if you are running rsh and invoke a rsh in the background without redirecting its input away from the terminal, it will block even if no reads are posted by the remote command. The -n option will prevent this.</p> <p>The type of remote shell (sh, rsh, or other) is determined by the user's entry in the file /etc/passwd on the remote system.</p>                                                                                                                                                                                                                                             |
| <b>OPERANDS</b>    | <p>The following operand is supported:</p> <p><i>command</i>              The command to be executed on the specified <i>hostname</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>USAGE</b>       | See largefile(5) for the description of the behavior of rsh and remsh when encountering files greater than or equal to 2 Gbyte (2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

The `rsh` and `remsh` commands are IPv6-enabled. See `ip6(7P)`.

Hostnames are given in the `hosts` database, which may be contained in the `/etc/hosts` file, the Internet domain name database, or both. Each host has one official name (the first name in the database entry) and optionally one or more nicknames. Official hostnames or nicknames may be given as `hostname`.

If the name of the file from which `rsh` is executed is anything other than `rsh`, `rsh` takes this name as its `hostname` argument. This allows you to create a symbolic link to `rsh` in the name of a host which, when executed, will invoke a remote shell on that host. By creating a directory and populating it with symbolic links in the names of commonly used hosts, then including the directory in your shell's search path, you can run `rsh` by typing `hostname` to your shell.

If `rsh` is invoked with the basename `remsh`, `rsh` will check for the existence of the file `/usr/bin/remsh`. If this file exists, `rsh` will behave as if `remsh` is an alias for `rsh`. If `/usr/bin/remsh` does not exist, `rsh` will behave as if `remsh` is a host name.

Each remote machine may have a file named `/etc/hosts.equiv` containing a list of trusted hostnames with which it shares usernames. Users with the same username on both the local and remote machine may run `rsh` from the machines listed in the remote machine's `/etc/hosts` file. Individual users may set up a similar private equivalence list with the file `.rhosts` in their home directories. Each line in this file contains two names: a `hostname` and a `username` separated by a space. The entry permits the user named `username` who is logged into `hostname` to use `rsh` to access the remote machine as the remote user. If the name of the local host is not found in the `/etc/hosts.equiv` file on the remote machine, and the local username and hostname are not found in the remote user's `.rhosts` file, then the access is denied. The hostnames listed in the `/etc/hosts.equiv` and `.rhosts` files must be the official hostnames listed in the `hosts` database; nicknames may not be used in either of these files.

`rsh` will not prompt for a password if access is denied on the remote machine unless the `command` argument is omitted.

#### EXAMPLES **EXAMPLE 1** Using `rsh` to append files

The following command:

```
example% rsh lizard cat lizard.file >> example.file
```

appends the remote file `lizard.file` from the machine called `lizard` to the file called `example.file` on the machine called `example`, while the command:

```
example% rsh lizard cat lizard.file ">>" lizard.file2
```

appends the file `lizard.file` on the machine called `lizard` to the file `lizard.file2` which also resides on the machine called `lizard`.

## rsh(1)

**EXIT STATUS** The following exit values are returned:

0 Successful completion.  
1 An error occurred.

**FILES** /etc/hosts Internet host table  
/etc/hosts.equiv trusted remote hosts and users  
/etc/passwd system password file

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWrcmdc       |
| CSI            | enabled         |

**SEE ALSO** `on(1)`, `rlogin(1)`, `telnet(1)`, `vi(1)`, `in.named(1M)`, `hosts(4)`, `hosts.equiv(4)`, `ipnodes(4)`, `attributes(5)`, `largefile(5)`, `ip6(7P)`

**NOTES** When a system is listed in `hosts.equiv`, its security must be as good as local security. One insecure system listed in `hosts.equiv` can compromise the security of the entire system.

You cannot run an interactive command (such as `vi(1)`). Use `rlogin` if you wish to do this.

Stop signals stop the local `rsh` process only. This is arguably wrong, but currently hard to fix for reasons too complicated to explain here.

The current local environment is not passed to the remote shell.

Sometimes the `-n` option is needed for reasons that are less than obvious. For example, the command:

```
example% rsh somehost dd if=/dev/nrmt0 bs=20b | tar xvpBf -will put your shell into a strange state. Evidently, what happens is that the tar terminates before the rsh. The rsh then tries to write into the "broken pipe" and, instead of terminating neatly, proceeds to compete with your shell for its standard input. Invoking rsh with the -n option avoids such incidents.
```

This bug occurs only when `rsh` is at the beginning of a pipeline and is not reading standard input. Do not use the `-n` if `rsh` actually needs to read standard input. For example,

```
example% tar cf - . | rsh sundial dd of=/dev/rmt0 obs=20bdoes not produce the bug. If you were to use the -n in a case like this, rsh would incorrectly read from
```

| /dev/null instead of from the pipe.

run(1F)

**NAME** run – run an executable

**SYNOPSIS** **run** [-s] [-e] [-n] [-t *string*] *program*

**DESCRIPTION** The run command runs *program*, using the *PATH* variable to find it. By default, when *program* has completed, the user is prompted (Press ENTER to continue:), before being returned to FMLI. The argument *program* is a system executable followed by its options (if any).

**OPTIONS** The following options are supported:

- e If -e is specified, the user will be prompted before returning to FMLI only if there is an error condition
- n If -n is specified, the user will never be prompted before returning to FMLI (useful for programs like vi, in which the user must do some specific action to exit in the first place).
- s The -s option means "silent", implying that the screen will not have to be repainted when *program* has completed. Note that the -s option should only be used when *program* does not write to the terminal. In addition, when -s is used, *program* cannot be interrupted, even if it recognizes interrupts.
- t*string* If -t is specified, *string* is the name this process will have in the pop-up menu generated by the frm-list command. This feature requires the executable facesuspend (see face(1)) to suspend the process and return to the FMLI application.

**EXAMPLES** **EXAMPLE 1** Sample output of run command

Here is a menu that uses run:

```
menu="Edit special System files"
name="Password file"
action='run -e vi /etc/passwd`
name="Group file"
action='run -e vi /etc/group`
name="My .profile"
action='run -n vi $HOME/.profile`
```

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

run(1F)

**SEE ALSO** | face(1), attributes(5)

rup(1)

**NAME** rup – show host status of remote machines (RPC version)

**SYNOPSIS** **rup** [-hlt]  
**rup** [*host...*]

**DESCRIPTION** rup gives a status similar to uptime for remote machines. It broadcasts on the local network, and displays the responses it receives.

Normally, the listing is in the order that responses are received, but this order can be changed by specifying one of the options listed below.

When *host* arguments are given, rather than broadcasting rup will only query the list of specified hosts.

A remote host will only respond if it is running the rstatd daemon, which is normally started up from inetd(1M).

**OPTIONS** -h Sort the display alphabetically by host name.  
-l Sort the display by load average.  
-t Sort the display by up time.

**FILES** /etc/servers

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWesu         |

**SEE ALSO** ruptime(1), inetd(1M), attributes(5)  
*Solaris 8 Advanced Installation Guide*

**BUGS** Broadcasting does not work through gateways.

| <b>NAME</b>        | rup – show host status of remote machines (RPC version)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>rup</b> [-hlt]<br><b>rup</b> [ <i>host...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>rup gives a status similar to uptime for remote machines. It broadcasts on the local network, and displays the responses it receives.</p> <p>Normally, the listing is in the order that responses are received, but this order can be changed by specifying one of the options listed below.</p> <p>When <i>host</i> arguments are given, rather than broadcasting rup only queries the list of specified hosts.</p> <p>A remote host will only respond if it is running the rstatd daemon, which is normally started up from inetd(1M).</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-h        Sort the display alphabetically by host name.</p> <p>-l        Sort the display by load average.</p> <p>-t        Sort the display by up time.</p>                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |         |

| <b>BUGS</b>        | Broadcasting does not work through gateways.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |

ruptime(1)

**NAME** ruptime – show host status of local machines

**SYNOPSIS** **ruptime** [-alrtu]

**DESCRIPTION** ruptime gives a status line like uptime for each machine on the local network; these are formed from packets broadcast by each host on the network once a minute.

Machines for which no status report has been received for 5 minutes are shown as being down.

Normally, the listing is sorted by host name, but this order can be changed by specifying one of the options listed below.

**OPTIONS** The following options are supported:

- a Count even those users who have been idle for an hour or more.
- l Sort the display by load average.
- r Reverse the sorting order.
- t Sort the display by up time.
- u Sort the display by number of users.

**FILES** /var/spool/rwho/whod.\* data files

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>NAME</b>        | rusage – print resource usage for a command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                        |  |                   |      |          |                |     |          |                  |    |           |                                    |    |           |                                        |    |          |       |    |            |                        |    |            |                         |     |          |                            |     |           |                              |    |           |                           |    |          |             |    |          |                            |    |          |             |
| <b>SYNOPSIS</b>    | <code>/usr/ucb/rusage command</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                        |  |                   |      |          |                |     |          |                  |    |           |                                    |    |           |                                        |    |          |       |    |            |                        |    |            |                         |     |          |                            |     |           |                              |    |           |                           |    |          |             |    |          |                            |    |          |             |
| <b>DESCRIPTION</b> | <p>The rusage command is similar to <code>time(1)</code>. It runs the given <i>command</i>, which must be specified; that is, <i>command</i> is not optional as it is in the C shell's timing facility. When the command is complete, rusage displays the real (wall clock), the system CPU, and the user CPU times which elapsed during execution of the command, plus other fields in the rusage structure, all on one long line. Times are reported in seconds and hundredths of a second.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                        |  |                   |      |          |                |     |          |                  |    |           |                                    |    |           |                                        |    |          |       |    |            |                        |    |            |                         |     |          |                            |     |           |                              |    |           |                           |    |          |             |    |          |                            |    |          |             |

| <b>SYNOPSIS</b>    | <b>rusers</b> [-ahilu] <i>host...</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The <b>rusers</b> command produces output similar to <b>who(1)</b>, but for remote machines. The listing is in the order that responses are received, but this order can be changed by specifying one of the options listed below.</p> <p>The default is to print out the names of the users logged in. When the <b>-l</b> flag is given, additional information is printed for each user:</p> <pre><i>userid hostname:terminal login date login time idle time login host</i></pre> <p>If <i>hostname</i> and <i>login host</i> are the same value, the <i>login host</i> field is not displayed. Likewise, if <i>hostname</i> is not idle, the <i>idle time</i> is not displayed.</p> <p>A remote host will only respond if it is running the <b>rusersd</b> daemon, which may be started up from <b>inetd(1M)</b> or <b>listen(1M)</b>.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p><b>-a</b> Give a report for a machine even if no users are logged on.</p> <p><b>-h</b> Sort alphabetically by host name.</p> <p><b>-i</b> Sort by idle time.</p> <p><b>-l</b> Give a longer listing in the style of <b>who(1)</b>.</p> <p><b>-u</b> Sort by number of users.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>rwho</b> [-a]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DESCRIPTION</b> | <p>The rwho command produces output similar to who(1), but for all machines on your network. If no report has been received from a machine for 5 minutes, rwho assumes the machine is down, and does not report users last known to be logged into that machine.</p> <p>If a user has not typed to the system for a minute or more, rwho reports this idle time. If a user has not typed to the system for an hour or more, the user is omitted from the output of rwho unless the -a flag is given.</p> |
| <b>OPTIONS</b>     | -a            Report all users whether or not they have typed to the system in the past hour.                                                                                                                                                                                                                                                                                                                                                                                                            |

**NOTES** rwho does not work through gateways.

The directory /var/spool/rwho must exist on the host from which rwho is run.

This service takes up progressively more network bandwidth as the number of hosts on the local net increases. For large networks, the cost becomes prohibitive.

The rwho service daemon, in.rwhod(1M), must be enabled for this command to return useful results.

| <b>DESCRIPTION</b> | <p>The <i>sag</i> utility graphically displays the system activity data stored in a binary data file by a previous <i>sar</i>(1) run. Any of the <i>sar</i> data items may be plotted singly or in combination, as cross plots or versus time. Simple arithmetic combinations of data may be specified. <i>sag</i> invokes <i>sar</i> and finds the desired data by string-matching the data column header (run <i>sar</i> to see what is available). The <i>sag</i> utility requires a graphic terminal to draw the graph, and uses <i>tp1ot</i>(1) to produce its output. When running Solaris 2.x and OpenWindows, perform the following steps:</p> <ol style="list-style-type: none"> <li>1. Run an "xterm" as a Tektronics terminal: <code>prompt# xterm -t</code></li> <li>2. In the "xterm" window, run <i>sag</i> specifying a <i>tek</i> terminal: <code>prompt# sag -T tek options</code></li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>OPTIONS</b>     | <p>The following options are supported and passed through to <i>sar</i> (see <i>sar</i>(1)):</p> <p>-e <i>time</i>    Select data up to <i>time</i>. Default is 18:00.</p> <p>-f <i>file</i>    Use <i>file</i> as the data source for <i>sar</i>. Default is the current daily data file <code>/usr/adm/sa/sadd</code>.</p> <p>-i <i>sec</i>    Select data at intervals as close as possible to <i>sec</i> seconds.</p> <p>-s <i>time</i>    Select data later than <i>time</i> in the form <i>hh [:mm]</i>. Default is 08:00.</p> <p>-T <i>term</i>    Produce output suitable for terminal <i>term</i>. See <i>tp1ot</i>(1) for known terminals. Default for <i>term</i> is <code>\$TERM</code>.</p> <p>-x <i>spec</i>    x axis specification with <i>spec</i> in the form:</p> <p style="margin-left: 40px;"><i>name</i> [<i>op name</i>] . . . [<i>lo hi</i>]</p> <p style="margin-left: 40px;"><i>name</i> is either a string that will match a column header in the <i>sar</i> report, with an optional device name in square brackets, for example, <code>r+w/s [dsk-1]</code>, or an integer value. <i>op</i> is + - * or / surrounded by blank spaces. Up to five names may be specified. Parentheses are not recognized. Contrary to custom, + and - have precedence over * and /. Evaluation is left to right. Thus, <code>A/A+B*100</code> is evaluated as <code>(A/(A+B))*100</code>, and <code>A+B/C+D</code> is <code>(A+B)/(C+D)</code>. <i>lo</i> and <i>hi</i> are optional numeric scale limits. If unspecified, they are deduced from the data.</p> <p style="margin-left: 40px;">Enclose <i>spec</i> in double-quotes (" ") if it includes white space.</p> <p style="margin-left: 40px;">A single <i>spec</i> is permitted for the x axis. If unspecified, <i>time</i> is used.</p> <p>-y <i>spec</i>    y axis specification with <i>spec</i> in the same form as for -x. Up to 5 <i>spec</i> arguments separated by a semi-colon (;) may be given for -y. The -y default is:</p> <p style="margin-left: 40px;"><code>-y"%usr0100;%usr+%sys0100;%usr+%sys+%wio0100"</code></p> |

sag(1)

**EXAMPLES** **EXAMPLE 1** Examples of the sag command.

To see today's CPU utilization:

```
example$ sag
```

To see activity over 15 minutes of all disk drives:

```
example$ TS=`date +%H:%M`
example$ sar -o /tmp/tempfile 60 15
example$ TE=`date +%H:%M`
example$ sag -f /tmp/tempfile -s $TS -e $TE -y "r+w/s[dsk]"
```

