

man pages section 1M: System Administration Commands

Sun Microsystems, Inc.
4150 Network Circle
Santa Clara, CA 95054
U.S.A.

Part No: 816-3319-10
February 2002

Copyright 2002 Sun Microsystems, Inc. 4150 Network Circle Santa Clara, CA 95054 U.S.A. All rights reserved.

This product or document is protected by copyright and distributed under licenses restricting its use, copying, distribution, and decompilation. No part of this product or document may be reproduced in any form by any means without prior written authorization of Sun and its licensors, if any. Third-party software, including font technology, is copyrighted and licensed from Sun suppliers.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, docs.sun.com, AnswerBook, AnswerBook2, and Solaris are trademarks, registered trademarks, or service marks of Sun Microsystems, Inc. in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc.

The OPEN LOOK and Sun™ Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Federal Acquisitions: Commercial Software—Government Users Subject to Standard License Terms and Conditions.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

Copyright 2002 Sun Microsystems, Inc. 4150 Network Circle Santa Clara, CA 95054 U.S.A. Tous droits réservés

Ce produit ou document est protégé par un copyright et distribué avec des licences qui en restreignent l'utilisation, la copie, la distribution, et la décompilation. Aucune partie de ce produit ou document ne peut être reproduite sous aucune forme, par quelque moyen que ce soit, sans l'autorisation préalable et écrite de Sun et de ses bailleurs de licence, s'il y en a. Le logiciel détenu par des tiers, et qui comprend la technologie relative aux polices de caractères, est protégé par un copyright et licencié par des fournisseurs de Sun.

Des parties de ce produit pourront être dérivées du système Berkeley BSD licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays et licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, docs.sun.com, AnswerBook, AnswerBook2, et Solaris sont des marques de fabrique ou des marques déposées, ou marques de service, de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc.

L'interface d'utilisation graphique OPEN LOOK et Sun™ a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui en outre se conforment aux licences écrites de Sun.

CETTE PUBLICATION EST FOURNIE "EN L'ETAT" ET AUCUNE GARANTIE, EXPRESSE OU IMPLICITE, N'EST ACCORDEE, Y COMPRIS DES GARANTIES CONCERNANT LA VALEUR MARCHANDE, L'APTITUDE DE LA PUBLICATION A REPOUDRE A UNE UTILISATION PARTICULIERE, OU LE FAIT QU'ELLE NE SOIT PAS CONTREFAISANTE DE PRODUIT DE TIERS. CE DENI DE GARANTIE NE S'APPLIQUERAIT PAS, DANS LA MESURE OU IL SERAIT TENU JURIDIQUEMENT NUL ET NON AVENU.

Preface

Both novice users and those familiar with the SunOS operating system can use online man pages to obtain information about the system and its features. A man page is intended to answer concisely the question “What does it do?” The man pages in general comprise a reference manual. They are not intended to be a tutorial.

Overview

The following contains a brief description of each man page section and the information it references:

- Section 1 describes, in alphabetical order, commands available with the operating system.
- Section 1M describes, in alphabetical order, commands that are used chiefly for system maintenance and administration purposes.
- Section 2 describes all of the system calls. Most of these calls have one or more error returns. An error condition is indicated by an otherwise impossible returned value.
- Section 3 describes functions found in various libraries, other than those functions that directly invoke UNIX system primitives, which are described in Section 2.
- Section 4 outlines the formats of various files. The C structure declarations for the file formats are given where applicable.
- Section 5 contains miscellaneous documentation such as character-set tables.
- Section 6 contains available games and demos.
- Section 7 describes various special files that refer to specific hardware peripherals and device drivers. STREAMS software drivers, modules and the STREAMS-generic set of system calls are also described.

- Section 9 provides reference information needed to write device drivers in the kernel environment. It describes two device driver interface specifications: the Device Driver Interface (DDI) and the Driver/Kernel Interface (DKI).
- Section 9E describes the DDI/DKI, DDI-only, and DKI-only entry-point routines a developer can include in a device driver.
- Section 9F describes the kernel functions available for use by device drivers.
- Section 9S describes the data structures used by drivers to share information between the driver and the kernel.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. For example, if there are no bugs to report, there is no BUGS section. See the `intro` pages for more information and detail about each section, and `man(1)` for more information about man pages in general.

NAME	This section gives the names of the commands or functions documented, followed by a brief description of what they do.								
SYNOPSIS	<p>This section shows the syntax of commands or functions. When a command or file does not exist in the standard path, its full path name is shown. Options and arguments are alphabetized, with single letter arguments first, and options with arguments next, unless a different argument order is required.</p> <p>The following special characters are used in this section:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 10px;">[]</td> <td>Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.</td> </tr> <tr> <td style="padding-right: 10px;">. . .</td> <td>Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename . . .".</td> </tr> <tr> <td style="padding-right: 10px;"> </td> <td>Separator. Only one of the arguments separated by this character can be specified at a time.</td> </tr> <tr> <td style="padding-right: 10px;">{ }</td> <td>Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.</td> </tr> </table>	[]	Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.	. . .	Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename . . .".		Separator. Only one of the arguments separated by this character can be specified at a time.	{ }	Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.
[]	Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.								
. . .	Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename . . .".								
	Separator. Only one of the arguments separated by this character can be specified at a time.								
{ }	Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.								

PROTOCOL	This section occurs only in subsection 3R to indicate the protocol description file.
DESCRIPTION	This section defines the functionality and behavior of the service. Thus it describes concisely what the command does. It does not discuss OPTIONS or cite EXAMPLES. Interactive commands, subcommands, requests, macros, and functions are described under USAGE.
IOCTL	This section appears on pages in Section 7 only. Only the device class that supplies appropriate parameters to the <code>ioctl(2)</code> system call is called <code>ioctl</code> and generates its own heading. <code>ioctl</code> calls for a specific device are listed alphabetically (on the man page for that specific device). <code>ioctl</code> calls are used for a particular class of devices all of which have an <code>io</code> ending, such as <code>mtio(7I)</code> .
OPTIONS	This section lists the command options with a concise summary of what each option does. The options are listed literally and in the order they appear in the SYNOPSIS section. Possible arguments to options are discussed under the option, and where appropriate, default values are supplied.
OPERANDS	This section lists the command operands and describes how they affect the actions of the command.
OUTPUT	This section describes the output – standard output, standard error, or output files – generated by the command.
RETURN VALUES	If the man page documents functions that return values, this section lists these values and describes the conditions under which they are returned. If a function can return only constant values, such as 0 or -1, these values are listed in tagged paragraphs. Otherwise, a single paragraph describes the return values of each function. Functions declared void do not return values, so they are not discussed in RETURN VALUES.
ERRORS	On failure, most functions place an error code in the global variable <code>errno</code> indicating why they failed. This section lists alphabetically all error codes a function can generate and describes the conditions that cause each error. When more than

	one condition can cause the same error, each condition is described in a separate paragraph under the error code.
USAGE	This section lists special rules, features, and commands that require in-depth explanations. The subsections listed here are used to explain built-in functionality: Commands Modifiers Variables Expressions Input Grammar
EXAMPLES	This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command-line entry and machine response is shown. Whenever an example is given, the prompt is shown as <code>example%</code> , or if the user must be superuser, <code>example#</code> . Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS, and USAGE sections.
ENVIRONMENT VARIABLES	This section lists any environment variables that the command or function affects, followed by a brief description of the effect.
EXIT STATUS	This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion, and values other than zero for various error conditions.
FILES	This section lists all file names referred to by the man page, files of interest, and files created or required by commands. Each is followed by a descriptive summary or explanation.
ATTRIBUTES	This section lists characteristics of commands, utilities, and device drivers by defining the attribute type and its corresponding value. See <code>attributes(5)</code> for more information.
SEE ALSO	This section lists references to other man pages, in-house documentation, and outside publications.

DIAGNOSTICS	This section lists diagnostic messages with a brief explanation of the condition causing the error.
WARNINGS	This section lists warnings about special conditions which could seriously affect your working conditions. This is not a list of diagnostics.
NOTES	This section lists additional information that does not belong anywhere else on the page. It takes the form of an aside to the user, covering points of special interest. Critical information is never covered here.
BUGS	This section describes known bugs and, wherever possible, suggests workarounds.

Introduction

Intro(1M)

NAME	Intro – introduction to maintenance commands and application programs												
DESCRIPTION	<p>This section describes, in alphabetical order, commands that are used chiefly for system maintenance and administration purposes.</p> <p>Because of command restructuring for the Virtual File System architecture, there are several instances of multiple manual pages that begin with the same name. For example, the <code>mount</code>, pages – <code>mount(1M)</code>, <code>mount_cachefs(1M)</code>, <code>mount_hsf(1M)</code>, <code>mount_nfs(1M)</code>, <code>mount_tmpfs(1M)</code>, and <code>mount_ufs(1M)</code>. In each such case the first of the multiple pages describes the syntax and options of the generic command, that is, those options applicable to all FSTypes (file system types). The succeeding pages describe the functionality of the FSType-specific modules of the command. These pages list the command followed by an underscore (<code>_</code>) and the FSType to which they pertain. Note that the administrator should not attempt to call these modules directly. The generic command provides a common interface to all of them. Thus the FSType-specific manual pages should not be viewed as describing distinct commands, but rather as detailing those aspects of a command that are specific to a particular FSType.</p>												
COMMAND SYNTAX	<p>Unless otherwise noted, commands described in this section accept options and other arguments according to the following syntax:</p> <p><i>name</i> [<i>option</i> (s)] [<i>cmdarg</i> (s)] where:</p> <table><tr><td><i>name</i></td><td>The name of an executable file.</td></tr><tr><td><i>option</i></td><td>– <i>noargletter</i>(s) or, – <i>argletter</i>< ><i>optarg</i></td></tr></table> <p>where < > is optional white space.</p> <table><tr><td><i>noargletter</i></td><td>A single letter representing an option without an argument.</td></tr><tr><td><i>argletter</i></td><td>A single letter representing an option requiring an argument.</td></tr><tr><td><i>optarg</i></td><td>Argument (character string) satisfying preceding <i>argletter</i>.</td></tr><tr><td><i>cmdarg</i></td><td>Pathname (or other command argument) <i>not</i> beginning with – or, – by itself indicating the standard input.</td></tr></table>	<i>name</i>	The name of an executable file.	<i>option</i>	– <i>noargletter</i> (s) or, – <i>argletter</i> < > <i>optarg</i>	<i>noargletter</i>	A single letter representing an option without an argument.	<i>argletter</i>	A single letter representing an option requiring an argument.	<i>optarg</i>	Argument (character string) satisfying preceding <i>argletter</i> .	<i>cmdarg</i>	Pathname (or other command argument) <i>not</i> beginning with – or, – by itself indicating the standard input.
<i>name</i>	The name of an executable file.												
<i>option</i>	– <i>noargletter</i> (s) or, – <i>argletter</i> < > <i>optarg</i>												
<i>noargletter</i>	A single letter representing an option without an argument.												
<i>argletter</i>	A single letter representing an option requiring an argument.												
<i>optarg</i>	Argument (character string) satisfying preceding <i>argletter</i> .												
<i>cmdarg</i>	Pathname (or other command argument) <i>not</i> beginning with – or, – by itself indicating the standard input.												
ATTRIBUTES	See <code>attributes(5)</code> for a discussion of the attributes listed in this section.												
SEE ALSO	<code>getopt(1)</code> , <code>getopt(3C)</code> , <code>attributes(5)</code>												
DIAGNOSTICS	Upon termination, each command returns 0 for normal termination and non-zero to indicate troubles such as erroneous parameters, bad or inaccessible data, or other inability to cope with the task at hand. It is called variously “exit code,” “exit status,” or “return code,” and is described only where special conventions are involved.												
NOTES	Unfortunately, not all commands adhere to the standard syntax.												

Maintenance Commands

ab2admin(1M)

NAME	ab2admin – command-line interface for AnswerBook2 administration								
SYNOPSIS	<code>/usr/lib/ab2/bin/ab2admin [-h [<i>command</i>]] [-o <i>command</i> [<i>arguments</i>]]</code>								
DESCRIPTION	<p>The <code>ab2admin</code> command is a command-line interface for administering AnswerBook2 collections and documents on a specified AnswerBook2 server. The command can install and uninstall AnswerBook1 and AnswerBook2 collections to a server, scan for locally installed collections and update the server database, and obtain a listing of collections and books.</p> <p><code>ab2admin</code> server management functions include: stopping the server, starting the server, restarting the server, turning the server log files on or off, and rotating the log files. The server can be configured to resolve links to books located on other AnswerBook2 servers.</p> <p><code>ab2admin</code> can also be used to control server access by adding users to or deleting users from the pool of administrative users. The access control can be enabled or disabled.</p> <p><code>ab2admin</code> can connect to any AnswerBook2 server (local or remote). Certain functions (such as <code>stop</code>, <code>start</code>, and <code>restart</code>) apply only to the local AnswerBook2 server. If the AnswerBook2 server is protected by a password, then a user ID and password are required to initiate an administration task.</p> <p>To run <code>ab2admin</code> interactively, type <code>ab2admin</code> from the command line and then enter commands as prompted. It can also be executed entirely from the command line using the <code>-o</code> option.</p>								
OPTIONS	<p>The following options are supported:</p> <table><tr><td><code>-h [<i>command</i>]</code></td><td>Displays help and specified help on a <i>command</i>.</td></tr><tr><td><code>-o <i>sub-command</i> [<i>arguments</i>]</code></td><td>The supported sub-commands are listed below.</td></tr></table>	<code>-h [<i>command</i>]</code>	Displays help and specified help on a <i>command</i> .	<code>-o <i>sub-command</i> [<i>arguments</i>]</code>	The supported sub-commands are listed below.				
<code>-h [<i>command</i>]</code>	Displays help and specified help on a <i>command</i> .								
<code>-o <i>sub-command</i> [<i>arguments</i>]</code>	The supported sub-commands are listed below.								
Sub-commands	<p>The following sub-commands to the <code>-o</code> option are supported:</p> <table><tr><td><code>access_off [-m <i>server</i>] [-p <i>server_port_number</i>]</code></td><td>Disables the server access log file.</td></tr><tr><td><code>access_on [-m <i>server</i>] [-p <i>server_port_number</i>]</code></td><td>Enables the server access log file.</td></tr><tr><td><code>add_admin -u <i>user_id</i> [-m <i>server</i>] [-p <i>server_port_number</i>]</code></td><td>Adds a user to the authorized list of server administrators.</td></tr><tr><td><code>add_coll -d <i>path</i> [-m <i>server</i>] [-p <i>server_port_number</i>]</code></td><td>Adds AnswerBook1 or AnswerBook2 collections to the specified AnswerBook2 server database.</td></tr></table>	<code>access_off [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Disables the server access log file.	<code>access_on [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Enables the server access log file.	<code>add_admin -u <i>user_id</i> [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Adds a user to the authorized list of server administrators.	<code>add_coll -d <i>path</i> [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Adds AnswerBook1 or AnswerBook2 collections to the specified AnswerBook2 server database.
<code>access_off [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Disables the server access log file.								
<code>access_on [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Enables the server access log file.								
<code>add_admin -u <i>user_id</i> [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Adds a user to the authorized list of server administrators.								
<code>add_coll -d <i>path</i> [-m <i>server</i>] [-p <i>server_port_number</i>]</code>	Adds AnswerBook1 or AnswerBook2 collections to the specified AnswerBook2 server database.								

```

add_server -M alternate_server -P alternate_server_port_number
           [ -m server ] [ -p server_port_number ]
           Adds an alternate server to the specified server.

auth_off [ -m server ] [ -p server_port_number ]
           Disables server administration verification.

auth_on [ -m server ] [ -p server_port_number ]
           Enables server administration verification.

autostart_no [ -m server ] [ -p server_port_number ]
           Stops AnswerBook2 server from starting automatically when system is (re)booted.

autostart_yes [ -m server ] [ -p server_port_number ]
           Causes AnswerBook2 server to start automatically when system is (re)booted.

browser [ -m server ] [ -p server_port_number ]
           Launches a web browser for accessing AnswerBook2 Administration pages.

change_password -u admin_id [ -m server ] [ -p server_port_number ]
           Changes authorized administrator's password.

del_admin -u user_id [ -m server ] [ -p server_port_number ]
           Deletes a user from the list of authorized server administrators.

del_coll -t collection_title [ -m server ] [ -p server_port_number ]
           Removes AnswerBook1 or AnswerBook2 collections from the specified server's
           database.

del_server -M alternate_server -P alternate_server_port_number
           [ -m server ] [ -p server_port_number ]
           Deletes alternate server from list of servers known to the specified server.

error_off [ -m server ] [ -p server_port_number ]
           Disables the server error log file.

error_on [ -m server ] [ -p server_port_number ]
           Enables the server error log file.

help [ command ]
           Lists all information about a particular command or all commands.

list [ -m server ] [ -p server_port_number ]
           Lists AnswerBook1 and AnswerBook2 collections available on the specified server.
           The listing includes the books contained within collections.

list_server [ -m server ] [ -p server_port_number ]
           Lists all alternate servers defined for the specified server.

menu
           Displays a condensed list of command options.

modify_server_name -s new_server_name [ -m server ] [ -p server_port_number ]
           Modifies the server's name.

```

ab2admin(1M)

`modify_server_port -a new_server_port_number [-m server] [-p server_port_number]`
Modifies the server's port number.

`restart`
Restarts local AnswerBook2 server. Requires root access.

`rotate_access [-m server] [-p server_port_number]`
Saves and resets the server access log file.

`rotate_error [-m server] [-p server_port_number]`
Saves and resets the server error log file.

`scan [-m server] [-p server_port_number]`
Scans for locally installed collections (AnswerBook1 or AnswerBook2) and updates the collections on the specified server's database.

`start`
Starts local AnswerBook2 server. Requires root access.

`start -D`
Starts local AnswerBook2 server in debug mode. Requires root access.

`stop`
Stops local AnswerBook2 server. Requires root access.

`view_access [-m server] [-p server_port_number]`
Views the contents of the server access log file.

`view_config [-m server] [-p server_port_number]`
Views the configuration settings of the server.

`view_error [-m server] [-p server_port_number]`
Views the contents of the server error log file.

USAGE

`quit` Exit interactive mode.

`q` Exit interactive mode.

`bye` Exit interactive mode.

`exit` Exit interactive mode.

`? [command]` Get help in interactive mode.

`h [command]` Get help in interactive mode.

EXAMPLES

EXAMPLE 1 Listing AnswerBook2 collections available on a server

To list the collections available on a server named `foo.com`, using port number `8888`:

```
example% ab2admin -o list -m foo.com -p 8888
```

EXAMPLE 1 Listing AnswerBook2 collections available on a server (Continued)

EXAMPLE 2 Using interactive mode to list collections

To use `ab2admin` in interactive mode for the same operation as shown above:

```
example% ab2admin
>> list -m foo.com -p 8888
```

EXAMPLE 3 Installing an AnswerBook2 collection

To install an AnswerBook2 collection using the `pkgadd` utility:

```
example# pkgadd -d package_directory/ SUNWabsdk
```

The collection directory structure will be copied into the system (by default) to `/opt/answerbooks/`

EXAMPLE 4 Installing an AnswerBook2 collection not updated to server database

To install an AnswerBook2 collection that has been introduced to the system (via `pkgadd`) but did not get updated to the server database:

```
example# ab2admin -o add_coll -d
/opt/answerbooks/english/solaris_2.6/SUNWabsdk
```

(Note: `-d path` must include the `collinfo` file (for an AnswerBook2 collection) or the `ab_cardcatalog` file (for an AnswerBook1 collection).

EXAMPLE 5 Inspecting the definition of an AnswerBook1 collection

To inspect how an AnswerBook1 collection is defined:

```
example% cat /opt/SUNWans/ab_cardcatalog
:id=SUNWab_10_4: \
:version=: \
:title=Solaris XGL 3.1 AnswerBook: \
:tocpath=/net/elirium.Eng/export/answerbook/Solaris_2.4/SUNWaxg/toc: \
:pspath=/net/elirium.Eng/export/answerbook/Solaris_2.4/SUNWaxg/ps: \
:indexpath=/net/elirium.Eng/export/answerbook/Solaris_2.4/SUNWaxg/inde
```

EXAMPLE 6 Inspecting the definition of an AnswerBook2 collection

To inspect how an AnswerBook2 collection is defined:

```
example% cat/opt/answerbooks/english/solaris_2.6/SUNabsd/collinfo
dwCollections {
  coll.45.4 dwCollection
}
dwSetParam coll.45.4 {
  location /opt/answerbooks/english/solaris_2.6/SUNWabsdk
  title "Solaris 2.6 Software Developer AnswerBook Vol 1"
  type EbtCollection
```

EXAMPLE 6 Inspecting the definition of an AnswerBook2 collection (Continued)

}

NAME	ab2cd – run AnswerBook2 server from the Documentation CD
SYNOPSIS	ab2cd [-h] [stop] [-d <i>path_to_CD_mountpoint</i>] [-p <i>port_number</i>] [-s] [-v]
DESCRIPTION	The ab2cd utility runs an AnswerBook2 server directly from the Documentation CD by creating necessary space in the /tmp/.ab2 directory to store configuration files and other necessary data. It attempts to launch a web browser with the appropriate URL to display the library page for the user.
OPTIONS	The following options are supported: <ul style="list-style-type: none"> -d <i>path_to_CD_mountpoint</i> Specifies a mount point for the CD other than /cdrom. -h Displays a usage statement and a brief list of options. -p <i>port_number</i> Specifies a port number to use for the server. Default value is 8888. -s Scans for AnswerBook1 and AnswerBook2 collections installed on the system and adds them to the database of the AnswerBook2 server running from the CD. stop Stops AnswerBook2 server running from the CD and removes any files in the /tmp/.ab2 directory. -v Returns the version number of the ab2cd script.
USAGE	<p>ab2cd expects /cdrom as the default mount point. To override this default, use the -d option.</p> <p>Use the stop option to shut down the server running from the Documentation CD. This option cleans up any files in /tmp/.ab2.</p> <p>By default, the ab2cd script attempts to launch a web browser (preferably Netscape Navigator) with the appropriate URL to display the library page for the user. If Netscape is not found in the user's path, it then looks for other browsers.</p> <p>For an AnswerBook2 server to read multi-byte characters correctly, the iconv utility must be installed on the system. If it is not, the ab2cd script starts the server, but the user cannot correctly view Asian book titles or other information.</p>
EXAMPLES	<p>EXAMPLE 1 Running ab2cd</p> <p>In this example, the user runs the AnswerBook2 server from the CD. The ab2cd script then offers to launch a web browser with the URL for the library page.</p> <pre>example# ab2cd Scanning for collections and attempting to start AnswerBook2 server from CD. ```

To read documents from the CD, open a browser with the URL:
<http://threads1:8888>

After you are finished reading documents from the CD, stop the server using:
 /tmp/ab2cd stop

EXAMPLE 3 Running ab2cd Without Support for Multi-byte Locales

In this example, the user launches ab2cd successfully; however, support for all locales is not provided. Also, the ab2cd script is located in a specific place.

```
example# ab2cd -d /home/myuser/CDROM
Warning : AnswerBook2 requires the following iconv packages to be installed
prior to running ab2cd:
SUNWcius8 SUNWhiu8 SUNWjui8 SUNWkiu8 SUNWuiu8
```

If you continue running ab2cd, multiple-byte characters might not display correctly and collections with non-English titles will not be viewable with this server.

Do you want to continue? [y,n]y

NAME	ab2regsvr – register an AnswerBook2 document server with FNS (Federated Naming Service)				
SYNOPSIS	<code>/usr/lib/ab2/bin/ab2regsvr [-d] [-h] [-l] [-r] server-url</code>				
DESCRIPTION	<p>The <code>ab2regsvr</code> command sets up the appropriate name space for the AnswerBook2 document server, depending on which naming service has been selected by the system administrator. The naming service can be <code>NIS</code>, <code>NIS+</code>, or <code>files</code>.</p> <p>To register the server with <code>NIS</code>, it is necessary to be logged in as root on the <code>NIS</code> master server. To register with <code>NIS+</code>, administrative privileges are necessary; you can be on either the <code>NIS+</code> master or <code>NIS+</code> client. To register for <code>files</code>, you must be logged in as root on the machine; this is machine-specific and is not seen on other machines.</p> <p>Registering an AnswerBook2 document server with FNS allows a system administrator to specify the default AnswerBook2 server that users access when they select AnswerBook2 from the CDE desktop or from the OpenWindows root menu. The server's URL does not have to be entered into a web browser.</p>				
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -d Deletes the AnswerBook2 entry in FNS. -h Displays a usage statement and a brief list of options. -l Lists currently registered AnswerBook2 document servers. -r Replaces the currently defined URL for AnswerBook2 with a new URL. 				
OPERANDS	<p>The following operand is supported:</p> <p><code>server-url</code> Fully qualified URL for users to access the registered server.</p>				
EXAMPLES	<p>EXAMPLE 1 Using the <code>ab2regsvr</code> command</p> <p>To register a server named <code>imaserver</code> located at port <code>8888</code>:</p> <pre>example# ab2regsvr http://imaserver.eng.sun.com:8888/</pre>

accept(1M)

NAME	accept, reject – accept or reject print requests						
SYNOPSIS	accept <i>destination</i> ... reject [-r <i>reason</i>] <i>destination</i> ...						
DESCRIPTION	<p>accept allows the queuing of print requests for the named destinations.</p> <p>reject prevents queuing of print requests for the named destinations.</p> <p>Use <code>lpstat -a</code> to check if destinations are accepting or rejecting print requests.</p> <p>accept and request must be run on the print server; they have no meaning to a client system.</p>						
OPTIONS	<p>The following options are supported for <code>reject</code>.</p> <p>-r <i>reason</i> Assigns a reason for rejection of print requests for <i>destination</i>. Enclose <i>reason</i> in quotes if it contains blanks. <i>reason</i> is reported by <code>lpstat -a</code>. By default, <i>reason</i> is unknown reason for existing destinations, and new <code>printer</code> for destinations added to the system but not yet accepting requests.</p>						
OPERANDS	<p>The following operands are supported.</p> <p><i>destination</i> The name of the destination accepting or rejecting print requests. Destination specifies the name of a printer or class of printers (see <code>lpadmin(1M)</code>). Specify <i>destination</i> using atomic name. See <code>printers.conf(4)</code> for information regarding the naming conventions for atomic names.</p>						
EXIT STATUS	<p>The following exit values are returned:</p> <p>0 Successful completion.</p> <p><i>non-zero</i> An error occurred.</p>						
FILES	<code>/var/spool/lp/*</code> LP print queue.						
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:						
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Availability</td><td>SUNWpcu</td></tr><tr><td>CSI</td><td>Enabled (see NOTES)</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWpcu	CSI	Enabled (see NOTES)
ATTRIBUTE TYPE	ATTRIBUTE VALUE						
Availability	SUNWpcu						
CSI	Enabled (see NOTES)						
SEE ALSO	<code>enable(1)</code> , <code>lp(1)</code> , <code>lpstat(1)</code> , <code>lpadmin(1M)</code> , <code>lpsched(1M)</code> , <code>printers.conf(4)</code> , <code>attributes(5)</code>						

accept(1M)

NOTES | accept and reject affect only queueing on the print server's spooling system. Requests made from a client system remain queued in the client system's queueing mechanism until they are cancelled or accepted by the print server's spooling system.

accept is CSI-enabled except for the *destination* name.

acct(1M)

NAME	acct, acctdisk, acctdusg, accton, acctwtmp, closewtmp, utmp2wtmp – overview of accounting and miscellaneous accounting commands
SYNOPSIS	<pre>/usr/lib/acct/acctdisk /usr/lib/acct/acctdusg [-u filename] [-p filename] /usr/lib/acct/accton [filename] /usr/lib/acct/acctwtmp reason filename /usr/lib/acct/closewtmp /usr/lib/acct/utmp2wtmp</pre>
DESCRIPTION	<p>Accounting software is structured as a set of tools (consisting of both C programs and shell procedures) that can be used to build accounting systems. acctsh(1M) describes the set of shell procedures built on top of the C programs.</p> <p>Connect time accounting is handled by various programs that write records into /var/adm/wtmpx, as described in utmpx(4). The programs described in acctcon(1M) convert this file into session and charging records, which are then summarized by acctmerg(1M).</p> <p>Process accounting is performed by the system kernel. Upon termination of a process, one record per process is written to a file (normally /var/adm/pacct). The programs in acctprc(1M) summarize this data for charging purposes; acctcms(1M) is used to summarize command usage. Current process data may be examined using acctcom(1).</p> <p>Process accounting records and connect time accounting records (or any accounting records in the tacct format described in acct(3HEAD)) can be merged and summarized into total accounting records by acctmerg (see tacct format in acct(3HEAD)). prtacct (see acctsh(1M)) is used to format any or all accounting records.</p> <p>acctdisk reads lines that contain user ID, login name, and number of disk blocks and converts them to total accounting records that can be merged with other accounting records. acctdisk returns an error if the input file is corrupt or improperly formatted.</p> <p>acctdusg reads its standard input (usually from find / -print) and computes disk resource consumption (including indirect blocks) by login.</p> <p>accton without arguments turns process accounting off. If filename is given, it must be the name of an existing file, to which the kernel appends process accounting records (see acct(2) and acct(3HEAD)).</p> <p>acctwtmp writes a utmpx(4) record to filename. The record contains the current time and a string of characters that describe the reason. A record type of ACCOUNTING is</p>

assigned (see `utmpx(4)`) *reason* must be a string of 11 or fewer characters, numbers, \$, or spaces. For example, the following are suggestions for use in reboot and shutdown procedures, respectively:

```
acctwtmp "acctg on" /var/adm/wtmpx
acctwtmp "acctg off" /var/adm/wtmpx
```

For each user currently logged on, `closewtmp` puts a false `DEAD_PROCESS` record in the `/var/adm/wtmpx` file. `runacct` (see `runacct(1M)`) uses this false `DEAD_PROCESS` record so that the connect accounting procedures can track the time used by users logged on before `runacct` was invoked.