**FILES** /usr/adm/sa/sadd            daily data file for day dd

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWaccu        |

| <b>NAME</b>        | sar – system activity reporter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <pre> <b>sar</b> [-aAbcdgkmpqruvwy] [-o <i>filename</i>] <i>t</i> [<i>n</i>] <b>sar</b> [-aAbcdgkmpqruvwy] [-e <i>time</i>] [-f <i>filename</i>] [-i <i>sec</i>] [-s <i>time</i>] </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DESCRIPTION</b> | <p>In the first instance, <i>sar</i> samples cumulative activity counters in the operating system at <i>n</i> intervals of <i>t</i> seconds, where <i>t</i> should be 5 or greater. If <i>t</i> is specified with more than one option, all headers are printed together and the output may be difficult to read. (If the sampling interval is less than 5, the activity of <i>sar</i> itself may affect the sample.) If the <i>-o</i> option is specified, it saves the samples in <i>filename</i> in binary format. The default value of <i>n</i> is 1.</p> <p>In the second instance, no sampling interval is specified. <i>sar</i> extracts data from a previously recorded <i>filename</i>, either the one specified by the <i>-f</i> option or, by default, the standard system activity daily data file <i>/var/adm/sa/sadd</i> for the current day <i>dd</i>. The starting and ending times of the report can be bounded using the <i>-e</i> and <i>-s</i> arguments with <i>time</i> specified in the form <i>hh[:mm[:ss]]</i>. The <i>-i</i> option selects records at <i>sec</i> second intervals. Otherwise, all intervals found in the data file are reported.</p>                                                                       |
| <b>OPTIONS</b>     | <p>The following options modify the subsets of information reported by <i>sar</i>.</p> <ul style="list-style-type: none"> <li>-a Report use of file access system routines: <i>iget/s</i>, <i>namei/s</i>, <i>dirblk/s</i></li> <li>-A Report all data. Equivalent to <i>-abcdgkmpqruvwy</i>.</li> <li>-b Report buffer activity: <ul style="list-style-type: none"> <li><i>bread/s</i>, <i>bwrit/s</i><br/>transfers per second of data between system buffers and disk or other block devices.</li> <li><i>lread/s</i>, <i>lwrit/s</i><br/>accesses of system buffers.</li> <li><i>%rcache</i>, <i>%wcache</i><br/>cache hit ratios, that is, <math>(1 - \text{bread}/\text{lread})</math> as a percentage.</li> <li><i>pread/s</i>, <i>pwrit/s</i><br/>transfers using raw (physical) device mechanism.</li> </ul> </li> <li>-c Report system calls: <ul style="list-style-type: none"> <li><i>scall/s</i><br/>system calls of all types.</li> <li><i>sread/s</i>, <i>swrit/s</i>, <i>fork/s</i>, <i>exec/s</i><br/>specific system calls.</li> <li><i>rchar/s</i>, <i>wchar/s</i><br/>characters transferred by read and write system calls. No incoming or outgoing <i>exec(2)</i> and <i>fork(2)</i> calls are reported.</li> </ul> </li> </ul> |

## sar(1)

- d** Report activity for each block device (for example, disk or tape drive) with the exception of XDC disks and tape drives. When data is displayed, the device specification *dsk-* is generally used to represent a disk drive. The device specification used to represent a tape drive is machine dependent. The activity data reported is:
- %busy, avque**  
portion of time device was busy servicing a transfer request, average number of requests outstanding during that time.
  - read/s, write/s, blks/s**  
number of read/write transfers from or to device, number of bytes transferred in 512-byte units.
  - await**  
average wait time in milliseconds.
  - avserv**  
average service time in milliseconds.
- For more general system statistics, use *iostat(1M)*, *sar(1M)*, or *vmstat(1M)*.
- See *System Administration Guide, Volume 1* for naming conventions for disks.
- e time** Select data up to *time*. Default is 18:00.
- f filename** Use *filename* as the data source for *sar*. Default is the current daily data file */var/adm/sa/sadd*.
- g** Report paging activities:
- pgout/s** page-out requests per second.
  - ppgout/s** pages paged-out per second.
  - pgfree/s** pages per second placed on the free list by the page stealing daemon.
  - pgscan/s** pages per second scanned by the page stealing daemon.
  - %ufs\_ipf** the percentage of UFS inodes taken off the freelist by *iget* which had reusable pages associated with them. These pages are flushed and cannot be reclaimed by processes. Thus, this is the percentage of *igets* with page flushes.
- i sec** Select data at intervals as close as possible to *sec* seconds.
- k** Report kernel memory allocation (KMA) activities:

|                    |                                                                           |                                                                                                                                                                                                                                                                                                                        |
|--------------------|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | sml_mem, alloc, fail                                                      | information about the memory pool reserving and allocating space for small requests: the amount of memory in bytes KMA has for the small pool, the number of bytes allocated to satisfy requests for small amounts of memory, and the number of requests for small amounts of memory that were not satisfied (failed). |
|                    | lg_mem, alloc, fail                                                       | information for the large memory pool (analogous to the information for the small memory pool).                                                                                                                                                                                                                        |

|----|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | freemem     | average pages available to user processes.                                                                                                                                                                                                                          |
|    | freeswap    | disk blocks available for page swapping.                                                                                                                                                                                                                            |
| -s | <i>time</i> | Select data later than <i>time</i> in the form <i>hh[:mm]</i> . Default is 08:00.                                                                                                                                                                                   |
| -u |             | Report CPU utilization (the default):<br><br>%usr, %sys, %wio, %idle<br>portion of time running in user mode, running in system mode, idle with some process waiting for block I/O, and otherwise idle.                                                             |
| -v |             | Report status of process, i-node, file tables:<br><br>proc-sz, inod-sz, file-sz, lock-sz<br>entries/size for each table, evaluated once at sampling point.<br><br>ov<br>overflows that occur between sampling points for each table.                                |
| -w |             | Report system swapping and switching activity:<br><br>swpin/s, swpot/s, bswin/s, bswot/s<br>number of transfers and number of 512-byte units transferred for swapins and swapouts (including initial loading of some programs).<br><br>pswch/s<br>process switches. |
| -y |             | Report TTY device activity:<br><br>rawch/s, canch/s, outch/s<br>input character rate, input character rate processed by canon, output character rate.<br><br>rcvin/s, xmtin/s, mdmin/s<br>receive, transmit and modem interrupt rates.                              |

## EXAMPLES

### EXAMPLE 1 Viewing system activity

To see today's CPU activity so far:

```
example% sar
```

### EXAMPLE 2 Watching system activity evolve

To watch CPU activity evolve for 10 minutes and save data:

```
example% sar -o temp 60 10
```

**EXAMPLE 2** Watching system activity evolve (Continued)

**EXAMPLE 3** Reviewing disk and tape activity

To later review disk and tape activity from that period:

```
example% sar -d -f temp
```

**FILES** /var/adm/sa/sadd daily data file, where *dd* are digits representing the day of the month

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWaccu        |

**SEE ALSO** `sag(1)`, `iostat(1M)`, `sar(1M)`, `vmstat(1M)`, `exec(2)`, `fork(2)`, `attributes(5)`

*System Administration Guide, Volume 1*

**NOTES** The sum of CPU utilization might vary slightly from 100 because of rounding errors in the production of a percentage figure.

| <b>DESCRIPTION</b>              | <p>The <code>sccs</code> command is a comprehensive, straightforward front end to the various utility programs of the Source Code Control System (SCCS).</p> <p><code>sccs</code> applies the indicated <i>subcommand</i> to the history file associated with each of the indicated files.</p> <p>The name of an SCCS history file is derived by prepending the 's.' prefix to the filename of a working copy. The <code>sccs</code> command normally expects these 's.' files to reside in an SCCS subdirectory. Thus, when you supply <code>sccs</code> with a <i>file</i> argument, it normally applies the subcommand to a file named <i>s.file</i> in the SCCS subdirectory. If <i>file</i> is a path name, <code>sccs</code> looks for the history file in the SCCS subdirectory of that file's parent directory. If <i>file</i> is a directory, however, <code>sccs</code> applies the subcommand to every <i>s.</i> file file it contains. Thus, the command:</p> <pre>example% sccs get program.c</pre> <p>would apply the <code>get</code> subcommand to a history file named <code>SCCS/s.program.c</code>, while the command:</p> <pre>example% sccs get SCCS</pre> <p>would apply it to every <i>s.</i> file in the SCCS subdirectory.</p> <p>Options for the <code>sccs</code> command itself must appear before the <i>subcommand</i> argument. Options for a given subcommand must appear after the <i>subcommand</i> argument. These options are specific to each subcommand, and are described along with the subcommands themselves (see <i>Subcommands</i>, below).</p> |
| <b>Running Setuid</b>           | The <code>sccs</code> command also includes the capability to run "setuid" to provide additional protection. However, this does not apply to subcommands such as <code>sccs-admin(1)</code> , since this would allow anyone to change the authorizations of the history file. Commands that would do so always run as the real user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>OPTIONS</b>                  | The following options are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <code>/usr/xpg4/bin/sccs</code> | <code>-d rootprefix</code> Define the root portion of the path name for SCCS history files. The default root portion is the current directory. <i>rootprefix</i> is prepended to the entire <i>file</i> argument, even if <i>file</i> is an absolute path name. <code>-d</code> overrides any directory specified by the <code>PROJECTDIR</code> environment variable (see <i>ENVIRONMENT</i> , below).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Subcommands</b>        | Many of the following <i>sccs</i> subcommands invoke programs that reside in <i>/usr/ccs/bin</i> . Many of these subcommands accept additional arguments that are documented in the reference page for the utility program the subcommand invokes. |                                                                                                                                                                                                                                                                                                                                                              |
|                           | admin                                                                                                                                                                                                                                              | Modify the flags or checksum of an SCCS history file. Refer to <i>sccs-admin(1)</i> for more information about the <i>admin</i> utility. While <i>admin</i> can be used to initialize a history file, you may find that the <i>create</i> subcommand is simpler to use for this purpose.                                                                     |
| <i>/usr/ccs/bin/sccs</i>  | <i>cdc -rsid [ -y[comment]]</i>                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                              |
| <i>/usr/xpg4/bin/sccs</i> | <i>cdc -rsid   -rsid [ -y[comment]]</i>                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                              |
|                           | Annotate (change) the delta commentary. Refer to <i>sccs-cdc(1)</i> . The <i>fix</i> subcommand can be used to replace the delta, rather than merely annotating the existing commentary.                                                           |                                                                                                                                                                                                                                                                                                                                                              |
| <i>/usr/ccs/bin/sccs</i>  | -rsid                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                              |
| <i>/usr/xpg4/bin/sccs</i> | -r <i>sid</i>   -rsid                                                                                                                                                                                                                              | Specify the SCCS delta ID (SID) to which the change notation is to be added. The SID for a given delta is a number, in Dewey decimal format, composed of two or four fields: the <i>release</i> and <i>level</i> fields, and for branch deltas, the <i>branch</i> and <i>sequence</i> fields. For instance, the SID for the initial delta is normally 1 . 1. |
|                           | -y[comment]"                                                                                                                                                                                                                                       | Specify the comment with which to annotate the delta commentary. If <i>-y</i> is omitted, <i>sccs</i> prompts for a comment. A null <i>comment</i> results in an empty annotation.                                                                                                                                                                           |
| <i>/usr/ccs/bin/sccs</i>  | <i>check [-b] [-u[username]]</i>                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                              |

|                           | Check for files currently being edited. Like <i>info</i> and <i>tell</i> , but returns an exit code, rather than producing a listing of files. <i>check</i> returns a non-zero exit status if anything is being edited.                            |                                                                                                                                                                                                                                                                                                                                                              |

sccs(1)

`/usr/ccs/bin/sccs`  
`/usr/xpg4/bin/sccs`

`-b` Ignore branches.

`-u[username]`

`-u [ username ] | -U` Check only files being edited by you. When *username* is specified, check only files being edited by that user. For `/usr/xpg4/bin/sccs`, the `-U` option is equivalent to `-u <current_user>`.

`clean [ -b ]`  
Remove everything in the current directory that can be retrieved from an SCCS history. Does not remove files that are being edited.

`-b` Do not check branches to see if they are being edited. '`clean -b`' is dangerous when branch versions are kept in the same directory.

`comb`  
Generate scripts to combine deltas. Refer to `sccs-comb(1)`.

`create`  
Create (initialize) history files. `create` performs the following steps:

- Renames the original source file to `, program.c` in the current directory.
- Create the history file called `s.program.c` in the SCCS subdirectory.
- Performs an '`sccs get`' on `program.c` to retrieve a read-only copy of the initial version.

`deledit [-s] [-y[comment]]`  
Equivalent to an '`sccs delta`' and then an '`sccs edit`'. `deledit` checks in a delta, and checks the file back out again, but leaves the current working copy of the file intact.

`-s` Silent. Do not report delta numbers or statistics.

`-y [comment]` Supply a comment for the delta commentary. If `-y` is omitted, `delta` prompts for a comment. A null *comment* results in an empty comment field for the delta.

`delget [-s] [-y[comment]]`  
Perform an '`sccs delta`' and then an '`sccs get`' to check in a delta and retrieve read-only copies of the resulting new version. See the `deledit` subcommand for a description of `-s` and `-y`. `sccs` performs a `delta` on all the files specified in the argument list, and then a `get` on all the files. If an error occurs during the `delta`, the `get` is not performed.

`delta [-s] [-y[comment]]`  
Check in pending changes. Records the line-by-line changes introduced while the file was checked out. The effective user ID must be the same as the ID of the person who has the file checked out. Refer to `sccs-delta(1)`. See the `deledit` subcommand for a description of `-s` and `-y`.

|                           |                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>/usr/xpg4/bin/sccs</b> | <code>diffs [-C] [-I] [-cdate-time   -c date-time] [-rsid   -r sid] diff-options</code> | Compare (in <code>diff(1)</code> format) the working copy of a file that is checked out for editing, with a version from the SCCS history. Use the most recent checked-in version by default. The <code>diffs</code> subcommand accepts the same options as <code>diff</code> .                                                                                                                                                                                                                                                                                                                                          |
|                           |                                                                                         | Any <code>-r</code> , <code>-c</code> , <code>-i</code> , <code>-x</code> , and <code>-t</code> options are passed to subcommand <code>get</code> . Any <code>-l</code> , <code>-s</code> , <code>-e</code> , <code>-f</code> , <code>-h</code> , and <code>-b</code> options are passed to command <code>diff</code> . A <code>-C</code> option is passed to <code>diff</code> as <code>-c</code> . An <code>-I</code> option is passed to <code>diff</code> as <code>-i</code> .                                                                                                                                       |
| <b>/usr/ccs/bin/sccs</b>  | <code>-cdate-time</code>                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>/usr/xpg4/bin/sccs</b> | <code>-c date-time   -cdate-time</code>                                                 | Use the most recent version checked in before the indicated date and time for comparison. <code>date-time</code> takes the form: <code>yy[mm[dd[ hh[mm[ss] ] ] ] ]</code> . Omitted units default to their maximum possible values; that is <code>-c7502</code> is equivalent to <code>-c750228235959</code> .                                                                                                                                                                                                                                                                                                           |
| <b>/usr/ccs/bin/sccs</b>  | <code>-rsid</code>                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>/usr/xpg4/bin/sccs</b> | <code>-r sid   -rsid</code>                                                             | Use the version corresponding to the indicated delta for comparison.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                           | <code>edit</code>                                                                       | Retrieve a version of the file for editing. ' <code>sccs edit</code> ' extracts a version of the file that is writable by you, and creates a <code>p.</code> file in the SCCS subdirectory as lock on the history, so that no one else can check that version in or out. ID keywords are retrieved in unexpanded form. <code>edit</code> accepts the same options as <code>get</code> , below. Refer to <code>sccs-get(1)</code> for a list of ID keywords and their definitions.                                                                                                                                        |
|                           | <code>enter</code>                                                                      | Similar to <code>create</code> , but omits the final ' <code>sccs get</code> '. This may be used if an ' <code>sccs edit</code> ' is to be performed immediately after the history file is initialized.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>/usr/ccs/bin/sccs</b>  | <code>fix -rsid</code>                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>/usr/xpg4/bin/sccs</b> | <code>fix -r sid   -rsid</code>                                                         | Revise a (leaf) delta. Remove the indicated delta from the SCCS history, but leave a working copy of the current version in the directory. This is useful for incorporating trivial updates for which no audit record is needed, or for revising the delta commentary. <code>fix</code> must be followed by a <code>-r</code> option, to specify the SID of the delta to remove. The indicated delta must be the most recent (leaf) delta in its branch. Use <code>fix</code> with caution since it does not leave an audit trail of differences (although the previous commentary is retained within the history file). |

| <code>/usr/xpg4/bin/sccs</code> | <code>tell [-b] [-u [username]   -U]</code>                           | Display the list of files that are currently checked out, one file per line.                                                                                                                          |
|                                 | <code>-b</code>                                                       | Ignore branches.                                                                                                                                                                                      |
| <code>/usr/ccs/bin/sccs</code>  | <code>-u[username]</code>                                             |                                                                                                                                                                                                       |
| <code>/usr/xpg4/bin/sccs</code> | <code>-u [username]   -U</code>                                       | List only files checked out to you. When <code>username</code> is specified, list only files checked out to that user. For <code>/usr/xpg4/bin/sccs</code> , the <code>-U</code> option is equivalent |

sccs(1)

```
 to -u <current_user>.
unedit "Undo" the last edit or 'get -e', and return the working copy to
 its previous condition. unedit backs out all pending changes
 made since the file was checked out.
unget Same as unedit. Refer to sccs-unget(1).
val Validate the history file. Refer to sccs-val(1).
what Display any expanded ID keyword strings contained in a binary
 (object) or text file. Refer to what(1) for more information.
```

**EXAMPLES**    **EXAMPLE 1** Checking out, editing, and checking in a file

To check out a copy of `program.c` for editing, edit it, and then check it back in:

```
example% sccs edit program.c1.1
new delta 1.2
14 linesexample% vi program.c
your editing sessionexample% sccs delget program.c

comments? clarified cryptic diagnostic1.2
3 inserted
2 deleted
12 unchanged
1.2
15 lines
```

**EXAMPLE 2** Defining the root portion of the command pathname

sccs converts the command:

```
example% sccs -d/usr/src/include get stdio.h

to:

/usr/ccs/bin/get /usr/src/include/SCCS/s.stdio.h
```

**EXAMPLE 3** Defining the resident subdirectory

The command:

```
example% sccs -pprivate get include/stdio.h

becomes:

/usr/ccs/bin/get include/private/s.stdio.h
```

**EXAMPLE 4** Initializing a history file

To initialize the history file for a source file named `program.c`, make the SCCS subdirectory, and then use `'sccs create'`:

**EXAMPLE 4** Initializing a history file (Continued)

```
example% mkdir SCCS
example% sccs create program.c
1.1
14 lines
```

After verifying the working copy, you can remove the backup file that starts with a comma:

```
example% diff program.c ,program.c
example% rm ,program.c
```

**EXAMPLE 5** Retrieving a file from another directory

To retrieve a file from another directory into the current directory:

```
example% sccs get /usr/src/sccs/cc.c
```

OR:

```
example% sccs -p/usr/src/sccs/ get cc.c
```

**EXAMPLE 6** Checking out all files

To check out all files under SCCS in the current directory:

```
example% sccs edit SCCS
```

**EXAMPLE 7** Checking in all files

To check in all files currently checked out to you:

```
example% sccs delta `sccs tell -u`
```

**ENVIRONMENT  
VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `sccs`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**PROJECTDIR** If contains an absolute path name (beginning with a slash), `sccs` searches for SCCS history files in the directory given by that variable.

If `PROJECTDIR` does not begin with a slash, it is taken as the name of a user, and `sccs` searches the `src` or `source` subdirectory of that user's home directory for history files. If such a directory is found, it is used. Otherwise, the value is used as a relative path name.

**EXIT STATUS**

The following exit values are returned:

```
0 Successful completion.
>0 An error occurred.
```

| <b>DESCRIPTION</b> | <p>The <code>admin</code> command creates or modifies the flags and other parameters of SCCS history files. Filenames of SCCS history files begin with the ‘<code>s.</code>’ prefix, and are referred to as <code>s.</code> files, or “history” files.</p> <p>The named <code>s.</code> file is created if it does not exist already. Its parameters are initialized or modified according to the options you specify. Parameters not specified are given default values when the file is initialized, otherwise they remain unchanged.</p> <p>If a directory name is used in place of the <code>s.filename</code> argument, the <code>admin</code> command applies to all <code>s.</code> files in that directory. Unreadable <code>s.</code> files produce an error. The use of ‘<code>-</code>’ as the <code>s.filename</code> argument indicates that the names of files are to be read from the standard input, one <code>s.</code> file per line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-b</code><br/>Force encoding of binary data. Files that contain ASCII NUL or other control characters, or that do not end with a NEWLINE, are recognized as binary data files. The contents of such files are stored in the history file in encoded form. See <code>uuencode(1C)</code> for details about the encoding. This option is normally used in conjunction with <code>-i</code> to force <code>admin</code> to encode initial versions not recognized as containing binary data.</p> <p><code>-h</code><br/>Check the structure of an existing <code>s.</code> file (see <code>sccsfile(4)</code>), and compare a newly computed check-sum with one stored in the first line of that file. <code>-h</code> inhibits writing on the file; and so nullifies the effect of any other options.</p> <p><code>-n</code><br/>Create a new SCCS history file.</p> <p><code>-z</code><br/>Recompute the file check-sum and store it in the first line of the <code>s.</code> file. Caution: it is important to verify the contents of the history file (see <code>sccs-val(1)</code>, and the <code>print</code> subcommand in <code>sccs(1)</code>), since using <code>-z</code> on a truly corrupted file may prevent detection of the error.</p> <p><code>-a <i>username</i>   <i>groupid</i></code><br/>Add a user name, or a numerical group ID, to the list of users who may check deltas in or out. If the list is empty, any user is allowed to do so.</p> <p><code>-d <i>flag</i></code><br/>Delete the indicated <code>flag</code> from the SCCS file. The <code>-d</code> option may be specified only for existing <code>s.</code>files. See <code>-f</code> for the list of recognized flags.</p> |

## sccs-admin(1)

|                                                                           |                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-e <i>username</i>   <i>groupid</i></code>                          | Erase a user name or group ID from the list of users allowed to make deltas.                                                                                                                                                           |
| <code>-f <i>flag</i> [<i>value</i>]</code>                                | Set the indicated <i>flag</i> to the (optional) <i>value</i> specified. The following flags are recognized:                                                                                                                            |
| <code>b</code>                                                            | Enable branch deltas. When <code>b</code> is set, branches can be created using the <code>-b</code> option of the SCCS <code>get</code> command (see <code>sccs-get(1)</code> ).                                                       |
| <code>cceil</code>                                                        | Set a ceiling on the releases that can be checked out. <i>ceil</i> is a number less than or equal to 9999. If <code>c</code> is not set, the ceiling is 9999.                                                                          |
| <code>f floor</code>                                                      | Set a floor on the releases that can be checked out. The floor is a number greater than 0 but less than 9999. If <code>f</code> is not set, the floor is 1.                                                                            |
| <code>dsid</code>                                                         | The default delta number, or SID, to be used by an SCCS <code>get</code> command.                                                                                                                                                      |
| <code>i</code>                                                            | Treat the 'No id keywords (ge6)' message issued by an SCCS <code>get</code> or <code>delta</code> command as an error rather than a warning.                                                                                           |
| <code>j</code>                                                            | Allow concurrent updates.                                                                                                                                                                                                              |
| <code>la</code><br><code>l <i>release</i> [, <i>release</i> . . .]</code> | Lock the indicated list of releases against deltas. If <code>a</code> is used, lock out deltas to all releases. An SCCS 'get -e' command fails when applied against a locked release.                                                  |
| <code>n</code>                                                            | Create empty releases when releases are skipped. These null (empty) deltas serve as anchor points for branch deltas.                                                                                                                   |
| <code>o <i>value</i></code>                                               | Supply a <i>value</i> to which the keyword is to expand when a read-only version is retrieved with the SCCS <code>get</code> command.                                                                                                  |
| <code>m <i>module</i></code>                                              | Supply a value for the module name to which the <code>sccs-admin.1</code> keyword is to expand. If the <code>m</code> flag is not specified, the value assigned is the name of the SCCS file with the leading <code>s.</code> removed. |
| <code>t <i>type</i></code>                                                | Supply a value for the module type to which the keyword is to expand.                                                                                                                                                                  |
| <code>v [<i>program</i>]</code>                                           | Specify a validation <i>program</i> for the MR numbers associated with a new delta. The optional <i>program</i> specifies the name of an MR number validity                                                                            |

checking *program*. If this flag is set when creating an SCCS file, the *-m* option must also be used, in which case the list of MRs may be empty.

**-i** [*filename*]

Initialize the history file with text from the indicated file. This text constitutes the initial delta, or set of checked-in changes. If *filename* is omitted, the initial text is obtained from the standard input. Omitting the *-i* option altogether creates an empty *s*.file. You can only initialize one *s*.file with text using *-i*. This option implies the *-n* option.

**-m** *mr-list*

Insert the indicated Modification Request (MR) numbers into the commentary for the initial version. When specifying more than one MR number on the command line, *mr-list* takes the form of a quoted, space-separated list. A warning results if the *v* flag is not set or the MR validation fails.

**-r** *release*

Specify the release for the initial delta. *-r* may be used only in conjunction with *-i*. The initial delta is inserted into release 1 if this option is omitted. The level of the initial delta is always 1; initial deltas are named 1.1 by default.

**-t** [*description-file*]

Insert descriptive text from the file *description-file*. When *-t* is used in conjunction with *-n*, or *-i* to initialize a new *s*.file, the *description-file* must be supplied. When modifying the description for an existing file: a *-t* option without a *description-file* removes the descriptive text, if any; a *-t* option with a *description-file* replaces the existing text.

**-y** [*comment*]

Insert the indicated *comment* in the "Comments:" field for the initial delta. Valid only in conjunction with *-i* or *-n*. If *-y* option is omitted, a default comment line is inserted that notes the date and time the history file was created.

**EXIT STATUS** The following exit values are returned:

- 0 Successful completion.
- 1 An error occurred.

**FILES**

- s*.\* history file
- SCCS/*s*.\* history file in SCCS subdirectory
- z*.\* temporary lock file

**ATTRIBUTES** See *attributes(5)* for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWspot        |

## sccs-admin(1)

`sccs-rmdel(1)`, `sccs-val(1)`, `sccsfile(4)`, `attributes(5)`

**DIAGNOSTICS** Use the `SCCS help` command for explanations (see `sccs-help(1)`).

**WARNINGS** The last component of all SCCS filenames must have the `'s.'` prefix. New SCCS files are given mode 444 (see `chmod(1)`). All writing done by `admin` is to a temporary file with an `x.` prefix, created with mode 444 for a new SCCS file, or with the same mode as an existing SCCS file. After successful execution of `admin`, the existing `s.` file is removed and replaced with the `x.` file. This ensures that changes are made to the SCCS file only when no errors have occurred.

It is recommended that directories containing SCCS files have permission mode 755, and that the `s.` files themselves have mode 444. The mode for directories allows only the owner to modify the SCCS files contained in the directories, while the mode of the `s.` files prevents all modifications except those performed using SCCS commands.

If it should be necessary to patch an SCCS file for any reason, the mode may be changed to 644 by the owner to allow use of a text editor. However, extreme care must be taken when doing this. The edited file should *always* be processed by an `'admin -h'` to check for corruption, followed by an `'admin -z'` to generate a proper check-sum. Another `'admin -h'` is recommended to ensure that the resulting `s.` file is valid.

`admin` also uses a temporary lock `s.` file, starting with the `'z.'` prefix, to prevent simultaneous updates to the `s.` file. See `sccs-get(1)` for further information about the `'z.` file'.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>NAME</b>        | sccs-cdc, cdc – change the delta commentary of an SCCS delta                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>    | <code>/usr/ccs/bin/cdc -rsid [-mmr-list] [-y [comment]] s.filename...</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | <p>cdc annotates the delta commentary for the SCCS delta ID (SID) specified by the <code>-r</code> option in each named <code>s</code> . file.</p> <p>If the <code>v</code> flag is set in the <code>s</code> . file, you can also use <code>cdc</code> to update the Modification Request (MR) list.</p> <p>If you checked in the delta, or, if you own the file and directory and have write permission, you can use <code>cdc</code> to annotate the commentary.</p> <p>Rather than replacing the existing commentary, <code>cdc</code> inserts the new comment you supply, followed by a line of the form:</p> <pre>*** CHANGED *** yy/mm/dd hh/mm/ss username</pre> <p>above the existing commentary.</p> <p>If a directory is named as the <code>s.filename</code> argument, the <code>cdc</code> command applies to all <code>s</code> . files in that directory. Unreadable <code>s</code> . files produce an error; processing continues with the next file (if any). If <code>'-'</code> is given as the <code>s.filename</code> argument, each line of the standard input is taken as the name of an SCCS history file to be processed, and the <code>-m</code> and <code>-y</code> options must be used.</p>                                                                                                                                                                                                                                                                                                           |
| <b>OPTIONS</b>     | <p><code>-rsid</code> Specify the SID of the delta to change.</p> <p><code>-mmr-list</code> Specify one or more MR numbers to add or delete. When specifying more than one MR on the command line, <code>mmr-list</code> takes the form of a quoted, space-separated list. To delete an MR number, precede it with a <code>!</code> character (an empty MR list has no effect). A list of deleted MRs is placed in the comment section of the delta commentary. If <code>-m</code> is not used and the standard input is a terminal, <code>cdc</code> prompts with <code>MRS?</code> for the list (before issuing the <code>comments?</code> prompt). <code>-m</code> is only useful when the <code>v</code> flag is set in the <code>s</code> . file. If that flag has a value, it is taken to be the name of a program to validate the MR numbers. If that validation program returns a non-zero exit status, <code>cdc</code> terminates and the delta commentary remains unchanged.</p> <p><code>-y[comment]</code> Use <code>comment</code> as the annotation in the delta commentary. The previous comments are retained; the <code>comment</code> is added along with a notation that the commentary was changed. A null <code>comment</code> leaves the commentary unaffected. If <code>-y</code> is not specified and the standard input is a terminal, <code>cdc</code> prompts with <code>comments?</code> for the text of the notation to be added. An unescaped NEWLINE character terminates the annotation text.</p> |

scs-cdc(1)

**EXAMPLES** | **EXAMPLE 1** Changing the annotated commentary

The following command:

```
example% cdc -r1.6 -y"corrected commentary" s.program.c
```

produces the following annotated commentary for delta 1.6 in s.program.c:

```
D 1.6 88/07/05 23:21:07 username 9 0 00001/00000/00000
MRs:
COMMENTS:
corrected commentary
*** CHANGED *** 88/07/07 14:09:41 username
performance enhancements in main()
```

**NAME** sccs-comb, comb – combine SCCS deltas

**SYNOPSIS** `/usr/ccs/bin/comb [-os] [-csid-list] [-psid] s.filename...`

**DESCRIPTION** comb generates a shell script (see `sh(1)`) that you can use to reconstruct the indicated `s` . files. This script is written to the standard output.

If a directory name is used in place of the `s.filename` argument, the `comb` command applies to all `s` . files in that directory. Unreadable `s` . files produce an error; processing continues with the next file (if any). The use of `'-'` as the `s.filename` argument indicates that the names of files are to be read from the standard input, one `s` . file per line.

If no options are specified, `comb` preserves only the most recent (leaf) delta in a branch, and the minimal number of ancestors needed to preserve the history.

**OPTIONS** The following options are supported:

- o For each `'get -e'` generated, access the reconstructed file at the release of the delta to be created. Otherwise, the reconstructed file is accessed at the most recent ancestor. The use of `-o` may decrease the size of the reconstructed `s` . file. It may also alter the shape of the delta tree of the original file.
- s Generate scripts to gather statistics, rather than combining deltas. When run, the shell scripts report: the file name, size (in blocks) after combining, original size (also in blocks), and the percentage size change, computed by the formula:  
  

$$100 * ( original - combined ) / original$$

This option can be used to calculate the space that will be saved, before actually doing the combining.
- csid-list Include the indicated list of deltas. All other deltas are omitted. `sid-list` is a comma-separated list of SCCS delta IDs (SIDs). To specify a range of deltas, use a `'-'` separator instead of a comma, between two SIDs in the list.
- pSID The SID of the oldest delta to be preserved.

**FILES**

|                        |                         |
|------------------------|-------------------------|
| <code>s</code> . COMB  | reconstructed SCCS file |
| <code>comb?????</code> | temporary file          |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWsprt        |

scs-comb(1)

**SEE ALSO** | *scs(1)*, *scs-admin(1)*, *scs-cdc(1)*, *scs-delta(1)*, *scs-help(1)*,  
*scs-prs(1)*, *scs-prt(1)*, *scs-rmdel(1)*, *scs-scsdiff(1)*, *what(1)*,  
*scsfile(4)*, *attributes(5)*

**DIAGNOSTICS** | Use the SCCS help command for explanations (see *scs-help(1)*).

**BUGS** | comb may rearrange the shape of the tree of deltas. It may not save any space; in fact, it is possible for the reconstructed file to actually be larger than the original.