For each user currently logged on, `runacct` uses `utmp2wtmp` to create an entry in the file `/var/adm/wtmpx`, created by `runacct`. Entries in `/var/adm/wtmpx` enable subsequent invocations of `runacct` to account for connect times of users currently logged in.

OPTIONS The following options are supported:

`-u filename` Places in *filename* records consisting of those filenames for which `acctdusg` charges no one (a potential source for finding users trying to avoid disk charges).

`-p filename` Specifies a password file, *filename*. This option is not needed if the password file is `/etc/passwd`.

**ENVIRONMENT
VARIABLES**

If any of the `LC_*` variables (`LC_TYPE`, `LC_MESSAGES`, `LC_TIME`, `LC_COLLATE`, `LC_NUMERIC`, and `LC_MONETARY`) (see `environ(5)`) are not set in the environment, the operational behavior of `acct` for each corresponding locale category is determined by the value of the `LANG` environment variable. If `LC_ALL` is set, its contents are used to override both the `LANG` and the other `LC_*` variables. If none of the above variables are set in the environment, the "C" (U.S. style) locale determines how `acct` behaves.

`LC_CTYPE` Determines how `acct` handles characters. When `LC_CTYPE` is set to a valid value, `acct` can display and handle text and filenames containing valid characters for that locale. `acct` can display and handle Extended Unix Code (EUC) characters where any character can be 1, 2, or 3 bytes wide. `acct` can also handle EUC characters of 1, 2, or more column widths. In the "C" locale, only characters from ISO 8859-1 are valid.

`LC_TIME` Determines how `acct` handles date and time formats. In the "C" locale, date and time handling follows the U.S. rules.

FILES

`/etc/passwd` Used for login name to user ID conversions.

`/usr/lib/acct` Holds all accounting commands listed in sub-class 1M of this manual.

`/var/adm/pacct` Current process accounting file.

acct(1M)

/var/adm/wtmpx history of user access and administration information

acctadm(1M)

EXAMPLE 1 Displaying current status *(Continued)*

```
$ acctadm
      Task accounting: active
      Task accounting file: /var/adm/exacct/task
      Tracked task resources: extended,mstate
      Untracked task resources: host
      Process accounting: inactive
      Process accounting file: none
      Tracked process resources: none
      Untracked process resources: extended,host,mstate
```

EXAMPLE 2 Activating basic process accounting

The following command activates basic process accounting:

```
$ acctadm -e basic -f /var/adm/exacct/proc process
```

EXAMPLE 3 Displaying available resource groups

The following command displays available resource groups:

```
$ acctadm -r
extended pid,uid,gid,cpu,time,command,TTY,projid,taskid,flag
basic    pid,uid,gid,cpu,time,command,TTY,flag
```

EXIT STATUS

The following exit values are returned:

- 0 Successful completion.

The modifications to the current configuration were valid and made successfully.
- 1 An error occurred.

A fatal error occurred either in obtaining or modifying the accounting configuration.
- 2 Invalid command line options were specified.

FILES

/etc/acctadm.conf

NOTES Both extended accounting and regular accounting can be active.

Available resources can vary from system to system, and from platform to platform.

acctcms(1M)

NAME	acctcms – command summary from process accounting records
SYNOPSIS	<code>/usr/lib/acct/acctcms [-a [-o] [-p]] [-c] [-j] [-n] [-s] [-t]</code> <i>filename...</i>
DESCRIPTION	acctcms reads one or more <i>filenames</i> , normally in the form described in acct(3HEAD). It adds all records for processes that executed identically named commands, sorts them, and writes them to the standard output, normally using an internal summary format.
OPTIONS	<p>-a Print output in ASCII rather than in the internal summary format. The output includes command name, number of times executed, total kcore-minutes, total CPU minutes, total real minutes, mean size (in K), mean CPU minutes per invocation, "hog factor," characters transferred, and blocks read and written, as in acctcom(1). Output is normally sorted by total kcore-minutes.</p> <p>Use the following options only with the -a option:</p> <p>-o Output a (non-prime) offshift-time-only command summary.</p> <p>-p Output a prime-time-only command summary.</p> <p>When -o and -p are used together, a combination prime-time and non-prime-time report is produced. All the output summaries are total usage except number of times executed, CPU minutes, and real minutes, which are split into prime and non-prime.</p> <p>-c Sort by total CPU time, rather than total kcore-minutes.</p> <p>-j Combine all commands invoked only once under "***other".</p> <p>-n Sort by number of command invocations.</p> <p>-s Any file names encountered hereafter are already in internal summary format.</p> <p>-t Process all records as total accounting records. The default internal summary format splits each field into prime and non-prime-time parts. This option combines the prime and non-prime time parts into a single field that is the total of both, and provides upward compatibility with old style acctcms internal summary format records.</p>
EXAMPLES	<p>EXAMPLE 1 Using the acctcms command.</p> <p>A typical sequence for performing daily command accounting and for maintaining a running total is:</p> <pre>example% acctcms filename ... > today example% cp total previoustotal example% acctcms -s today previoustotal > total example% acctcms -a -s today</pre>

EXAMPLE 1 Using the `acctcms` command. *(Continued)*

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWaccu

SEE ALSO `acctcom(1)`, `acct(1M)`, `acctcon(1M)`, `acctmerg(1M)`, `acctprc(1M)`, `acctsh(1M)`, `fwtmp(1M)`, `runacct(1M)`, `acct(2)`, `acct(3HEAD)`, `utmpx(4)`, `attributes(5)`

NOTES Unpredictable output results if `-t` is used on new style internal summary format files, or if it is not used with old style internal summary format files.

acctcon(1M)

NAME	acctcon, acctcon1, acctcon2 – connect-time accounting
SYNOPSIS	<pre>/usr/lib/acct/acctcon [-l <i>lineuse</i>] [-o <i>reboot</i>] /usr/lib/acct/acctcon1 [-p] [-t] [-l <i>lineuse</i>] [-o <i>reboot</i>] /usr/lib/acct/acctcon2</pre>
DESCRIPTION	<p>acctcon converts a sequence of login/logoff records to total accounting records (see the <i>tacct</i> format in <i>acct(3HEAD)</i>). The login/logoff records are read from standard input. The file <i>/var/adm/wtmpx</i> is usually the source of the login/logoff records; however, because it might contain corrupted records or system date changes, it should first be fixed using <i>wtmpfix</i>. The fixed version of file <i>/var/adm/wtmpx</i> can then be redirected to <i>acctcon</i>. The <i>tacct</i> records are written to standard output.</p> <p>acctcon is a combination of the programs <i>acctcon1</i> and <i>acctcon2</i>. <i>acctcon1</i> converts login/logoff records, taken from the fixed <i>/var/adm/wtmpx</i> file, to ASCII output. <i>acctcon2</i> reads the ASCII records produced by <i>acctcon1</i> and converts them to <i>tacct</i> records. <i>acctcon1</i> can be used with the <i>-l</i> and <i>-o</i> options, described below, as well as with the <i>-p</i> and <i>-t</i> options.</p>
OPTIONS	<p><i>-p</i> Print input only, showing line name, login name, and time (in both numeric and date/time formats).</p> <p><i>-t</i> <i>acctcon1</i> maintains a list of lines on which users are logged in. When it reaches the end of its input, it emits a session record for each line that still appears to be active. It normally assumes that its input is a current file, so that it uses the current time as the ending time for each session still in progress. The <i>-t</i> flag causes it to use, instead, the last time found in its input, thus assuring reasonable and repeatable numbers for non-current files.</p> <p><i>-l lineuse</i> <i>lineuse</i> is created to contain a summary of line usage showing line name, number of minutes used, percentage of total elapsed time used, number of sessions charged, number of logins, and number of logoffs. This file helps track line usage, identify bad lines, and find software and hardware oddities. Hangup, termination of <i>login(1)</i> and termination of the login shell each generate logoff records, so that the number of logoffs is often three to four times the number of sessions. See <i>init(1M)</i> and <i>utmpx(4)</i>.</p> <p><i>-o reboot</i> <i>reboot</i> is filled with an overall record for the accounting period, giving starting time, ending time, number of reboots, and number of date changes.</p>
EXAMPLES	<p>EXAMPLE 1 Using the <i>acctcon</i> command.</p> <p>The <i>acctcon</i> command is typically used as follows:</p> <pre>example% acctcon -l lineuse -o reboots < tmpwtmp > ctacct</pre> <p>The <i>acctcon1</i> and <i>acctcon2</i> commands are typically used as follows:</p>

EXAMPLE 1 Using the `acctcon` command. (Continued)

```
example% acctcon1 -l lineuse -o reboots < tmpwtmp | sort +1n +2 > ctmp
example% acctcon2 < ctmp > ctacct
```

FILES /var/adm/wtmpx History of user access and administration information

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWaccu

SEE ALSO `acctcom(1)`, `login(1)`, `acct(1M)`, `acctcms(1M)`, `acctmerg(1M)`, `acctprc(1M)`, `acctsh(1M)`, `fwtmp(1M)`, `init(1M)`, `runacct(1M)`, `acct(2)`, `acct(3HEAD)`, `utmpx(4)`, `attributes(5)`

System Administration Guide, Volume 1

NOTES The line usage report is confused by date changes. Use `wtmpfix` (see `fwtmp(1M)`), with the `/var/adm/wtmpx` file as an argument, to correct this situation.

During a single invocation of any given command, the `acctcon`, `acctcon1`, and `acctcon2` commands can process a maximum of:

- 6000 distinct session
- 1000 distinct terminal lines
- 2000 distinct login names

If at some point the actual number of any one of these items exceeds the maximum, the command will not succeed.

acctmerg(1M)

NAME acctmerg – merge or add total accounting files

SYNOPSIS `/usr/lib/acct/acctmerg [-a] [-i] [-p] [-t] [-u] [-v] [filename] ...`

DESCRIPTION acctmerg reads its standard input and up to nine additional files, all in the `tacct` format (see `acct(3HEAD)`) or an ASCII version thereof. It merges these inputs by adding records whose keys (normally user ID and name) are identical, and expects the inputs to be sorted on those keys.

OPTIONS

- a Produce output in ASCII version of `tacct`.
- i Produce input in ASCII version of `tacct`.
- p Print input with no processing.
- t Produce a single record that totals all input.
- u Summarize by user ID, rather than by user ID and name.
- v Produce output in verbose ASCII format, with more precise notation for floating-point numbers.

EXAMPLES

EXAMPLE 1 Using the `acctmerg` command.

The following sequence is useful for making "repairs" to any file kept in this format:

```
example% acctmerg -v <filename1 >filename2
```

Edit `filename2` as you want:

```
example% acctmerg -i <filename2 >filename1
```

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

System Administration Guide, Volume 1

NAME	acctprc, acctprc1, acctprc2 – process accounting				
SYNOPSIS	<pre> /usr/lib/acct/acctprc /usr/lib/acct/acctprc1 [ctmp] /usr/lib/acct/acctprc2 </pre>				
DESCRIPTION	<p>acctprc reads the standard input, in the form described by acct(3HEAD), and converts it to total accounting records (see the tacct record in acct(3HEAD)). acctprc divides CPU time into prime time and non-prime time and determines mean memory size (in memory segment units). acctprc then summarizes the tacct records, according to user IDs, and adds login names corresponding to the user IDs. The summarized records are then written to the standard output. acctprc1 reads input in the form described by acct(4), adds login names corresponding to user IDs, then writes for each process an ASCII line giving user ID, login name, prime CPU time (tics), non-prime CPU time (tics), and mean memory size (in memory segment units). If <i>ctmp</i> is given, it should contain a list of login sessions sorted by user ID and login name. If this file is not supplied, it obtains login names from the password file, just as acctprc does. The information in <i>ctmp</i> helps it distinguish between different login names that share the same user ID.</p> <p>From the standard input, acctprc2 reads records in the form written by acctprc1, summarizes them according to user ID and name, then writes the sorted summaries to the standard output as total accounting records.</p>				
EXAMPLES	<p>EXAMPLE 1 Examples of acctprc.</p> <p>The acctprc command is typically used as shown below:</p> <pre>example% acctprc < /var/adm/pacct > ptacct</pre> <p>The acctprc1 and acctprc2s commands are typically used as shown below:</p> <pre>example% acctprc1 ctmp </var/adm/pacct example% acctprc2 > ptacct</pre>				
FILES	/etc/passwd system password file				
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWaccu</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWaccu
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWaccu				
SEE ALSO	acctcom(1), acct(1M), acctcms(1M), acctcon(1M), acctmerg(1M), acctsh(1M), cron(1M), fwtmp(1M), runacct(1M), acct(2), acct(3HEAD), utmpx(4), attributes(5)				

acctprc(1M)

NOTES | Although it is possible for `acctprc1` to distinguish among login names that share user IDs for commands run from a command line, it is difficult for `acctprc1` to make this distinction for commands invoked in other ways. A command run from `cron(1M)` is an example of where `acctprc1` might have difficulty. A more precise conversion can be done using the `acctwtmp` program in `acct(1M)`. `acctprc` does not distinguish between users with identical user IDs.

A memory segment of the mean memory size is a unit of measure for the number of bytes in a logical memory segment on a particular processor.

During a single invocation of any given command, the `acctprc`, `acctprc1`, and `acctprc2` commands can process a maximum of

- 6000 distinct sessions
- 1000 distinct terminal lines
- 2000 distinct login names

If at some point the actual number of any one of these items exceeds the maximum, the command will not succeed.

NAME	acctsh, chargefee, ckpacct, dodisk, lastlogin, monacct, nulladm, prctmp, prdaily, prtacct, shutacct, startup, turnacct – shell procedures for accounting
SYNOPSIS	<pre> /usr/lib/acct/chargefee login-name number /usr/lib/acct/ckpacct [blocks] /usr/lib/acct/dodisk [-o] [filename...] /usr/lib/acct/lastlogin /usr/lib/acct/monacct number /usr/lib/acct/nulladm filename... /usr/lib/acct/prctmp filename /usr/lib/acct/prdaily [-c] [-l] [mddd] /usr/lib/acct/prtacct filename [' heading '] /usr/lib/acct/shutacct [' reason '] /usr/lib/acct/startup /usr/lib/acct/turnacct on off switch </pre>
chargefee Command	chargefee can be invoked to charge a <i>number</i> of units to <i>login-name</i> . A record is written to <code>/var/adm/fee</code> , to be merged with other accounting records by <code>runacct(1M)</code> .
ckpacct Command	ckpacct should be initiated using <code>cron(1M)</code> to periodically check the size of <code>/var/adm/pacct</code> . If the size exceeds <i>blocks</i> , 500 by default, <code>turnacct</code> will be invoked with argument <code>switch</code> . To avoid a conflict with <code>turnacct switch</code> execution in <code>runacct</code> , do not run <code>ckpacct</code> and <code>runacct</code> simultaneously. If the number of free disk blocks in the <code>/var</code> file system falls below 500, <code>ckpacct</code> will automatically turn off the collection of process accounting records via the <code>off</code> argument to <code>turnacct</code> . When at least 500 blocks are restored, the accounting will be activated again on the next invocation of <code>ckpacct</code> . This feature is sensitive to the frequency at which <code>ckpacct</code> is executed, usually by <code>cron</code> .
dodisk Command	<code>dodisk</code> should be invoked by <code>cron</code> to perform the disk accounting functions.
lastlogin Command	<code>lastlogin</code> is invoked by <code>runacct(1M)</code> to update <code>/var/adm/acct/sum/loginlog</code> , which shows the last date on which each person logged in.
monacct Command	<code>monacct</code> should be invoked once each month or each accounting period. <i>number</i> indicates which month or period it is. If <i>number</i> is not given, it defaults to the current month (01–12). This default is useful if <code>monacct</code> is to be executed using <code>cron(1M)</code> on the first day of each month. <code>monacct</code> creates summary files in <code>/var/adm/acct/fiscal</code> and restarts the summary files in <code>/var/adm/acct/sum</code> .

acctsh(1M)

nulladm Command	nulladm creates <i>filename</i> with mode 664 and ensures that owner and group are adm. It is called by various accounting shell procedures.
prctmp Command	prctmp can be used to print the session record file (normally <i>/var/adm/acct/nite/ctmp</i> created by acctcon1 (see acctcon(1M))).
prdaily Command	prdaily is invoked by runacct(1M) to format a report of the previous day's accounting data. The report resides in <i>/var/adm/acct/sum/rprt/mmdd</i> where <i>mmdd</i> is the month and day of the report. The current daily accounting reports may be printed by typing prdaily. Previous days' accounting reports can be printed by using the <i>mmdd</i> option and specifying the exact report date desired.
prtacct Command	prtacct can be used to format and print any total accounting (tacct)file.
shutacct Command	shutacct is invoked during a system shutdown to turn process accounting off and append a <i>reason</i> record to <i>/var/adm/wtmpx</i> .
startup Command	startup can be invoked when the system is brought to a multi-user state to turn process accounting on.
turnacct Command	turnacct is an interface to accton (see acct(1M)) to turn process accounting on or off. The switch argument moves the current <i>/var/adm/pacct</i> to the next free name in <i>/var/adm/pacctincr</i> (where <i>incr</i> is a number starting with 1 and incrementing by one for each additional <i>pacct</i> file), then turns accounting back on again. This procedure is called by ckpacct and thus can be taken care of by the cron and used to keep <i>pacct</i> to a reasonable size. shutacct uses turnacct to stop process accounting. startup uses turnacct to start process accounting.

OPTIONS The following options are supported:

- c This option prints a report of exceptional resource usage by command, and may be used on current day's accounting data only.
- l This option prints a report of exceptional usage by login id for the specified date. Previous daily reports are cleaned up and therefore inaccessible after each invocation of monacct.
- o This option uses acctdusg (see acct(1M)) to do a slower version of disk accounting by login directory. *filenames* specifies the one or more filesystem names where disk accounting will be done. If *filenames* are used, disk accounting will be done on these filesystems only. If the -o option is used, *filenames* should be mount points of mounted filesystems. If the -o option is omitted, *filenames* should be the special file names of mountable filesystems.

FILES */usr/lib/acct*
holds all accounting commands listed in section 1M of this manual
/usr/lib/acct/ptecms.awk
contains the limits for exceptional usage by command name

/usr/lib/acct/ptelus.awk
 contains the limits for exceptional usage by login ID

/var/adm/acct/fiscal
 fiscal reports directory

/var/adm/acct/nite
 working directory

/var/adm/acct/sum
 summary directory contains information for monacct

/var/adm/acct/sum/loginlog
 file updated by last login

/var/adm/fee
 accumulator for fees

/var/adm/pacct
 current file for per-process accounting

/var/adm/pacctincr
 used if pacct gets large and during execution of daily accounting procedure

/var/adm/wtmpx
 history of user access and administration information

ATTRIBUTES See attributes(5) for descriptions of the following attributes:

NOTES See runacct(1M) for the main daily accounting shell script, which performs the accumulation of connect, process, fee, and disk accounting on a daily basis. It also creates summaries of command usage.

adbgen(1M)

NAME	adbgen – generate adb script												
SYNOPSIS	<code>/usr/lib/adb/adbgen [-m <i>model</i>] <i>filename</i>.adb . . .</code>												
DESCRIPTION	<p>adbgen makes it possible to write adb(1) scripts that do not contain hard-coded dependencies on structure member offsets. The input to adbgen is a file named <i>filename</i>.adb that contains header information, then a null line, then the name of a structure, and finally an adb script. adbgen only deals with one structure per file; all member names are assumed to be in this structure. The output of adbgen is an adb script in <i>filename</i>. adbgen operates by generating a C program which determines structure member offsets and sizes, which in turn generate the adb script.</p> <p>The header lines, up to the null line, are copied verbatim into the generated C program. Typically, these are <code>#include</code> statements, which include the headers containing the relevant structure declarations.</p> <p>The adb script part may contain any valid adb commands (see adb(1)), and may also contain adbgen requests, each enclosed in braces (<code>{ }</code>). Request types are:</p> <ul style="list-style-type: none">■ Print a structure member. The request form is <code>{member, format}</code>. <i>member</i> is a member name of the <i>structure</i> given earlier, and <i>format</i> is any valid adb format request or any of the adbgen format specifiers (such as <code>{POINTER}</code>) listed below. For example, to print the <code>p_pid</code> field of the <i>proc</i> structure as a decimal number, you would write <code>{p_pid, d}</code>.■ Print the appropriate adb format character for the given adbgen format specifier. This action takes the data model into consideration. The request form is <code>{format specifier}</code>. The valid adbgen format specifiers are:<table><tr><td><code>{POINTER}</code></td><td>pointer value in hexadecimal</td></tr><tr><td><code>{LONGDEC}</code></td><td>long value in decimal</td></tr><tr><td><code>{ULONGDEC}</code></td><td>unsigned long value in decimal</td></tr><tr><td><code>{ULONGHEX}</code></td><td>unsigned long value in hexadecimal</td></tr><tr><td><code>{LONGOCT}</code></td><td>long value in octal</td></tr><tr><td><code>{ULONGOCT}</code></td><td>unsigned long value in octal</td></tr></table>■ Reference a structure member. The request form is <code>{*member, base}</code>. <i>member</i> is the member name whose value is desired, and <i>base</i> is an adb register name which contains the base address of the structure. For example, to get the <code>p_pid</code> field of the <i>proc</i> structure, you would get the <i>proc</i> structure address in an adb register, for example <code><f</code>, and write <code>{*p_pid, <f}</code>.■ Tell adbgen that the offset is valid. The request form is <code>{OFFSETOK}</code>. This is useful after invoking another adb script which moves the adb <i>dot</i>.■ Get the size of the <i>structure</i>. The request form is <code>{SIZEOF}</code>. adbgen replaces this request with the size of the structure. This is useful in incrementing a pointer to step through an array of structures.	<code>{POINTER}</code>	pointer value in hexadecimal	<code>{LONGDEC}</code>	long value in decimal	<code>{ULONGDEC}</code>	unsigned long value in decimal	<code>{ULONGHEX}</code>	unsigned long value in hexadecimal	<code>{LONGOCT}</code>	long value in octal	<code>{ULONGOCT}</code>	unsigned long value in octal
<code>{POINTER}</code>	pointer value in hexadecimal												
<code>{LONGDEC}</code>	long value in decimal												
<code>{ULONGDEC}</code>	unsigned long value in decimal												
<code>{ULONGHEX}</code>	unsigned long value in hexadecimal												
<code>{LONGOCT}</code>	long value in octal												
<code>{ULONGOCT}</code>	unsigned long value in octal												

- Calculate an arbitrary C expression. The request form is `{EXPR, expression}`. adbggen replaces this request with the value of the expression. This is useful when more than one structure is involved in the script.
- Get the offset to the end of the structure. The request form is `{END}`. This is useful at the end of the structure to get adb to align the *dot* for printing the next structure member.

adbgen keeps track of the movement of the adb *dot* and generates adb code to move forward or backward as necessary before printing any structure member in a script. adbggen's model of the behavior of adb's *dot* is simple: it is assumed that the first line of the script is of the form *struct_address/adb text* and that subsequent lines are of the form *+/adb text*. The adb *dot* then moves in a sane fashion. adbggen does not check the script to ensure that these limitations are met. adbggen also checks the size of the structure member against the size of the adb format code and warns if they are not equal.

OPTIONS The following option is supported:

`-m model` Specifies the data type model to be used by adbggen for the macro. This affects the outcome of the *{format specifier}* requests described under DESCRIPTION and the offsets and sizes of data types. *model* can be `ilp32` or `lp64`. If the `-m` option is not given, the data type model defaults to `ilp32`.

OPERANDS The following operand is supported:

`filename.adb` Input file that contains header information, followed by a null line, the name of the structure, and finally an adb script.

EXAMPLES **EXAMPLE 1** A sample adbggen file.

For an include file `x.h` which contained

```
struct x {
    char    *x_cp;
    char    x_c;
    int     x_i;
};
```

then, an adbggen file (call it `script.adb`) to print the file `x.h` would be:

```
#include "x.h"
x
./"x_cp"16t"x_c"8t"x_i"n{x_cp, {POINTER}}{x_c,C}{x_i,D}
```

After running adbggen as follows,

```
% /usr/lib/adb/adbggen script.adb
```

the output file `script` contains:

```
./"x_cp"16t"x_c"8t"x_i"nXC3+D
```

adbgen(1M)

EXAMPLE 1 A sample adbgen file. (Continued)

For a macro generated for a 64-bit program using the lp64 data model as follows,

```
% /usr/lib/adb/adbgen/ -m lp64 script.adb
```

the output file script would contain:

```
./"x_cp"16t"x_c"8t"x_i"nJC3+D
```

To invoke the script, type:

```
example% adb program
x$<script
```

FILES /usr/platform/*platform-name*/lib/adb/*
platform-specific adb scripts for debugging the 32-bit kernel

/usr/platform/*platform-name*/lib/adb/sparcv9/*
platform-specific adb scripts for debugging the 64-bit SPARC V9 kernel

/usr/lib/adb/*
adb scripts for debugging the 32-bit kernel

/usr/lib/adb/sparcv9/*
adb scripts for debugging the 64-bit SPARC V9 kernel

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWesu

SEE ALSO `adb(1)`, `uname(1)`, `kadb(1M)`, `attributes(5)`

DIAGNOSTICS Warnings are given about structure member sizes not equal to adb format items and about badly formatted requests. The C compiler complains if a structure member that does not exist is referenced. It also complains about an ampersand before array names; these complaints may be ignored.

NOTES *platform-name* can be found using the `-i` option of `uname(1)`.

BUGS adb syntax is ugly; there should be a higher level interface for generating scripts.

Structure members which are bit fields cannot be handled because C will not give the address of a bit field. The address is needed to determine the offset.

NAME	addbadsec – map out defective disk blocks						
SYNOPSIS	addbadsec [-p] [-a <i>blkno</i> [<i>blkno...</i>]] [-f <i>filename</i>] <i>raw_device</i>						
DESCRIPTION	<p>addbadsec is used by the system administrator to map out bad disk blocks. Normally, these blocks are identified during surface analysis, but occasionally the disk subsystem reports unrecoverable data errors indicating a bad block. A block number reported in this way can be fed directly into addbadsec, and the block will be remapped. addbadsec will first attempt hardware remapping. This is supported on SCSI drives and takes place at the disk hardware level. If the target is an IDE drive, then software remapping is used. In order for software remapping to succeed, the partition must contain an alternate slice and there must be room in this slice to perform the mapping.</p> <p>It should be understood that bad blocks lead to data loss. Remapping a defective block does not repair a damaged file. If a bad block occurs to a disk-resident file system structure such as a superblock, the entire slice might have to be recovered from a backup.</p>						
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -a Adds the specified blocks to the hardware or software map. If more than one block number is specified, the entire list should be quoted and block numbers should be separated by white space. -f Adds the specified blocks to the hardware or software map. The bad blocks are listed, one per line, in the specified file. -p Causes addbadsec to print the current software map. The output shows the defective block and the assigned alternate. This option cannot be used to print the hardware map. 						
OPERANDS	<p>The following operand is supported:</p> <p><i>raw_device</i> The address of the disk drive (see FILES).</p>						
FILES	The raw device should be /dev/rdisk/c? [t?] d?p0. See disks(1M) for an explanation of SCSI and IDE device naming conventions.						
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:						
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">ATTRIBUTE TYPE</th> <th style="text-align: center;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Architecture</td> <td>IA</td> </tr> <tr> <td>Availability</td> <td>SUNWcsu</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Architecture	IA	Availability	SUNWcsu
ATTRIBUTE TYPE	ATTRIBUTE VALUE						
Architecture	IA						
Availability	SUNWcsu						
SEE ALSO	disks(1M), diskscan(1M), fdisk(1M), fmthard(1M), format(1M), attributes(5)						

addbadsec(1M)

NOTES | The `format(1M)` utility is available to format, label, analyze, and repair SCSI disks. This utility is included with the `addbadsec`, `diskscan(1M)`, `fdisk(1M)`, and `fmthard(1M)` commands available for IA. To format an IDE disk, use the DOS "format" utility; however, to label, analyze, or repair IDE disks on IA systems, use the Solaris `format(1M)` utility.