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>NAME</b>                      | sccs-delta, delta – make a delta to an SCCS file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>                  | <pre> /usr/ccs/bin/delta [-dnps] [-g sid-list   -gsid-list] [-m mr-list     -mmr-list] [-r sid   -rsid] [-y [comment]] s.filename...  /usr/xpg4/bin/delta [-dnps] [-g sid-list   -gsid-list] [-m mr-list     -mmr-list] [-r sid   -rsid] [-y [comment]] s.filename... </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b>               | <p>delta checks in a record of the line-by-line differences made to a checked-out version of a file under SCCS control. These changes are taken from the writable working copy that was retrieved using the SCCS <code>get</code> command (see <code>sccs-get(1)</code>). This working copy does not have the 's.' prefix, and is also referred to as a g-file.</p> <p>If a directory name is used in place of the <i>s.filename</i> argument, the <code>delta</code> command applies to all <i>s.</i> files in that directory. Unreadable <i>s.</i> files produce an error; processing continues with the next file (if any). The use of '-' as the <i>s.filename</i> argument indicates that the names of files are to be read from the standard input, one <i>s.</i> file per line (requires <code>-y</code>, and in some cases, <code>-m</code>).</p> <p>delta may issue prompts on the standard output depending upon the options specified and the flags that are set in the <i>s.</i> file (see <code>sccs-admin(1)</code>, and the <code>-m</code> and <code>-y</code> options below, for details).</p>                                                    |
| <code>/usr/xpg4/bin/delta</code> | The SID of the delta is not echoed to <code>stdout</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>OPTIONS</b>                   | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li><code>-d</code> Use command <code>diff(1)</code> instead of <code>bdiff(1)</code>. Returns exit status 2 if <i>s.filename</i> argument is not specified.</li> <li><code>-n</code> Retain the edited g-file, which is normally removed at the completion of processing.</li> <li><code>-p</code> Display line-by-line differences (in <code>diff(1)</code> format) on the standard output.</li> <li><code>-s</code> Silent. Do not display warning or confirmation messages. Do not suppress error messages (which are written to standard error).</li> <li><code>-g sid-list   -gsid-list</code> Specify a list of deltas to omit when the file is accessed at the SCCS version ID (SID) created by this delta. <i>sid-list</i> is a comma-separated list of SIDs. To specify a range of deltas, use a '-' separator instead of a comma, between two SIDs in the list.</li> <li><code>-m mr-list   -mmr-list</code> If the SCCS file has the <code>v</code> flag set (see <code>sccs-admin(1)</code>), you must supply one or more Modification Request (MR) numbers</li> </ul> |

sccs-delta(1)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -r <i>sid</i>   -r <i>sid</i> | <p>for the new delta. When specifying more than one MR number on the command line, <i>mr-list</i> takes the form of a quoted, space-separated list. If -m is not used and the standard input is a terminal, <i>delta</i> prompts with <i>MRs?</i> for the list (before issuing the <i>comments?</i> prompt). If the <i>v</i> flag in the <i>s</i>.file has a value, it is taken to be the name of a program to validate the MR numbers. If that validation program returns a non-zero exit status, <i>delta</i> terminates without checking in the changes.</p> <p>When two or more versions are checked out, specify the version to check in. This SID value can be either the SID specified on the <i>get</i> command line, or the SID of the new version to be checked in as reported by <i>get</i>. A diagnostic results if the specified SID is ambiguous, or if one is required but not supplied.</p> |
| -y[ <i>comment</i> ]          | <p>Supply a comment for the delta table (version log). A null comment is accepted, and produces an empty commentary in the log. If -y is not specified and the standard input is a terminal, <i>delta</i> prompts with '<i>comments?</i>'. An unescaped NEWLINE terminates the comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**DIAGNOSTICS** Use the `sccs help` command for explanations (see `sccs-help(1)`).

**WARNINGS** Lines beginning with an ASCII SOH character (binary 001) cannot be placed in the SCCS file unless the SOH is escaped. This character has special meaning to SCCS (see `sccsfile(4)`) and produces an error.

| <b>DESCRIPTION</b> | <p>The <code>get</code> utility retrieves a working copy from the SCCS history file, according to the specified options.</p> <p>For each <i>s.filename</i> argument, <code>get</code> displays the SCCS delta ID (SID) and number of lines retrieved.</p> <p>If a directory name is used in place of the <i>s.filename</i> argument, the <code>get</code> command applies to all <i>s.</i> files in that directory. Unreadable <i>s.</i> files produce an error; processing continues with the next file (if any). The use of <code>'-'</code> as the <i>s.filename</i> argument indicates that the names of files are to be read from the standard input, one <i>s.</i> file per line.</p> <p>The retrieved file normally has the same filename base as the <i>s.</i> file, less the prefix, and is referred to as the <i>g</i>-file.</p> <p>For each file processed, <code>get</code> responds (on the standard output) with the SID being accessed, and with the number of lines retrieved from the <i>s.</i> file.</p>                                                                                                                                                                                                                                                                      |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-b</code> Create a new branch. Used with the <code>-e</code> option to indicate that the new delta should have an SID in a new branch. Instead of incrementing the level for version to be checked in, <code>get</code> indicates in the <i>p.</i> file that the delta to be checked in should either initialize a new branch and sequence (if there is no existing branch at the current level), or increment the branch component of the SID. If the <code>b</code> flag is not set in the <i>s.</i> file, this option is ignored.</p> <p><code>-e</code> Retrieve a version for editing. With this option, <code>get</code> places a lock on the <i>s.</i> file, so that no one else can check in changes to the version you have checked out. If the <code>j</code> flag is set in the <i>s.</i> file, the lock is advisory: <code>get</code> issues a warning message. Concurrent use of <code>'get -e'</code> for different SIDs is allowed; however, <code>get</code> will not check out a version of the file if a writable version is present in the directory. All SCCS file protections stored in the <i>s.</i> file, including the release ceiling, floor, and authorized user list, are honored by <code>'get -e'</code>.</p> |

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -g                                        | Get the SCCS version ID, without retrieving the version itself. Used to verify the existence of a particular SID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| -k                                        | Suppress expansion of ID keywords. -k is implied by the -e.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| -m                                        | Precede each retrieved line with the SID of the delta in which it was added to the file. The SID is separated from the line with a TAB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| -n                                        | Precede each line with the %M% ID keyword and a TAB. When both the -m and -n options are used, the ID keyword precedes the SID, and the line of text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| -p                                        | Write the text of the retrieved version to the standard output. All messages that normally go to the standard output are written to the standard error instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -s                                        | Suppress all output normally written on the standard output. However, fatal error messages (which always go to the standard error) remain unaffected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| -t                                        | Retrieve the most recently created (top) delta in a given release (for example: -r1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| -l ]& p ]                                 | Retrieve a summary of the delta table (version log) and write it to a listing file, with the 'l .' prefix (called 'l . file'). When -lp is used, write the summary onto the standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| -asequence                                | Retrieve the version corresponding to the indicated delta sequence number. This option is used primarily by the SCCS comb command (see sccs-comb(1)); for users, -r is an easier way to specify a version. -a supersedes -r when both are used.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -c <i>date-time</i>   -c <i>date-time</i> | Retrieve the latest version checked in prior to the date and time indicated by the <i>date-time</i> argument. <i>date-time</i> takes the form:<br><br><i>yy</i> [ <i>mm</i> [ <i>dd</i> [ <i>hh</i> [ <i>mm</i> [ <i>ss</i> ] ] ] ] ] ]<br><br>Units omitted from the indicated date and time default to their maximum possible values; that is -c7502 is equivalent to -c750228235959. Values of <i>yy</i> in the range 69–99 refer to the twentieth century. Values in the range 00–68 refer to the twenty-first century. Any number of non-numeric characters may separate the various 2 digit components. If white-space characters occur, the <i>date-time</i> specification must be quoted. |
| -G <i>newname</i>                         | Use <i>newname</i> as the name of the retrieved version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| /usr/ccs/bin/get  | -i <i>sid-list</i>   -i <i>sid-list</i>                                                                 | Specify a list of deltas to include in the retrieved version. The included deltas are noted in the standard output message. <i>sid-list</i> is a comma-separated list of SIDs. To specify a range of deltas, use a '-' separator instead of a comma, between two SIDs in the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                   | -r[ <i>sid</i> ]                                                                                        | Retrieve the version corresponding to the indicated SID (delta).<br><br>The SID for a given delta is a number, in Dewey decimal format, composed of two or four fields: the <i>release</i> and <i>level</i> fields, and for branch deltas, the <i>branch</i> and <i>sequence</i> fields. For instance, if 1.2 is the SID, 1 is the release, and 2 is the level number. If 1.2.3.4 is the SID, 3 is the branch and 4 is the sequence number.<br><br>You need not specify the entire SID to retrieve a version with <i>get</i> . When you omit -r altogether, or when you omit both release and level, <i>get</i> normally retrieves the highest release and level. If the d flag is set to an SID in the s. file and you omit the SID, <i>get</i> retrieves the default version indicated by that flag.<br><br>When you specify a release but omit the level, <i>get</i> retrieves the highest level in that release. If that release does not exist, <i>get</i> retrieves highest level from the next-highest existing release.<br><br>Similarly with branches, if you specify a release, level and branch, <i>get</i> retrieves the highest sequence in that branch. |

| R.L                                         | yes                | No trunk succ.                              | R.L           | R.L.(mB+1).1               |
| R.L                                         | -                  | Trunk succ. in release $\geq$ R             | R.L           | R.L.(mB+1).1               |
| R.L.B                                       | no                 | No branch succ.                             | R.L.B.mS      | R.L.B.(mS+1)               |
| R.L.B                                       | yes                | No branch succ.                             | R.L.B.mS      | R.L.(mB+1).1               |
| R.L.B.S                                     | no                 | No branch succ.                             | R.L.B.S       | R.L.B.(S+1)                |
| R.L.B.S                                     | yes                | No branch succ.                             | R.L.B.S       | R.L.(mB+1).1               |
| R.L.B.S                                     | -                  | Branch succ.                                | R.L.B.S       | R.L.(mB+1).1               |

(1) 'R', 'L', 'B', and 'S' are the 'release', 'level', 'branch', and 'sequence' components of the SID, respectively; 'm' means 'maximum'. Thus, for example, 'R.mL' means 'the maximum level number within release R'; 'R.L.(mB+1).1' means 'the first sequence number on the *new* branch (that is, maximum branch number plus one) of level L within release R'. Note: if the SID specified is of the form 'R.L', 'R.L.B', or 'R.L.B.S', each of the specified components *must* exist.

(2) The -b option is effective only if the b flag is present in the file. An entry of '-' means 'irrelevant'.

- (3) This case applies if the `d` (default SID) flag is *not* present in the file. If the `d` flag *is* present in the file, the SID obtained from the `d` flag is interpreted as if it had been specified on the command line. Thus, one of the other cases in this table applies.
- (4) Forces creation of the *first* delta in a *new* release.
- (5) 'hR' is the highest *existing* release that is lower than the specified, *nonexistent*, release R.
- (6) Successor.

**FILES**

`/usr/xpg4/bin/get`

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4t       |

**SEE ALSO** `sccs(1)`, `sccs-admin(1)`, `sccs-delta(1)`, `sccs-help(1)`, `sccs-prs(1)`, `sccs-prt(1)`, `sccs-sact(1)`, `sccs-unget(1)`, `what(1)`, `sccsfile(4)`, `attributes(5)`, `XPG4(5)`

**DIAGNOSTICS** Use the `SCCS help` command for explanations (see `sccs-help(1)`).

**BUGS** If the effective user has write permission (either explicitly or implicitly) in the directory containing the SCCS files, but the real user does not, only one file may be named when using `-e`.

sccs-help(1)

**NAME** | sccs-help, help – ask for help regarding SCCS error or warning messages

**SYNOPSIS** | `/usr/ccs/bin/help` [*argument...*]

**DESCRIPTION** | The help utility retrieves information to further explain errors messages and warnings from SCCS commands. It also provides some information about SCCS command usage. If no arguments are given, help prompts for one.

| An *argument* may be a message number (which normally appears in parentheses following each SCCS error or warning message), or an SCCS command name. help responds with an explanation of the message or a usage line for the command.

| When all else fails, try `'/usr/ccs/bin/help stuck'`.

**FILES** | `/usr/lib/help` directory containing files of message text

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| <b>DESCRIPTION</b> | <p>The <code>prs</code> utility displays part or all of the SCCS file (see <code>sccsfile(4)</code>) in a user supplied format.</p> <p>If a directory name is used in place of the <code>s.filename</code> argument, the <code>prs</code> command applies to all <code>s.</code> files in that directory. Unreadable <code>s.</code> files produce an error; processing continues with the next file (if any). The use of <code>'-'</code> as the <code>s.filename</code> argument indicates that the names of files are to be read from the standard input, one <code>s.</code> file per line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>OPTIONS</b>     | <p>In the absence of options, <code>prs</code> displays the delta table (version log). In the absence of <code>-d</code>, or <code>-l</code>, <code>prs</code> displays the entry for each delta indicated by the other options.</p> <p><code>-a</code> Includes all deltas, including those marked as removed (see <code>sccs-rmdel(1)</code>).</p> <p><code>-e</code> Requests information for all deltas created <i>earlier</i> than, and including, the delta indicated with <code>-r</code> or <code>-c</code>.</p> <p><code>-l</code> Requests information for all deltas created <i>later</i> than, and including, the delta indicated with <code>-r</code> or <code>-c</code>.</p> <p><code>-cdate-time</code> Either options <code>-e</code> or <code>-l</code> must be used with this option. <code>-cdate-time</code> displays information on the deltas checked in either prior to and including the date and time indicated by the <code>date-time</code> argument (option <code>-e</code>); or later than and including the date and time indicated (option <code>-l</code>). <code>date-time</code> takes the form:</p> <pre>yy[mm[dd[hh[mm[ss] ] ] ] ]</pre> <p>Units omitted from the indicated date and time default to their maximum possible values; that is <code>-c7502</code> is equivalent to <code>-c750228235959</code>. Any number of non-numeric characters may separate the various 2 digit components. If white-space characters occur, the <code>date-time</code> specification must be quoted. Values of <code>yy</code> in the range 69–99 refer to the twentieth century. Values in the range of 00–68 refer to the twenty-first century.</p> <p><code>-ddataspec</code> Produce a report according to the indicated data specification. <code>dataspec</code> consists of a (quoted) text string that includes embedded data keywords of the form: <code>' :key: '</code> (see <code>Data Keywords</code>, below). <code>prs</code> expands these keywords in the output it produces. To specify a TAB character in the output, use <code>\t</code>; to specify a NEWLINE in the output, use <code>\n</code>.</p> <p><code>-rsid</code> Specifies the SCCS delta ID (SID) of the delta for which information is desired. If no SID is specified, the most recently created delta is used.</p> |

**Data Keywords**

Data keywords specify which parts of an SCCS file are to be retrieved. All parts of an SCCS file (see `sccsfile(4)`) have an associated data keyword. A data keyword may appear any number of times in a data specification argument to `-d`. These data keywords are listed in the table below:

| <i>Keyword</i> | <i>Data Item</i>                              | <i>File Section*</i> | <i>Value</i>                      | <i>Format**</i> |
|----------------|-----------------------------------------------|----------------------|-----------------------------------|-----------------|
| :A:            | a format for the what string:                 | N/A                  | :Z::Y: :M: :I::Z:                 | S               |
| :B:            | branch number                                 | D                    | <i>nnnn</i>                       | S               |
| :BD:           | body                                          | B                    | <i>text</i>                       | M               |
| :BF:           | branch flag                                   | F                    | yes or no                         | S               |
| :CB:           | ceiling boundary                              | F                    | :R:                               | S               |
| :C:            | comments for delta                            | D                    | <i>text</i>                       | M               |
| :D:            | date delta created                            | D                    | :Dy:/ :Dm:/ :Dd:                  | S               |

| <b>DESCRIPTION</b> | <p>prt prints selected portions of an SCCS file. By default, it prints the delta table (version log).</p> <p>If a directory name is used in place of the <i>s.filename</i> argument, the prt command applies to all <i>s</i>.files in that directory. Unreadable <i>s</i>.files produce an error; processing continues with the next file (if any). The use of '-' as the <i>s.filename</i> argument indicates that the names of files are to be read from the standard input, one <i>s</i>.file per line.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>OPTIONS</b>     | <p>If any option other than -y, -c, or -r is supplied, the name of each file being processed (preceded by one NEWLINE and followed by two NEWLINE characters) appears above its contents.</p> <p>If none of the -u, -f, -t, or -b options are used, -d is assumed. -s, -i are mutually exclusive, as are -c and -r.</p> <ul style="list-style-type: none"> <li>-a                    Display log entries for all deltas, including those marked as removed.</li> <li>-b                    Print the body of the <i>s</i>.file.</li> <li>-d                    Print delta table entries. This is the default.</li> <li>-e                    Everything. This option implies -d, -i, -u, -f, and -t.</li> <li>-f                    Print the flags of each named <i>s</i>.file.</li> <li>-i                    Print the serial numbers of included, excluded, and ignored deltas.</li> <li>-s                    Print only the first line of the delta table entries; that is, only up to the statistics.</li> <li>-t                    Print the descriptive text contained in the <i>s</i>.file.</li> <li>-u                    Print the user-names and/or numerical group IDs of users allowed to make deltas.</li> <li>-cdate-time        Exclude delta table entries that are specified cutoff date and time. Each entry is printed as a single line, preceded by the name of the SCCS file. This format (also produced by -r, and -y) makes it easy to sort multiple delta tables in chronological order. When both -y and -c, or -y and -r are supplied, prt stops printing when the first of the two conditions is met.</li> <li>-rdate-time        Exclude delta table entries that are newer than the specified cutoff date and time.</li> <li>-ysid                Exclude delta table entries made prior to the SID specified. If no delta in the table has the specified SID, the entire table is printed. If no SID is specified, the most recent delta is printed.</li> </ul> |

scs-prt(1)

**Output Format**

The following format is used to print those portions of the `s` file that are specified by the various options.

- NEWLINE
- Type of delta (D or R)
- SPACE
- SCCS delta ID (SID)
- TAB
- Date and time of creation in the form: *yy/mm/dd hh/mm/ss*
- SPACE
- Username the delta's creator

- Line-by-line change statistics in the form: *inserted/deleted/unchanged*
- NEWLINE
- List of included deltas, followed by a NEWLINE (only if there were any such deltas and the `-i` options was used)
- List of excluded deltas, followed by a NEWLINE (only if there were any such deltas and the `-i` options was used)
- List of ignored deltas, followed by a NEWLINE (only if there were any such deltas and the `-i` options was used)
- List of modification requests (MRs), followed by a NEWLINE (only if any MR numbers were supplied).
- Lines of the delta commentary (if any), followed by a NEWLINE.

**EXAMPLES**

**EXAMPLE 1** Examples of `prt`.

The following command:

```
example% /usr/ccs/bin/prt -y program.c
```

produces a one-line display of the delta table entry for the most recent version:

```
s.program.c: D 1.6 88/07/06 21:39:39 username 5 4
00159/00080/00636...
```

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

sccs-prt(1)

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWspot        |

**SEE ALSO** *sccs(1), sccs-cdc(1), sccs-delta(1), sccs-get(1), sccs-help(1), sccs-prs(1), sccs-sact(1), sccs-sccsdiff(1), what(1), sccsfile(4), attributes(5)*

**DIAGNOSTICS** Use the SCCS help command for explanations (see *sccs-help(1)*).

sccs-rmdel(1)

**NAME** | sccs-rmdel, rmdel – remove a delta from an SCCS file

**SYNOPSIS** | `/usr/ccs/bin/rmdel -rsid s.filename...`

**DESCRIPTION** | rmdel removes the delta specified by the SCCS delta ID (SID) supplied with -r. The delta to be removed must be the most recent (leaf) delta in its branch. In addition, the SID must *not* be that of a version checked out for editing; it must not appear in any entry of the version lock file (p . file).

If you created the delta, or, if you own the file and directory and have write permission, you can remove it with rmdel.

If a directory name is used in place of the *s.filename* argument, the rmdel command applies to all *s . files* in that directory. Unreadable *s . files* produce an error; processing continues with the next file (if any). The use of '-' as the *s.filename* argument indicates that the names of files are to be read from the standard input, one *s . file* per line.

**OPTIONS** | The following option is supported:

-rsid      Remove the version corresponding to the indicated SID (delta).

**FILES** | p . file    permissions file  
s . file    history file  
z . file    temporary copy of the s . file

**ATTRIBUTES** | See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWspot        |

**SEE ALSO** | sccs(1), sccs-admin(1), sccs-cdc(1), sccs-comb(1), sccs-delta(1), sccs-help(1), sccs-prs(1), sccs-prt(1), sccs-sccsdiff(1), sccs-unget(1), what(1), sccsfile(4), attributes(5)

**DIAGNOSTICS** | Use the SCCS help command for explanations (see sccs-help(1)).

| <b>NAME</b>        | sccs-sact, sact – show editing activity status of an SCCS file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                 |              |          |

sccs-sccsdiff(1)

**NAME** | sccs-sccsdiff, sccsdiff – compare two versions of an SCCS file

**SYNOPSIS** | `/usr/ccs/bin/sccsdiff [-p] -rsid -rsid [diff-options] s.filename`

**DESCRIPTION** | `sccsdiff` compares two versions of an SCCS file and displays the differences between the two versions. Any number of SCCS files may be specified; the options specified apply to all named `s`. files.

**OPTIONS** | The following options are supported:

- `-p` | Pipe output for each file through `pr(1)`.
- `-rsid` | Specify a version corresponding to the indicated SCCS delta ID (SID) for comparison. Versions are passed to `diff(1)` in the order given.
- `diff-options` | Pass options to `diff(1)`, including: `-c`, `-e`, `-f`, `-h`, `-b` and `-D`.

**FILES** | `/tmp/get?????` temporary files

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWspot        |

**SEE ALSO** | `diff(1)`, `sccs(1)`, `sccs-delta(1)`, `sccs-get(1)`, `sccs-help(1)`, `sccs-prs(1)`, `sccs-prt(1)`, `what(1)`, `sccsfile(4)`, `attributes(5)`

**DIAGNOSTICS** | `filename: No differences` | If the two versions are the same.

Use the SCCS help command for explanations of other messages (see `sccs-help(1)`).

| <b>NAME</b>        | sccs-unget, unget – undo a previous get of an SCCS file                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |          |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|----------|
| <b>SYNOPSIS</b>    | <code>/usr/ccs/bin/unget [-ns] [-rsid] s.filename...</code>                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |          |
| <b>DESCRIPTION</b> | <p>unget undoes the effect of a 'get -e' done prior to the creation of the pending delta.</p> <p>If a directory name is used in place of the <i>s.filename</i> argument, the unget command applies to all <i>s.</i> files in that directory. Unreadable <i>s.</i> files produce an error; processing continues with the next file (if any). The use of '-' as the <i>s.filename</i> argument indicates that the names of files are to be read from the standard input, one <i>s.</i> file per line.</p> |                |                 |              |          |
| <b>OPTIONS</b>     | <p>-n        Retain the retrieved version, which is otherwise removed.</p> <p>-s        Suppress display of the SCCS delta ID (SID).</p> <p>-rsid     When multiple versions are checked out, specify which pending delta to abort. A diagnostic results if the specified SID is ambiguous, or if it is necessary but omitted from the command line.</p>                                                                                                                                                |                |                 |              |          |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                 |              |          |

scs-val(1)

**NAME** | sccs-val, val – validate an SCCS file

**SYNOPSIS** | `/usr/ccs/bin/val -`  
`/usr/ccs/bin/val [-s] [-m name] [-rsid] [-y type] s.filename...`

**DESCRIPTION** | val determines if the specified s . files meet the characteristics specified by the indicated arguments. val can process up to 50 files on a single command line.

val has a special argument, '-', which reads the standard input until the end-of-file condition is detected. Each line read is independently processed as if it were a command line argument list.

val generates diagnostic messages on the standard output for each command line and file processed and also returns a single 8-bit code upon exit as described below.

The 8-bit code returned by val is a disjunction of the possible errors, that is, it can be interpreted as a bit string where (moving from left to right) the bits set are interpreted as follows:

```

bit 0 = missing file argument
bit 1 = unknown or duplicate option
bit 2 = corrupted s.file
bit 3 = can not open file or file not in s.file format
bit 4 = the SCCS delta ID (SID) is invalid or ambiguous
bit 5 = the SID does not exist
bit 6 = mismatch between and -y argument
bit 7 = mismatch between sccs-val.1 -m argument

```

val can process two or more files on a given command line, and in turn can process multiple command lines (when reading the standard input). In these cases, an aggregate code is returned which is the logical OR of the codes generated for each command line and file processed.

**OPTIONS** | The following options are supported:

- s            Silent. Suppress the normal error or warning messages.
- m name      Compare name with the sccs-val . 1 ID keyword in the s . file.
- rsid        Check to see if the indicated SID is ambiguous, invalid, or absent from the s . file.
- y type      Compare type with the ID keyword.

**ATTRIBUTES** | See attributes(5) for descriptions of the following attributes:

**SEE ALSO** sccs(1), sccs-admin(1), sccs-delta(1), sccs-get(1), sccs-help(1), what(1), sccsfile(4), attributes(5)

**DIAGNOSTICS** Use the SCCS help command for explanations (see sccs-help(1)).

script(1)

**NAME** | script – make record of a terminal session

**SYNOPSIS** | **script** [-a] [*filename*]

**DESCRIPTION** | script makes a record of everything printed on your screen. The record is written to *filename*. If no file name is given, the record is saved in the file `typescript`.

| The `script` command forks and creates a sub-shell, according to the value of `$SHELL`, and records the text from this session. The script ends when the forked shell exits or when CTRL-D is typed.

**OPTIONS** | -a            Append the session record to *filename*, rather than overwrite it.

**NOTES** | script places everything that appears on the screen in *filename*, including prompts.

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| <b>DESCRIPTION</b> | <i>sdiff</i> uses the output of the <i>diff</i> command to produce a side-by-side listing of two files indicating lines that are different. Lines of the two files are printed with a blank gutter between them if the lines are identical, a < in the gutter if the line appears only in <i>filename1</i> , a > in the gutter if the line appears only in <i>filename2</i> , and a   for lines that are different. (See the <b>EXAMPLES</b> section below.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>OPTIONS</b>     | <p>-l                    Print only the left side of any lines that are identical.to</p> <p>-s                    Do not print identical lines.</p> <p>-o <i>output</i>            Use the argument <i>output</i> as the name of a third file that is created as a user-controlled merge of <i>filename1</i> and <i>filename2</i>. Identical lines of <i>filename1</i> and <i>filename2</i> are copied to <i>output</i>. Sets of differences, as produced by <i>diff</i>, are printed; where a set of differences share a common gutter character. After printing each set of differences, <i>sdiff</i> prompts the user with a % and waits for one of the following user-typed commands:</p> <p>l                    Append the left column to the output file.</p> <p>r                    Append the right column to the output file.</p> <p>s                    Turn on silent mode; do not print identical lines.</p> <p>v                    Turn off silent mode.</p> <p>e l                  Call the editor with the left column.</p> <p>e r                  Call the editor with the right column.</p> <p>e b                  Call the editor with the concatenation of left and right.</p> <p>e                    Call the editor with a zero length file.</p> <p>q                    Exit from the program.</p> <p>On exit from the editor, the resulting file is concatenated to the end of the <i>output</i> file.</p> <p>-w <i>n</i>                Use the argument <i>n</i> as the width of the output line. The default line length is 130 characters.</p> |
| <b>USAGE</b>       | See <i>largefile</i> (5) for the description of the behavior of <i>sdiff</i> when encountering files greater than or equal to 2 Gbyte ( 2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> An example of the <i>sdiff</i> command.</p> <p>A sample output of <i>sdiff</i> follows.</p> <pre>x       y a       a b   &lt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

sdiff(1)

**EXAMPLE 1** An example of the `sdiff` command. (Continued)

```
c <
d d
 > c
```

**ENVIRONMENT VARIABLES**

If any of the `LC_*` variables ( `LC_CTYPE`, `LC_MESSAGES`, `LC_TIME`, `LC_COLLATE`, `LC_NUMERIC`, and `LC_MONETARY` ) (see `environ(5)`) are not set in the environment, the operational behavior of `sdiff` for each corresponding locale category is determined by the value of the `LANG` environment variable. If `LC_ALL` is set, its contents are used to override both the `LANG` and the other `LC_*` variables. If none of the above variables is set in the environment, the "C" locale determines how `sdiff` behaves.

`LC_CTYPE` Determines how `sdiff` handles characters. When `LC_CTYPE` is set to a valid value, `sdiff` can display and handle text and filenames containing valid characters for that locale.

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWesu         |
| CSI            | Enabled         |

**SEE ALSO**

| <b>DESCRIPTION</b> | <p>The sed utility is a stream editor that reads one or more text files, makes editing changes according to a script of editing commands, and writes the results to standard output. The script is obtained from either the <i>script</i> operand string, or a combination of the option-arguments from the <i>-e script</i> and <i>-f script_file</i> options.</p> <p>The sed utility is a text editor. It cannot edit binary files or files containing ASCII NUL (\0) characters or very long lines.</p>                                                                                                                                                                                                              |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li><i>-e script</i>            <i>script</i> is an edit command for sed. See USAGE below for more information on the format of <i>script</i>. If there is just one <i>-e</i> option and no <i>-f</i> options, the flag <i>-e</i> may be omitted.</li> <li><i>-f script_file</i>        Take the script from <i>script_file</i>. <i>script_file</i> consists of editing commands, one per line.</li> <li><i>-n</i>                    Suppress the default output.</li> </ul> <p>Multiple <i>-e</i> and <i>-f</i> options may be specified. All commands are added to the script in the order specified, regardless of their origin.</p> |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <ul style="list-style-type: none"> <li><i>file</i>                    A path name of a file whose contents will be read and edited. If multiple <i>file</i> operands are specified, the named files will be read in the order specified and the concatenation will be edited. If no <i>file</i> operands are specified, the standard input will be used.</li> <li><i>script</i>                 A string to be used as the script of editing commands. The application must not present a <i>script</i> that violates the restrictions of a text file except that the final character need not be a NEWLINE character.</li> </ul>                                          |
| <b>USAGE</b>       | <p>A script consists of editing commands, one per line, of the following form:</p> <pre>[ address [ , address ] ] command [ arguments ]</pre> <p>Zero or more blank characters are accepted before the first address and before <i>command</i>. Any number of semicolons are accepted before the first address.</p>                                                                                                                                                                                                                                                                                                                                                                                                     |

sed(1)

In normal operation, *sed* cyclically copies a line of input (less its terminating NEWLINE character) into a *pattern space* (unless there is something left after a D command), applies in sequence all commands whose *addresses* select that pattern space, and copies the resulting pattern space to the standard output (except under -n) and deletes the pattern space. Whenever the pattern space is written to standard output or a named file, *sed* will immediately follow it with a NEWLINE character.

Some of the commands use a *hold space* to save all or part of the *pattern space* for subsequent retrieval. The *pattern* and *hold spaces* will each be able to hold at least 8192 bytes.

**sed Addresses**

An *address* is either empty, a decimal number that counts input lines cumulatively across files, a \$ that addresses the last line of input, or a context address, which consists of a */regular expression/* as described on the `regexp(5)` manual page.

A command line with no addresses selects every pattern space.

A command line with one address selects each pattern space that matches the address.

A command line with two addresses selects the inclusive range from the first pattern space that matches the first address through the next pattern space that matches the second address. Thereafter the process is repeated, looking again for the first address. (If the second address is a number less than or equal to the line number selected by the first address, only the line corresponding to the first address is selected.)