NAME	add_drv – add a new device driver to the system
SYNOPSIS	add_drv [-b <i>basedir</i>] [-c <i>class_name</i>] [-i ' <i>identify_name...</i> '] [-m ' <i>permission</i> ', ' <i>...</i> '] [-n] [-f] [-v] <i>device_driver</i>
DESCRIPTION	<p>The <code>add_drv</code> command is used to inform the system about newly installed device drivers.</p> <p>Each device on the system has a name associated with it. This name is represented by the <code>name</code> property for the device. Similarly, the device may also have a list of driver names associated with it. This list is represented by the <code>compatible</code> property for the device.</p> <p>The system determines which devices will be managed by the driver being added by examining the contents of the <code>name</code> property and the <code>compatible</code> property (if it exists) on each device. If the value in the <code>name</code> property does not match the driver being added, each entry in the <code>compatible</code> property is tried, in order, until either a match occurs or there are no more entries in the <code>compatible</code> property.</p> <p>In some cases, adding a new driver may require a reconfiguration boot. See the NOTES section.</p>
OPTIONS	<p>-b <i>basedir</i> Installs the driver on the system with a root directory of <i>basedir</i> rather than installing on the system executing <code>add_drv</code>. This option is typically used in package post-installation scripts when the package is not being installed on the system executing the <code>pkgadd</code> command. The system using <i>basedir</i> as its root directory must reboot to complete the driver installation.</p> <p>-c <i>class_name</i> The driver being added to the system exports the class <i>class_name</i>.</p> <p>-i '<i>identify_name</i>' A white-space separated list of aliases for the driver <i>device_driver</i>.</p> <p>-m '<i>permission</i>' Specify the file system permissions for device nodes created by the system on behalf of <i>device_driver</i>.</p> <p>-n Do not try to load and attach <i>device_driver</i>, just modify the system configuration files for the <i>device_driver</i>.</p> <p>-f Normally if a reconfiguration boot is required to complete the configuration of the driver into the system, <code>add_drv</code> will not add the driver. The force flag forces <code>add_drv</code> to add the driver even if a reconfiguration boot is required. See the <code>-v</code> flag.</p> <p>-v The verbose flag causes <code>add_drv</code> to provide additional information regarding the success or failure of a driver's configuration into the system. See the</p>

add_drv(1M)

EXAMPLES section.

EXAMPLES

EXAMPLE 1 Adding The SUNW, Example Driver to the System

The following example adds the SUNW, example driver to the system, with an alias name of SUNW, alias. It assumes the driver has already been copied to /usr/kernel/drv.

```
example# add_drv -m '* 0666 bin bin', 'a 0644 root sys' \  
-i 'SUNW,alias' SUNW,example
```

Every minor node created by the system for the SUNW, example driver will have the permission 0666, and be owned by user bin in the group bin, except for the minor device a, which will be owned by root, group sys, and have a permission of 0644.

EXAMPLE 2 Adding The Driver To The Client /export/root/sun1

The following example adds the driver to the client /export/root/sun1. The driver is installed and loaded when the client machine, sun1, is rebooted. This second example produces the same result as the first, except the changes are on the diskless client, sun1, and the client must be rebooted for the driver to be installed.

```
example# add_drv -m '* 0666 bin bin', 'a 0644 root sys' \  
-i 'SUNW,alias' -b /export/root/sun1 \  
SUNW,example
```

EXAMPLE 3 Adding A Driver For A Device That Is Already Managed By An Existing Driver

The following example illustrates the case where a new driver is added for a device that is already managed by an existing driver. Consider a device that is currently managed by the driver dumb_framebuffer. The name and compatible properties for this device are as follows:

```
name="display"  
compatible="whizzy_framebuffer", "dumb_framebuffer"
```

If add_drv is used to add the whizzy_framebuffer driver, the following will result.

```
example# add_drv whizzy_framebuffer  
Error: Could not install driver (whizzy_framebuffer)  
Device managed by another driver.
```

If the -v flag is specified, the following will result.

```
example# add_drv -v whizzy_framebuffer  
Error: Could not install driver (whizzy_framebuffer)  
Device managed by another driver.  
Driver installation failed because the following  
entries in /devices would be affected:
```

```
    /devices/iommu@f,e0000000/sbus@f,e0001000/display[:*]  
    (Device currently managed by driver "dumb_framebuffer")
```

The following entries in /dev would be affected:

EXAMPLE 3 Adding A Driver For A Device That Is Already Managed By An Existing Driver (Continued)

```
/dev/fbs/dumb_framebuffer0
```

If the `-v` and `-f` flags are specified, the driver will be added resulting in the following.

```
example# add_drv -vf whizzy_framebuffer
```

A reconfiguration boot must be performed to complete the installation of this driver.

The following entries in `/devices` will be affected:

```
/devices/iommu@f,e0000000/sbus@f,e0001000/display[:*]  
(Device currently managed by driver "dumb_framebuffer")
```

The following entries in `/dev` will be affected:

```
/dev/fbs/dumb_framebuffer0
```

The above example is currently only relevant to devices exporting a generic device name.

EXIT STATUS

`add_drv` returns 0 on success and 1 on failure.

FILES

- `/kernel/drv`
boot device drivers
- `/usr/kernel/drv`
other drivers that could potentially be shared between platforms
- `/platform/`uname -i`/kernel/drv`
platform-dependent drivers
- `/etc/driver_aliases`
driver aliases file
- `/etc/driver_classes`
driver classes file
- `/etc/minor_perm`
minor node permissions
- `/etc/name_to_major`
major number binding

ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

add_drv(1M)

SEE ALSO boot(1M), devlinks(1M), disks(1M), drvconfig(1M), kernel(1M), modinfo(1M), ports(1M), rem_drv(1M), tapes(1M), driver.conf(4), system(4), attributes(5), ddi_create_minor_node(9F)

Writing Device Drivers

NOTES Aliases may require quoting (with double-quotes) if they contain numbers.

It is possible to add a driver for a device already being managed by a different driver, where the driver being added appears in the device's `compatible` list before the current driver. In such cases, a reconfiguration boot is required (see `boot(1M)` and `kernel(1M)`). After the reconfiguration boot, device nodes in `/devices`, entries in `/dev`, and references to these files may no longer be valid (see the `-v` flag). If a reconfiguration boot would be required to complete the driver installation, `add_drv` will fail unless the `-f` option is specified. See Example 3 in the `EXAMPLES` section.

BUGS `add_drv` will accept a full pathname for `device_driver`. However, the kernel does not use the full pathname; it only uses the final component and searches the internal driver search path for the driver. This can lead to the kernel loading a different driver than expected.

For this reason, it is not recommended that you use `add_drv` with a full pathname. See `kernel(1M)` for more information on the driver search path.

NAME	admintool – system administration with a graphical user interface												
SYNOPSIS	<code>/usr/bin/admintool</code>												
DESCRIPTION	<p>admintool is a graphical user interface that enables you to accomplish several system administration tasks on a local system. Membership in the sysadmin group (gid 14) is used to restrict access to administrative tasks. Members of the sysadmin group can use admintool to create, delete, and modify local system files. Non-members have read-only permissions (where applicable).</p> <p>Help is available by using the Help button.</p> <p>admintool is not the tool for a distributed environment. It is used for local administration.</p>												
USAGE	<p>admintool allows you to do the following tasks:</p> <table> <tr> <td>Manage users</td> <td>Use admintool to add, delete, or modify user accounts. admintool makes the appropriate changes to the system's <code>/etc/passwd</code> file (see <code>passwd(4)</code>).</td> </tr> <tr> <td>Manage groups</td> <td>Use admintool to add, delete, or modify groups. admintool makes the appropriate changes to the system's <code>/etc/group</code> file (see <code>group(4)</code>).</td> </tr> <tr> <td>Manage hosts</td> <td>Use admintool to add, delete, or modify hosts. admintool makes the appropriate changes to the system's <code>/etc/hosts</code> file (see <code>hosts(4)</code>).</td> </tr> <tr> <td>Manage printers</td> <td>Use admintool to add or delete access to a printer, or to modify a system's printer access. admintool makes the appropriate changes to the system's <code>/etc/lp</code> directory.</td> </tr> <tr> <td>Manage serial port services</td> <td>Use admintool to enable or disable serial port services. admintool sets up the software services necessary to use a modem or terminal attached to a system's serial port.</td> </tr> <tr> <td>Manage software</td> <td>Use admintool to add or remove software. admintool adds software from a product CD or on a hard disk to an installed system, or removes software from an installed system.</td> </tr> </table>	Manage users	Use admintool to add, delete, or modify user accounts. admintool makes the appropriate changes to the system's <code>/etc/passwd</code> file (see <code>passwd(4)</code>).	Manage groups	Use admintool to add, delete, or modify groups. admintool makes the appropriate changes to the system's <code>/etc/group</code> file (see <code>group(4)</code>).	Manage hosts	Use admintool to add, delete, or modify hosts. admintool makes the appropriate changes to the system's <code>/etc/hosts</code> file (see <code>hosts(4)</code>).	Manage printers	Use admintool to add or delete access to a printer, or to modify a system's printer access. admintool makes the appropriate changes to the system's <code>/etc/lp</code> directory.	Manage serial port services	Use admintool to enable or disable serial port services. admintool sets up the software services necessary to use a modem or terminal attached to a system's serial port.	Manage software	Use admintool to add or remove software. admintool adds software from a product CD or on a hard disk to an installed system, or removes software from an installed system.
Manage users	Use admintool to add, delete, or modify user accounts. admintool makes the appropriate changes to the system's <code>/etc/passwd</code> file (see <code>passwd(4)</code>).												
Manage groups	Use admintool to add, delete, or modify groups. admintool makes the appropriate changes to the system's <code>/etc/group</code> file (see <code>group(4)</code>).												
Manage hosts	Use admintool to add, delete, or modify hosts. admintool makes the appropriate changes to the system's <code>/etc/hosts</code> file (see <code>hosts(4)</code>).												
Manage printers	Use admintool to add or delete access to a printer, or to modify a system's printer access. admintool makes the appropriate changes to the system's <code>/etc/lp</code> directory.												
Manage serial port services	Use admintool to enable or disable serial port services. admintool sets up the software services necessary to use a modem or terminal attached to a system's serial port.												
Manage software	Use admintool to add or remove software. admintool adds software from a product CD or on a hard disk to an installed system, or removes software from an installed system.												
EXIT STATUS	admintool terminates with exit status 0.												
ATTRIBUTES	See <code>attributes(5)</code> for descriptions of the following attributes:

admintool(1M)

SEE ALSO | `group(4)`, `hosts(4)`, `passwd(4)`, `attributes(5)`

OpenWindows Advanced User's Guide

WARNINGS | If you use `admintool` to add a host, your local system and your site uses a network name service such as NIS or NIS+, `admintool` host operations may not have the desired effect. This is because information in the network name service will take precedence over the information in the local `/etc/hosts` file, which is where `admintool` updates information.

NOTES | `admintool` modifies files on the local system, i.e., the system on which you are running `admintool`. `admintool` does not modify or update global networked databases such as NIS or NIS+.

NAME	afbconfig, SUNWafb_config – configure the AFB Graphics Accelerator
SYNOPSIS	<pre> /usr/sbin/afbconfig [-dev <i>device-filename</i>] [-res <i>video-mode</i> [now try] [noconfirm nocheck]] [-file machine system] [-deflinear true false] [-defoverlay true false] [-overlayorder first last] [-expvis enable disable] [-sov enable disable] [-maxwinds <i>n</i>] [-extovl enable disable] [-g <i>gamma-correction-value</i>] [-gfile <i>gamma-correction-file</i>] [-propt] [-prconf] [-defaults] /usr/sbin/afbconfig [-propt] [-prconf] /usr/sbin/afbconfig [-help] [-res ?] </pre>
DESCRIPTION	<p>afbconfig configures the AFB Graphics Accelerator and some of the X11 window system defaults for AFB.</p> <p>The following form of afbconfig stores the specified options in the OWconfig file:</p> <pre> /usr/sbin/afbconfig [-dev<i>device-filename</i>] [-res <i>video-mode</i> [now try] [noconfirm nocheck]] [-file machine system] [-deflinear true false] [-defoverlay true false] [-overlayorderfirst last] [-expvisenable disable] [-sov enable disable] [-maxwinds<i>n</i>] [-extovl enable disable] [-g<i>gamma-correction-value</i>] [-gfile<i>gamma-correction-file</i>] [-propt] [-prconf] [-defaults] </pre> <p>The options are used to initialize the AFB device the next time the window system is run on that device. Updating options in the OWconfig file provides persistence of these options across window system sessions and system reboots.</p> <p>The following forms of the afbconfig command invoke only the -prconf, -propt, -help, and -res ? options. None of these options update the OWconfig file.</p> <pre> /usr/sbin/afbconfig [-propt] [-prconf] /usr/sbin/afbconfig [-help] [-res ?] </pre> <p>Additionally, the following invocation of afbconfig ignores all other options:</p> <pre> /usr/sbin/afbconfig [-help] [-res ?] </pre> <p>You can only specify options for one AFB device at a time. Specifying options for multiple AFB devices requires multiple invocations of the afbconfig command.</p> <p>Only AFB-specific options can be specified through afbconfig. The normal window system options for specifying default depth, visual class and so forth are still specified as device modifiers on the openwin command line.</p> <p>You can also specify the OWconfig file that is to be updated. By default, the machine-specific file in the /etc/openwin directory tree is updated. The -file option can be used to specify an alternate file to use. For example, the system-global OWconfig file in the /usr/openwin directory tree can be updated instead.</p>

afbconfig(1M)

Both of these standard `OWconfig` files can only be written by root. Consequently, the `afbconfig` program, which is owned by the root user, always runs with `setuid` root permission.

Option Defaults

For a given invocation of `afbconfig` command line if an option does not appear on the command line, the corresponding `OWconfig` option is not updated; it retains its previous value. When the window system is run, if an AFB option has never been specified by way of `afbconfig`, a default value is used. The option defaults are as follows:

<code>-dev</code>	<code>/dev/fbs/afb0</code>
<code>-file</code>	<code>machine</code>
<code>-res</code>	<code>none</code>
<code>-deflinear</code>	<code>false</code>
<code>-defoverlay</code>	<code>false</code>
<code>-linearorder</code>	<code>last</code>
<code>-overlayorder</code>	<code>last</code>
<code>-expvis</code>	<code>enabled</code>
<code>-sov</code>	<code>enabled</code>
<code>-maxwids</code>	<code>32</code>
<code>-extovl</code>	<code>enabled</code>
<code>-g</code>	<code>2.22</code>

The default for the `-res` option of `none` means that when the window system is run the screen resolution is the video mode currently programmed in the device.

This provides compatibility for users who are used to specifying the device resolution through the PROM. On some devices (for example, `GX`) this is the only way of specifying the video mode. This means that the PROM ultimately determines the default AFB video mode.

OPTIONS

The following options are supported:

`-defaults`

Resets all option values to their default values.

`-deflinear true | false`

AFB possesses two types of visuals: linear and nonlinear. Linear visuals are gamma corrected and nonlinear visuals are not. There are two visuals that have both linear and nonlinear versions: 24-bit TrueColor and 8-bit StaticGray.

If `true`, the default visual is set to the linear visual that satisfies other specified default visual selection options (specifically, the Xsun(1) `defdepth` and `defclass` options described in the OpenWindows Reference Manual).

If false, or if there is no linear visual that satisfies the other default visual selection options, the non-linear visual specified by these other options are chosen as the default. This option cannot be used when the `-defoverlay` option is present, because AFB doesn't possess a linear overlay visual.

`-defoverlay true | false`

The AFB provides an 8-bit PseudoColor visual whose pixels are disjoint from the rest of the AFB visuals. This is called the overlay visual. Windows created in this visual do not damage windows created in other visuals. The converse, however, is not true. Windows created in other visuals damage overlay windows.

The number of colors available to the windows created using this visual depends on the settings for the `-extovl` option. If the `-extovl` is enabled, extended overlay with 256 opaque color values is available. See `-extovl`. If `-extovl` is disabled, extended overlay is not available and the visual has 256 `-maxwids`) number of opaque color values. See `-maxwids`.

If the value of `-defoverlay` is `true`, the overlay visual is made the default visual. If the value of `-defoverlay` is `false`, the nonoverlay visual that satisfies the other default visual selection options, such as `def`, `depth`, and `defclass`, are chosen as the default visual. See the OpenWindows Reference Manual.

Whenever the `defoverlay true` option is used, the default depth and class specified on the `openwin` command line must be 8-bit PseudoColor. If not, a warning message is printed and the `-defoverlay` option is treated as `false`.

The `-defoverlay` option can not be used when the `-deflinear` option specified, because AFB doesn't possess a linear overlay visual.

`-dev device-filename`

Specifies the AFB special file. The default is `/dev/fbs/afb0`.

`-expvis enable | disable`

If enabled, activates OpenGL Visual Expansion. Multiple instances of selected visual groups (8-bit PseudoColor, 24-bit TrueColor and so forth) are in the screen visual list.

`-extovl enable | disable`

If enabled, makes extended overlay available. The overlay visuals have 256 opaque colors. The SOV visuals have 255 opaque colors and 1 transparent color.

This option also enables hardware supported transparency, thus provides better performance for windows using the SOV visuals.

`-file machine | system`

Specifies which `OWconfig` file to update. If `machine` is specified, the machine-specific `OWconfig` file in the `/etc/openwin` directory tree is used. If `system` specifies the global `OWconfig` file in the `/usr/openwin` directory tree. If the specified file does not exist, it is created.

afbconfig(1M)

-g *gamma-correction value*

Allows changing the gamma correction value. All linear visuals provide gamma correction. By default, the *gamma-correction-value* is 2.22. Any value less than 0 is illegal. The gamma correction value is applied to the linear visual, which then has an effective gamma value of 1.0, which is the value returned by `XSolarisGetVisualGamma(3)`. See `XSolarisGetVisualGamma(3)` for a description of that function.

This option can be used while the window system is running. Changing the gamma correction value affects all the windows being displayed using the linear visuals.

-gfile *gamma-correction-file*

Loads the gamma correction table from the specified file (*gamma-correction-file*). This file should be formatted to provide the gamma correction values for R, G and B channels on each line. Each of these values should be in hexadecimal format and separated from each other by at least one space. *gamma-correction-file* should also provide 256 such triplets.

An example of a *gamma-correction-file* follows.

```
0x00 0x00 0x00
0x01 0x01 0x01
0x02 0x02 0x02
...
...
0xff 0xff 0xff
```

Using this option, the gamma correction table can be loaded while the window system is running. The new gamma correction affects all the windows being displayed using the linear visuals. When gamma correction is being done using user specified table, the gamma correction value is undefined. By default, the window system assumes a gamma correction value of 2.22 and loads the gamma table it creates corresponding to this value.

-help

Prints a list of the `afbconfig` command line options, along with a brief explanation of each.

-linearorder *first* | *last*

If *first*, linear visuals come before their non-linear counterparts on the X11 screen visual list for the AFB screen. If *last*, the nonlinear visuals come before the linear ones.

-maxwids *n*

Specifies the maximum number of AFB X channel pixel values that are reserved for use as window IDs (WIDs). The remainder of the pixel values in overlay colormaps are used for normal X11 opaque color pixels. The reserved WIDs are allocated on a first-come first-serve basis by 3D graphics windows (such as XGL), MBX windows, and windows that have a non-default visual. The X channel codes 0 to (255 - *n*) are opaque color pixels. The X channel codes (255 - *n* + 1) to 255 are reserved for use as WIDs. Legal values are 1, 2, 4, 8, 16, 32, and 64.

This option is available only if the `-extovl` is disabled.

`-overlayorder first | last`

If `first`, the depth 8 PseudoColor Overlay visual comes before the non-overlay visual on the X11 screen visual list for the AFB screen. If `last`, the non-overlay visual comes before the overlay one.

`-propt`

Prints the current values of all AFB options in the `OWconfig` file specified by the `-file` option for the device specified by the `-dev` option. Prints the values of options as they will be in the `OWconfig` file after the call to `afbconfig` completes.

The following is a typical display:

```
--- OpenWindows Configuration for /dev/fbs/afb0 ---
OWconfig: machine
Video Mode: 1280x1024x76
Default Visual: Non-Linear Normal Visual
Visual Ordering: Linear Visuals are last
                  Overlay Visuals are last
OpenGL Visual Expansion: enabled
Server Overlay Visuals: enabled
Extended Overlay: enabled
Underlay WIDs: 64 (not configurable)
Overlay WIDs: 4 (not configurable)
Gamma Correction Value: 2.220
Gamma Correction Table: Available
```

`-prconf`

Prints the AFB hardware configuration.

The following is a typical display:

```
--- Hardware Configuration for /dev/fbs/afb0 ---
Type: double-buffered AFB with Z-buffer
Board: rev 0 (Horizontal)
Number of Floats: 6
PROM Information: @(#)afb.fth x.xx xx/xx/xx
AFB ID: 0x101df06d
DAC: Brooktree 9070, version 1 (Pac2)
3DRAM: Mitsubishi 130a, version x
EDID Data: Available - EDID version 1 revision x
Monitor Sense ID: 4 (Sun 37x29cm RGB color monitor)
Monitor possible resolutions: 1024x768x77, 1024x800x84, 1
                             1152x900x76, 1280x1024x67, 1280x1024x76, 960x680xx108s
Current resolution setting: 1280x1024x76
```

`-sov enable | disable`

If enabled, the root window's `SERVER_OVERLAY_VISUALS` property are advertised. SOV visuals are exported and their transparent types, values and layers can be retrieved through this property. If disabled, the `SERVER_OVERLAY_VISUALS` property are not defined and SOV visuals are not exported.

afbconfig(1M)

`-res video-mode [now | try [noconfirm | nocheck]]`

Specifies the video mode used to drive the monitor connected to the specified AFB device.

The format of these built-in video modes is: *widthxheightxrate*, where *width* is the screen width in pixels, *height* is the screen height in pixels, and *rate* is the vertical frequency of the screen refresh.

The *s* suffix of `960x680x112s` and `960x680x108s` means that these are stereo video modes. The *i* suffix of `640x480x60i` and `768x575x50i` designates interlaced video timing. If absent, non-interlaced timing is used.

As a convenience, the `-res` also accepts formats with an at sign (@) in front of the refresh rate instead of *n*, (`1280x1024@76`). Some video-modes, supported by AFB, may not be supported by the monitor. The list of video-modes supported by the AFB device and the monitor can be obtained by running `afbconfig` with the `-res ?` option (the third form shown SYNOPSIS).

A list of all possible video-modes supported on AFB follows:

```
1024x768x60
1024x768x70
1024x768x75
1024x768x77
1024x800x84
1152x900x66
1152x900x76
1280x800x76
1280x1024x60
1280x1024x67
1280x1024x76
960x680x112s (Stereo)
960x680x108s (Stereo)
640x480x60
640x480x60i (Interlaced)
768x575x50i (Interlaced)
```

For convenience, some of the video-modes supported on the AFB have *symbolic names* defined for them. Instead of the form *widthxheightxrate*, one of these names may be supplied as the argument to the `-res` option. The meaning of the symbolic name `none` is that when the window system is run, the screen resolution is the video mode that is currently programmed in the device.

A list of symbolic names for video-modes supported on AFB follows:

Name	Corresponding Video Mode
<code>svga</code>	<code>1024x768x60</code>
<code>1152</code>	<code>1152x900x76</code>
<code>1280</code>	<code>1280x1024x76</code>

stereo 960x680x112s
 ntsc 640x480x60i
 pal 768x575x50i
 none (see text above)

The `-res` option also accepts the additional, optional arguments immediately following the video mode specification. Any or all of the following arguments can be specified:

- `noconfirm` Using the `-res` option, the user could potentially put the system into an unusable state, a state where there is no video output. This can happen if there is ambiguity in the monitor sense codes for the particular code read. To reduce the chance of this, the default behavior of `afbconfig` is to print a warning message to this effect and to prompt the user to find out if it is okay to continue. The `noconfirm` option instructs `afbconfig` to bypass this confirmation and to program the requested video mode anyway. This option is useful when `afbconfig` is being run from a shell script.
- `nocheck` If present, the normal error checking based on the monitor sense code is suspended. The video mode specified by the user is accepted regardless of whether it is appropriate for the currently attached monitor. (This option is useful if a different monitor is to be connected to the AFB device). Use of this option implies `noconfirm` well.
- `now` Updates the video mode in the `OWconfig` file, and immediately programs the AFB device to display this video mode. This is useful for changing the video mode before starting the window system.
- It is inadvisable to use this argument with `afbconfig` while the configured device is being used (for example, while running the window system); unpredictable results may occur. To run `afbconfig` with the `now` argument, first bring the window system down. If the `now` argument is used within a window system session, the video mode is changed immediately, but the width and height of the affected screen won't change until the window system is exited and re-entered again. In addition, the system may not recognize changes in stereo mode. Consequently, this usage is strongly discouraged.

afbconfig(1M)

try

If present, the specified video mode is programmed on a trial basis. The user is asked to confirm the video mode by typing `y` within 10 seconds. Or the user may terminate the trial before 10 seconds are up by typing any character. Any character other than `y` or Return is considered a `no`. The previous video mode is restored and `afbconfig` does not change the video mode in the `OWconfig` file (other options specified still take effect). If a Return is typed, the user is prompted for a `yes` or `no` answer on whether to keep the new video mode. This option implies the `now` argument (see the warning note on the `now` argument).