Typically, address are separated from each other by a comma (,). They may also be separated by a semicolon (;).

**sed Regular Expressions**

*sed* supports the basic regular expressions described on the `regexp(5)` manual page, with the following additions:

`\cREc` In a context address, the construction `\cREc`, where *c* is any character other than a backslash or NEWLINE character, is identical to `/RE/`. If the character designated by *c* appears following a backslash, then it is considered to be that literal character, which does not terminate the RE. For example, in the context address `\xabc\xdefx`, the second `x` stands for itself, so that the regular expression is `abcxdef`.

`\n` The escape sequence `\n` matches a NEWLINE character embedded in the pattern space. A literal NEWLINE character must not be used in the regular expression of a context address or in the substitute command.

Editing commands can be applied only to non-selected pattern spaces by use of the negation command `!` (described below).

**sed Editing Commands**

In the following list of functions the maximum number of permissible addresses for each function is indicated.

The `r` and `w` commands take an optional *rfile* (or *wfile*) parameter, separated from the command letter by one or more blank characters.

Multiple commands can be specified by separating them with a semicolon (;) on the same command line.

The *text* argument consists of one or more lines, all but the last of which end with \ to hide the NEWLINE. Each embedded NEWLINE character in the text must be preceded by a backslash. Other backslashes in text are removed and the following character is treated literally. Backslashes in text are treated like backslashes in the replacement string of an s command, and may be used to protect initial blanks and tabs against the stripping that is done on every script line. The *rfile* or *wfile* argument must terminate the command line and must be preceded by exactly one blank. The use of the *wfile* parameter causes that file to be initially created, if it does not exist, or will replace the contents of an existing file. There can be at most 10 distinct *wfile* arguments.

Regular expressions match entire strings, not just individual lines, but a NEWLINE character is matched by \n in a sed RE; a NEWLINE character is not allowed in an RE. Also note that \n cannot be used to match a NEWLINE character at the end of an input line; NEWLINE characters appear in the pattern space as a result of the N editing command.

Two of the commands take a *command-list*, which is a list of sed commands separated by NEWLINE characters, as follows:

```
{ command
 command
}
```

The { can be preceded with blank characters and can be followed with white space. The *commands* can be preceded by white space. The terminating } must be preceded by a NEWLINE character and can be preceded or followed by <blank>s. The braces may be preceded or followed by <blank>s. The command may be preceded by <blank>s, but may not be followed by <blank>s.

The following table lists the functions, with the maximum number of permissible addresses.

| Max Address | Command         | Description                                                                                                                                                        |
|-------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1           | a \ <i>text</i> | Append by executing N command or beginning a new cycle. Place <i>text</i> on the output before reading the next input line.                                        |
| 2           | b <i>label</i>  | Branch to the : command bearing the <i>label</i> . If <i>label</i> is empty, branch to the end of the script. Labels are recognized unique up to eight characters. |
| 2           | c \ <i>text</i> | Change. Delete the pattern space. Place <i>text</i> on the output. Start the next cycle.                                                                           |
| 2           | d               | Delete the pattern space. Start the next cycle.                                                                                                                    |

sed(1)

| Max Address | Command         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2           | D               | Delete the initial segment of the pattern space through the first new-line. Start the next cycle. (See the N command below.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2           | g               | Replace the contents of the pattern space by the contents of the hold space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2           | G               | Append the contents of the hold space to the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2           | h               | Replace the contents of the hold space by the contents of the pattern space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2           | H               | Append the contents of the pattern space to the hold space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1           | i \ <i>text</i> | Insert. Place <i>text</i> on the standard output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2           | l               | /usr/bin/sed: List the pattern space on the standard output in an unambiguous form. Non-printable characters are displayed in octal notation and long lines are folded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|             |                 | <p>/usr/xpg4/bin/sed: List the pattern space on the standard output in an unambiguous form. Non-printable characters are displayed in octal notation and long lines are folded. The characters (\, \a, \b, \f, \r, \t, and \v) are written as the corresponding escape sequences. Non-printable characters not in that table will be written as one three-digit octal number (with a preceding backslash character) for each byte in the character (most significant byte first). If the size of a byte on the system is greater than nine bits, the format used for non-printable characters is implementation dependent.</p> <p>Long lines are folded, with the point of folding indicated by writing a backslash followed by a NEWLINE; the length at which folding occurs is unspecified, but should be appropriate for the output device. The end of each line is marked with a \$.</p> |
| 2           | n               | Copy the pattern space to the standard output if default output is not suppressed. Replace the pattern space with the next line of input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Max Address | Command                 | Description                                                                                                                                                                                                                                                                                                                                                       |
|-------------|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2           | N                       | Append the next line of input to the pattern space with an embedded new-line. (The current line number changes.) If no next line of input is available, the N command verb shall branch to the end of the script and quit without starting a new cycle and without writing the pattern space.                                                                     |
| 2           | p                       | Print. Copy the pattern space to the standard output.                                                                                                                                                                                                                                                                                                             |
| 2           | P                       | Copy the initial segment of the pattern space through the first new-line to the standard output.                                                                                                                                                                                                                                                                  |
| 1           | q                       | Quit. Branch to the end of the script. Do not start a new cycle.                                                                                                                                                                                                                                                                                                  |
| 2           | r <i>rfile</i>          | Read the contents of <i>rfile</i> . Place them on the output before reading the next input line. If <i>rfile</i> does not exist or cannot be read, it is treated as if it were an empty file, causing no error condition.                                                                                                                                         |
| 2           | t <i>label</i>          | Test. Branch to the : command bearing the <i>label</i> if any substitutions have been made since the most recent reading of an input line or execution of a t. If <i>label</i> is empty, branch to the end of the script.                                                                                                                                         |
| 2           | w <i>wfile</i>          | Write. Append the pattern space to <i>wfile</i> . The first occurrence of w will cause <i>wfile</i> to be cleared. Subsequent invocations of w will append. Each time the sed command is used, <i>wfile</i> is overwritten.                                                                                                                                       |
| 2           | x                       | Exchange the contents of the pattern and hold spaces.                                                                                                                                                                                                                                                                                                             |
| 2           | ! <i>command</i>        | Don't. Apply the <i>command</i> (or group, if <i>command</i> is { }) only to lines <i>not</i> selected by the address(es).                                                                                                                                                                                                                                        |
| 0           | : <i>label</i>          | This command does nothing; it bears a <i>label</i> for b and t commands to branch to.                                                                                                                                                                                                                                                                             |
| 1           | =                       | Place the current line number on the standard output as a line.                                                                                                                                                                                                                                                                                                   |
| 2           | { <i>command-list</i> } | Execute <i>command-list</i> only when the pattern space is selected.                                                                                                                                                                                                                                                                                              |
| 0           |                         | An empty command is ignored.                                                                                                                                                                                                                                                                                                                                      |
| 0           | #                       | If a # appears as the first character on a line of a script file, then that entire line is treated as a comment, with one exception: if a # appears on the first line and the character after the # is an n, then the default output will be suppressed. The rest of the line after #n is also ignored. A script file must contain at least one non-comment line. |

sed(1)

| Max Addr | Command (Using <i>strings</i> ) and Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2        | <p><i>s/regular expression/replacement/flags</i></p> <p>Substitute the <i>replacement</i> string for instances of the <i>regular expression</i> in the pattern space. Any character other than backslash or newline can be used instead of a slash to delimit the RE and the replacement. Within the RE and the replacement, the RE delimiter itself can be used as a literal character if it is preceded by a backslash.</p> <p>An ampersand (&amp;) appearing in the <i>replacement</i> will be replaced by the string matching the RE. The special meaning of &amp; in this context can be suppressed by preceding it by backslash. The characters <i>\n</i>, where <i>n</i> is a digit, will be replaced by the text matched by the corresponding backreference expression. For each backslash (\) encountered in scanning <i>replacement</i> from beginning to end, the following character loses its special meaning (if any). It is unspecified what special meaning is given to any character other than &amp;, \ or digits.</p> <p>A line can be split by substituting a NEWLINE character into it. The application must escape the NEWLINE character in the <i>replacement</i> by preceding it with backslash. A substitution is considered to have been performed even if the replacement string is identical to the string that it replaces.</p> <p><i>flags</i> is zero or more of:</p> <p><i>n n= 1 - 512</i>. Substitute for just the <i>n</i>th occurrence of the <i>regular expression</i>.</p> <p><i>g</i> Global. Substitute for all nonoverlapping instances of the <i>regular expression</i> rather than just the first one. If both <i>g</i> and <i>n</i> are specified, the results are unspecified.</p> |
|          | <p><i>p</i> Print the pattern space if a replacement was made.</p> <p><i>P</i> Copy the initial segment of the pattern space through the first new-line to the standard output.</p> <p><i>w wfile</i> Write. Append the pattern space to <i>wfile</i> if a replacement was made. The first occurrence of <i>w</i> will cause <i>wfile</i> to be cleared. Subsequent invocations of <i>w</i> will append. Each time the <i>sed</i> command is used, <i>wfile</i> is overwritten.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2        | <p><i>y/string1 / string2 /</i></p> <p>Transform. Replace all occurrences of characters in <i>string1</i> with the corresponding characters in <i>string2</i>. <i>string1</i> and <i>string2</i> must have the same number of characters, or if any of the characters in <i>string1</i> appear more than once, the results are undefined. Any character other than backslash or NEWLINE can be used instead of slash to delimit the strings. Within <i>string1</i> and <i>string2</i>, the delimiter itself can be used as a literal character if it is preceded by a backslash. For example, <i>y/abc/ABC/</i> replaces a with A, b with B, and c with C.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

See `largefile(5)` for the description of the behavior of `sed` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

**EXAMPLES** **EXAMPLE 1** An example sed script

This sed script simulates the BSD `cat -s` command, squeezing excess blank lines from standard input.

```
sed -n '
Write non-empty lines.
./ {
 p
 d
}
Write a single empty line, then look for more empty lines.
/^$/ p
Get next line, discard the held <newline> (empty line),
and look for more empty lines.
:Empty
/^$/ {
 N
 s/./ /
 b Empty
}
Write the non-empty line before going back to search
for the first in a set of empty lines.
p
'
```