EXAMPLES

EXAMPLE 1 Switching the monitor type

The following example switches the monitor type to a resolution of 1280 x 1024 at 76 Hz:

```
example% /usr/sbin/afbconfig -res 1280x1024x76
```

NAME	allocate – device allocation								
SYNOPSIS	<p>allocate [-s] [-U <i>uname</i>] <i>device</i></p> <p>allocate [-s] [-U <i>uname</i>] -g <i>dev</i> -<i>type</i></p> <p>allocate [-s] [-U <i>uname</i>] -F <i>device</i></p>								
DESCRIPTION	<p>allocate manages the ownership of devices through its allocation mechanism. It ensures that each device is used by only one qualified user at a time.</p> <p>The <i>device</i> argument specifies the device to be manipulated. To preserve the integrity of the device's owner, the allocate operation is executed on all the device special files associated with that device.</p> <p>The argument <i>dev-type</i>, is the device type to be operated on. The argument <i>dev-type</i>, can only be used with the -g option.</p> <p>The default allocate operation, allocates the device special files associated with <i>device</i> to the uid of the current process.</p> <p>If the -F option is specified, the device cleaning program is executed when allocation is performed. This cleaning program is found in <code>/etc/security/lib</code>. The name of this program is found in the <code>device_allocate(4)</code> entry for the device in the <i>dev-exec</i> field.</p> <p>Only authorized users may allocate a device. The required authorizations are specified in <code>device_allocate(4)</code>.</p>								
OPTIONS	<table border="0"> <tr> <td style="vertical-align: top;">-g <i>dev-type</i></td> <td>Allocate a non-allocated device with a device-type matching <i>dev-type</i>.</td> </tr> <tr> <td style="vertical-align: top;">-s</td> <td>Silent. Suppresses any diagnostic output.</td> </tr> <tr> <td style="vertical-align: top;">-F <i>device</i></td> <td>Reallocate the device allocated to another user. This option is often used with -U to reallocate a specific device to a specific user. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.</td> </tr> <tr> <td style="vertical-align: top;">-U <i>uname</i></td> <td>Use the user ID <i>uname</i> instead of the user ID of the current process when performing the allocate operation. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.</td> </tr> </table>	-g <i>dev-type</i>	Allocate a non-allocated device with a device-type matching <i>dev-type</i> .	-s	Silent. Suppresses any diagnostic output.	-F <i>device</i>	Reallocate the device allocated to another user. This option is often used with -U to reallocate a specific device to a specific user. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.	-U <i>uname</i>	Use the user ID <i>uname</i> instead of the user ID of the current process when performing the allocate operation. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.
-g <i>dev-type</i>	Allocate a non-allocated device with a device-type matching <i>dev-type</i> .								
-s	Silent. Suppresses any diagnostic output.								
-F <i>device</i>	Reallocate the device allocated to another user. This option is often used with -U to reallocate a specific device to a specific user. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.								
-U <i>uname</i>	Use the user ID <i>uname</i> instead of the user ID of the current process when performing the allocate operation. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.								
DIAGNOSTICS	allocate returns a non-zero exit status in the event of an error.								

allocate(1M)

NAME	answerbook2_admin – bring up AnswerBook2 administration tool GUI				
SYNOPSIS	<code>/usr/dt/bin/answerbook2_admin [-h]</code>				
DESCRIPTION	<p>answerbook2_admin brings up the default web browser showing the administration interface for the local AnswerBook2 server. The AnswerBook2 administration tool based on the Web browser provides the same functionality as the ab2admin(1M) command-line administration tool.</p> <p>This functionality is also accessible through the AnswerBook2 Admin option within the System_Admin subset of the Application Manager function on the CDE front panel Applications menu.</p>				
OPTIONS	<p>The following option is supported:</p> <p>-h Displays a usage statement.</p>				
USAGE	At startup time, answerbook2_admin starts up the default web browser (for example, HotJava or Netscape) and displays the URL specified for administering the local AnswerBook2 server (<code>http://localhost:8888</code>). If the user has set up administration access control, the web browser prompts for a valid administrator login and password for this document server before displaying the administration tool.				
FILES	<p><code>/usr/lib/ab2/dweb/data/config/admin_passwd</code> File containing <i>username: password</i></p>				
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>SUNWab2m</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Availability	SUNWab2m
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Availability	SUNWab2m				
SEE ALSO	ab2admin(1M), attributes(5)				
NOTES	Once there is an open web browser and access to the AnswerBook2 Administration tool, use its online Help system to find out more about administering the AnswerBook2 server.				

apache(1M)

NAME	apache – Apache hypertext transfer protocol server overview																						
DESCRIPTION	apache consists of a main server daemon, loadable server modules, some additional support utilities, configuration files, and documentation.																						
FILES	<p>The apache HTTPD server is integrated with Solaris.</p> <p>The following files specify the installation locations for apache:</p> <table><tr><td>/etc/apache</td><td>Contains server configuration files.</td></tr><tr><td></td><td>A newly-installed server must be manually configured before use. Typically this involves copying <code>httpd.conf-example</code> to the <code>httpd.conf</code> file and making local configuration adjustments.</td></tr><tr><td>/usr/apache/bin</td><td>Contains the <code>httpd</code> executable as well as other utility programs.</td></tr><tr><td>/usr/apache/htdocs</td><td>Contains the Apache manual in HTML format. This documentation is accessible by way of a link on the server test page that gets installed upon fresh installation.</td></tr><tr><td>/usr/apache/include</td><td>Contains the Apache header files, which are needed for building various optional server extensions with <code>apxs(8)</code></td></tr><tr><td>/usr/apache/jserv</td><td>Contains documentation for the <code>mod_jserv</code> java servlet module. Documentation can be read with a web browser using the url: <code>file:/usr/apache/jserv/docs/index.html</code></td></tr><tr><td>/usr/apache/libexec</td><td>Contains loadable modules (DSOs) supplied with the server. Any modules which are added using <code>apxs(8)</code> are also copied into this directory.</td></tr><tr><td>/usr/apache/man</td><td>Contains man pages for the server, utility programs, and <code>mod_perl</code>. Add this directory to your <code>MANPATH</code> to read the Apache man pages. See <code>NOTES</code>.</td></tr><tr><td>/usr/apache/perl5</td><td>Contains the modules and library files used by the <code>mod_perl</code> extension to Apache.</td></tr><tr><td>/var/apache/cgi-bin</td><td>Default location for the CGI scripts. This can be changed by altering the <code>httpd.conf</code> file and restarting the server.</td></tr><tr><td>/var/apache/htdocs</td><td>Default document root.</td></tr></table>	/etc/apache	Contains server configuration files.		A newly-installed server must be manually configured before use. Typically this involves copying <code>httpd.conf-example</code> to the <code>httpd.conf</code> file and making local configuration adjustments.	/usr/apache/bin	Contains the <code>httpd</code> executable as well as other utility programs.	/usr/apache/htdocs	Contains the Apache manual in HTML format. This documentation is accessible by way of a link on the server test page that gets installed upon fresh installation.	/usr/apache/include	Contains the Apache header files, which are needed for building various optional server extensions with <code>apxs(8)</code>	/usr/apache/jserv	Contains documentation for the <code>mod_jserv</code> java servlet module. Documentation can be read with a web browser using the url: <code>file:/usr/apache/jserv/docs/index.html</code>	/usr/apache/libexec	Contains loadable modules (DSOs) supplied with the server. Any modules which are added using <code>apxs(8)</code> are also copied into this directory.	/usr/apache/man	Contains man pages for the server, utility programs, and <code>mod_perl</code> . Add this directory to your <code>MANPATH</code> to read the Apache man pages. See <code>NOTES</code> .	/usr/apache/perl5	Contains the modules and library files used by the <code>mod_perl</code> extension to Apache.	/var/apache/cgi-bin	Default location for the CGI scripts. This can be changed by altering the <code>httpd.conf</code> file and restarting the server.	/var/apache/htdocs	Default document root.
/etc/apache	Contains server configuration files.																						
	A newly-installed server must be manually configured before use. Typically this involves copying <code>httpd.conf-example</code> to the <code>httpd.conf</code> file and making local configuration adjustments.																						
/usr/apache/bin	Contains the <code>httpd</code> executable as well as other utility programs.																						
/usr/apache/htdocs	Contains the Apache manual in HTML format. This documentation is accessible by way of a link on the server test page that gets installed upon fresh installation.																						
/usr/apache/include	Contains the Apache header files, which are needed for building various optional server extensions with <code>apxs(8)</code>																						
/usr/apache/jserv	Contains documentation for the <code>mod_jserv</code> java servlet module. Documentation can be read with a web browser using the url: <code>file:/usr/apache/jserv/docs/index.html</code>																						
/usr/apache/libexec	Contains loadable modules (DSOs) supplied with the server. Any modules which are added using <code>apxs(8)</code> are also copied into this directory.																						
/usr/apache/man	Contains man pages for the server, utility programs, and <code>mod_perl</code> . Add this directory to your <code>MANPATH</code> to read the Apache man pages. See <code>NOTES</code> .																						
/usr/apache/perl5	Contains the modules and library files used by the <code>mod_perl</code> extension to Apache.																						
/var/apache/cgi-bin	Default location for the CGI scripts. This can be changed by altering the <code>httpd.conf</code> file and restarting the server.																						
/var/apache/htdocs	Default document root.																						

This can be changed by altering the `httpd.conf` file and restarting the server.

`/var/apache/icons` Icons used by the server.

This normally shouldn't need to be changed.

`/var/apache/logs` Contains server log files.

The formats, names, and locations of the files in this directory can be altered by various configuration directives in the `httpd.conf` file.

`/var/apache/proxy` Directory used to cache pages if the caching feature of `mod_proxy` is enabled in the `httpd.conf` file.

The location of the cache can also be changed by changing the proxy configuration in the `httpd.conf` file.

NOTES In addition to the documentation and man pages included with Solaris, more information is available at <http://www.apache.org>

The Apache man pages are provided with the programming modules. To view the manual pages for the Apache modules with the `man` command, add `/usr/apache/man` to the `MANPATH` environment variable. See `man(1)` for more information. Running `catman(1M)` on the Apache manual pages is not supported.

arp(1M)

NAME	arp – address resolution display and control								
SYNOPSIS	arp <i>hostname</i> arp -a arp -d <i>hostname</i> arp -f <i>filename</i> arp -s <i>hostname ether_address</i> [<i>temp</i>] [<i>pub</i>] [<i>trail</i>]								
DESCRIPTION	<p>The arp program displays and modifies the Internet-to-Ethernet address translation tables used by the address resolution protocol (see arp(7P)).</p> <p>With no flags, the program displays the current ARP entry for <i>hostname</i>. The host may be specified by name or by number, using Internet dot notation.</p>								
OPTIONS	<p>-a Display all of the current ARP entries. The definition for the flags in the table are:</p> <table><tr><td>P</td><td>Publish; includes IP address for the machine and the addresses that have explicitly been added by the -s option. ARP will respond to ARP requests for this address.</td></tr><tr><td>S</td><td>Static; not learned for the ARP protocol.</td></tr><tr><td>U</td><td>Unresolved; waiting for ARP response.</td></tr><tr><td>M</td><td>Mapping; only used for the multicast entry for 224.0.0.0</td></tr></table> <p>-d Delete an entry for the host called <i>hostname</i>. This option may only be used by the super-user.</p> <p>-f Read the file named <i>filename</i> and set multiple entries in the ARP tables. Entries in the file should be of the form</p> <p style="padding-left: 40px;"><i>hostname ether_address</i> [<i>temp</i>] [<i>pub</i>] [<i>trail</i>]</p> <p>(see option -s for argument definitions).</p> <p>-s Create an ARP entry for the host called <i>hostname</i> with the Ethernet address <i>ether_address</i>. The Ethernet address is given as six hexadecimal bytes separated by colons. The entry will be permanent unless the word <i>temp</i> is given in the command. If the word <i>pub</i> is given, the entry will be published. For instance, this system will respond to ARP requests for <i>hostname</i> even though the hostname is not its own. The word <i>trail</i> indicates that trailer encapsulations may be sent to this host. arp -s can be used for a limited form of proxy ARP when a host on one of the directly attached networks is not physically present on the subnet. Another machine can then be configured to respond to ARP requests using arp -s. This is useful in certain SLIP or PPP configurations.</p>	P	Publish; includes IP address for the machine and the addresses that have explicitly been added by the -s option. ARP will respond to ARP requests for this address.	S	Static; not learned for the ARP protocol.	U	Unresolved; waiting for ARP response.	M	Mapping; only used for the multicast entry for 224.0.0.0
P	Publish; includes IP address for the machine and the addresses that have explicitly been added by the -s option. ARP will respond to ARP requests for this address.								
S	Static; not learned for the ARP protocol.								
U	Unresolved; waiting for ARP response.								
M	Mapping; only used for the multicast entry for 224.0.0.0

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO `ifconfig(1M)`, `arp(7P)`, `attributes(5)`

aset(1M)

NAME	aset – monitors or restricts accesses to system files and directories		
SYNOPSIS	aset [-p] [-d <i>aset_dir</i>] [-l <i>sec_level</i>] [-n <i>user@host</i>] [-u <i>userlist_file</i>]		
DESCRIPTION	<p>The Automated Security Enhancement Tool (ASET) is a set of administrative utilities that can improve system security by allowing the system administrators to check the settings of system files, including both the attributes (permissions, ownership, etc.) and the contents of the system files. It warns the users of potential security problems and, where appropriate, sets the system files automatically according to the security level specified.</p> <p>The security level for <code>aset</code> can be specified by setting the <code>-l</code> command line option or the <code>ASETSECLEVEL</code> environment variable to be one of 3 values: <code>low</code>, <code>med</code>, or <code>high</code>. All the functionality operates based on the value of the security level.</p> <p>At the <code>low</code> level, <code>aset</code> performs a number of checks and reports any potential security weaknesses.</p> <p>At the <code>med</code> level, <code>aset</code> modifies some of the settings of system files and parameters, thus restricting system access, to reduce the risks from security attacks. Again it will report the security weaknesses and the modifications performed to restrict access. This does not affect the operations of system services. All the system applications and commands will maintain all of their original functionality.</p> <p>At the <code>high</code> level, further restrictions are made to system access, rendering a very defensive system. Security practices which are not normally required are included. Many system files and parameters settings are modified to minimum access permissions. At this level, security is the foremost concern, higher than any other considerations that affect system behavior. The vast majority of system applications and commands will maintain their functionality, although there may be a few that exhibit behaviors that are not familiar in normal system environment.</p> <p>More exact definitions of these levels (what exactly <code>aset</code> will do at each level) can be found in the administrator manual. The <code>asetenv(4)</code> file and the <i>master files</i> (see <code>asetmasters(4)</code>) determine to a large extent what <code>aset</code> performs at each level, and can be used by the experienced administrators to redefine the definitions of the levels to suit their particular needs. These files are provided by default to fit most security conscious environments and in most cases provide adequate security safeguards without modification. They are, however, designed in a way that can be easily edited by experienced administrators with specific needs.</p> <p><code>aset</code> can be periodically activated at the specified security level with default definitions using the <code>-p</code> option. <code>aset</code> will be automatically activated at a frequency specified by the administrator starting from a designated future time (see <code>asetenv(4)</code>). Without the <code>-p</code> option, <code>aset</code> will operate only once immediately.</p>		
OPTIONS	<p>The following options are supported:</p> <table><tr><td><code>-d <i>aset_dir</i></code></td><td>Specifies a working directory other than <code>/usr/aset</code> for ASET. <code>/usr/aset</code> is the default working directory.</td></tr></table>	<code>-d <i>aset_dir</i></code>	Specifies a working directory other than <code>/usr/aset</code> for ASET. <code>/usr/aset</code> is the default working directory.
<code>-d <i>aset_dir</i></code>	Specifies a working directory other than <code>/usr/aset</code> for ASET. <code>/usr/aset</code> is the default working directory.		

	It is where ASET is installed, and is the <i>root</i> directory of all ASET utilities and data files. If another directory is to be used as the ASET working directory you can either define it with the <code>-d</code> option, or by setting the <code>ASETDIR</code> environment variable before invoking <code>aset</code> . The command line option, if specified, overwrites the environment variable.
<code>-l <i>sec_level</i></code>	Specifies a security level (<code>low</code> , <code>med</code> , or <code>high</code>) for <code>aset</code> to operate at. The default level is <code>low</code> . Each security level is explained in detail above. The level can also be specified by setting the <code>ASETSECLEVEL</code> environment variable before invoking <code>aset</code> . The command line option, if specified, overwrites the environment variable.
<code>-n <i>user@host</i></code>	Notifies <i>user</i> at machine <i>host</i> . Send the output of <code>aset</code> to <i>user</i> through e-mail. If this option is not specified, the output is sent to the standard output. Note that this is not the reports of ASET, but rather an execution log including error messages if there are any. This output is typically fairly brief. The actual reports of ASET are found in the <code>/usr/aset/reports/latest</code> directory. See the <code>-d</code> option.
<code>-p</code>	Schedules <code>aset</code> to be executed periodically. This adds an entry for <code>aset</code> in the <code>/etc/crontab</code> file. The <code>PERIODIC_SCHEDULE</code> environment variable in the <code>/usr/aset/asetenv</code> file is used to define the time for execution. See <code>crontab(1)</code> and <code>asetenv(4)</code> . If a <code>crontab(1)</code> entry for <code>aset</code> already exists, a warning is produced in the execution log.
<code>-u <i>userlist_file</i></code>	Specifies a file containing a list of users. <code>aset</code> will perform environment checks (for example, <code>UMASK</code> and <code>PATH</code> variables) on these users. By default, <code>aset</code> only checks for <code>root</code> . <i>userlist_file</i> is an ASCII text file. Each entry in the file is a line that contains only one user name (login name).

USAGE The following paragraphs discuss the features provided by ASET. Hereafter, each feature is referred to as a *task*. The first task, `tune`, is intended to be executed only once per installation of ASET. The other tasks are intended to be executed periodically at the specified frequency.

tune Task This task is used to tighten system file permissions. In standard releases, system files or directories have permissions defined to maximize open information sharing. In a more security conscious environment, the administrator may want to redefine these permission settings to more restrictive values. `aset` allows resetting of these

aset(1M)

permissions, based on the specified security level. Generally, at the low level the permissions are set to what they should be as released. At the medium level the permissions are tightened to ensure reasonable security that is adequate for most environments. At the high level they are further tightened to very restrictive access. The system files affected and the respective restrictions at different levels are configurable, using the `tune.low`, `tune.med`, and `tune.high` files. See `asetmasters(4)`.

cklist Task

System directories that contain relatively static files (that is, their contents and attributes do not change frequently) are examined and compared with a master description file. The `/usr/aset/masters/cklist.level` files are automatically generated the first time the `cklist` task is executed. See `asetenv(4)`. Any discrepancy found is reported. The directories and files are compared based on the following:

- owner and group
- permission bits
- size and checksum (if file)
- number of links
- last modification time

The lists of directories to check are defined in `asetenv(4)`, based on the specified security level, and are configurable using the `CKLISTPATH_LOW`, `CKLISTPATH_MED`, and `CKLISTPATH_HIGH` environment variables. Typically, the lower level lists are subsets of the higher level lists.

usrgrp Task

`aset` checks the consistency and integrity of user accounts and groups as defined in the `passwd` and `group` databases, respectively. Any potential problems are reported. Potential problems for the `passwd` file include:

- `passwd` file entries are not in the correct format.
- User accounts without a password.
- Duplicate user names.
- Duplicate user IDs. Duplicate user IDs are reported unless allowed by the `uid_alias` file. See `asetmasters(4)`.
- Invalid login directories.
- If C2 is enabled, check C2 hidden `passwd` format.

Potential problems for the `group` file include:

- Group file entries not in the right format.
- Duplicate group names.
- Duplicate group IDs.
- Null group passwords.

`aset` checks the local `passwd` file. If the `YPCHECK` environment variable is set to `true`, `aset` also checks the NIS `passwd` files. See `asetenv(4)`. Problems in the NIS

passwd file are only reported and not corrected automatically. The checking is done for all three security levels except where noted.

sysconf Task

aset checks various system configuration tables, most of which are in the /etc directory. aset checks and makes appropriate corrections for each system table at all three levels except where noted. The following discussion assumes familiarity with the various system tables. See the manual pages for these tables for further details.

The operations for each system table are:

/etc/hosts.equiv	<p>The default file contains a single "+" line, thus making every known host a trusted host, which is not advised for system security. aset performs the following operations:</p> <p>Low Warns the administrators about the "+" line.</p> <p>Medium</p> <p>High Warns about and deletes that entry.</p>
/etc/inetd.conf	<p>The following entries for system daemons are checked for possible weaknesses.</p> <p>tftp(1) does not do any authentication. aset ensures that in.tftpd(1M) is started in the right directory on the server and is not running on clients. At the low level, it gives warnings if the mentioned condition is not true. At the medium and high levels it gives warnings, and changes (if necessary) the in.tftpd entry to include the -s /tftpboot option after ensuring the directory /tftpboot exists.</p> <p>ps(1) and netstat(1M) provide valuable information to potential system crackers. These are disabled when aset is executed at a high security level.</p> <p>rexid is also known to have poor authentication mechanism. aset disables rexd for medium and high security levels by commenting out this entry. If rexd is activated with the -s (secure RPC) option, it is not disabled.</p>
/etc/aliases	<p>The decode alias of UUCP is a potential security weakness. aset disables the alias for medium and high security levels by commenting out this entry.</p>
/etc/default/login	<p>The CONSOLE= line is checked to allow root login only at a specific terminal depending on the security level:</p> <p>Low No action taken.</p>

aset(1M)

		Medium
		High Adds the following line to the file: CONSOLE=/dev/console
	/etc/vfstab	aset checks for world-readable or writeable device files for mounted file systems.
	/etc/dfs/dfstab	aset checks for file systems that are exported without any restrictions.
	/etc/ftpusers	At high security level, aset ensures root is in /etc/ftpusers (create if necessary), thus disallowing ftp(1) to be used as root.
	/var/adm/utmpx	aset makes these files not world-writeable for the high level (some applications may not run properly with this setting.)
	/.rhosts	The usage of a .rhosts file for the entire system is not advised. aset gives warnings for the low level and moves it to /.rhosts.bak for levels medium and high.
env Task	aset checks critical environment variables for root and users specified with the -u <i>userlist_file</i> option by parsing the /.profile, /.login, and /.cshrc files. This task checks the PATH variable to ensure that it does not contain '.' as a directory, which makes an easy target for <i>trojan horse</i> attacks. It also checks that the directories in the PATH variable are not world-writeable. Furthermore, it checks the UMASK variable to ensure files are not created as readable or writeable by world. Any problems found by these checks are reported.	
eeprom Task	Newer versions of the EEPROM allow specification of a <i>secure</i> parameter. See eeprom(1M). aset recommends that the administrator sets the parameter to <i>command</i> for the medium level and to <i>full</i> for the high level. It gives warnings if it detects the parameter is not set adequately.	
firewall Task	At the high security level, aset takes proper measures such that the system can be safely used as a firewall in a network. This mainly involves disabling IP packets forwarding and making routing information invisible. Firewalling provides protection against external access to the network.	
ENVIRONMENT VARIABLES	ASETDIR	Specify ASET's working directory. Defaults to /usr/aset.
	ASETSECLEVEL	Specify ASET's security level. Defaults to low.
	TASKS	Specify the tasks to be executed by aset. Defaults to all tasks.
FILES	/usr/aset/reports	directory of ASET reports

aset.restore(1M)

NAME	aset.restore – restores system files to their content before ASET is installed				
SYNOPSIS	aset.restore [-d <i>aset_dir</i>]				
DESCRIPTION	<p>aset.restore restores system files that are affected by the Automated Security Enhancement Tool (ASET) to their pre-ASET content. When ASET is executed for the first time, it saves and archives the original system files in the /usr/aset/archives directory. The aset.restore utility reinstates these files. It also deschedules ASET, if it is currently scheduled for periodic execution. See asetenv(4).</p> <p>If you have made changes to system files after running ASET, these changes are lost when you run aset.restore. If you want to be absolutely sure that you keep the existing system state, it is recommended that you back-up your system before using aset.restore.</p> <p>You should use aset.restore, under the following circumstances:</p> <p>You want to remove ASET permanently and restore the original system (if you want to deactivate ASET, you can remove it from scheduling).</p> <p>You are unfamiliar with ASET and want to experiment with it. You can use aset.restore to restore the original system state.</p> <p>When some major system functionality is not working properly and you suspect that ASET is causing the problem; you may want to restore the system to see if the problem persists without ASET.</p> <p>aset.restore requires root privileges to execute.</p>				
OPTIONS	<p>The following options are supported:</p> <p>-d <i>aset_dir</i> Specify the working directory for ASET. By default, this directory is /usr/aset. With this option the archives directory will be located under <i>aset_dir</i>.</p>				
FILES	/usr/aset/archives archive of system files prior to executing aset				
ATTRIBUTES	See attributes(5) for descriptions of the following attributes:

NAME	aspppd, aspppls – asynchronous PPP link manager
SYNOPSIS	<pre>/usr/sbin/aspppd [-d <i>debug-level</i>]</pre> <pre>/usr/sbin/aspppls</pre>
DESCRIPTION	<p>Note – aspppd has been superseded and may be removed from future versions of Solaris. Refer to pppd(1M) instead. See <code>/etc/ppp/</code> for configuration files. Use <code>man pppd</code> for more information.</p> <p>aspppd is the link manager for the asynchronous data link protocol specified in RFC1331, <i>The Point-to-Point Protocol (PPP) for the Transmission of Multi-protocol Datagrams over Point-to-Point Links</i>. It is a user level daemon that works in concert with the IP-Dialup driver (<code>ipdcm</code>) and PPP streams module (<code>ppp(7M)</code>) to provide IP network services over an analog modem using dialed voice grade telephone lines. The link manager automates the process of connecting to a peer (remote) host when PPP service with that host is required. The connection process can be initiated either by sending an IP datagram to a (disconnected) peer host or by receiving a notification that a peer host desires to establish a connection.</p> <p>aspppls is the login <i>service</i> that connects the peer host machine to aspppd. aspppls is invoked by the serial port monitor when a peer machine logs into a PPP-enabled account. Its purpose is to cause the link manager to accept the incoming call.</p>
OPTIONS	<p><code>- d <i>debug-level</i></code> The <i>debug-level</i> is a number between 0 and 9. Higher numbers give more detailed debugging information. The output is written to the log file <code>/etc/log/asppp.log</code>.</p>
USAGE	<p>The link manager is invoked at boot time if the configuration file <code>/etc/asppp.cf</code> is present. After parsing the configuration file and building a <i>path</i> object for each peer host, it sleeps until (1) an IP datagram is routed to one of the <code>ipd</code> or <code>ipdptp</code> interfaces (see <code>ppp(7M)</code>), or (2) it is notified by the login service that a peer host is attempting to make a connection.</p> <p>In the first case, it consults the UUCP database, dials the modem, logs into the peer host, establishes the PPP data link, brings up IP, and forwards the IP datagram that initiated the process.</p> <p>In the second case, the link manager opens the file descriptor supplied by the login service, establishes the PPP data link, and brings up IP.</p> <p>If the link manager determines that there has been no IP traffic for the period specified by the <code>inactivity_timeout</code> keyword, it disconnects the link by bringing down IP and PPP and closing the connection with the peer host.</p> <p>The link manager can be reinitialized by sending it the <code>-HUP</code> signal (with <code>kill(1)</code> for example), which causes it to disconnect all open PPP links and reread the configuration file.</p>

aspppd(1M)

Path	<p>A <i>path</i> is an object that contains the state of a connection with a peer host. Information such as system names, interface names, timeout values, and other attributes are kept in the path object. There exists a path for each potential peer host. Paths are defined in the configuration file.</p>
Interfaces	<p>The link manager supports two types of IP layer interfaces; the point-to-multipoint interface (<code>ipd</code>) and the point-to-point interface (<code>ipdptp</code>) (see <code>ppp(7M)</code>).</p> <p>The point-to-multipoint interface logically connects the host machine to a network containing one or more peer hosts. IP traffic to or from any of the peer hosts is routed through the point-to-multipoint interface. When an <code>ipd</code> interface is configured, only one IP address, that of the host, is assigned. In other words, it behaves very similarly to an Ethernet interface, although the broadcast capability is not supported. This type of interface is well suited for a dial in PPP server.</p> <p>The point-to-point interface logically connects the host machine with one peer host. Only IP traffic to or from the peer host is routed through this interface. When an <code>ipdptp</code> interface is configured, two IP addresses are assigned. This type of interface is well suited to support a remote, or nomadic, machine.</p> <p>An interface must be fully configured and enabled (that is, up) before an IP datagram will be routed to it. It's also true that a point-to-multipoint interface must be fully configured and enabled before the link manager will associate an incoming connection with it. It's not necessary, however, for a point-to-point interface to be configured and enabled before an incoming connection will be assigned to it. A point-to-point interface that is "plumbed", but otherwise not configured or enabled (that is, down), can be used to accept an incoming connection if the path associated with the potential connection contains a dynamic interface specification (for example, <code>interface ipdptp*</code>). In this case the link manager will select a disabled (down) interface, configure the host and peer addresses, bring it up, and assign it for the duration of the connection.</p>
Routing	<p>Special attention should be paid to routing issues that may arise if a host has more than one interface configured and enabled. By definition, a host with more than one enabled interface is a <i>router</i>, and the routing daemon (typically <code>in.routed</code>) will advertise the routes provided by the PPP interfaces. This is normally acceptable behavior for a dial in server, but can cause network disruptions if not administered properly.</p> <p>To prevent routing information packets (RIP) from flowing over point-to-point interfaces, specify the <code>norip</code> keyword followed by the interface name in the <code>/etc/gateways</code> file. These entries, for example, prevent RIP from being sent over <code>ipdptp0</code> and <code>ipdptp1</code>:</p> <pre>norip ipdptp0 norip ipdptp1</pre> <p>See <code>in.routed(1M)</code> for further information.</p>

Authentication | The link manager can be configured to support either the Password Authentication Protocol (PAP) or the Challenge Handshake Authentication Protocol (CHAP) as specified in RFC1334. Both protocols can be configured simultaneously, in which case, CHAP has precedence. A single host may participate as an authenticator (the local host requests that the peer host authenticate itself) or an authenticatee (the local host has been asked by the peer host to authenticate itself) or as both. It is also possible for a host to be an authenticator for one protocol and an authenticatee for the other protocol.

PAP is a simple protocol similar to a standard login/password type of authentication. The PAP authenticator sends a message to its peer requesting that the peer authenticate itself. The peer responds with an authenticate request packet that contains an id and a password (both in plaintext). The id and password are matched against a local copy, and if they match, the connection is established. If they don't match, the connection is dropped.

CHAP does not pass any plaintext authentication data across the link. The CHAP authenticator sends a challenge packet to the peer that contains a random string. The peer then takes the string in the challenge packet and computes a response string that is a function of the challenge string and a shared secret key. The peer then sends a response packet back to the authenticator. The authenticator computes a string based on the original challenge string and the shared secret key and matches that result with the received response. If they match, the connection is established. Otherwise the connection is dropped.

Configuration File | The primary purpose of the `/etc/aspppd.cf` configuration file is to define each path used by the link manager to establish and maintain communication with a peer system.

The file consists of a sequence of tokens separated by white space (blanks, tabs, and new lines). There are no record boundaries or any other constraints on the placement of the tokens. If a token begins with a pound sign (`#`), all characters between the pound sign and the next newline (`\`) are ignored (that is, they are treated as a comment). Alphanumeric tokens are case insensitive and are translated by the lexical analyzer into lower case before further processing.

A *string* is a single token that does not contain embedded white space. The standard ANSI C `\\` escape sequence may be used to embed special characters (see an ANSI C manual for a list of escaped special characters). Use `\\s` for the space character. If a pound sign appears at the beginning of a *string*, it must be escaped (`\\#`) to avoid interpretation as a comment. A NULL (`\\0`) will truncate the *string*.

Groups of tokens are assembled into units known as *paths* (essentially a human-readable form of the path object). A path begins with the keyword `path` and ends at the token found before any subsequent `path` (or `defaults`) keyword or at the last token in the file. The tokens comprising a path are further partitioned into

aspppd(1M)

small groups consisting mostly of keyword/value pairs that define the attributes of the current path. If a particular keyword/value pair is not listed for a path, the default value is assumed.

The token sequences that begin with the substrings `ipcp_` or `lcp_` refer to PPP initial configuration options as specified in RFC1332, *The PPP Internet Protocol Control Protocol (IPCP)*. See the RFC for a more complete definition of these options.

The following is an alphabetic list of the token sequences that can be contained in a configuration file. Required sequences are noted.

Keywords

<code>chap_name string</code>	One or more octets representing the identification of this host. The name should not be NUL or CR/LF terminated. The name is sent to the authenticator in a response packet. Place this key/value pair in the authenticatee's configuration file.
<code>chap_peer_secret string</code>	One or more octets, preferably at least sixteen, that contain the secret key that is used with the challenge value to generate the string to match with the response received from the peer. Place this key/value pair in the authenticator's configuration file.
<code>chap_peer_name string</code>	One or more octets representing the identification of the peer transmitting the packet. The name should not be NUL or CR/LF terminated. The name is received from the peer in a response packet. Place this key/value pair in the authenticator's configuration file.
<code>chap_secret string</code>	One or more octets, preferably at least sixteen, that contain the secret key that is used with the received challenge value to generate the response sent to the authenticator. Place this key/value pair in the authenticatee's configuration file.
<code>debug_level number</code>	<i>number</i> is between 0 and 9. Higher numbers give more detailed debugging information as shown in the table below. The output is written to the <code>/etc/log/asppp.log</code> file. The value set by the <code>debug_level</code> keyword overrides the <code>-d</code> command line option.

level	meaning
-	-
0	errors only
1	minimal information
4	some uucp chat-script info
5	all uucp chat-script info
7	maximum uucp info
8	PPP message traces
9	Raw IP packets

defaults

Indicates that all following token sequences up the next `path` keyword, or the end of file, set default attributes that affect subsequently defined paths.

default_route

When the IP layer corresponding to the current path is fully operational, add the peer IP address to the route table as the default destination. The route is removed when the IP layer is brought down. Note: the `default_route` keyword is only installed by point-to-point interfaces.

ifconfig *parameters*

(Required) The `ifconfig` keyword and associated *parameters* are passed to the shell for evaluation and execution. It's used to define an interface. See the `ifconfig(1M)` man page for more information.

inactivity_timeout *seconds*

seconds is the maximum number of seconds that the connection associated with the current path can remain idle before it is terminated. 0 may be specified to indicate no timeout. The default is 120 seconds.

interface (*ipd n* | *ipdptn* | *ipdptp)**

(Required) Associates a specific point-to-multipoint or point-to-point interface as denoted by the non-negative integer *n* with the current path. The third form, *ipdptp**, indicates that the interface associated with the path is a dynamic interface that will be selected at connect time from a pool of previously configured, inactive (down) point-to-point interfaces.

ipcp_async_map *hex-number*

Specifies the async control character map for the current path. The *hex-number* is the natural (that is, big endian) form representation of the four octets that comprise the map. The default value is `ffffff`.

ipcp_compression (*vj* | *off*)

Indicates whether IP compression is enabled or not. If enabled (*vj*), the Van Jacobson compression algorithm is used. The default is compression (*vj*).

aspppd(1M)

`lcp_compression (on | off)`

Indicates whether PPP address, control, and protocol field compression is enabled or not. If enabled, both the address and control field compression and the protocol field compression options are set. The default is compression (on).

`lcp_mru number`

number specifies a desired maximum receive unit packet size in octets. The default is 1500.

`negotiate_address (on | off)`

Indicates whether or not local IP address assignment is obtained through negotiation and assigned dynamically. If enabled, the local address will be obtained from the remote end of the PPP link. If so obtained, any local address other than 0.0.0.0 can be used to initially configure the interface. The default is to not negotiate (off).

`pap_id string`

One or more octets that represent the name of the host which will be sent to the authenticator. To indicate a zero length string, do not include the keyword. Place this key/value pair in the authenticatee's configuration file.

`pap_password string`

One or more octets that indicate the password for this host which will be sent to the authenticator. To indicate a zero length string, do not include the keyword. Place this key/value pair in the authenticatee's configuration file.

`pap_peer_id string`

One or more octets that indicate the name of the peer to be authenticated. To indicate a zero length string, do not include the keyword. Place this key/value pair in the authenticator's configuration file.

`pap_peer_password string`

One or more octets that indicate the password to be used for authentication. To indicate a zero length string, do not include the keyword. Place this key/value pair in the authenticator's configuration file.

`path`

(Required) Indicates that all following token sequences are to be grouped together as attributes of this (current) path. The collection of attributes comprising the current path are terminated by the occurrence of a subsequent `path` or `defaults` keyword or by the end of file.

`peer_ip_address IP-address`

(Required for point-to-multipoint paths) Associates the *IP-address* with the current path. The value is ignored if the path specifies a point-to-point interface. The *IP-address* may be in "dotted decimal", hexadecimal, or symbolic (that is, hostname) format.

`peer_system_name name`

(Required) Associates the peer system *name* with the current path. The name is used to look up modem and peer specific information for outbound connections in the

UUCP `/etc/uucp/Systems` file. For incoming connections, the appropriate path is determined by matching *name* with the login name that was used to obtain the connection (that is, an entry in the `/etc/passwd` file specifies *name* in the username field).

`require_authentication (off | pap [chap] | chap [pap])`

Indicates that the local host is the authenticator, and that the peer is required to authenticate itself. If either `pap` or `chap` is present, the peer must participate in the authentication protocol or the connection will be terminated. If both `pap` and `chap` are present, then the local host will try to negotiate `chap`, and if that fails, the connection will be terminated. The local host will not try to negotiate `pap`. The default does not require authentication (`off`).

If `pap` is required, then the `pap_peer_id` and `pap_peer_password` keywords and values should be specified for the associated path. If they are not specified, the corresponding values are set to the null string. If `chap` is required then the `chap_peer_name` and `chap_peer_secret` keywords and values must be specified for the associated path.

`version n`

Specifies that the contents of the configuration file correspond to format version *n*. If this keyword is present, it must be the first keyword in the file. If absent, the version is assumed to be 1. This document contains the definition of the version 1 format for the configuration file.

`will_do_authentication (off | pap [chap] | chap [pap])`

Indicates that the local host is a potential authenticatee and is willing to participate in the specified authentication protocol. If both `pap` and `chap` are present then the local host is willing to participate in either authentication protocol. The default does not participate in authentication (`off`).

If `pap` is available, then the `pap_id` and `pap_password` keywords and values should be specified for the associated path. If they are not specified, the corresponding values are set to the null string. If `chap` is available then the `chap_name` and `chap_secret` keywords and values must be specified for the associated path.

EXAMPLES **EXAMPLE 1** Remote Machine

In this example, the remote machine is most likely a nomadic or home machine with a single modem.

```
#
# Dial in to two servers
#
ifconfig ipdptp0 plumb nomad1 dialin1 private up
path
    interface ipdptp0
    peer_system_name Pdialin1
    will_do_authentication pap
    pap_id nomad1
```

EXAMPLE 1 Remote Machine (Continued)

```

    pap_password secret
ifconfig ipdptp1 plumb nomad1 dialin2 private up
path
    interface ipdptp1
    peer_system_name Pdialin2
    lcp_mru 1006

```

EXAMPLE 2 Dial In Server supporting a point-to-multipoint interface

This example shows a dial in server supporting a point-to-multipoint interface. There may be several modems attached to this server. The network addressed by the `ipd` interface will be advertised by the router, and all traffic destined for that network will be routed through this host. For that reason, it is not wise to support multiple dial in servers with point-to-multipoint interfaces to the same network.

```

#
# A point-to-multipoint dial in server
#
ifconfig ipd0 plumb dialin1 netmask + up
defaults
    interface ipd0
    inactivity_timeout 900 # 15 minutes
    require_authentication chap pap
    chap_peer_name nomads
path
    peer_system_name Pnomad1
    chap_peer_secret abcd
    pap_peer_id nomad1
    pap_peer_password secret
    peer_ip_address nomad1
path
    peer_system_name Pnomad2
    chap_peer_secret a\\sspace
    peer_ip_address nomad2
path
    peer_system_name Pnomad3
    inactivity_timeout 0 # No timeout for this host
    chap_peer_secret \\#123;.
    peer_ip_address nomad3
path
    peer_system_name Pnomad4
    chap_peer_secret My\\sSecret#Word
    peer_ip_address nomad4

```

EXAMPLE 3 Dynamic point to-point dial in server

This is another dial in server that supports dynamic point-to-point interfaces. Usually the server has one modem for each interface. One advantage of using dynamic interfaces is that (host) routes will only be advertised when an interface is up. Therefore, multiple dial in servers can be supported.

EXAMPLE 3 Dynamic point to-point dial in server (Continued)

```

#
# A dynamic point-to-point dial in server
#
ifconfig ipdptp0 plumb dialin2 client1 down
ifconfig ipdptp1 plumb dialin2 client2 down
ifconfig ipdptp2 plumb dialin2 client3 down
defaults
    interface ipdptp*
    inactivity_timeout 900
    debug_level 5

path
    peer_system_name Pnomad1
path
    peer_system_name Pnomad2
path
    peer_system_name Pnomad3
path
    peer_system_name Pnomad4

System Administration Guide, Volume 3

audit(1M)

NAME audit – control the behavior of the audit daemon

SYNOPSIS `audit -n | -s | -t`

DESCRIPTION The `audit` command is the general administrator’s interface to maintaining the audit trail. The audit daemon may be notified to read the contents of the `audit_control(4)` file and re-initialize the current audit directory to the first directory listed in the `audit_control` file or to open a new audit file in the current audit directory specified in the `audit_control` file as last read by the audit daemon. The audit daemon may also be signaled to close the audit trail and disable auditing.

OPTIONS

- n Signal audit daemon to close the current audit file and open a new audit file in the current audit directory.
- s Signal audit daemon to read audit control file. The audit daemon stores the information internally.
- t Signal audit daemon to close the current audit trail file, disable auditing and die.

DIAGNOSTICS The `audit` command will exit with 0 upon success and a positive integer upon failure.

FILES `/etc/security/audit_user`
`/etc/security/audit_control`

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO `bsmconv(1M)`, `praudit(1M)`, `audit(2)`, `audit_control(4)`, `audit_user(4)`, `attributes(5)`

NOTES The functionality described in this man page is available only if the Basic Security Module (BSM) has been enabled. See `bsmconv(1M)` for more information.

This command does not modify a process’s preselection mask. It only affects which audit directories are used for audit data storage and to specify the minimum size free.

NAME	auditconfig – configure auditing
SYNOPSIS	auditconfig <i>option...</i>
DESCRIPTION	<p>auditconfig provides a command line interface to get and set kernel audit parameters.</p> <p>The functionality described in this man page is available only if the Basic Security Module (BSM) has been enabled. See bsmconv(1M) for more information.</p>
OPTIONS	<p>-chkconf Check the configuration of kernel audit event to class mappings. If the runtime class mask of a kernel audit event does not match the configured class mask, a mismatch is reported.</p> <p>-conf Configure kernel audit event to class mappings. Runtime class mappings are changed to match those in the audit event to class database file.</p> <p>-getfsize Return the maximum audit file size in bytes and the current size of the audit file in bytes.</p> <p>-setfsize <i>size</i> Set the maximum size of an audit file to <i>size</i> bytes. When the size limit is reached, the audit file is closed and another is started.</p> <p>-getcond Display the kernel audit condition. The condition displayed is the literal string <code>auditing</code> meaning auditing is enabled and turned on (the kernel audit module is constructing and queuing audit records) or <code>noaudit</code> meaning auditing is enabled but turned off (the kernel audit module is not constructing and queuing audit records), or <code>disabled</code> meaning that the audit module has not been enabled. See <code>auditon(2)</code> and <code>auditd(1M)</code> for further information.</p> <p>-setcond[<i>auditing noaudit</i>] Set the kernel audit condition to the <i>condition</i> specified where <i>condition</i> is the literal string <code>auditing</code> indicating auditing should be enabled or <code>noaudit</code> indicating auditing should be disabled.</p> <p>-getclass <i>event</i> Display the preselection mask associated with the specified kernel audit event. <i>event</i> is the kernel event number or event name.</p> <p>-setclass <i>event</i> <i>audit_flag</i>[<i>audit_flag</i> . . .] Map the kernel event <i>event</i> to the classes specified by <i>audit_flags</i>. <i>event</i> is an event number or name. An <i>audit_flag</i> is a two character string representing an audit class. See <code>audit_control(4)</code> for further information.</p> <p>-lsevent Display the currently configured (runtime) kernel and user level audit event information.</p>

auditconfig(1M)

- getpinfo *pid*
Display the audit ID, preselection mask, terminal ID and audit session ID for the specified process.
- setpmask *pid flags*
Set the preselection mask of the specified process. *flags* is the ASCII representation of the flags similar to that in `audit_control(4)`.
- setsmask *asid flags*
Set the preselection mask of all processes with the specified audit session ID.
- setumask *asid flags*
Set the preselection mask of all processes with the specified audit ID.
- lspolicy
Display the kernel audit policies with a description of each policy.
- getpolicy
Display the kernel audit policy.
- setpolicy[+|-]*policy_flag[,policy_flag ...]*
Set the kernel audit policy. A policy *policy_flag* is literal strings that denotes an audit policy. A prefix of + adds the policies specified to the current audit policies. A prefix of - removes the policies specified from the current audit policies. The following are the valid policy flag strings (`auditconfig -lspolicy` also lists the current valid audit policy flag strings):
 - arge Include the `execv(2)` system call environment arguments to the audit record. This information is not included by default.
 - argv Include the `execv(2)` system call parameter arguments to the audit record. This information is not included by default.
 - cnt Do not suspend processes when audit resources are exhausted. Instead, drop audit records and keep a count of the number of records dropped. By default, process are suspended until audit resources become available.
 - group Include the supplementary group token in audit records. By default, the group token is not included.
 - path Add secondary path tokens to audit record. These are typically the pathnames of dynamically linked shared libraries or command interpreters for shell scripts. By default, they are not included.
 - trail Include the trailer token in every audit record. By default, the trailer token is not included.
 - seq Include the sequence token as part of every audit record. By default, the sequence token is not included. The sequence token attaches a sequence number to every audit record.

EXAMPLES **EXAMPLE 1** A sample auditconfig program

```
#
# map kernel audit event number 10 to the "fr" audit class
#
% auditconfig -setclass 10 fr

#
# turn on inclusion of exec arguments in exec audit records
#
% auditconfig -setpolicy +argv
```

EXIT STATUS 0 Successful completion.

1 An error occurred.

FILES /etc/security/audit_event

/etc/security/audit_class

auditd(1M)

NAME	auditd – audit daemon
SYNOPSIS	<code>/usr/sbin/auditd</code>
DESCRIPTION	<p>The audit daemon controls the generation and location of audit trail files. If auditing is desired, auditd reads the <code>audit_control(4)</code> file to get a list of directories into which audit files can be written and the percentage limit for how much space to reserve on each filesystem before changing to the next directory.</p> <p>If auditd receives the signal <code>SIGUSR1</code>, the current audit file is closed and another is opened. If <code>SIGHUP</code> is received, the current audit trail is closed, the <code>audit_control</code> file reread, and a new trail is opened. If <code>SIGTERM</code> is received, the audit trail is closed and auditing is terminated. The program <code>audit(1M)</code> sends these signals and is recommended for this purpose.</p> <p>Each time the audit daemon opens a new audit trail file, it updates the file <code>audit_data(4)</code> to include the correct name.</p>
Auditing Conditions	<p>The audit daemon invokes the program <code>audit_warn(1M)</code> under the following conditions with the indicated options:</p> <p><code>audit_warn soft pathname</code> The file system upon which <i>pathname</i> resides has exceeded the minimum free space limit defined in <code>audit_control(4)</code>. A new audit trail has been opened on another file system.</p> <p><code>audit_warn allsoft</code> All available file systems have been filled beyond the minimum free space limit. A new audit trail has been opened anyway.</p> <p><code>audit_warn hard pathname</code> The file system upon which <i>pathname</i> resides has filled or for some reason become unavailable. A new audit trail has been opened on another file system.</p> <p><code>audit_warn allhard count</code> All available file systems have been filled or for some reason become unavailable. The audit daemon will repeat this call to <code>audit_warn</code> every twenty seconds until space becomes available. <i>count</i> is the number of times that <code>audit_warn</code> has been called since the problem arose.</p> <p><code>audit_warn ebusy</code> There is already an audit daemon running.</p> <p><code>audit_warn tmpfile</code> The file <code>/etc/security/audit/audit_tmp</code> exists, indicating a fatal error.</p> <p><code>audit_warn nostart</code> The internal system audit condition is <code>AUC_FCHDONE</code>. Auditing cannot be started without rebooting the system.</p>

audit_warn auditoff

The internal system audit condition has been changed to not be AUC_AUDITING by someone other than the audit daemon. This causes the audit daemon to exit.

audit_warn postsigterm

An error occurred during the orderly shutdown of the auditing system.

audit_warn getacdir

There is a problem getting the directory list from /etc/security/audit/audit_control.

The audit daemon will hang in a sleep loop until this file is fixed.

FILES /etc/security/audit/audit_control

/etc/security/audit/audit_data

auditreduce(1M)

NAME	auditreduce – merge and select audit records from audit trail files
SYNOPSIS	auditreduce [<i>options</i>] [<i>audit-trail-file...</i>]
DESCRIPTION	<p>auditreduce allows you to select or merge records from audit trail files. Audit files may be from one or more machines.</p> <p>The merge function merges together audit records from one or more input audit trail files into a single output file. The records in an audit trail file are assumed to be sorted in chronological order (oldest first) and this order is maintained by auditreduce in the output file.</p> <p>Unless instructed otherwise, auditreduce will merge the entire audit trail, which consists of all the audit trail files in the directory structure <i>audit_root_dir</i>/*/files (see <i>audit_control</i>(4) for details of the structure of the audit root). Unless stated with the <i>-R</i> or <i>-S</i> option, <i>audit_root_dir</i> defaults to <i>/etc/security/audit</i>. By using the file selection options it is possible to select some subset of these files, or files from another directory, or files named explicitly on the command line.</p> <p>The select function allows audit records to be selected on the basis of numerous criteria relating to the record's content (see <i>audit.log</i>(4) for details of record content). A record must meet all of the <i>record-selection-option</i> criteria to be selected.</p>
Audit Trail Filename Format	<p>Any audit trail file not named on the command line must conform to the audit trail filename format. Files produced by the audit system already have this format. Output file names produced by auditreduce are in this format. It is:</p> <p><i>start-time . end-time . suffix</i></p> <p>where <i>start-time</i> is the 14-character timestamp of when the file was opened, <i>end-time</i> is the 14-character timestamp of when the file was closed, and <i>suffix</i> is the name of the machine which generated the audit trail file, or some other meaningful suffix (e.g., <i>all</i>, if the file contains a combined group of records from many machines). The <i>end-time</i> may be the literal string <i>not_terminated</i>, to indicate that the file is still being written to by the audit system. Timestamps are of the form <i>yyyymmddhhmmss</i> (year, month, day, hour, minute, second). The timestamps are in Greenwich Mean Time (GMT).</p>
File Selection Options	<p>The file selection options indicate which files are to be processed and certain types of special treatment.</p> <p><i>-A</i></p> <p>All of the records from the input files will be selected regardless of their timestamp. This option effectively disables the <i>-a</i>, <i>-b</i>, and <i>-d</i> options. This is useful in preventing the loss of records if the <i>-D</i> option is used to delete the input files after they are processed. Note, however, that if a record is <i>not</i> selected due to another option, then <i>-A</i> will not override that.</p>

-C

Only process complete files. Files whose filename *end-time* timestamp is `not_terminated` are not processed (such a file is currently being written to by the audit system). This is useful in preventing the loss of records if `-D` is used to delete the input files after they are processed. It does not apply to files specified on the command line.

-D *suffix*

Delete input files after they deleted if the entire run is successful. If `auditreduce` detects an error while reading a file, then that file is not deleted. If `-D` is specified, `-A`, `-C` and `-O` are also implied. *suffix* is given to the `-O` option. This helps prevent the loss of audit records by ensuring that all of the records are written, only complete files are processed, and the records are written to a file before being deleted. Note that if both `-D` and `-O` are specified in the command line, the order of specification is significant. The *suffix* associated with the latter specification is in effect.

-M *machine*

Allows selection of records from files with *machine* as the filename suffix. If `-M` is not specified, all files are processed regardless of suffix. `-M` can also be used to allow selection of records from files that contain combined records from many machines and have a common suffix (such as `all`).

-N

Select objects in *new mode*. This flag is off by default, thus retaining backward compatibility. In the existing, *old mode*, specifying the `-e`, `-f`, `-g`, `-r`, or `-u` flags would select not only actions taken with those IDs, but also certain objects owned by those IDs. When running in *new mode*, only actions are selected. In order to select objects, the `-o` option must be used.

-O *suffix*

Direct output stream to a file in the current `audit_root_dir` with the indicated suffix. *suffix* may alternatively contain a full pathname, in which case the last component is taken as the suffix, ahead of which the timestamps will be placed, ahead of which the remainder of the pathname will be placed. If the `-O` option is not specified, the output is sent to the standard output. When `auditreduce` places timestamps in the filename, it uses the times of the first and last records in the merge as the *start-time* and *end-time*.

-Q

Quiet. Suppress notification about errors with input files.

-R *pathname*

Specify the pathname of an alternate audit root directory `audit_root_dir` to be *pathname*. Therefore, rather than using `/etc/security/audit/*/files` by default, `pathname/*/files` will be examined instead.

-S *server*

This option causes `auditreduce` to read audit trail files from a specific location (server directory). *server* is normally interpreted as the name of a subdirectory of

auditreduce(1M)

the audit root, therefore `auditreduce` will look in `audit_root_dir/server/files` for the audit trail files. But if `server` contains any `'/'` characters, it is the name of a specific directory not necessarily contained in the audit root. In this case, `server/files` will be consulted. This option allows archived files to be manipulated easily, without requiring that they be physically located in a directory structure like that of `/etc/security/audit`.

`-V`

Verbose. Display the name of each file as it is opened, and how many records total were written to the output stream.

Record Selection Options

The record selection options listed below are used to indicate which records are written to the output file produced by `auditreduce`.

Multiple arguments of the same type are not permitted.

`-a date-time`

Select records that occurred at or after `date-time`. The `date-time` argument is described under `Option Arguments`, below. `date-time` is in local time. The `-a` and `-b` options can be used together to form a range.

`-b date-time`

Select records that occurred before `date-time`.

`-c audit-classes`

Select records by audit class. Records with events that are mapped to the audit classes specified by `audit-classes` are selected. Audit class names are defined in `audit_class(4)`. The `audit-classes` can be a comma separated list of `audit flags` like those described in `audit_control(4)`. Using the `audit flags`, one can select records based upon success and failure criteria.

`-d date-time`

Select records that occurred on a specific day (a 24-hour period beginning at 00:00:00 of the day specified and ending at 23:59:59). The day specified is in local time. The time portion of the argument, if supplied, is ignored. Any records with timestamps during that day are selected. If any hours, minutes, or seconds are given in `time`, they are ignored. `-d` can not be used with `-a` or `-b`.

`-e effective-user`

Select records with the specified `effective-user`.

`-f effective-group`

Select records with the specified `effective-group`.

`-g real-group`

Select records with the specified `real-group`.

`-j subject-ID`

Select records with the specified `subject-ID` where `subject-ID` is a process ID.

`-m event`

Select records with the indicated *event*. The *event* is the literal string or the *event* number.

`-o object_type=objectID_value`

Select records by object type. A match occurs when the record contains the information describing the specified *object_type* and the object ID equals the value specified by *objectID_value*. The allowable object types and values are as follows:

`file=pathname`

Select records containing file system objects with the specified pathname, where pathname is a comma separated list of regular expressions. If a regular expression is preceded by a tilde (~), files matching the expression are excluded from the output. For example, the option `file=~usr/openwin,usr,etc` would select all files in `usr` or `etc` except those in `usr/openwin`. The order of the regular expressions is important because `auditreduce` processes them from left to right, and stops when a file is known to be either selected or excluded. Thus the option `file=usr,etc,~usr/openwin` would select all files in `usr` and all files in `etc`. Files in `usr/openwin` are not excluded because the regular expression `usr` is matched first. Care should be given in surrounding the *pathname* with quotes so as to prevent the shell from expanding any tildes.

`filegroup=group`

Select records containing file system objects with *group* as the owning group.

`fileowner=user`

Select records containing file system objects with *user* as the owning user.

`msgqid=ID`

Select records containing message queue objects with the specified *ID* where *ID* is a message queue ID.

`msgqgroup=group`

Select records containing message queue objects with *group* as the owning or creating group.

`msgqowner=user`

Select records containing message queue objects with *user* as the owning or creating user.

`pid=ID`

Select records containing process objects with the specified *ID* where *ID* is a process ID. Process are objects when they are receivers of signals.

`procgroup=group`

Select records containing process objects with *group* as the real or effective group.

`procowner=user`

Select records containing process objects with *user* as the real or effective user.

auditreduce(1M)

semid=ID

Select records containing semaphore objects with the specified *ID* where *ID* is a semaphore ID.

semgroup=group

Select records containing semaphore objects with *group* as the owning or creating group.

semowner=user

Select records containing semaphore objects with *user* as the owning or creating user.

shmid=ID

Select records containing shared memory objects with the specified *ID* where *ID* is a shared memory ID.

shmgroup=group

Select records containing shared memory objects with *group* as the owning or creating group.

shmowner=user

Select records containing shared memory objects with *user* as the owning or creating user.

sock=port_number | machine

Select records containing socket objects with the specified *port_number* or the specified *machine* where *machine* is a machine name as defined in `hosts(4)`.

-r real-user

Select records with the specified *real-user*.

-u audit-user

Select records with the specified *audit-user*. When one or more *filename* arguments appear on the command line, only the named files are processed. Files specified in this way need not conform to the audit trail filename format. However, *-M*, *-S*, and *-R* may not be used when processing named files. If the *filename* is *"-"* then the input is taken from the standard input.

Option Arguments

audit-trail-file

An audit trail file as defined in `audit.log(4)`. An audit trail file not named on the command line must conform to the audit trail file name format. Audit trail files produced as output of `auditreduce` are in this format as well. The format is:

start-time . end-time . suffix

start-time is the 14 character time stamp denoting when the file was opened.

end-time is the 14 character time stamp denoting when the file was closed. *end-time* may also be the literal string `not_terminated`, indicating the file is still be written to by the audit daemon or the file was not closed properly (a system crash or abrupt halt occurred). *suffix* is the name of the machine that generated the audit trail

file (or some other meaningful suffix; e.g. `all` would be a good suffix if the audit trail file contains a combined group of records from many machines).

date-time

The *date-time* argument to `-a`, `-b`, and `-d` can be of two forms: An absolute *date-time* takes the form:

```
yyyymmdd [ hh [ mm [ ss ] ] ]
```

where *yyyy* specifies a year (with 1970 as the earliest value), *mm* is the month (01-12), *dd* is the day (01-31), *hh* is the hour (00-23), *mm* is the minute (00-59), and *ss* is the second (00-59). The default is 00 for *hh*, *mm* and *ss*.

An offset can be specified as: `+n d|h|m|s` where *n* is a number of units, and the tags *d*, *h*, *m*, and *s* stand for days, hours, minutes and seconds, respectively. An offset is relative to the starting time. Thus, this form can only be used with the `-b` option.

event

The literal string or ordinal event number as found in `audit_event(4)`. If *event* is not found in the `audit_event` file it is considered invalid.

group

The literal string or ordinal group ID number as found in `group(4)`. If *group* is not found in the `group` file it is considered invalid. *group* may be negative.

pathname

A regular expression describing a pathname.

user

The literal username or ordinal user ID number as found in `passwd(4)`. If the username is not found in the `passwd` file it is considered invalid. *user* may be negative.

EXAMPLES **EXAMPLE 1** The `auditreduce` command.

`praudit(1M)` is available to display audit records in a human-readable form.

This will display the entire audit trail in a human-readable form:

```
% auditreduce | praudit
```

If all the audit trail files are being combined into one large file, then deleting the original files could be desirable to prevent the records from appearing twice:

```
% auditreduce -V -d /etc/security/audit/combined/all
```

This will print what user `milner` did on April 13, 1988. The output will be displayed in a human-readable form to the standard output:

```
% auditreduce -d 19880413 -u milner | praudit
```

auditreduce(1M)

EXAMPLE 1 The `auditreduce` command. (Continued)

The above example may produce a large volume of data if `milner` has been busy. Perhaps looking at only login and logout times would be simpler. The `-c` option will select records from a specified class:

```
% auditreduce -d 19880413 -u milner -c lo | praudit
```

To see `milner`'s login/logout activity for April 13, 14, and 15 the following is used. The results are saved to a file in the current working directory. Note that the name of the output file will have `milnerlo` as the *suffix*, with the appropriate timestamp prefixes. Note that the long form of the name is used for the `-c` option:

```
% auditreduce -a 19880413 -b +3d -u milner -c login_logout -o milnerlo
```

To follow `milner`'s movement about the file system on April 13, 14, and 15 the `chdir` record types could be viewed. Note that in order to get the same time range as the above example we needed to specify the `-b` time as the day after our range. This is because 19880416 defaults to midnight of that day, and records before that fall on 0415, the end-day of the range.