**ENVIRONMENT VARIABLES** See `environ(5)` for descriptions of the following environment variables that affect the execution of sed: `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS** The following exit values are returned:

```
0 Successful completion.
>0 An error occurred.
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

`/usr/bin/sed`

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |
| CSI            | Not enabled     |

`/usr/xpg4/bin/sed`

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWxcu4        |
| CSI            | Enabled         |

**SEE ALSO** `awk(1)`, `ed(1)`, `grep(1)`, `attributes(5)`, `environ(5)`, `largefile(5)`, `regex(5)`, `XPG4(5)`

| <b>DESCRIPTION</b>                | The <i>sed</i> utility copies the <i>filenames</i> (standard input default) to the standard output, edited according to a script of commands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |       |                                                                                                                                                                                                                                                                     |    |                                                  |   |                                                                    |             |                                                             |                |                                          |                                   |                                                                                                                                         |
| <b>OPTIONS</b>                    | The following options are supported:<br>-n                    Suppresses the default output.<br>-e <i>script</i> <i>script</i> is an edit command for <i>sed</i> . If there is just one -e option and no -f options, the -e flag may be omitted.<br>-f <i>sfilename</i> Takes the script from <i>sfilename</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |       |                                                                                                                                                                                                                                                                     |    |                                                  |   |                                                                    |             |                                                             |                |                                          |                                   |                                                                                                                                         |
| <b>sed Scripts</b>                | <i>sed scripts</i> consist of editing commands, one per line, of the following form:<br>[ <i>address</i> [, <i>address</i> ] ] <i>function</i> [ <i>arguments</i> ]<br><br>In normal operation, <i>sed</i> cyclically copies a line of input into a <i>pattern space</i> (unless there is something left after a D command), sequentially applies all commands with <i>addresses</i> matching that pattern space until reaching the end of the script, copies the pattern space to the standard output (except under -n), and finally, deletes the pattern space.<br><br>Some commands use a <i>hold space</i> to save all or part of the pattern space for subsequent retrieval.<br><br>An <i>address</i> is either:<br><ul style="list-style-type: none"> <li>■ a decimal number linecount, which is cumulative across input files;</li> <li>■ a \$, which addresses the last input line;</li> <li>■ or a context address, which is a <i>/regular expression/</i> as described on the <i>regex(5)</i> manual page, with the following exceptions:<br/> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 10px;">\?RE?</td> <td>In a context address, the construction \ <i>?regular expression?</i>, where ? is any character, is identical to <i>/regular expression/</i>. Note: in the context address \xabc\xdefx, the second x stands for itself, so that the regular expression is abcxdef.</td> </tr> <tr> <td style="padding-right: 10px;">\n</td> <td>Matches a NEWLINE embedded in the pattern space.</td> </tr> <tr> <td style="padding-right: 10px;">.</td> <td>Matches any character except the NEWLINE ending the pattern space.</td> </tr> <tr> <td style="padding-right: 10px;"><i>null</i></td> <td>A command line with no address selects every pattern space.</td> </tr> <tr> <td style="padding-right: 10px;"><i>address</i></td> <td>Selects each pattern space that matches.</td> </tr> <tr> <td style="padding-right: 10px;"><i>address1</i> , <i>address2</i></td> <td>Selects the inclusive range from the first pattern space matching <i>address1</i> to the first pattern space matching <i>address2</i>.</td> </tr> </table> </li> </ul> | \?RE? | In a context address, the construction \ <i>?regular expression?</i> , where ? is any character, is identical to <i>/regular expression/</i> . Note: in the context address \xabc\xdefx, the second x stands for itself, so that the regular expression is abcxdef. | \n | Matches a NEWLINE embedded in the pattern space. | . | Matches any character except the NEWLINE ending the pattern space. | <i>null</i> | A command line with no address selects every pattern space. | <i>address</i> | Selects each pattern space that matches. | <i>address1</i> , <i>address2</i> | Selects the inclusive range from the first pattern space matching <i>address1</i> to the first pattern space matching <i>address2</i> . |
| \?RE?                             | In a context address, the construction \ <i>?regular expression?</i> , where ? is any character, is identical to <i>/regular expression/</i> . Note: in the context address \xabc\xdefx, the second x stands for itself, so that the regular expression is abcxdef.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |                                                                                                                                                                                                                                                                     |    |                                                  |   |                                                                    |             |                                                             |                |                                          |                                   |                                                                                                                                         |

| <b>Comments</b>  | <p>If the first nonwhite character in a line is a '#' (pound sign), <i>sed</i> treats that line as a comment, and ignores it. If, however, the first such line is of the form:</p> <pre>#n</pre> <p><i>sed</i> runs as if the <code>-n</code> flag were specified.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Functions</b> | <p>The maximum number of permissible addresses for each function is indicated in parentheses in the list below.</p> <p>An argument denoted <i>text</i> consists of one or more lines, all but the last of which end with <code>\</code> to hide the NEWLINE. Backslashes in <i>text</i> are treated like backslashes in the replacement string of an <code>s</code> command, and may be used to protect initial SPACE and TAB characters against the stripping that is done on every script line.</p> <p>An argument denoted <i>rfilename</i> or <i>wfilename</i> must terminate the command line and must be preceded by exactly one SPACE. Each <i>wfilename</i> is created before processing begins. There can be at most 10 distinct <i>wfilename</i> arguments.</p> <p>(1) <code>a \</code><br/><i>text</i>                    Append: place <i>text</i> on the output before reading the next input line.</p> <p>(2) <code>b label</code>            Branch to the ':' command bearing the <i>label</i>. Branch to the end of the script if <i>label</i> is empty.</p> <p>(2) <code>c \</code><br/><i>text</i>                    Change: delete the pattern space. With 0 or 1 address or at the end of a 2 address range, place <i>text</i> on the output. Start the next cycle.</p> <p>(2) <code>d</code>                    Delete the pattern space. Start the next cycle.</p> <p>(2) <code>D</code>                    Delete the initial segment of the pattern space through the first NEWLINE. Start the next cycle.</p> <p>(2) <code>g</code>                    Replace the contents of the pattern space by the contents of the hold space.</p> <p>(2) <code>G</code>                    Append the contents of the hold space to the pattern space.</p> <p>(2) <code>h</code>                    Replace the contents of the hold space by the contents of the pattern space.</p> <p>(2) <code>H</code>                    Append the contents of the pattern space to the hold space.</p> <p>(1) <code>i \</code><br/><i>text</i>                    Insert: place <i>text</i> on the standard output.</p> |

| (0) : <i>label</i>                                                   | This command does nothing; it bears a <i>label</i> for b and t commands to branch to. Note: the maximum length of <i>label</i> is seven characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |          |                                                                                                       |          |                                                                                                                      |          |                                                    |                    |                                                                                |

- (1) = Place the current line number on the standard output as a line.
- (2) { Execute the following commands through a matching '}' only when the pattern space is selected. Commands are separated by ';'.
- (0) An empty command is ignored.

**Large Files**

See `largefile(5)` for the description of the behavior of `sed` when encountering files greater than or equal to 2 Gbyte (  $2^{31}$  bytes).

**DIAGNOSTICS**

Too many commands

The command list contained more than 200 commands.

Too much command text

The command list was too big for `sed` to handle. Text in the `a`, `c`, and `i` commands, text read in by `r` commands, addresses, regular expressions and replacement strings in `s` commands, and translation tables in `y` commands all require `sed` to store data internally.

Command line too long

A command line was longer than 4000 characters.

Too many line numbers

More than 256 decimal number linecounts were specified as addresses in the command list.

Too many files in `w` commands

More than 10 different files were specified in `w` commands or `w` options for `s` commands in the command list.

Too many labels

More than 50 labels were specified in the command list.

Unrecognized command

A command was not one of the ones recognized by `sed`.

Extra text at end of command

A command had extra text after the end.

Illegal line number

An address was neither a decimal number linecount, a `$`, nor a context address.

Space missing before filename

There was no space between an `r` or `w` command, or the `w` option for a `s` command, and the filename specified for that command.

Too many { 's

There were more { than } in the list of commands to be executed.

Too many } 's

There were more } than { in the list of commands to be executed.

sed(1B)

No addresses allowed  
A command that takes no addresses had an address specified.

Only one address allowed  
A command that takes one address had two addresses specified.

"\digit" out of range  
The number in a \n item in a regular expression or a replacement string in an s command was greater than 9.

Bad number  
One of the endpoints in a range item in a regular expression (that is, an item of the form {n} or {n,m}) was not a number.

Range endpoint too large  
One of the endpoints in a range item in a regular expression was greater than 255.

More than 2 numbers given in \{ \}  
More than two endpoints were given in a range expression.

} expected after \  
A \ appeared in a range expression and was not followed by a }.

First number exceeds second in \{ \}  
The first endpoint in a range expression was greater than the second.

Illegal or missing delimiter  
The delimiter at the end of a regular expression was absent.

\( \) imbalance  
There were more \( than \), or more \) than \(, in a regular expression.

[ ] imbalance  
There were more [ than ], or more ] than [, in a regular expression.

First RE may not be null  
The first regular expression in an address or in a s command was null (empty).

Ending delimiter missing on substitution  
The ending delimiter in a s command was absent.

Ending delimiter missing on string  
The ending delimiter in a y command was absent.

Transform strings not the same size  
The two strings in a y command were not the same size.

Suffix too large - 512 max  
The suffix in a s command, specifying which occurrence of the regular expression should be replaced, was greater than 512.

Label too long  
A label in a command was longer than 8 characters.

**Duplicate labels**

The same label was specified by more than one `:` command.

**File name too long**

The filename specified in a `r` or `w` command, or in the `w` option for a `s` command, was longer than 1024 characters.

**Output line too long**

An output line was longer than 4000 characters long.

**Too many appends or reads after line *n***

More than 20 `a` or `r` commands were to be executed for line *n*.

**Hold space overflowed.**

More than 4000 characters were to be stored in the *hold space*.

**FILES** `usr/ucb/sed`

BSD `sed`

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWscpu        |

**SEE ALSO** `awk(1)`, `grep(1)`, `lex(1)`, `attributes(5)`, `largefile(5)`, `regexp(5)`

**BUGS** There is a combined limit of 200 `-e` and `-f` arguments. In addition, there are various internal size limits which, in rare cases, may overflow. To overcome these limitations, either combine or break out scripts, or use a pipeline of `sed` commands.

| <b>sh</b>   | The set built-in command has the following options:<br>-- Do not change any of the flags; useful in setting \$1 to –.<br>-a Mark variables which are modified or created for export.<br>-e Exit immediately if a command exits with a non-zero exit status.<br>-f Disable file name generation.<br>-h Locate and remember function commands as functions are defined (function commands are normally located when the function is executed).<br>-k All keyword arguments are placed in the environment for a command, not just those that precede the command name.<br>-n Read commands but do not execute them.<br>-t Exit after reading and executing one command.<br>-u Treat unset variables as an error when substituting.<br>-v Print shell input lines as they are read.<br>-x Print commands and their arguments as they are executed.<br><br>Using + rather than – causes these flags to be turned off. These flags can also be used upon invocation of the shell. The current set of flags may be found in \$-. The remaining <i>arguments</i> are positional parameters and are assigned, in order, to \$1, \$2, . . . . If no <i>arguments</i> are given the values of all names are printed.<br><br>For each <i>name</i> , unset removes the corresponding variable or function value. The variables PATH, PS1, PS2, MAILCHECK, and IF cannot be unset. |

With the `export` built-in, the given *names* are marked for automatic export to the *environment* of subsequently executed commands. If no arguments are given, variable names that have been marked for export during the current shell's execution are listed. Function names are *not* exported.

**cs**h With no arguments, `set` displays the values of all shell variables. Multiword values are displayed as a parenthesized list. With the *var* argument alone, `set` assigns an empty (null) value to the variable *var*. With arguments of the form *var = value* `set` assigns *value* to *var*, where *value* is one of:

*word*                    A single word (or quoted string).

(*wordlist*)              A space-separated list of words enclosed in parentheses.

Values are command and filename expanded before being assigned. The form `set var [n] =word` replaces the *n*'th word in a multiword value with *word*.

`unset` removes variables whose names match (filename substitution) *pattern*. All variables are removed by `'unset *'`; this has noticeably distasteful side effects.

With no arguments, `setenv` displays all environment variables. With the *VAR* argument, `setenv` sets the environment variable *VAR* to an empty (null) value. (By convention, environment variables are normally given upper-case names.) With both *VAR* and *word* arguments specified, `setenv` sets *VAR* to *word*, which must be either a single word or a quoted string. The *PATH* variable can take multiple *word* arguments, separated by colons (see EXAMPLES). The most commonly used environment variables, *USER*, *TERM*, and *PATH*, are automatically imported to and exported from the `cs`h variables *user*, *term*, and *path*. Use `setenv` if you need to change these variables. In addition, the shell sets the *PWD* environment variable from the `cs`h variable *cwd* whenever the latter changes.

The environment variables *LC\_CTYPE*, *LC\_MESSAGES*, *LC\_TIME*, *LC\_COLLATE*, *LC\_NUMERIC*, and *LC\_MONETARY* take immediate effect when changed within the C shell. See `environ(5)` for descriptions of these environment variables.

`unsetenv` removes *variable* from the environment. As with `unset`, pattern matching is not performed.

**ks**h The flags for the `set` built-in have meaning as follows:

- A            Array assignment. Unset the variable *name* and assign values sequentially from the list *arg*. If +A is used, the variable *name* is not unset first.
- a            All subsequent variables that are defined are automatically exported.
- e            If a command has a non-zero exit status, execute the ERR trap, if set, and exit. This mode is disabled while reading profiles.
- f            Disables file name generation.
- h            Each command becomes a tracked alias when first encountered.

set(1)

|            |                                                                                                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -k         | All variable assignment arguments are placed in the environment for a command, not just those that precede the command name.                                                                                                                                  |
| -m         | Background jobs will run in a separate process group and a line will print upon completion. The exit status of background jobs is reported in a completion message. On systems with job control, this flag is turned on automatically for interactive shells. |
| -n         | Read commands and check them for syntax errors, but do not execute them. Ignored for interactive shells.                                                                                                                                                      |
| -o         | The following argument can be one of the following option names:                                                                                                                                                                                              |
| allexport  | Same as -a.                                                                                                                                                                                                                                                   |
| errexit    | Same as -e.                                                                                                                                                                                                                                                   |
| bgnice     | All background jobs are run at a lower priority. This is the default mode. <code>emacs</code> Puts you in an <code>emacs</code> style in-line editor for command entry.                                                                                       |
| gmacs      | Puts you in a <code>gmacs</code> style in-line editor for command entry.                                                                                                                                                                                      |
| ignoreeof  | The shell will not exit on end-of-file. The command <code>exit</code> must be used.                                                                                                                                                                           |
| keyword    | Same as -k.                                                                                                                                                                                                                                                   |
| markdirs   | All directory names resulting from file name generation have a trailing / appended.                                                                                                                                                                           |
| monitor    | Same as -m.                                                                                                                                                                                                                                                   |
| noclobber  | Prevents redirection <code>&gt;</code> from truncating existing files. Require <code>&gt; </code> to truncate a file when turned on.                                                                                                                          |
| noexec     | Same as -n.                                                                                                                                                                                                                                                   |
| noglob     | Same as -f.                                                                                                                                                                                                                                                   |
| nolog      | Do not save function definitions in history file.                                                                                                                                                                                                             |
| nounset    | Same as -u.                                                                                                                                                                                                                                                   |
| privileged | Same as -p.                                                                                                                                                                                                                                                   |
| verbose    | Same as -v.                                                                                                                                                                                                                                                   |
| trackall   | Same as -h.                                                                                                                                                                                                                                                   |
| vi         | Puts you in insert mode of a <code>vi</code> style in-line editor until you hit escape character <code>033</code> . This puts you in control mode. A return sends the line.                                                                                   |
| viraw      | Each character is processed as it is typed in <code>vi</code> mode.                                                                                                                                                                                           |

xtrace            Same as -x.

If no option name is supplied then the current option settings are printed.

- p            Disables processing of the `$HOME/.profile` file and uses the file `/etc/suid_profile` instead of the `ENV` file. This mode is on whenever the effective uid is not equal to the real uid, or when the effective gid is not equal to the real gid. Turning this off causes the effective uid and gid to be set to the real uid and gid.
- s            Sort the positional parameters lexicographically.
- t            Exit after reading and executing one command.
- u            Treat unset parameters as an error when substituting.
- v            Print shell input lines as they are read.
- x            Print commands and their arguments as they are executed.
- Turns off -x and -v flags and stops examining arguments for flags.
- Do not change any of the flags; useful in setting `$1` to a value beginning with -. If no arguments follow this flag then the positional parameters are unset.

Using + rather than - causes these flags to be turned off. These flags can also be used upon invocation of the shell. The current set of flags may be found in `$-`. Unless -A is specified, the remaining arguments are positional parameters and are assigned, in order, to `$1 $2 . . .`. If no arguments are given then the names and values of all variables are printed on the standard output.

The variables given by the list of *names* are unassigned, i.e., their values and attributes are erased. `readonly` variables cannot be unset. If the -f, flag is set, then the names refer to function names. Unsetting `ERRNO`, `LINENO`, `MAILCHECK`, `OPTARG`, `OPTIND`, `RANDOM`, `SECONDS`, `TMOUT`, and `_` removes their special meaning even if they are subsequently assigned.

When using `unset`, the variables given by the list of *names* are unassigned, i.e., their values and attributes are erased. `readonly` variables cannot be unset. If the -f, flag is set, then the names refer to function names. Unsetting `ERRNO`, `LINENO`, `MAILCHECK`, `OPTARG`, `OPTIND`, `RANDOM`, `SECONDS`, `TMOUT`, and `_` removes their special meaning even if they are subsequently assigned.

With the `export` built-in, the given *names* are marked for automatic export to the environment of subsequently-executed commands.

On this man page, `ksh(1)` commands that are preceded by one or two \* (asterisks) are treated specially in the following ways:

1. Variable assignment lists preceding the command remain in effect when the command completes.

set(1)

2. I/O redirections are processed after variable assignments.
3. Errors cause a script that contains them to abort.
4. Words, following a command preceded by \*\* that are in the format of a variable assignment, are expanded with the same rules as a variable assignment. This means that tilde substitution is performed after the = sign and word splitting and file name generation are not performed.

**csh** The following example sets the PATH variable to search for files in the /bin, /usr/bin, /usr/sbin, and /usr/ucb/bin directories, in that order.

```
setenv PATH "/bin:/usr/bin:/usr/sbin:usr/ucb/bin"
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `csh(1)`, `ksh(1)`, `read(1)`, `sh(1)`, `typeset(1)`, `attributes(5)`, `environ(5)`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAME</b>        | set, unset – set and unset local or global environment variables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <pre> <b>set</b> [-l <i>variable</i> [=value]] ... <b>set</b> [-e <i>variable</i> [=value]] ... <b>set</b> [-f<i>file</i> <i>variable</i> [=value]...] ... <b>unset</b> -l <i>variable</i>... <b>unset</b> -f <i>file</i> <i>variable</i>... </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>The <code>set</code> command sets <i>variable</i> in the environment, or adds <i>variable=value</i> to <i>file</i>. If <i>variable</i> is not equated it to a value, <code>set</code> expects the value to be on <i>stdin</i>. The <code>unset</code> command removes <i>variable</i>. Note that the FMLI predefined, read-only variables (such as ARG1), may not be set or unset.</p> <p>Note that at least one of the above options must be used for each variable being set or unset. If you set a variable with the <code>-ffilename</code> option, you must thereafter include <i>filename</i> in references to that variable. For example, <code>\${(file) VARIABLE}</code>.</p> <p>FMLI inherits the UNIX environment when invoked.</p> |
| <b>OPTIONS</b>     | <pre> -l      Sets or unsets the specified variable in the local environment. Variables set         with -l will not be inherited by processes invoked from FMLI.  -e      Sets the specified variable in the UNIX environment. Variables set with -e         will be inherited by any processes started from FMLI. Note that these         variables cannot be unset .  -f<i>file</i> Sets or unsets the specified variable in the global environment. The         argument <i>file</i> is the name, or pathname, of a file containing lines of the         form <i>variable=value</i>. <i>file</i> will be created if it does not already exist. Note         that no space intervenes between -f and <i>file</i>. </pre>                       |

| <b>SYNOPSIS</b>    | <b>setcolor</b> <i>color red_level green_level blue_level</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |
| <b>DESCRIPTION</b> | The <code>setcolor</code> command takes four arguments: <i>color</i> , which must be a string naming the color; and the arguments <i>red_level</i> , <i>green_level</i> , and <i>blue_level</i> , which must be integer values defining, respectively, the intensity of the red, green, and blue components of <i>color</i> . Intensities must be in the range of 0 to 1000. If you are redefining an existing color, you must use its current name (default color names are: black, blue, green, cyan, red, magenta, yellow, and white). <code>setcolor</code> returns the color's name string. |                |                 |              |         |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> A sample output of <code>setcolor</code> command.</p> <p>The following is an example of the arguments that <code>setcolor</code> takes:</p> <pre>'setcolor blue 100 24 300'</pre> <p>BUILT-IN FMLI</p>                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |

| <b>DESCRIPTION</b>        | <p>For each file specified, <code>setfacl</code> will either replace its entire ACL, including the default ACL on a directory, or it will add, modify, or delete one or more ACL entries, including default entries on directories.</p> <p>Setting an ACL on a file also modifies the file's permission bits. The <code>user</code> entry modifies the file owner permission bits. If you don't specify a <code>mask</code> entry, the <code>group</code> entry modifies the file group owner permission bits. If you specify a <code>mask</code> entry, the file group owner permission bits are modified based on the intersection (bitwise AND) of the <code>group</code> and <code>mask</code> entries. The <code>other</code> entry modifies the other permission bits.</p> <p>If you use the <code>chmod(1)</code> command to change the file group owner permissions on a file with ACL entries, both the file group owner permissions and the ACL mask are changed to the new permissions. Be aware that the new ACL mask permissions may change the effective permissions for additional users and groups who have ACL entries on the file.</p> <p>A directory may contain default ACL entries. If a file or directory is created in a directory that contains default ACL entries, the newly created file will have permissions generated according to the intersection of the default ACL entries and the permissions requested at creation time. The <code>umask(1)</code> will not be applied if the directory contains default ACL entries. If a default ACL is specified for a specific user (or users), the file will have a regular ACL created; otherwise, only the mode bits will be initialized according to the intersection described above. The default ACL should be thought of as the maximum discretionary access permissions that may be granted.</p> |                   |                                                                                                                                                                        |                          |                                                                                         |              |                                                                                                                                                                                                                               |
| <i>acl_entries</i> Syntax | <p>For the <code>-m</code> and <code>-s</code> options, <i>acl_entries</i> are one or more comma-separated ACL entries.</p> <p>An ACL entry consists of the following fields separated by colons:</p> <table><tr><td><i>entry_type</i></td><td>Type of ACL entry on which to set file permissions. For example, <i>entry_type</i> can be <code>user</code> (the owner of a file) or <code>mask</code> (the ACL mask).</td></tr><tr><td><i>uid</i> or <i>gid</i></td><td>User name or user identification number. Or, group name or group identification number.</td></tr><tr><td><i>perms</i></td><td>Represents the permissions that are set on <i>entry_type</i>. <i>perms</i> can be indicated by the symbolic characters <code>rxw</code> or a number (the same permissions numbers used with the <code>chmod</code> command).</td></tr></table> <p>The following table shows the valid ACL entries (default entries may only be specified for directories):</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <i>entry_type</i> | Type of ACL entry on which to set file permissions. For example, <i>entry_type</i> can be <code>user</code> (the owner of a file) or <code>mask</code> (the ACL mask). | <i>uid</i> or <i>gid</i> | User name or user identification number. Or, group name or group identification number. | <i>perms</i> | Represents the permissions that are set on <i>entry_type</i> . <i>perms</i> can be indicated by the symbolic characters <code>rxw</code> or a number (the same permissions numbers used with the <code>chmod</code> command). |
| <i>entry_type</i>         | Type of ACL entry on which to set file permissions. For example, <i>entry_type</i> can be <code>user</code> (the owner of a file) or <code>mask</code> (the ACL mask).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                   |                                                                                                                                                                        |                          |                                                                                         |              |                                                                                                                                                                                                                               |
| <i>uid</i> or <i>gid</i>  | User name or user identification number. Or, group name or group identification number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                   |                                                                                                                                                                        |                          |                                                                                         |              |                                                                                                                                                                                                                               |
| <i>perms</i>              | Represents the permissions that are set on <i>entry_type</i> . <i>perms</i> can be indicated by the symbolic characters <code>rxw</code> or a number (the same permissions numbers used with the <code>chmod</code> command).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                   |                                                                                                                                                                        |                          |                                                                                         |              |                                                                                                                                                                                                                               |

| ACL Entry                                | Description                                                                                                                                                                                        |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>u[ser]::perms</code>               | File owner permissions.                                                                                                                                                                            |
| <code>g[roup]::perms</code>              | File group owner permissions.                                                                                                                                                                      |
| <code>o[ther]:perms</code>               | Permissions for users other than the file owner or members of file group owner.                                                                                                                    |
| <code>m[ask]:perms</code>                | The ACL mask. The mask entry indicates the maximum permissions allowed for users (other than the owner) and for groups. The mask is a quick way to change permissions on all the users and groups. |
| <code>u[ser]:uid:perms</code>            | Permissions for a specific user. For <i>uid</i> , you can specify either a user name or a numeric UID.                                                                                             |
| <code>g[roup]:gid:perms</code>           | Permissions for a specific group. For <i>gid</i> , you can specify either a group name or a numeric GID.                                                                                           |
| <code>d[efault]:u[ser]::perms</code>     | Default file owner permissions.                                                                                                                                                                    |
| <code>d[efault]:g[roup]::perms</code>    | Default file group owner permissions.                                                                                                                                                              |
| <code>d[efault]:o[ther]:perms</code>     | Default permissions for users other than the file owner or members of the file group owner.                                                                                                        |
| <code>d[efault]:m[ask]:perms</code>      | Default ACL mask.                                                                                                                                                                                  |
| <code>d[efault]:u[ser]:uid:perms</code>  | Default permissions for a specific user. For <i>uid</i> , you can specify either a user name or a numeric UID.                                                                                     |
| <code>d[efault]:g[roup]:gid:perms</code> | Default permissions for a specific group. For <i>gid</i> , you can specify either a group name or a numeric GID.                                                                                   |

For the `-d` option, *acl\_entries* are one or more comma-separated ACL entries without permissions. Note that the entries for file owner, file group owner, ACL mask, and others may not be deleted.

**OPTIONS** The options have the following meaning:

`-s acl_entries`

Set a file's ACL. All old ACL entries are removed and replaced with the newly specified ACL. The entries need not be in any specific order. They will be sorted by the command before being applied to the file.

Required entries:

- Exactly one user entry specified for the file owner.
- Exactly one group entry for the file group owner.
- Exactly one other entry specified.

If there are additional user and group entries:

## setfacl(1)

- Exactly one mask entry specified for the ACL mask that indicates the maximum permissions allowed for users (other than the owner) and groups.
- Must not be duplicate user entries with the same *uid*.
- Must not be duplicate group entries with the same *gid*.

If *file* is a directory, the following default ACL entries may be specified:

- Exactly one default user entry for the file owner.
- Exactly one default group entry for the file group owner.
- Exactly one default mask entry for the ACL mask.
- Exactly one default other entry.

There may be additional default user entries and additional default group entries specified, but there may not be duplicate additional default user entries with the same *uid*, or duplicate default group entries with the same *gid*.

### -m *acl\_entries*

Add one or more new ACL entries to the file, and/or modify one or more existing ACL entries on the file. If an entry already exists for a specified *uid* or *gid*, the specified permissions will replace the current permissions. If an entry does not exist for the specified *uid* or *gid*, an entry will be created.

### -d *acl\_entries*

Delete one or more entries from the file. The entries for the file owner, the file group owner, and others may not be deleted from the ACL. Note that deleting an entry does not necessarily have the same effect as removing all permissions from the entry.

### -f *acl\_file*

Set a file's ACL with the ACL entries contained in the file named *acl\_file*. The same constraints on specified entries hold as with the *-s* option. The entries are not required to be in any specific order in the file. Also, if you specify a dash '-' for *acl\_file*, standard input is used to set the file's ACL.

The character "#" in *acl\_file* may be used to indicate a comment. All characters, starting with the "#" until the end of the line, will be ignored. Note that if the *acl\_file* has been created as the output of the `getfacl(1)` command, any effective permissions, which will follow a "#", will be ignored.

### -r

Recalculate the permissions for the ACL mask entry. The permissions specified in the ACL mask entry are ignored and replaced by the maximum permissions necessary to grant the access to all additional user, file group owner, and additional group entries in the ACL. The permissions in the additional user, file group owner, and additional group entries are left unchanged.

## EXAMPLES

### EXAMPLE 1 Adding read permission only

The following example adds one ACL entry to file `abc`, which gives user `shea` read permission only.

**EXAMPLE 1** Adding read permission only (Continued)

```
setfacl -m user:shea:r- abc
```

**EXAMPLE 2** Replacing a file's entire ACL

The following example replaces the entire ACL for the file `abc`, which gives `shea` read access, the file owner all access, the file group owner read access only, the ACL mask read/write access, and others no access.

```
setfacl -s user:shea:rw, user::rx, group::rw-, mask:r--, other:--- abc
```

Note that after this command, the file permission bits are `rwxr----`. Even though the file group owner was set with read/write permissions, the ACL mask entry limits it to have only read permissions. The mask entry also specifies the maximum permissions available to all additional user and group ACL entries. Once again, even though the user `shea` was set with all access, the mask limits it to have only read permissions. The ACL mask entry is a quick way to limit or open access to all the user and group entries in an ACL. For example, by changing the mask entry to read/write, both the file group owner and user `shea` would be given read/write access.

**EXAMPLE 3** Setting the same ACL on two files

The following example sets the same ACL on file `abc` as the file `xyz`.

```
getfacl xyz | setfacl -f - abc
```

**FILES** `/etc/passwd` password file  
`/etc/group` group file

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

| <b>DESCRIPTION</b> | <p>The <code>/usr/bin/sh</code> utility is a command programming language that executes commands read from a terminal or a file.</p> <p>The <code>/usr/xpg4/bin/sh</code> utility is identical to <code>/usr/bin/ksh</code>. See <code>ksh(1)</code>.</p> <p>The <code>jsh</code> utility is an interface to the shell that provides all of the functionality of <code>sh</code> and enables job control (see <code>Job Control</code> section below).</p> <p>Arguments to the shell are listed in the <code>Invocation</code> section below.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Definitions</b> | <p>A <i>blank</i> is a tab or a space. A <i>name</i> is a sequence of ASCII letters, digits, or underscores, beginning with a letter or an underscore. A <i>parameter</i> is a name, a digit, or any of the characters <code>*</code>, <code>@</code>, <code>#</code>, <code>?</code>, <code>-</code>, <code>\$</code>, and <code>!</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Commands</b>    | <p>A <i>simple-command</i> is a sequence of non-blank <i>words</i> separated by <i>blanks</i>. The first <i>word</i> specifies the name of the command to be executed. Except as specified below, the remaining <i>words</i> are passed as arguments to the invoked command. The command name is passed as argument 0 (see <code>exec(2)</code>). The <i>value</i> of a <i>simple-command</i> is its exit status if it terminates normally, or (octal) <code>200+status</code> if it terminates abnormally; see <code>signal(3HEAD)</code> for a list of status values.</p> <p>A <i>pipeline</i> is a sequence of one or more <i>commands</i> separated by <code> </code>. The standard output of each <i>command</i> but the last is connected by a <code>pipe(2)</code> to the standard input of the next <i>command</i>. Each <i>command</i> is run as a separate process; the shell waits for the last <i>command</i> to terminate. The exit status of a <i>pipeline</i> is the exit status of the last <i>command</i> in the <i>pipeline</i>.</p> <p>A <i>list</i> is a sequence of one or more <i>pipelines</i> separated by <code>;</code>, <code>&amp;</code>, <code>&amp;&amp;</code>, or <code>   </code>, and optionally terminated by <code>;</code> or <code>&amp;</code>. Of these four symbols, <code>;</code> and <code>&amp;</code> have equal precedence, which is lower than that of <code>&amp;&amp;</code> and <code>   </code>. The symbols <code>&amp;&amp;</code> and <code>   </code> also have equal precedence. A semicolon (<code>;</code>) causes sequential execution of the preceding <i>pipeline</i> (that is, the shell waits for the <i>pipeline</i> to finish before executing any <i>commands</i> following the semicolon); an ampersand (<code>&amp;</code>) causes asynchronous execution of the preceding <i>pipeline</i> (that is, the shell does <i>not</i> wait for that <i>pipeline</i> to finish). The symbol <code>&amp;&amp;</code> (<code>   </code>) causes the <i>list</i> following it to be executed only if the preceding <i>pipeline</i> returns a zero (non-zero) exit status. An arbitrary number of newlines may appear in a <i>list</i>, instead of semicolons, to delimit <i>commands</i>.</p> <p>A <i>command</i> is either a <i>simple-command</i> or one of the following. Unless otherwise stated, the value returned by a <i>command</i> is that of the last <i>simple-command</i> executed in the <i>command</i>.</p> |

`for name [ in word ... ] do list done`

Each time a `for` command is executed, *name* is set to the next *word* taken from the `in word` list. If `in word ...` is omitted, then the `for` command executes the `do list` once for each positional parameter that is set (see `Parameter Substitution` section below). Execution ends when there are no more words in the list.

`case word in [ pattern [ | pattern ] ) list ; ; ]... esac` A `case` command executes the *list* associated with the first *pattern* that matches *word*. The form of the patterns is the same as that used for file-name generation (see `File Name Generation` section) except that a slash, a leading dot, or a dot immediately following a slash need not be matched explicitly.

`if list ; then list ; [ elif list ; then list ; ] ... [ else list ; ] fi`

The *list* following `if` is executed and, if it returns a zero exit status, the *list* following the first `then` is executed. Otherwise, the *list* following `elif` is executed and, if its value is zero, the *list* following the next `then` is executed. Failing that, the `else list` is executed. If no `else list` or `then list` is executed, then the `if` command returns a zero exit status.

`while list do list done`

A `while` command repeatedly executes the `while list` and, if the exit status of the last command in the list is zero, executes the `do list`; otherwise the loop terminates. If no commands in the `do list` are executed, then the `while` command returns a zero exit status; `until` may be used in place of `while` to negate the loop termination test.

`(list)`

Execute *list* in a sub-shell.

`{ list ; }`

*list* is executed in the current (that is, parent) shell. The `{` must be followed by a space.

`name ( ) { list ; }`

Define a function which is referenced by *name*. The body of the function is the *list* of commands between `{` and `}`. The `{` must be followed by a space. Execution of functions is described below (see `Execution` section). The `{` and `}` are unnecessary if the body of the function is a command as defined above, under `Commands`.

The following words are only recognized as the first word of a command and when not quoted:

`if then else elif fi case esac for while until do done { }`

sh(1)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Comments Lines</b>         | A word beginning with # causes that word and all the following characters up to a newline to be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Command Substitution</b>   | <p>The shell reads commands from the string between two grave accents ( ` ` ) and the standard output from these commands may be used as all or part of a word. Trailing newlines from the standard output are removed.</p> <p>No interpretation is done on the string before the string is read, except to remove backslashes ( \ ) used to escape other characters. Backslashes may be used to escape a grave accent ( ` ) or another backslash ( \ ) and are removed before the command string is read. Escaping grave accents allows nested command substitution. If the command substitution lies within a pair of double quotes ( " . . . ` . . . ` . . . " ), a backslash used to escape a double quote ( \ " ) will be removed; otherwise, it will be left intact.</p> <p>If a backslash is used to escape a newline character ( \newLine ), both the backslash and the newline are removed (see the later section on Quoting). In addition, backslashes used to escape dollar signs ( \\$ ) are removed. Since no parameter substitution is done on the command string before it is read, inserting a backslash to escape a dollar sign has no effect. Backslashes that precede characters other than \ , ` , " , newLine , and \$ are left intact when the command string is read.</p>                                                    |
| <b>Parameter Substitution</b> | <p>The character \$ is used to introduce substitutable <i>parameters</i>. There are two types of parameters, positional and keyword. If <i>parameter</i> is a digit, it is a positional parameter. Positional parameters may be assigned values by <i>set</i>. Keyword parameters (also known as variables) may be assigned values by writing:</p> <pre>name=value [ name=value ] . . .</pre> <p>Pattern-matching is not performed on <i>value</i>. There cannot be a function and a variable with the same <i>name</i>.</p> <p><code> \${parameter} </code></p> <p>The value, if any, of the parameter is substituted. The braces are required only when <i>parameter</i> is followed by a letter, digit, or underscore that is not to be interpreted as part of its name. If <i>parameter</i> is * or @, all the positional parameters, starting with \$1, are substituted (separated by spaces). Parameter \$0 is set from argument zero when the shell is invoked.</p> <p><code> \${parameter:-word} </code></p> <p>If <i>parameter</i> is set and is non-null, substitute its value; otherwise substitute <i>word</i>.</p> <p><code> \${parameter:=word} </code></p> <p>If <i>parameter</i> is not set or is null set it to <i>word</i>; the value of the parameter is substituted. Positional parameters may not be assigned in this way.</p> |

|                                  |                                                                                                                                                                                                        |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\${parameter:?word}</code> | If <i>parameter</i> is set and is non-null, substitute its value; otherwise, print <i>word</i> and exit from the shell. If <i>word</i> is omitted, the message “parameter null or not set” is printed. |
| <code>\${parameter:+word}</code> | If <i>parameter</i> is set and is non-null, substitute <i>word</i> ; otherwise substitute nothing.                                                                                                     |

In the above, *word* is not evaluated unless it is to be used as the substituted string, so that, in the following example, `pwd` is executed only if `d` is not set or is null:

```
echo ${d:-`pwd`}
```

If the colon (:) is omitted from the above expressions, the shell only checks whether *parameter* is set or not.

The following parameters are automatically set by the shell.