```
% auditreduce -a 19880413 -b 19880416 -u milner -m AUE_CHDIR | praudit
```

In this example the audit records are being collected in summary form (the login/logout records only). The records are being written to a summary file in a different directory than the normal audit root to prevent the selected records from existing twice in the audit root.

```
% auditreduce -d 19880330 -c lo -o /etc/security/audit_summary/logins
```

If activity for user ID 9944 has been observed, but that user is not known to the system administrator, then the following example will search the entire audit trail for any records generated by that user. `auditreduce` will query the system as to the current validity of ID 9944, and print a warning message if it is not currently active:

```
% auditreduce -o /etc/security/audit_suspect/user9944 -u 9944
```

FILES `/etc/security/audit/server/files/*`
location of audit trails, when stored

ATTRIBUTES See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsu

SEE ALSO `bsmconv(1M)`, `praudit(1M)`, `audit.log(4)`, `audit_class(4)`, `audit_control(4)`, `group(4)`, `hosts(4)`, `passwd(4)`, `attributes(5)`

DIAGNOSTICS	<p>auditreduce will print out error messages if there are command line errors and then exit. If there are fatal errors during the run auditreduce will print an explanatory message and exit. In this case the output file may be in an inconsistent state (no trailer or partially written record) and auditreduce will print a warning message before exiting. Successful invocation returns 0 and unsuccessful invocation returns 1.</p> <p>Since auditreduce may be processing a large number of input files, it is possible that the machine-wide limit on open files will be exceeded. If this happens, auditreduce will print a message to that effect, give information on how many file there are, and exit.</p> <p>If auditreduce prints a record's timestamp in a diagnostic message, that time is in local time. However, when filenames are displayed, their timestamps are in GMT.</p>
BUGS	<p>Conjunction, disjunction, negation, and grouping of record selection options should be allowed.</p>
NOTES	<p>The functionality described in this man page is available only if the Basic Security Module (BSM) has been enabled. See bsmconv(1M) for more information.</p>

audit_startup(1M)

NAME	audit_startup – audit subsystem initialization script
SYNOPSIS	<code>/etc/security/audit_startup</code>
DESCRIPTION	The <code>audit_startup</code> script is used to initialize the audit subsystem before the audit daemon is started. This script is configurable by the system administrator, and currently consists of a series of <code>auditconfig(1M)</code> commands to set the system default policy, and download the initial event to class mapping.
SEE ALSO	<code>auditconfig(1M)</code> , <code>auditd(1M)</code> , <code>bsmconv(1M)</code> , <code>attributes(5)</code>
NOTES	The functionality described in this man page is available only if the Basic Security Module (BSM) has been enabled. See <code>bsmconv(1M)</code> for more information.

NAME	auditstat – display kernel audit statistics
SYNOPSIS	auditstat [-c <i>count</i>] [-h <i>numlines</i>] [-i <i>interval</i>] [-n] [-v]
DESCRIPTION	<p>auditstat displays kernel audit statistics. The fields displayed are as follows:</p> <p>aud The total number of audit records processed by the audit(2) system call.</p> <p>ctl This field is obsolete.</p> <p>drop The total number of audit records that have been dropped. Records are dropped according to the kernel audit policy. See auditon(2), AUDIT_CNT policy for details.</p> <p>enq The total number of audit records put on the kernel audit queue.</p> <p>gen The total number of audit records that have been constructed (not the number written).</p> <p>kern The total number of audit records produced by user processes (as a result of system calls).</p> <p>mem The total number of Kbytes of memory currently in use by the kernel audit module.</p> <p>nona The total number of non-attributable audit records that have been constructed. These are audit records that are not attributable to any particular user.</p> <p>rblk The total number of times that auditsvc(2) has blocked waiting to process audit data.</p> <p>tot The total number of Kbytes of audit data written to the audit trail.</p> <p>wblk The total number of times that user processes blocked on the audit queue at the high water mark.</p> <p>wrtn The total number of audit records written. The difference between enq and wrtn is the number of outstanding audit records on the audit queue that have not been written.</p>
OPTIONS	<p>-c <i>count</i> Display the statistics a total of <i>count</i> times. If <i>count</i> is equal to zero, statistics are displayed indefinitely. A time interval must be specified.</p> <p>-h <i>numlines</i> Display a header for every <i>numlines</i> of statistics printed. The default is to display the header every 20 lines. If <i>numlines</i> is equal to zero, the header is never displayed.</p> <p>-i <i>interval</i> Display the statistics every <i>interval</i> where <i>interval</i> is the number of seconds to sleep between each collection.</p> <p>-n Display the number of kernel audit events currently configured.</p> <p>-v Display the version number of the kernel audit module software.</p>

auditstat(1M)

EXIT STATUS | auditstat returns 0 upon success and 1 upon failure.

NAME	audit_warn – audit daemon warning script	
SYNOPSIS	/etc/security/audit_warn [option [arguments]]	
DESCRIPTION	<p>The audit_warn script processes warning or error messages from the audit daemon. When a problem is encountered, the audit daemon, auditd(1M) calls audit_warn with the appropriate arguments. The <i>option</i> argument specifies the error type.</p> <p>The system administrator can specify a list of mail recipients to be notified when an audit_warn situation arises by defining a mail alias called audit_warn in aliases(4). The users that make up the audit_warn alias are typically the audit and root users.</p>	
OPTIONS	allhard <i>count</i>	Indicates that the hard limit for all filesystems has been exceeded <i>count</i> times. The default action for this option is to send mail to the audit_warn alias only if the <i>count</i> is 1, and to write a message to the machine console every time. It is recommended that mail <i>not</i> be sent every time as this could result in a the saturation of the file system that contains the mail spool directory.
	allsoft	Indicates that the soft limit for all filesystems has been exceeded. The default action for this option is to send mail to the audit_warn alias and to write a message to the machine console.
	auditoff	Indicates that someone other than the audit daemon changed the system audit state to something other than AUC_AUDITING. The audit daemon will have exited in this case. The default action for this option is to send mail to the audit_warn alias and to write a message to the machine console.
	ebusy	Indicates that the audit daemon is already running. The default action for this option is to send mail to the audit_warn alias and to write a message to the machine console.
	getacdir <i>count</i>	Indicates that there is a problem getting the directory list from audit_control(4). The audit daemon will hang in a sleep loop until the file is fixed. The default action for this option is to send mail to the audit_warn alias only if <i>count</i> is 1, and to write a message to the machine console every time. It is recommended that mail <i>not</i> be sent every time as this could result in a the saturation of the file system that contains the mail spool directory.
	hard <i>filename</i>	Indicates that the hard limit for the file has been exceeded. The default action for this option is to send

audit_warn(1M)

	mail to the <code>audit_warn</code> alias and to write a message to the machine console.
<code>nostart</code>	Indicates that auditing could not be started. The default action for this option is to send mail to the <code>audit_warn</code> alias and to write a message to the machine console. Some administrators may prefer to modify <code>audit_warn</code> to reboot the system when this error occurs.
<code>postsigterm</code>	Indicates that an error occurred during the orderly shutdown of the audit daemon. The default action for this option is to send mail to the <code>audit_warn</code> alias and to write a message to the machine console.
<code>soft filename</code>	Indicates that the soft limit for <i>filename</i> has been exceeded. The default action for this option is to send mail to the <code>audit_warn</code> alias and to write a message to the machine console.
<code>tmpfile</code>	Indicates that the temporary audit file already exists indicating a fatal error. The default action for this option is to send mail to the <code>audit_warn</code> alias and to write a message to the machine console.

NAME	automount – install automatic mount points
SYNOPSIS	<code>/usr/sbin/automount</code> [-t <i>duration</i>] [-v]
DESCRIPTION	<p>The automount utility installs <code>autofs</code> mount points and associates an automount map with each mount point. The <code>autofs</code> file system monitors attempts to access directories within it and notifies the <code>automountd(1M)</code> daemon. The daemon uses the map to locate a file system, which it then mounts at the point of reference within the <code>autofs</code> file system. A map can be assigned to an <code>autofs</code> mount using an entry in the <code>/etc/auto_master</code> map or a direct map.</p> <p>If the file system is not accessed within an appropriate interval (10 minutes by default), the <code>automountd</code> daemon unmounts the file system.</p> <p>The file <code>/etc/auto_master</code> determines the locations of all <code>autofs</code> mount points. By default, this file contains four entries:</p> <pre># Master map for automounter # +auto_master /net -hosts -nosuid /home auto_home /xfn -xfn</pre> <p>The <code>+auto_master</code> entry is a reference to an external NIS or NIS+ master map. If one exists, then its entries are read as if they occurred in place of the <code>+auto_master</code> entry. The remaining entries in the master file specify a directory on which an <code>autofs</code> mount will be made followed by the automounter map to be associated with it. Optional mount options may be supplied as an optional third field in the each entry. These options are used for any entries in the map that do not specify mount options explicitly. The <code>automount</code> command is usually run without arguments. It compares the entries <code>/etc/auto_master</code> with the current list of <code>autofs</code> mounts in <code>/etc/mnttab</code> and adds, removes or updates <code>autofs</code> mounts to bring the <code>/etc/mnttab</code> up to date with the <code>/etc/auto_master</code>. At boot time it installs all <code>autofs</code> mounts from the master map. Subsequently, it may be run to install <code>autofs</code> mounts for new entries in the master map or the direct map, or to perform unmounts for entries that have been removed from these maps.</p>
OPTIONS	<p>The following options are supported:</p> <ul style="list-style-type: none"> -t <i>duration</i> Specifies a <i>duration</i>, in seconds, that a file system is to remain mounted when not in use. The default is 10 minutes. -v Verbose mode. Notifies of <code>autofs</code> mounts, unmounts, or other non-essential information.
Map Entry Format	<p>A simple map entry (mapping) takes the form:</p> <pre>key [-mount-options] location . . .</pre>

automount(1M)

where *key* is the full pathname of the directory to mount when used in a direct map, or the simple name of a subdirectory in an indirect map. *mount-options* is a comma-separated list of mount options, and *location* specifies a file system from which the directory may be mounted. In the case of a simple NFS mount, the options that can be used are as specified in `mount_nfs(1M)`, and *location* takes the form:

```
host : pathname
```

host is the name of the host from which to mount the file system, and *pathname* is the absolute pathname of the directory to mount.

Options to other file systems are documented on the other `mount_*` reference manual pages, for example, `mount_cacheFs(1M)`.

Replicated File Systems

Multiple *location* fields can be specified for replicated NFS file systems, in which case `automount` and the kernel will each try to use that information to increase availability. If the read-only flag is set in the map entry, `automount` mounts a list of locations that the kernel may use, sorted by several criteria. When a server does not respond, the kernel will switch to an alternate server. The sort ordering of `automount` is used to determine how the next server is chosen. If the read-only flag is not set, `automount` will mount the best single location, chosen by the same sort ordering, and new servers will only be chosen when an unmount has been possible, and a remount is done. Servers on the same local subnet are given the strongest preference, and servers on the local net are given the second strongest preference. Among servers equally far away, response times will determine the order if no weighting factors (see below) are used.

If the list includes server locations using both the NFS Version 2 Protocol and the NFS Version 3 Protocol, `automount` will choose only a subset of the server locations on the list, so that all entries will be the same protocol. It will choose servers with the NFS Version 3 Protocol so long as an NFS Version 2 Protocol server on a local subnet will not be ignored. See the *System Administration Guide, Volume 3* for additional details.

If each *location* in the list shares the same *pathname* then a single *location* may be used with a comma-separated list of hostnames:

```
hostname,hostname . . . : pathname
```

Requests for a server may be weighted, with the weighting factor appended to the server name as an integer in parentheses. Servers without a weighting are assumed to have a value of zero (most likely to be selected). Progressively higher values decrease the chance of being selected. In the example,

```
man -ro alpha,bravo,charlie(1),delta(4) : /usr/man
```

hosts `alpha` and `bravo` have the highest priority; host `delta` has the lowest.

Server proximity takes priority in the selection process. In the example above, if the server `delta` is on the same network segment as the client, but the others are on different network segments, then `delta` will be selected; the weighting value is ignored. The weighting has effect only when selecting between servers with the same network proximity.

In cases where each server has a different export point, the weighting can still be applied. For example:

```
man -ro alpha:/usr/man bravo,charlie(1):/usr/share/man
      delta(3):/export/man
```

A mapping can be continued across input lines by escaping the NEWLINE with a backslash (\) Comments begin with a number sign (#) and end at the subsequent NEWLINE.

Map Key Substitution

The ampersand (&) character is expanded to the value of the key field for the entry in which it occurs. In this case:

```
jane sparcserver : /home/&
```

the & expands to jane.

Wildcard Key

The asterisk (*) character, when supplied as the key field, is recognized as the catch-all entry. Such an entry will match any key not previously matched. For instance, if the following entry appeared in the indirect map for `/config`:

```
*          & : /export/config/&
```

this would allow automatic mounts in `/config` of any remote file system whose location could be specified as:

```
hostname : /export/config/hostname
```

Variable Substitution

Client specific variables can be used within an automount map. For instance, if `$HOST` appeared within a map, `automount` would expand it to its current value for the client's host name. Supported variables are:

ARCH	The application architecture is derived from the output of <code>uname -m</code>	The architecture name. For example, "sun4" on a sun4u machine.
CPU	The output of <code>uname -p</code>	The processor type. For example, "sparc"
HOST	The output of <code>uname -n</code>	The host name. For example, "biggles"

automount(1M)

OSNAME	The output of <code>uname -s</code>	The OS name. For example, "SunOS"
OSREL	The output of <code>uname -r</code>	The OS release name. For example "5.3"
OSVERS	The output of <code>uname -v</code>	The OS version. For example, "beta1.0"
NATISA	The output of <code>isainfo -n</code>	The native instruction set architecture for the system. For example, "sparcv9"

If a reference needs to be protected from affixed characters, you can surround the variable name with curly braces (`{ }`).

Multiple Mounts

A multiple mount entry takes the form:

```
key [-mount-options] [ [mountpoint] [-mount-options] location . . . ] . . .
```

The initial `/[mountpoint]` is optional for the first mount and mandatory for all subsequent mounts. The optional `mountpoint` is taken as a pathname relative to the directory named by `key`. If `mountpoint` is omitted in the first occurrence, a `mountpoint` of `/` (root) is implied.

Given an entry in the indirect map for `/src`

```
beta      -ro\  
/          svr1,svr2:/export/src/beta  \  
/1.0      svr1,svr2:/export/src/beta/1.0 \  
/1.0/man  svr1,svr2:/export/src/beta/1.0/man
```

All offsets must exist on the server under `beta`. `automount` will automatically mount `/src/beta`, `/src/beta/1.0`, and `/src/beta/1.0/man`, as needed, from either `svr1` or `svr2`, whichever host is nearest and responds first.

Other File System Types

The automounter assumes NFS mounts as a default file system type. Other file system types can be described using the `fstype` mount option. Other mount options specific to this file system type can be combined with the `fstype` option. The location field must contain information specific to the file system type. If the location field begins with a slash, a colon character must be prepended, for instance, to mount a CD file system:

```
cdrom -fstype=hsfs,ro : /dev/sr0
```

or to perform an `autofs` mount:

```
src -fstype=autofs auto_src
```

Note: Use this procedure only if you are not using Volume Manager.

Mounts using CacheFS are most useful when applied to an entire map as map defaults. The following entry in the master map describes cached home directory mounts. It assumes the default location of the cache directory, `/cache`.

```
/home auto_home -fstype=cachefs,backfstype=nfs
```

See the NOTES section for information on option inheritance.

- Indirect Maps** An indirect map allows you to specify mappings for the subdirectories you wish to mount under the `directory` indicated on the command line. In an indirect map, each key consists of a simple name that refers to one or more file systems that are to be mounted as needed.
- Direct Maps** Entries in a direct map are associated directly with `autofs` mount points. Each key is the full pathname of an `autofs` mount point. The direct map as a whole is not associated with any single directory.
- Included Maps** The contents of another map can be included within a map with an entry of the form
- ```
+mapname
```
- If *mapname* begins with a slash, it is assumed to be the pathname of a local file. Otherwise, the location of the map is determined by the policy of the name service switch according to the entry for the automounter in `/etc/nsswitch.conf`, such as
- ```
automount: files nis
```
- If the name service is `files`, then the name is assumed to be that of a local file in `/etc`. If the key being searched for is not found in the included map, the search continues with the next entry.
- Special Maps** There are three special maps available: `-hosts`, `-xfs`, and `-null`. The `-hosts` map is used with the `/net` directory and assumes that the map key is the hostname of an NFS server. The `automountd` daemon dynamically constructs a map entry from the server's list of exported file systems. References to a directory under `/net/hermes` will refer to the corresponding directory relative to `hermes` root.
- The `-xfs` map is used to mount the initial context of the Federated Naming Service (FNS) namespace under the `/xfs` directory. For more information on FNS, see `fns(5)`, `fns_initial_context(5)`, `fns_policies(5)`, and the Federated Naming Service Guide.
- The `-null` map cancels a previous map for the directory indicated. This is most useful in the `/etc/auto_master` for cancelling entries that would otherwise be inherited

automount(1M)

- from the `+auto_master` include entry. To be effective, the `-null` entries must be inserted before the included map entry.
- Executable Maps** Local maps that have the execute bit set in their file permissions will be executed by the automounter and provided with a key to be looked up as an argument. The executable map is expected to return the content of an automounter map entry on its stdout or no output if the entry cannot be determined. A direct map cannot be made executable.
- Configuration and the `auto_master` Map** When initiated without arguments, `automount` consults the master map for a list of `autoofs` mount points and their maps. It mounts any `autoofs` mounts that are not already mounted, and unmounts `autoofs` mounts that have been removed from the master map or direct map.
- The master map is assumed to be called `auto_master` and its location is determined by the name service switch policy. Normally the master map is located initially as a local file `/etc/auto_master`.
- Browsing** The Solaris 2.6 release supports browsability of indirect maps. This allows all of the potential mount points to be visible, whether or not they are mounted. The `-nobrowse` option can be added to any indirect `autoofs` map to disable browsing. For example:
- ```
/net -hosts -nosuid,nobrowse
/home auto_home
```
- In this case, any *hostnames* would only be visible in `/net` after they are mounted, but all potential mount points would be visible under `/home`. The `-browse` option enables browsability of `autoofs` file systems. This is the default for all indirect maps.
- EXIT STATUS** The following exit values are returned:
- |   |                        |
|---|------------------------|
| 0 | Successful completion. |
| 1 | An error occurred.     |
- FILES**
- |                                 |                                              |
|---------------------------------|----------------------------------------------|
| <code>/etc/auto_master</code>   | master automount map.                        |
| <code>/etc/auto_home</code>     | map to support automounted home directories. |
| <code>/etc/nsswitch.conf</code> | the name service switch configuration file.  |
- ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

automount(1M)

**SEE ALSO** isainfo(1), ls(1), uname(1), automountd(1M), mount(1M), mount\_cachefs(1M), mount\_nfs(1M), attributes(5), fns(5), fns\_initial\_context(5), fns\_policies(5), nfssec(5)

*System Administration Guide, Volume 3*

**NOTES** autofs mount points must not be hierarchically related. automount does not allow an autofs mount point to be created within another autofs mount.

Since each direct map entry results in a new autofs mount such maps should be kept short.

Entries in both direct and indirect maps can be modified at any time. The new information is used when automountd next uses the map entry to do a mount.

New entries added to a master map or direct map will not be useful until the automount command is run to install them as new autofs mount points. New entries added to an indirect map may be used immediately.

As of the Solaris 2.6 release, a listing (see ls(1)) of the autofs directory associated with an indirect map shows all potential mountable entries. The attributes associated with the potential mountable entries are temporary. The real file system attributes will only be shown once the file system has been mounted.

Default mount options can be assigned to an entire map when specified as an optional third field in the master map. These options apply only to map entries that have no mount options. Note that map entities with options override the default options, as at this time, the options do not concatenate. The concatenation feature is planned for a future release.

When operating on a map that invokes an NFS mount, the default number of retries for the automounter is 0, that is, a single mount attempt, with no retries. Note that this is significantly different from the default (10000) for the mount\_nfs(1M) utility.

The Network Information Service (NIS) was formerly known as Sun Yellow Pages (YP). The functionality of the two remains the same.

automountd(1M)

**NAME** automountd – autofs mount/unmount daemon

**SYNOPSIS** **automountd** [-Tvn] [-D *name=value*]

**DESCRIPTION** automountd is an RPC server that answers file system mount and unmount requests from the autofs file system. It uses local files or name service maps to locate file systems to be mounted. These maps are described with the automount(1M) command.

The automountd daemon is automatically invoked in run level 2.

**OPTIONS**

- T Trace. Expand each RPC call and display it on the standard output.
- v Verbose. Log status messages to the console.
- n Turn off browsing for all autofs mount points. This option overrides the -browse autofs map option on the local host.
- D *name=value* Assign *value* to the indicated automount map substitution variable. These assignments cannot be used to substitute variables in the master map auto\_master.

**USAGE** See largefile(5) for the description of the behavior of automountd when encountering files greater than or equal to 2 Gbyte ( 2<sup>31</sup> bytes).

**FILES** /etc/auto\_master master map for automounter

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** automount(1M), attributes(5), largefile(5)

| <b>SYNOPSIS</b>    | <pre>autopush -f filename autopush -g -M major -m minor autopush -r -M major -m minor</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | The autopush command configures the list of modules to be automatically pushed onto the stream when a device is opened. It can also be used to remove a previous setting or get information on a setting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><b>-f filename</b> Sets up the autopush configuration for each driver according to the information stored in <i>filename</i>. An autopush file consists of lines of four or more fields, separated by spaces as shown below:</p> <pre>major minor last-minor module1 module2 . . . module8</pre> <p>The first field is a string that specifies the <i>major</i> device name, as listed in the <code>/kernel/drv</code> directory. The next two fields are integers that specify the <i>minor</i> device number and <i>last-minor</i> device number. The fields following represent the names of modules. If <i>minor</i> is <code>-1</code>, then all minor devices of a major driver specified by <i>major</i> are configured, and the value for <i>last-minor</i> is ignored. If <i>last-minor</i> is <code>0</code>, then only a single minor device is configured. To configure a range of minor devices for a particular major, <i>minor</i> must be less than <i>last-minor</i>.</p> <p>The remaining fields list the names of modules to be automatically pushed onto the stream when opened, along with the position of an optional anchor. The maximum number of modules that can be pushed is eight. The modules are pushed in the order they are specified. The optional special character sequence <code>[anchor]</code> indicates that a STREAMS anchor should be placed on the stream at the module previously specified in the list; it is an error to specify more than one anchor or to have an anchor first in the list.</p> <p>A nonzero exit status indicates that one or more of the lines in the specified file failed to complete successfully.</p> <p><b>-g</b> Gets the current configuration setting of a particular <i>major</i> and <i>minor</i> device number specified with the <code>-M</code> and <code>-m</code> options respectively and displays the autopush modules associated with it. It will also return the starting minor device number if the request corresponds to a setting of a range (as described with the <code>-f</code> option).</p> <p><b>-m minor</b> Specifies the minor device number.</p> |

## autopush(1M)

**-M** *major* Specifies the major device number.

**-r** Removes the previous configuration setting of the particular *major* and *minor* device number specified with the **-M** and **-m** options respectively. If the values of *major* and *minor* correspond to a previously established setting of a range of minor devices, where *minor* matches the first minor device number in the range, the configuration would be removed for the entire range.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

non-zero An error occurred.

**EXAMPLES** **EXAMPLE 1** Using the autopush command.

The following example gets the current configuration settings for the *major* and *minor* device numbers as indicated and displays the autopush modules associated with them for the character-special device `/dev/term/a`:

```
example# autopush -g -M 29 -m 0
Major Minor Lastminor Modules
 29 0 1 ldterm ttcompat
```

**FILES** `/etc/iu.ap`

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>SYNOPSIS</b>    | <b>bdconfig</b> [ <i>startup</i> ] [ <i>off</i> ] [ <i>on</i> ] [ <i>term</i> ] [ <i>status</i> ] [ <i>verbose</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |           |
| <b>DESCRIPTION</b> | The <code>bdconfig</code> utility is responsible for configuring the autopush facility and defining to the system what serial device to use for the <code>bd</code> stream.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                 |              |           |
| <b>OPTIONS</b>     | <p>If no options are given, then an interactive mode is assumed. In this mode the current status is presented along with this usage line, and a series of interactive questions asked to determine the user's desires.</p> <p>Root privilege is required to change the configuration. The <code>status</code> option does not require root privilege. <code>bdconfig</code> can be installed as a <code>setuid</code> root program.</p> <p>The non-interactive options below can be given in any order.</p> <p><i>term</i>                Specify to the system the serial device for <code>bd</code> use. This option implies the <code>on</code> option unless the <code>off</code> option is present.</p> <p><i>iff</i>                 Reconfigure the configured <code>term</code> for <code>tty</code> use.</p> <p><i>on</i>                  Reconfigure the configured <code>term</code> for <code>bd</code> use. If <i>term</i> has not been previously specified, interactive questions are asked to determine the user's desires.</p> <p><i>startup</i>            Configure as was last configured before the system went down. This option is used by the startup script, and precludes the use of the <code>on</code>, <code>off</code>, and <i>term</i> options. This option implies non-interactive mode.</p> <p><i>status</i>             Emit the current configuration in terms of the words used as options: <code>off</code>, <code>on</code>, <code>/dev/term/a</code>, <code>/dev/term/b</code>, and so forth. This option implies non interactive mode.</p> <p><i>verbose</i>            <code>bdconfig</code> describes what it finds and what it is doing.</p> |                |                 |              |           |
| <b>EXIT STATUS</b> | The <code>bdconfig</code> utility returns 0 on success, 1 on general error, and 2 on argument error.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |           |

| <b>NOTES</b>       | All <code>bdconfig</code> does is configure the AUTOPUSH facility. <code>bdconfig</code> does not actually manipulate the serial port or stream in any way. Only the first open of a dismantled stream will see the effects of a previously run <code>bdconfig</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                 |              |           |

## bdconfig(1M)

The `bdconfig` utility is silent except for error messages unless:

- a) invoked with no args: status / usage line emitted
- b) interactive modes are invoked as described above
- c) the verbose option is used

**BUGS** The interface does not support more than one dialbox and one buttonbox, both of which must be on the same serial device.

There should be a library routine to read, parse, and validate records in the `iu.ap` file, so that `bdconfig` could return to the appropriate record in `iu.ap` as the default configuration.

|                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>DESCRIPTION</b>               | <p>Bootstrapping is the process of loading and executing a standalone program. For the purpose of this discussion, bootstrapping means the process of loading and executing the bootable operating system. Typically, the standalone program is the operating system kernel (see <code>kernel(1M)</code>), but any standalone program can be booted instead. On a SPARC-based system, the diagnostic monitor for a machine is a good example of a standalone program other than the operating system that can be booted.</p> <p>If the standalone is identified as a dynamically-linked executable, <code>boot</code> will load the interpreter (linker/loader) as indicated by the executable format and then transfer control to the interpreter. If the standalone is statically-linked, it will jump directly to the standalone.</p> <p>Once the kernel is loaded, it starts the UNIX system, mounts the necessary filesystems (see <code>vfstab(4)</code>), and runs <code>/sbin/init</code> to bring the system to the "initdefault" state specified in <code>/etc/inittab</code>. See <code>inittab(4)</code>.</p>                                                                                                                                                                                                           |
| <b>SPARC Bootstrap Procedure</b> | <p>On SPARC based systems, the bootstrap procedure on most machines consists of the following basic phases.</p> <p>After the machine is turned on, the system firmware (in PROM) executes power-on self-test (POST). The form and scope of these tests depends on the version of the firmware in your system.</p> <p>After the tests have been completed successfully, the firmware attempts to autoboot if the appropriate flag has been set in the non-volatile storage area used by the firmware. The name of the file to load, and the device to load it from can also be manipulated.</p> <p>These flags and names can be set using the <code>EEPROM(1M)</code> command from the shell, or by using PROM commands from the <code>ok</code> prompt after the system has been halted.</p> <p>The second level program is either <code>ufsboot</code> (when booting from a disk), or <code>inetboot</code> (when booting across the network).</p> <p>Network Booting</p> <p>Network booting can follow either of two paths, RARP/<code>bootparams</code> or DHCP (Dynamic Host Configuration Protocol), depending on the functions available in and configuration of the PROM. Machines of the <code>sun4u</code> kernel architecture have DHCP-capable PROMs and boot from the network using RARP/<code>bootparams</code> by</p> |

## boot(1M)

default. Whichever network boot path is specified, RARP or DHCP, is followed all the way through to multi-user mode; there is no mixture of the RARP and DHCP activities.

The boot command syntax for specifying the two methods of network booting are:

```
boot net:rarp
boot net:dhcp
```

The command:

```
boot net
```

without a `rarp` or `dhcp` specifier, invokes the default method for network booting over the network interface for which `net` is an alias.

The sequence of events for network booting using RARP/bootparams is described in the following paragraphs. The sequence for DHCP follows the RARP/bootparams description.

When booting over the network using RARP/bootparams, the PROM makes a reverse ARP request and when it receives a reply, the PROM broadcasts a TFTP request to fetch `inetboot` over the network from any server that responds and executes it. `inetboot` also makes another reverse ARP request, then uses the bootparams protocol (see `bootparams(4)`) to locate its root filesystem. It then fetches the kernel across the network using the NFS protocol and then executes it.

When booting over the network using DHCP, the PROM broadcasts the hardware address and kernel architecture and requests an IP address, boot parameters, and network configuration information. After a DHCP server responds and is selected (from among potentially multiple servers), that server sends to the client an IP address and all other information needed to boot the client. After receipt of this information, the client PROM downloads `inetboot`, loads that file into memory, and executes it. `inetboot` invokes the kernel, which loads the files it needs and releases `inetboot`. Startup scripts then initiate the DHCP agent (see `dhcpage(1M)`), which implements the further activities of the DHCP.

### Booting from Disk

When booting from disk (or disk-like device), the bootstrapping process consists of two conceptually distinct phases, primary boot and secondary boot. In the primary boot phase, the PROM loads the primary boot block from blocks 1 to 15 of the disk partition selected as the boot device.

If the pathname to the standalone is relative (does not begin with a slash), the second level boot will look for the standalone in a platform-dependent search path. This path is guaranteed to contain `/platform/platform-name`. Many SPARC platforms next search the platform-specific path entry `/platform/hardware-class-name`. See

**OpenBoot PROM**  
boot Command  
Behavior

filesystem(5). If the pathname is absolute, `boot` will use the specified path. The `boot` program then loads the standalone at the appropriate address, and then transfers control.

If the filename is not given on the command line or otherwise specified, for example, by the `boot-file` NVRAM variable, `boot` chooses an appropriate default file to load based on what software is installed on the system, the capabilities of the hardware and firmware, and on a user configurable policy file (see FILES, below).

The OpenBoot `boot` command takes arguments of the following form:

```
ok boot [device-specifier] [arguments]
```

The default `boot` command has no arguments:

```
ok boot
```

If no *device-specifier* is given on the `boot` command line, OpenBoot typically uses the *boot-device* or *diag-device* `nvr`am variable. If no optional *arguments* are given on the command line, OpenBoot typically uses the *boot-file* or *diag-file* `nvr`am variable as default `boot` arguments. (If the system is in diagnostics mode, *diag-device* and *diag-file* are used instead of *boot-device* and *boot-file*).

*arguments* may include more than one string. All *argument* strings are passed to the secondary booter; they are not interpreted by OpenBoot.

If any *arguments* are specified on the `boot` command line, then neither the *boot-file* nor the *diag-file* `nvr`am variable is used. The contents of the `nvr`am variables are not merged with command line arguments. For example, the command

```
ok boot -s
```

ignores the settings in both *boot-file* and *diag-file*; it interprets the string `"-s"` as *arguments*. `boot` will not use the contents of *boot-file* or *diag-file*.

The commands

```
ok boot netand
```

`ok boot cdrom` have no arguments; they will use the settings in *boot-file* or *diag-file*, if they are set, as default filename and arguments and pass them to `boot`. Accordingly, if *boot-file* is set to the 64-bit kernel filename and you attempt to boot the installation CD with `boot cdrom`, `boot` will fail if the installation CD contains only a 32-bit kernel.

Since the contents of *boot-file* or *diag-file* may be ignored depending on the form of the `boot` command used, reliance upon the *boot-file* should be discouraged for most production systems. To change the OS policy, change the policy file. A significant exception is when a production system has both 32-bit and 64-bit packages installed, but the production system requires use of the 32-bit OS.

In most cases, it is best to allow the `boot` command to choose an appropriate default based upon the system type, system hardware and firmware, and upon what is

boot(1M)

installed on the root filesystem. It is accepted practice to augment the `boot` command's policy by modifying the policy file; however, changing *boot-file* or *diag-file* may generate unexpected results in certain circumstances.

This behavior is found on most OpenBoot 2.x and 3.x based systems. Note that differences may occur on some platforms.

### IA Bootstrap Procedure

On IA based systems, the bootstrapping process consists of two conceptually distinct phases, primary boot and secondary boot. The primary boot is implemented in the BIOS ROM on the system board, and BIOS extensions in ROMs on peripheral boards. It is distinguished by its ability to control the installed peripheral devices and to provide I/O services through software interrupts. It begins the booting process by loading the first physical sector from a floppy disk, hard disk, or CD-ROM, or, if supported by the system or network adapter BIOS, by reading a bootstrap program from a network boot server. The primary boot is implemented in IA real-mode code.

The secondary boot is loaded by the primary boot. It is implemented in 32-bit, paged, protected mode code. It also loads and uses peripheral-specific BIOS extensions written in IA real-mode code. The secondary boot is called `boot.bin` and is capable of reading and booting from a UFS file system on a hard disk or a CD or by way of a LAN using the NFS protocol.

The secondary boot is responsible for running the Configuration Assistant program which determines the installed devices in the system (possibly with help from the user). The secondary boot then reads the script in `/etc/bootrc`, which controls the booting process. This file contains `boot interpreter` commands, which are defined below, and can be modified to change defaults or to adapt to a specific machine.

The standard `/etc/bootrc` script prompts the user to enter a `b` character to boot with specified options, an `i` character to invoke the interpreter interactively, or any other character to boot the default kernel. Once the kernel is loaded, it starts the operating system, loads the necessary modules, mounts the necessary filesystems (see `vfstab(4)`), and runs `/sbin/init` to bring the system to the "initdefault" state specified in `/etc/inittab`. See `inittab(4)`.

### SPARC

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OBP names</i> | Specify the open boot prom designations. For example, on Desktop SPARC based systems, the designation <code>/sbus/esp@0,800000/sd@3,0:a</code> indicates a SCSI disk ( <code>sd</code> ) at target 3, lun0 on the SCSI bus, with the <code>esp</code> host adapter plugged into slot 0.                                                                                                                                |
| <i>file</i>      | Name of a standalone program to boot. If a filename is not explicitly specified, either on the <code>boot</code> command line or in the <i>boot-file</i> NVRAM variable, <code>boot</code> chooses an appropriate default filename. On most systems, the default filename is the 32-bit kernel. On systems capable of supporting both the 32-bit and 64-bit kernels, the 64-bit kernel will be chosen in preference to |

|                            |                  |                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            |                  | the 32-bit kernel. <code>boot</code> chooses an appropriate default <i>file</i> to boot based on what software is installed on the system, the capabilities of the hardware and firmware, and on a user configurable policy file.                                                                                                                                                            |
| -a                         |                  | The boot program interprets this flag to mean <code>ask me</code> , and so it prompts for the name of the standalone. The <code>'-a'</code> flag is then passed to the standalone program.                                                                                                                                                                                                   |
| -f                         |                  | When booting an Autoclient system, this flag forces the boot program to bypass the client's local cache and read all files over the network from the client's file server. This flag is ignored for all non-Autoclient systems. The <code>-f</code> flag is then passed to the standalone program.                                                                                           |
| -V                         |                  | Display verbose debugging information.                                                                                                                                                                                                                                                                                                                                                       |
| -D <i>default-file</i>     |                  | Explicitly specify the <i>default-file</i> . On some systems, <code>boot</code> chooses a dynamic default file, used when none is otherwise specified. This option allows the <i>default-file</i> to be explicitly set and can be useful when booting <code>kadb(1M)</code> since, by default, <code>kadb</code> loads the <i>default-file</i> as exported by the <code>boot</code> program. |
| <i>boot-flags</i>          |                  | The boot program passes all <i>boot-flags</i> to <i>file</i> . They are not interpreted by <code>boot</code> . See the <code>kernel(1M)</code> and <code>kadb(1M)</code> manual pages for information about the options available with the default standalone program.                                                                                                                       |
| <i>client-program-args</i> |                  | The boot program passes all <i>client-program-args</i> to <i>file</i> . They are not interpreted by <code>boot</code> .                                                                                                                                                                                                                                                                      |
| <b>IA</b>                  | <i>file</i>      | Name of a standalone program to boot. The default is to boot <code>/platform/platform-name/kernel/unix</code> from the root partition, but you can specify another program on the command line.                                                                                                                                                                                              |
|                            | -f               | When booting an Autoclient system, this flag forces the boot program to bypass the client's local cache and read all files over the network from the client's file server. This flag is ignored for all non-Autoclient systems. The <code>-f</code> flag is then passed to the standalone program.                                                                                           |
|                            | <i>boot-args</i> | The boot program passes all <i>boot-args</i> to <i>file</i> . They are not interpreted by <code>boot</code> . See <code>kernel(1M)</code> and <code>kadb(1M)</code> for information about the options available with the kernel.                                                                                                                                                             |

**IA BOOT  
SEQUENCE  
DETAILS**

After a PC-compatible machine is turned on, the system firmware in the BIOS ROM executes a power-on self test (POST), runs BIOS extensions in peripheral board ROMs, and invokes software interrupt INT 19h, Bootstrap. The INT 19h handler typically performs the standard PC-compatible boot, which consists of trying to read the first

boot(1M)

**IA Primary Boot**

physical sector from the first diskette drive, or, if that fails, from the first hard disk. The processor then jumps to the first byte of the sector image in memory.

The first sector on a floppy disk contains the master boot block. The boot block is responsible for loading the image of the boot loader `strap.com`, which then loads the secondary boot, `boot.bin`. A similar sequence occurs for CD-ROM boot, but the master boot block location and contents are dictated by the El Torito specification. The El Torito boot also leads to `strap.com`, which in turn loads `boot.bin`.

The first sector on a hard disk contains the master boot block, which contains the master boot program and the FDISK table, named for the PC program that maintains it. The master boot finds the active partition in the FDISK table, loads its first sector, and jumps to its first byte in memory. This completes the standard PC-compatible hard disk boot sequence.

An IA FDISK partition for the Solaris software begins with a one-cylinder boot slice, which contains the partition boot program (`pboot`) in the first sector, the standard Solaris disk label and volume table of contents (VTOC) in the second and third sectors, and the `bootblk` program in the fourth and subsequent sectors. When the FDISK partition for the Solaris software is the active partition, the master boot program (`mboot`) reads the partition boot program in the first sector into memory and jumps to it. It in turn reads the `bootblk` program into memory and jumps to it. Regardless of the type of the active partition, if the drive contains multiple FDISK partitions, the user is given the opportunity to reboot another partition.

`bootblk` or `strap.com` (depending upon the active partition type) reads `boot.bin` from the file system in the Solaris root slice and jumps to its first byte in memory.

For network booting, you have the choice of the boot floppy or Intel's Preboot eXecution Environment (PXE) standard. When booting from the network using the boot floppy, you can select which network configuration strategy you want by editing the boot properties, changing the setting for `net-config-strategy`. By default, `net-config-strategy` is set to `rarp`. It can have two settings, `rarp` or `dhcp`. When booting from the network using PXE, the system or network adapter BIOS uses DHCP to locate a network bootstrap program (NBP) on a boot server and reads it using Trivial File Transfer Protocol (TFTP). The BIOS executes the NBP by jumping to its first byte in memory. The NBP uses DHCP to locate the secondary bootstrap on a boot server, reads it using TFTP, and executes it.

**IA Secondary Boot**

The secondary boot, `boot.bin`, switches the processor to 32-bit, paged, protected mode, and performs some limited machine initialization. It runs the Configuration Assistant program which either auto-boots the system, or presents a list of possible boot devices, depending on the state of the `auto-boot?` variable (see `eeprom(1M)`).

Disk target devices (including CDROM drives) are expected to contain UFS filesystems. Network devices can be configured to use either DHCP or Reverse Address Resolution Protocol (RARP) and `bootparams` RPC to discover the machine's IP address and which server will provide the root file system. The root file system is

|                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                   | then mounted using NFS. After a successful root mount, <code>boot .bin</code> invokes a command interpreter, which interprets <code>/etc/bootrc</code> .                                                                                                                                                                                                                                                                                                                                                                |
| <b>Secondary Boot Programming Language for IA</b> | The wide range of hardware that must be supported on IA based systems demands great flexibility in the booting process. This flexibility is achieved in part by making the secondary boot programmable. The secondary boot contains an interpreter that accepts a simple command language similar to those of <code>sh</code> and <code>csh</code> . The primary differences are that pipelines, loops, standard output, and output redirection are not supported.                                                      |
| <b>IA Lexical Structure</b>                       | The boot interpreter splits input lines into words separated by blanks and tabs. The metacharacters are dollar sign ( <code>\$</code> ), single-quote ( <code>'</code> ), double-quote ( <code>"</code> ), number sign ( <code>#</code> ), new-line, and backslash ( <code>\</code> ). The special meaning of metacharacters can be avoided by preceding them with a backslash. A new-line preceded by a backslash is treated as a blank. A number sign introduces a comment, which continues to the next new-line.     |
|                                                   | A string enclosed in a pair of single-quote or double-quote characters forms all or part of a single word. White space and new-line characters within a quoted string become part of the word. Characters within a quoted string can be quoted by preceding them with a backslash character; thus a single-quote character can appear in a single-quoted string by preceding it with a backslash. Two backslashes produce a single backslash, and a new-line preceded by a backslash produces a new-line in the string. |
| <b>IA Variables</b>                               | The boot maintains a set of variables, each of which has a string value. The first character of a variable name must be a letter, and subsequent characters can be letters, digits, or underscores. The <code>set</code> command creates a variable and/or assigns a value to it, or displays the values of variables. The <code>unset</code> command deletes a variable.                                                                                                                                               |
|                                                   | Variable substitution is performed when the interpreter encounters a dollar-sign that is not preceded by a backslash. The variable name following the dollar sign is replaced by the value of the variable, and parsing continues at the beginning of the value. Variable substitution is performed in double-quoted strings, but not in single-quoted strings. A variable name can be enclosed in braces to separate it from following characters.                                                                     |
| <b>IA Commands</b>                                | A command is a sequence of words terminated by a new-line character. The first word is the name of the command and subsequent words are arguments to the command. All commands are built-in commands. Standalone programs are executed with the <code>run</code> command.                                                                                                                                                                                                                                               |
| <b>IA Conditional Execution of Commands</b>       | Commands can be conditionally executed by surrounding them with the <code>if</code> , <code>elseif</code> , <code>else</code> , and <code>endif</code> commands:                                                                                                                                                                                                                                                                                                                                                        |
|                                                   | <pre> if <i>expr1</i> . . . elseif <i>expr2</i> . . . elseif <i>expr3</i> . . . else </pre>                                                                                                                                                                                                                                                                                                                                                                                                                             |

`endif` An `if` block may be embedded in other `if` blocks.

### IA Expressions

The `set`, `if`, and `elseif` commands evaluate arithmetic expressions with the syntax and semantics of the C programming language. The `|`, `&&`, `|`, `^`, `&`, `==`, `!=`, `<`, `>`, `<=`, `>=`, `>>`, `<<`, `+`, `-`, `*`, `/`, `%`, `~`, and `!` operators are accepted, as are `(`, `)`, and comma. Signed 32-bit integer arithmetic is performed.

Expressions are parsed after the full command line has been formed. Each token in an expression must be a separate argument word, so blanks must separate all tokens on the command line.

Before an arithmetic operation is performed on an operand word, it is converted from a string to a signed 32-bit integer value. After an optional leading sign, a leading `0` produces octal conversion and a leading `0x` or `0X` produces hexadecimal conversion. Otherwise, decimal conversion is performed. A string that is not a legal integer is converted to zero.

Several built-in functions for string manipulation are provided. Built-in function names begin with a dot. String arguments to these functions are not converted to integers. To cause an operator, for example, `-`, to be treated as a string, it must be preceded by a backslash, and that backslash must be quoted with another backslash. Also be aware that a null string can produce a blank argument, and thus an expression syntax error. For example:

```
if .strneq (${usrarg}X , \- , 1) is the safe way to test whether the variable usrarg
starts with a -, even if it could be null.
```

### IA I/O

The boot interpreter takes its input from the system console or from one or more files. The source command causes the interpreter to read a file into memory and begin parsing it. The console command causes the interpreter to take its input from the system console. Reaching EOF causes the interpreter to resume parsing the previous input source. CTRL-D entered at the beginning of console line is treated as EOF.

The `echo` command writes its arguments to the display. The `read` command reads the system console and assigns word values to its argument variables.

### IA Debugging

The `verbose` command turns verbose mode on and off. In verbose mode, the interpreter displays lines from the current source file and displays the command as actually executed after variable substitution.

The `singlestep` command turns singlestep mode on and off. In singlestep mode, the interpreter displays `step ?` before processing the next command, and waits for keyboard input, which is discarded. Processing proceeds when ENTER is pressed. This allows slow execution in verbose mode.

|                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>IA Initialization</b>                         | When the interpreter is first invoked by the boot, it begins execution of a compiled-in initialization string. This string typically consists of "source /etc/bootrc\n" to run the boot script in the root file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>IA Communication With Standalone Programs</b> | The boot passes information to standalone programs through arguments to the run command. A standalone program can pass information back to the boot by setting a boot interpreter variable using the <code>var_ops()</code> boot service function. It can also pass information to the kernel using the <code>setprop()</code> boot service function. The <code>whoami</code> property is set to the name of the standalone program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>IA Built-in Commands</b>                      | <p><code>console</code><br/>Interpret input from the console until CTRL-D.</p> <p><code>echo arg1 ...</code><br/>Display the arguments separated by blanks and terminate with a new-line.</p> <p><code>echo -n arg1 ...</code><br/>Display the arguments separated by blanks, but do not terminate with a new-line.</p> <p><code>getprop <i>propname varname</i></code><br/>Assign the value of property <i>propname</i> to the variable <i>varname</i>. A property value of length zero produces a null string. ## boot(1M)

`readt time . . .`  
Same as `read`, but timeout after `time` seconds.

`run name arg1 . . .`  
Load and transfer control to the standalone program `name`, passing it `arg1` and further arguments.

`set`  
Display all the current variables and their values.

`set name`  
Set the value of the variable `name` to the null string.

`set name word`  
Set the value of the variable `name` to `word`.

`set name expr`  
Set the value of the variable `name` to the value of `expr`. `expr` must consist of more than one word. The value is encoded in unsigned hexadecimal, so that `-1` is represented by `0xFFFFFFFF`.

`setcolor`  
Set the text mode display attributes. Allowable colors are `black`, `blue`, `green`, `cyan`, `red`, `magenta`, `brown`, `white`, `gray`, `lt_blue`, `lt_green`, `lt_cyan`, `lt_red`, `lt_magenta`, `yellow`, and `hi_white`.

`setprop propname word`  
Set the value of the property `propname` to `word`.

`singlestep` or `singlestep on`  
Turn on singlestep mode, in which the interpreter displays `step ?` before each command is processed, and waits for keyboard input. Press ENTER to execute the next command.

`singlestep off`  
Turn off singlestep mode.

`source name`  
Read the file `name` into memory and begin to interpret it. At EOF, return to the previous source of input.

`unset name`  
Delete the variable name.

`verbose` or `verbose on`  
Turn on verbose mode, which displays lines from source files and commands to be executed.

`verbose off`  
Turn off verbose mode.

### IA Built-in Functions

The following built-in functions are accepted within expressions:

|                                            |                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>.strcmp(string1, string2)</code>     | Returns an integer value that is less than, equal to, or greater than zero, as <i>string1</i> is lexicographically less than, equal to, or greater than <i>string2</i> .                                                                                                                                                                                                            |
| <code>.strncmp(string1, string2, n)</code> | Returns an integer value that is less than, equal to, or greater than zero, as <i>string1</i> is lexicographically less than, equal to, or greater than <i>string2</i> . At most, <i>n</i> characters are compared.                                                                                                                                                                 |
| <code>.streq(string1, string2)</code>      | Returns true if <i>string1</i> is equal to <i>string2</i> , and false otherwise.                                                                                                                                                                                                                                                                                                    |
| <code>.strneq(string1, string2, n)</code>  | Returns true if <i>string1</i> is equal to <i>string2</i> , and false otherwise. At most, <i>n</i> characters are compared.                                                                                                                                                                                                                                                         |
| <code>.strfind(string, addr, n)</code>     | Scans <i>n</i> locations in memory starting at <i>addr</i> , looking for the beginning of <i>string</i> . The <i>string</i> in memory need not be null-terminated. Returns true if <i>string</i> is found, and false otherwise. <code>.strfind</code> can be used to search for strings in the ROM BIOS and BIOS extensions that identify different machines and peripheral boards. |

**SPARC** **EXAMPLE 1** To Boot the Default Kernel In Single-User Interactive Mode

To boot the default kernel in single-user interactive mode, respond to the `ok` prompt with one of the following:

```
boot -as
```

```
boot disk3 -as
```

**32-bit SPARC** **EXAMPLE 2** To Boot `kadb` Specifying The 32-Bit Kernel As The Default File

To boot `kadb` specifying the 32-bit kernel as the default file:

```
boot kadb -D kernel/unix
```

**EXAMPLE 3** To Boot the 32-Bit Kernel Explicitly

To boot the 32-bit kernel explicitly, the kernel file name should be specified. So, to boot the 32-bit kernel in single-user interactive mode, respond to the `ok` prompt with one of the following:

```
boot kernel/unix -as
```

```
boot disk3 kernel/unix -as
```

## boot(1M)

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**WARNINGS** The `boot` utility is unable to determine which files can be used as bootable programs. If the booting of a file that is not bootable is requested, the `boot` utility loads it and branches to it. What happens after that is unpredictable.

**NOTES** *platform-name* can be found using the `-i` option of `uname(1)`. *hardware-class-name* can be found using the `-m` option of `uname(1)`.

#### 64-bit SPARC **Booting UltraSPARC Systems**

Certain platforms may need a firmware upgrade to run the 64-bit kernel. See the *Sun Hardware Platform Guide* for details. If the 64-bit kernel packages are installed and `boot` detects that the platform needs a firmware upgrade to run 64-bit, `boot` displays a message on the console and chooses the 32-bit kernel as the default file instead.

On systems containing 200MHz or lower UltraSPARC-1 processors, it is possible for a user to run a 64-bit program designed to exploit a problem that could cause a processor to stall. Since 64-bit programs cannot run on the 32-bit kernel, the 32-bit kernel is chosen as the default file on these systems.

The code sequence that exploits the problem is very unusual and is not likely to be generated by a compiler. Assembler code had to be specifically written to demonstrate the problem. It is highly unlikely that a legitimate handwritten assembler routine would use this code sequence.

Users willing to assume the risk that a user might accidentally or deliberately run a program that was designed to cause a processor to stall may choose to run the 64-bit kernel by modifying the `boot` policy file. Edit `/platform/platform-name/boot.conf` so that it contains an uncommented line with the variable named `ALLOW_64BIT_KERNEL_ON_UltraSPARC_1_CPU` set to the value `true` as shown in the example that follows:

```
ALLOW_64BIT_KERNEL_ON_UltraSPARC_1_CPU=true
```

For more information, see the *Sun Hardware Platform Guide*.

**IA Only** Because the “-” key on national language keyboards has been moved, an alternate key must be used to supply arguments to the `boot` command on an IA based system

## boot(1M)

using these keyboards. Use the “-” on the numeric keypad. The specific language keyboard and the alternate key to be used in place of the “-” during bootup is shown below.

| Keyboard | Substitute Key |
|----------|----------------|
| Italy    | '              |
| Spain    | '              |
| Sweden   | +              |
| France   | ?              |
| Germany  | ?              |

For example, `b -r` would be typed as `b +r` on Swedish keyboards, although the screen display will show as `b -r`.

| <b>NAME</b>        | bsmconv, bsmunconv – enable or disable the Basic Security Module (BSM) on Solaris                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |

| <b>DESCRIPTION</b> | <p>The <code>bsmconv</code> and <code>bsmunconv</code> scripts are used to enable or disable the BSM features on a Solaris system. The optional argument <code>rootdir</code> is a list of one or more root directories of diskless clients which have already been configured by way of the Host Manager, see <code>admintool(1M)</code></p> <p>To enable or disable BSM on a diskless client, a server, or a stand-alone system, logon as super-user to the system being converted and use the <code>bsmconv</code> or <code>bsmunconv</code> commands without any options.</p> <p>To enable or disable BSM on a diskless client from that client's server, logon to the server as super-user and use <code>bsmconv</code>, specifying the root directory of each diskless client you wish to affect. For example, the command:</p> <pre>myhost# bsmconv /export/root/client1 /export/root/client2</pre> <p>enables BSM on the two machines named <code>client1</code> and <code>client2</code>. While the command:</p> <pre>myhost# bsmconv</pre> <p>enables BSM only on the machine called <code>myhost</code>. It is no longer necessary to enable BSM on both the server and its diskless clients.</p> <p>After running <code>bsmconv</code> the system can be configured by editing the files in <code>/etc/security</code>. Each diskless client has its own copy of configuration files in its root directory. You may wish to edit these files before rebooting each client.</p> <p>Following the completion of either script, the affected system(s) should be rebooted to allow the auditing subsystem to come up properly initialized.</p> |                |                 |              |         |

| <b>NAME</b>        | busstat – report bus-related performance statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>SYNOPSIS</b>    | <b>busstat</b> -e <i>device-inst</i>   -h   -l<br><b>busstat</b> [-a] [-n] [-w <i>device-inst</i> [,pic0= <i>event</i> ,picn= <i>event</i> ] ]... [-r <i>device-inst</i> ]... [ <i>interval</i> [ <i>count</i> ]]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>busstat provides access to the bus-related performance counters in the system. These performance counters allow for the measurement of statistics like hardware clock cycles, bus statistics including DMA and cache coherency transactions on a multiprocessor system. Each bus device that supports these counters can be programmed to count a number of events from a specified list. Each device supports one or more Performance Instrumentation Counters (PIC) that are capable of counting events independently of each other.</p> <p>Separate events can be selected for each PIC on each instance of these devices. busstat summarizes the counts over the last interval seconds, repeating forever. If a count is given, the statistics are repeated count times.</p> <p>Only root users can program these counters. Non-root users have the option of reading the counters that have been programmed by a root user.</p> <p>The default value for the <i>interval</i> argument is 1 second, and the default <i>count</i> is unlimited.</p> <p>The devices that export these counters are highly platform-dependent and the data may be difficult to interpret without an in-depth understanding of the operation of the components that are being measured and of the system they reside in.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"><li>-a<br/>Display absolute counter values. The default is <code>delta</code> values.</li><li>-e <i>device-inst</i><br/>Display the list of events that the specified device supports for each pic.<br/>Specify <i>device-inst</i> as device (name) followed by an optional instance number. If an instance number is specified, the events for that instance are displayed. If no instance number is specified, the events for the first instance of the specified device are displayed.</li><li>-h<br/>Print a usage message.</li><li>-l<br/>List the devices in the system which support performance counters.</li><li>-n<br/>Do not display a title in the output. The default is to display titles.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**-r** *device-inst*

Read and display all pic values for the specified device

Specify *device-inst* as *device* (name) followed by *instance number*, if specifying an instance number of a device whose counters are to be read and displayed. If all instances of this device are to be read, use *device* (name) without an instance number. All pic values will be sampled when using the **-r** option.

**-w** *device-inst* [*pic0=event*] [*picn=event*]

Program (write) the specified devices to count the specified events. Write access to the counters is restricted to root users only. Non-root users can use **-r** option.

Specify *device-inst* as *device* (name) followed by an optional *instance number*. If specifying an instance number of a device to program these events on. If all instances of this device are to be programmed the same, then use *device* without an instance number. Specify an event to be counted for a specified pic by providing a comma separated list of *picn=event* values.

The **-e** option displays all valid event names for each device. Any devices that are programmed will be sampled every interval seconds and repeated count times. It is recommended that the interval specified is small enough to ensure that counter wraparound will be detected. The rate at which counters wraparound varies from device to device. If a user is programming events using the **-w** option and `busstat` detects that another user has changed the events that are being counted, the tool will terminate as the programmed devices are now being controlled by another user. Only one user can be programming a device instance at any one time. Extra devices can be sampled using the **-r** option. Using multiple instances of the **-w** option on the same command line, with the same *device-inst* specifying a different list of events for the pics will give the effect of multiplexing for that device. `busstat` will switch between the list of events for that device every interval seconds. Event can be a string representing the event name, or even a number representing the bit pattern to be programmed into the Performance Control Register (PCR). This assumes explicit knowledge of the meaning of the control register bits for a device. The number can be specified in hexadecimal, decimal, or octal, using the usual conventions of `strtoul(3C)`.

**EXIT STATUS** The following exit values are returned:

- 0 Successful completion.
- 1 An error occurred.
- 2 Another user is writing to the same devices.

**SPARC Only** **EXAMPLE 1** Programming and monitoring the Address Controller counters

In this example, `ac0` refers to the Address Controller instance 0. The counters are programmed to count Memory Bank stalls on an Ultra Enterprise system at 10 second intervals with the values displayed in absolute form instead of deltas.

**EXAMPLE 1** Programming and monitoring the Address Controller counters *(Continued)*

```
busstat -a -w ac0,pic0=mem_bank0_stall,pic1=mem_bank1_stall 10
time dev event0 pic0 event1 pic1
10 ac0 mem_bank0_stall 1234 mem_bank1_stall 5678
20 ac0 mem_bank0_stall 5678 mem_bank1_stall 12345
30 ac0 mem_bank0_stall 12345 mem_bank1_stall 56789
...
```

For a complete list of the supported events for a device, use the `-e` option.

**EXAMPLE 2** Programming and monitoring the counters on all instances of the Address Controller

In this example, `ac` refers to all `ac` instances. This example programs all instances of the Address Controller counters to count `_clock` cycles and `mem_bank0_rds` at 2 second intervals, 100 times, displaying the values as deltas.

```
busstat -w ac,pic0=clock_cycles,pic1=mem_bank0_rds 2 100
time dev event0 pic0 event1 pic1
2 ac0 clock_cycles 167242902 mem_bank0_rds 3144
2 ac1 clock_cycles 167254476 mem_bank0_rds 1392
4 ac0 clock_cycles 168025190 mem_bank0_rds 40302
4 ac1 clock_cycles 168024056 mem_bank0_rds 40580
...
```

**EXAMPLE 3** Monitoring the events being counted

This example monitors the events that are being counted on the `sbus1` device, 100 times at 1 second intervals. It suggests that a root user has changed the events that `sbus1` was counting to be `dvma_tlb_misses` and `interrupts` instead of `pio_cycles`.

```
% busstat -r sbus0 1 100

time dev event0 pic0 event1 pic1
1 sbus1 pio_cycles 2321 pio_cycles 2321
2 sbus1 pio_cycles 48 pio_cycles 48
3 sbus1 pio_cycles 49 pio_cycles 49
4 sbus1 pio_cycles 2281 pio_cycles 2281
5 sbus1 dvma_tlb_misses 0 interrupts 0
6 sbus1 dvma_tlb_misses 6 interrupts 2
7 sbus1 dvma_tlb_misses 8 interrupts 11
...
```

**EXAMPLE 4** Event Multiplexing

This example programs `ac0` to alternate between counting (clock cycles, `mem_bank0_rds`) and (`addr_pkts`, `data_pkts`) at 2 second intervals while also monitoring what `ac1` is counting :

**EXAMPLE 4** Event Multiplexing (Continued)

It shows the expected output of the above `busstat` command. Another root user on the machine has changed the events that this user had programmed and `busstat` has detected this and terminates the command with a message.

```
busstat -w ac0,pic0=clock_cycles,pic1=mem_bank0_rds \
-w ac0,pic0=addr_pkts,pic1=data_pkts \
-r ac1 2
```

| time | dev | event0       | pic0      | event1        | pic1   |
|------|-----|--------------|-----------|---------------|--------|
| 2    | ac0 | addr_pkts    | 12866     | data_pkts     | 17015  |
| 2    | ac1 | rio_pkts     | 385       | rio_pkts      | 385    |
| 4    | ac0 | clock_cycles | 168018914 | mem_bank0_rds | 2865   |
| 4    | ac1 | rio_pkts     | 506       | rio_pkts      | 506    |

| <b>NAME</b>        | <code>cachefslog</code> – Cache File System logging                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <code>cachefslog</code> [-f <i>logfile</i>   -h] <i>cachefs_mount_point</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | The <code>cachefslog</code> command displays where CacheFS statistics are being logged. Optionally, it sets where CacheFS statistics are being logged, or it halts logging for a cache specified by <i>cachefs_mount_point</i> . The <i>cachefs_mount_point</i> argument is a mount point of a cache file system. All file systems cached under the same cache as <i>cachefs_mount_point</i> will be logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>OPTIONS</b>     | The following options are supported. You must be super-user to use the -f and -h options.<br><br>-f <i>logfile</i> Specify the log file to be used.<br>-h                    Halt logging.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>OPERANDS</b>    | <i>cachefs_mount_point</i> A mount point of a cache file system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>USAGE</b>       | See <code>largefile(5)</code> for the description of the behavior of <code>cachefslog</code> when encountering files greater than or equal to 2 Gbyte (2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Checking the Logging of a directory.</p> <p>The example below checks if the directory <code>/home/sam</code> is being logged:</p> <pre>example% cachefslog /home/sam not logged: /home/sam</pre> <p><b>EXAMPLE 2</b> Changing the <i>logfile</i>.</p> <p>The example below changes the <i>logfile</i> of <code>/home/sam</code> to <code>/var/tmp/samlog</code>:</p> <pre>example# cachefslog -f /var/tmp/samlog /home/sam /var/tmp/samlog: /home/sam</pre> <p><b>EXAMPLE 3</b> Verifying the change of a <i>logfile</i>.</p> <p>The example below verifies the change of the previous example:</p> <pre>example% cachefslog /home/sam /var/tmp/samlog: /home/sam</pre> <p><b>EXAMPLE 4</b> Halting the logging of a directory.</p> <p>The example below halts logging for the <code>/home/sam</code> directory:</p> <pre>example# cachefslog -h /home/sam not logged: /home/sam</pre> |
| <b>EXIT STATUS</b> | The following exit values are returned:<br><br>0                    success                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

non-zero            an error has occurred.

**ATTRIBUTES**    See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>NAME</b>        | cachefspack – pack files and file systems in the cache                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYNOPSIS</b>    | <b>cachefspack</b> [-h] [-i   -p   -u] [-f <i>packing-list</i> ] [-U <i>cache-directory</i> ]<br>[ <i>file...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | The <code>cachefspack</code> utility is used to set up and maintain files in the cache. This utility affords greater control over the cache, ensuring that the specified files will be in the cache whenever possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>OPTIONS</b>     | The following options are supported:<br><br>-f <i>packing-list</i> Specify a file containing a list of files and directories to be packed. Options within subdirectories and files can also be specified. The format and rules governing <i>packing-list</i> are described on the <code>packingrules(4)</code> manual page. Directories are packed recursively. Symlinks that match a regular expression on a <code>LIST</code> command are followed. Symlinks encountered while recursively processing directories are not followed.<br><br>-h                                    Help. Print a brief summary of all the options.<br><br>-i                                    View information about the packed files.<br><br>-p                                    Pack the file or files specified by <i>file</i> . This is the default behavior.<br><br>-u                                    Unpack the file or files specified by <i>file</i> .<br><br>-U <i>cache-directory</i> Unpack all files in the specified cache directory. |
| <b>OPERANDS</b>    | The following operands are supported:<br><br><i>file</i> A path name of a file to be packed or unpacked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>USAGE</b>       | See <code>largefile(5)</code> for the description of the behavior of <code>cachefspack</code> when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>EXAMPLES</b>    | <b>EXAMPLE 1</b> The following example packs the file <code>projects</code> in the cache.<br><br>% <code>cachefspack -p projects</code><br><br><b>EXAMPLE 2</b> The following example packs the files <code>projects</code> , <code>updates</code> , and <code>master_plan</code> in the cache.<br><br>% <code>cachefspack -p projects updates master_plan</code><br><br><b>EXAMPLE 3</b> The following example unpacks the file <code>projects</code> from the cache.<br><br>% <code>cachefspack -u projects</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**EXAMPLE 4** The following example unpacks the files `projects`, `updates`, and `master_plan` from the cache.

```
% cachefspack -u projects updates master_plan
```

**EXAMPLE 5** The following example unpacks all files in the cache directory `cache1`.

```
% cachefspack -U /cache/cache1
```

**EXAMPLE 6** The following example illustrates the use of a packing list to specify files to be packed in the cache. The contents of `lists.pkg` are as follows:

```
IGNORE SCCS BASE /src/junk LIST *.c LIST *.h
```

This example will pack all files in the directory `/src/junk` with `.c` and `.h` extensions that do not contained the string `SCCS` in the file's path name.

```
% cachefspack -f lists.pkg
```

**EXIT STATUS**

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| <b>NAME</b>               | cachefsstat – Cache File System statistics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |
| <b>SYNOPSIS</b>           | <code>/usr/bin/cachefsstat [-z] [path...]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |
| <b>DESCRIPTION</b>        | <p>The <code>cachefsstat</code> command displays statistical information about the cache file system mounted on <i>path</i>. The statistical information includes cache hits and misses, consistency checking, and modification operations. If <i>path</i> is not specified, all mounted cache file systems are used.</p> <p><code>cachefsstat</code> can also be used to reinitialize this information (see <code>-z</code> option).</p> <p>The statistical information has the following format:</p> <pre>&lt;cache hit rate&gt;<br/>&lt;consistency checks&gt;<br/>&lt;modifies&gt;</pre> <p>where:</p> <table><tr><td><i>hit rate</i></td><td>The percentage of cache hits over the total number of attempts, followed by the actual numbers of hits and misses.</td></tr><tr><td><i>consistency checks</i></td><td>The number of consistency checks performed, followed by the number that passed, and the number that failed.</td></tr><tr><td><i>modifies</i></td><td>The number of modify operations, including writes, creates, etc.</td></tr></table> | <i>hit rate</i> | The percentage of cache hits over the total number of attempts, followed by the actual numbers of hits and misses. | <i>consistency checks</i> | The number of consistency checks performed, followed by the number that passed, and the number that failed. | <i>modifies</i> | The number of modify operations, including writes, creates, etc. |
| <i>hit rate</i>           | The percentage of cache hits over the total number of attempts, followed by the actual numbers of hits and misses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |
| <i>consistency checks</i> | The number of consistency checks performed, followed by the number that passed, and the number that failed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |
| <i>modifies</i>           | The number of modify operations, including writes, creates, etc.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |
| <b>OPTIONS</b>            | <p>The following option is supported:</p> <p><code>-z</code> Zero (reinitialize) statistics. Execute <code>cachefsstat -z</code> before executing <code>cachefsstat</code> again to gather statistics on the cache performance. This option can only be use by the superuser. The statistics printed reflect those just before the statistics are reinitialized.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |
| <b>USAGE</b>              | See <code>largefile(5)</code> for the description of the behavior of <code>cachefsstat</code> when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                 |                                                                                                                    |                           |                                                                                                             |                 |                                                                  |

| <b>DESCRIPTION</b> | The <b>cachefswssize</b> command displays the workspace size determined from <i>logfile</i> . This includes the amount of cache space needed for each filesystem that was mounted under the cache, as well as a total.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |        |                  |        |           |      |                  |      |           |       |                  |       |               |         |           |        |                  |        |
| <b>USAGE</b>       | See <b>largefile(5)</b> for the description of the behavior of <b>cachefswssize</b> when encountering files greater than or equal to 2 Gbyte (2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |           |        |                  |        |           |      |                  |      |           |       |                  |       |               |         |           |        |                  |        |

**SEE ALSO** cachefslog(1M), cachefsstat(1M), cfsadmin(1M), attributes(5), largefile(5)

**DIAGNOSTICS** problems were encountered writing log file  
There were problems encountered when the kernel was writing the logfile. The most common problem is running out of disk space.

invalid log file  
The logfile is not a valid logfile or was created with a newer version of Solaris than the one where cachefswssize is running.

## captoinfo(1M)

| <b>NAME</b>        | captoinfo – convert a termcap description into a terminfo description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>captoinfo</b> [-1] [-v...] [-V] [-w <i>width</i> ] <i>filename</i> ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>captoinfo looks in <i>filename</i> for termcap descriptions. For each one found, an equivalent terminfo description is written to standard output, along with any comments found. A description which is expressed as relative to another description (as specified in the termcap <code>tc = field</code>) is reduced to the minimum superset before being displayed.</p> <p>If no <i>filename</i> is given, then the environment variable <code>TERMCAP</code> is used for the filename or entry. If <code>TERMCAP</code> is a full pathname to a file, only the terminal whose name is specified in the environment variable <code>TERM</code> is extracted from that file. If the environment variable <code>TERMCAP</code> is not set, then the file <code>/usr/share/lib/termcap</code> is read.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-1                    Display the fields one to a line. Otherwise, the fields are printed several to a line, with a maximum width of 60 characters.</p> <p>-v                    Display tracing information on the standard error as the program runs. Specifying additional -v options displays more detailed information.</p> <p>-V                    Display the version of the program in use on the standard error and then exit.</p> <p>-w <i>width</i>            Change the output to <i>width</i> characters.</p>                                                                                                                                                                                                                                                                               |                |                 |              |         |
| <b>FILES</b>       | <p><code>/usr/share/lib/terminfo/??/*</code>      compiled terminal description database</p> <p><code>/usr/share/lib/termcap</code></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                 |              |         |

| <b>DESCRIPTION</b> | <p>The <code>catman</code> utility creates the preformatted versions of the on-line manual from the <code>nroff(1)</code> or <code>sgml(5)</code> input files. This feature allows easy distribution of the preformatted manual pages among a group of associated machines (for example, with <code>rdist(1)</code>), since it makes the directories of preformatted manual pages self-contained and independent of the unformatted entries.</p> <p><code>catman</code> also creates the <code>windex</code> database file in the directories specified by the <code>MANPATH</code> or the <code>-M</code> option. The <code>windex</code> database file is a three column list consisting of a keyword, the reference page that the keyword points to, and a line of text that describes the purpose of the utility or interface documented on the reference page. Each keyword is taken from the comma separated list of words on the <code>NAME</code> line before the ‘-’ (dash). The reference page that the keyword points to is the first word on the <code>NAME</code> line. The text after the – on the <code>NAME</code> line is the descriptive text in the third column. The <code>NAME</code> line must be immediately preceded by the page heading line created by the <code>.TH</code> macro (see <code>NOTES</code> for required format).</p> <p>Each manual page is examined and those whose preformatted versions are missing or out of date are recreated. If any changes are made, <code>catman</code> recreates the <code>windex</code> database.</p> <p>If a manual page is a <i>shadow</i> page, that is, it sources another manual page for its contents, a symbolic link is made in the <code>catx</code> or <code>fmtx</code> directory to the appropriate preformatted manual page.</p> <p>Shadow files in an unformatted <code>nroff</code> source file are identified by the first line being of the form <code>.so manx/yyy.x</code>.</p> <p>Shadow files in the <code>SGML</code> sources are identified by the string <code>SHADOW_PAGE</code>. The file entity declared in the shadow file identifies the file to be sourced.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li><code>-c</code> Create unformatted <code>nroff</code> source files in the appropriate <code>man</code> subdirectories from the <code>SGML</code> sources. This option will overwrite any existing file in the <code>man</code> directory of the same name as the <code>SGML</code> file.</li> <li><code>-n</code> Do not create (or recreate) the <code>windex</code> database. If the <code>-n</code> option is specified, the <code>windex</code> database is not created and the <code>apropos</code>, <code>whatis</code>, <code>man -f</code>, and <code>man -k</code> commands will fail.</li> <li><code>-p</code> Print what would be done instead of doing it.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## catman(1M)

|                              |                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | -t                                     | Create <code>troffed</code> entries in the appropriate <code>fmt</code> subdirectories instead of <code>nroffing</code> into the <code>cat</code> subdirectories.                                                                                                                                                                                                                                                                                                                                              |
|                              | -w                                     | Only create the <code>windex</code> database that is used by <code>whatis(1)</code> and the <code>man(1)</code> <code>-f</code> and <code>-k</code> options. No manual reformatting is done.                                                                                                                                                                                                                                                                                                                   |
|                              | -M <i>directory</i>                    | Update manual pages located in the specified <i>directory</i> , ( <code>/usr/share/man</code> by default). If the <code>-M</code> option is specified, the directory argument must not contain a <code>,</code> (comma), since a comma is used to delineate section numbers. See <code>man(1)</code> .                                                                                                                                                                                                         |
|                              | -T <i>macro-package</i>                | Use <i>macro-package</i> in place of the standard manual page macros, ( <code>man(5)</code> by default).                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>OPERANDS</b>              | The following operand is supported:    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                              | <i>sections</i>                        | If there is one parameter not starting with a <code>'-</code> , it is taken to be a space separated list of manual sections to be processed by <code>catman</code> . If this operand is specified, only the manual sections in the list will be processed. For example,<br><br><pre>catman 1 2 3</pre> only updates manual sections 1, 2, and 3. If specific sections are not listed, all sections in the <code>man</code> directory specified by the environment variable <code>MANPATH</code> are processed. |
| <b>ENVIRONMENT VARIABLES</b> | TROFF                                  | The name of the formatter to use when the <code>-t</code> flag is given. If not set, <code>troff(1)</code> is used.                                                                                                                                                                                                                                                                                                                                                                                            |
|                              | MANPATH                                | A colon-separated list of directories that are processed by <code>catman</code> and <code>man(1)</code> . Each directory can be followed by a comma-separated list of sections. If set, its value overrides <code>/usr/share/man</code> as the default directory search path, and the <code>man.cf</code> file as the default section search path. The <code>-M</code> and <code>-s</code> flags, in turn, override these values.                                                                              |
| <b>FILES</b>                 | <code>/usr/share/man</code>            | default manual directory location                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                              | <code>/usr/share/man/man*/**.*</code>  | raw <code>nroff</code> input files                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                              | <code>/usr/share/man/sman*/**.*</code> | raw SGML input files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                              | <code>/usr/share/man/cat*/**.*</code>  | preformatted <code>nroffed</code> manual pages                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                              | <code>/usr/share/lib/tmac/an</code>    | default macro package                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWdoc         |
| CSI            | Enabled         |

**SEE ALSO** `apropos(1)`, `man(1)`, `nroff(1)`, `rdist(1)`, `rm(1)`, `troff(1)`, `whatis(1)`, `attributes(5)`, `man(5)`, `sgml(5)`

**DIAGNOSTICS** `man?/xxx.? (.so'ed from man?/yyy.?)`: No such file or directory  
The file outside the parentheses is missing, and is referred to by the file inside them.

`target of .so in man?/xxx.? must be relative to /usr/man`  
catman only allows references to filenames that are relative to the directory `/usr/man`.

`opendir:man?`: No such file or directory  
A harmless warning message indicating that one of the directories catman normally looks for is missing.

`*.*`: No such file or directory  
A harmless warning message indicating catman came across an empty directory.

**WARNINGS** If a user, who has previously run catman to install the `cat*` directories, upgrades the operating system, the entire `cat*` directory structure should be removed prior to running catman. See `rm(1)`.

Do not re-run catman to re-build the `whatis` database unless the complete set of `man*` directories is present. catman builds this `windex` file based on the `man*` directories.

**NOTES** To generate a valid `windex` index file, catman has certain requirements. Within the individual man page file, catman requires two macro lines to have a specific format. These are the `.TH` page heading line and the `.SH NAME` line.

The `.TH` macro requires at least the first three arguments, that is, the filename, section number, and the date. The `.TH` line starts off with the `.TH` macro, followed by a space, the man page filename, a single space, the section number, another single space, and the date. The date should appear in double quotes and is specified as "day month year," with the month always abbreviated to the first three letters (Jan, Feb, Mar, and so forth).

The `.SH NAME` macro, also known as the `NAME` line, must immediately follow the `.TH` line, with nothing in between those lines. No font changes are permitted in the `NAME` line. The `NAME` line is immediately followed by a line containing the man page

catman(1M)

filename; then shadow page names, if applicable, separated by commas; a dash; and a brief summary statement. These elements should all be on one line; no carriage returns are permitted.

An example of proper coding of these lines is:

```
.TH nismatch 1M "10 Apr 1998"
.SH NAME
nismatch, nisgrep \- utilities for searching NIS+ tables
```

| <b>DESCRIPTION</b> | <p>The <code>cfgadm</code> command provides configuration administration operations on dynamically reconfigurable hardware resources. These operations include displaying status, (-l), initiating testing, (-t), invoking configuration state changes, (-c), invoking hardware specific functions, (-x), and obtaining configuration administration help messages (-h). Configuration administration is performed at <i>attachment points</i>, which are places where system software supports dynamic reconfiguration of hardware resources during continued operation of Solaris.</p> <p>Configuration administration makes a distinction between hardware resources that are physically present in the machine and hardware resources that are configured and visible to Solaris. The nature of configuration administration functions are hardware specific, and are performed by calling hardware specific libraries.</p> <p>Configuration administration operates on an <i>attachment point</i>. Hardware resources located at attachment points can or can not be physically replaceable during system operation, but are dynamically reconfigurable by way of the configuration administration interfaces.</p> <p>An attachment point defines two unique elements, which are distinct from the hardware resources that exist beyond the attachment point. The two elements of an attachment point are a <i>receptacle</i> and an <i>occupant</i>. Physical insertion or removal of hardware resources occurs at attachment points and results in a receptacle gaining or losing an occupant. Configuration administration supports the physical insertion and removal operations as well as other configuration administration functions at an attachment point.</p> <p>Attachment points have associated state and condition information. The configuration administration interfaces provide control for transitioning attachment point states. A receptacle can exist in one of three states: <i>empty</i>, <i>disconnected</i> or <i>connected</i>, while an occupant can exist in one of two states: <i>configured</i> or <i>unconfigured</i>.</p> <p>A receptacle can provide the <i>empty</i> state, which is the normal state of a receptacle when the attachment point has no occupants. A receptacle can also provide the <i>disconnected</i> state if it has the capability of isolating its occupants from normal system access. Typically this state is used for various hardware specific testing prior to bringing the occupant's resources into full use by the system, or as a step in preparing</p> |

an occupant for physical removal or reconfiguration. A receptacle in the `disconnected` state isolates its occupant from the system as much as its hardware allows, but can provide access for testing and setup. A receptacle must provide the `connected` state, which allows normal access to hardware resources contained on any occupants. The `connected` state is the normal state of a receptacle that contains an occupant and that is not currently undergoing configuration administration operations.

The hardware resources contained on an occupant in the `unconfigured` state are not represented by normal Solaris data structures and are thus not available for use by Solaris. Operations allowed on an unconfigured occupant are limited to configuration administration operations. The hardware resources of an occupant in the `configured` state are represented by normal Solaris data structures and thus some or all of those hardware resources can be in use by Solaris. All occupants provide both the `configured` and `unconfigured` states,

An attachment point can be in one of five conditions: `unknown`, `ok`, `failing`, `failed`, or `unusable`. An attachment point can enter the system in any condition depending upon results of power-on tests and non-volatile record keeping.

An attachment point with an occupant in the `configured` state is in one of four conditions: `unknown`, `ok`, `failing`, or `failed`. If the condition is not `failing` or `failed` an attachment point can change to `failing` during the course of operation if a hardware dependent recoverable error threshold is exceeded. If the condition is not `failed` an attachment point can change to `failed` during operation as a result of an unrecoverable error.

An attachment point with an occupant in the `unconfigured` state can be in any of the defined conditions. The condition of an attachment point with an `unconfigured` occupant can decay from `ok` to `unknown` after a machine dependent time threshold. Initiating a test function changes the attachment point's condition to `ok`, `failing` or `failed` depending on the outcome of the test. An attachment point that does not provide a test function can leave the attachment point in the `unknown` condition. If a test is interrupted, the attachment point's condition can be set to the previous condition, `unknown` or `failed`. An attachment point in the `unknown`, `ok`, `failing`, or `failed` conditions can be re-tested.

An attachment point can exist in the `unusable` condition for a variety of reasons, such as inadequate power or cooling for the receptacle, an occupant that is unidentifiable, unsupported, incorrectly configured, etc. An attachment point in the `unusable` condition can never be used by the system. It typically remains in this condition until the physical cause is remedied.

An attachment point also maintains busy information that indicates when a state change is in progress or the condition is being reevaluated.

Attachment points are referred to using hardware specific identifiers (*ap\_ids*) that are related to the type and location of the attachment points in the system device hierarchy. An *ap\_id* can not be ambiguous, it must identify a single attachment point.

Two types of *ap\_id* specifications are supported: physical and logical. A physical *ap\_id* contains a fully specified pathname, while a logical *ap\_id* contains a shorthand notation that identifies an attachment point in a more user-friendly way.

For example, an attachment point representing a system's backplane slot number 7 could have a physical *ap\_id* of `/devices/central/fhc/sysctrl:slot7` while the logical *ap\_id* could be `system:slot7`. Another example, the third receptacle on the second PCI I/O bus on a system could have a logical *ap\_id* of `pci2:plug3`.

Attachment points may also be created dynamically. A dynamic attachment point is named relative to a base attachment point which is present in the system. *ap\_ids* for dynamic attachment points consist of a base component followed by two colons (`::`) and a dynamic component. The base component is the base attachment point *ap\_id*. The dynamic component is hardware specific and generated by the corresponding hardware specific library.

For example, consider a base attachment point, which represents a SCSI HBA, with the physical *ap\_id* `/devices/sbus@1f,0/SUNW,fas@e,8800000:scsi` and logical *ap\_id* `c0`. A disk attached to this SCSI HBA could be represented by a dynamic attachment point with logical *ap\_id* `c0::dsk/c0t0d0` where `c0` is the base component and `dsk/c0t0d0` is the hardware specific dynamic component. Similarly the physical *ap\_id* for this dynamic attachment point would be:  
`/devices/sbus@1f,0/SUNW,fas@e,8800000:scsi::dsk/c0t0d0`

An *ap\_type* is a partial form of a logical *ap\_id* that can be ambiguous and not specify a particular attachment point. An *ap\_type* is a substring of the portion of the logical *ap\_id* up to but not including the colon (`:`) separator. For example, an *ap\_type* of `pci` would show all attachment points whose logical *ap\_ids* begin with `pci`.

The use of *ap\_types* is discouraged. The new `select` sub-option to the `-s` option provides a more general and flexible mechanism for selecting attachment points. See `OPTIONS`.

The `cfgadm` command interacts primarily with hardware dependent functions contained in hardware specific libraries and thus its behavior is hardware dependent.

For each configuration administration operation a service interruption can be required. Should the completion of the function requested require a noticeable service interruption to interactive users, a prompt is output on the standard error output for confirmation on the standard input before the function is started. Confirmation can be overridden using the `-y` or `-n` options to always answer yes or no respectively. Hardware specific options, such as test level, are supplied as sub-options using the `-o` option.

Operations that change the state of the system configuration are audited by the system log daemon `syslogd(1M)`.

The arguments for this command conform to the `getopt(3C)` and `getsubopt(3C)` syntax convention.

## cfgadm(1M)

### OPTIONS

The following options are supported:

-a

Specifies that the -l option must also list dynamic attachment points.

-c *function*

Performs the state change *function* on the attachment point specified by *ap\_id*.

Specify *function* as *insert*, *remove*, *disconnect*, *connect*, *configure* or *unconfigure*. These functions cause state transitions at the attachment point by calling hardware specific library routines and are defined in the following list.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>insert</i>      | Performs operations that allows the user to manually insert an occupant or to activate a hardware supplied mechanism that performs the physical insertion. <i>insert</i> can have hardware specific side effects that temporarily suspend activity in portions of the system. In such cases the hardware specific library generates appropriate warning messages and informs the user of any special considerations or procedures unique to that hardware. Various hardware specific errors can cause this function to fail and set the receptacle condition to unusable. |
| <i>remove</i>      | Performs operations that allow the user to manually remove an occupant or to activate a hardware supplied mechanism to perform the physical removal. <i>remove</i> can have hardware specific side effects that temporarily suspend activity in portions of the system. In such cases the hardware specific library generates appropriate warning messages and informs the user of any special considerations or procedures unique to that hardware. Various hardware specific errors can cause this function to fail and set the receptacle condition to unusable.       |
| <i>disconnect</i>  | Performs hardware specific operations to put a receptacle in the disconnected state, which can prevent an occupant from operating in a normal fashion through the receptacle.                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>connect</i>     | Performs hardware specific operations to put the receptacle in the connected state, which allows an occupant to operate in a normal fashion through the receptacle.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>configure</i>   | Performs hardware specific operations that allow an occupant's hardware resources to be usable by Solaris. Occupants that are configured are part of the system configuration and are available for manipulation by Solaris device manipulation maintenance commands (eg: <i>psradm(1M)</i> , <i>mount(1M)</i> , <i>ifconfig(1M)</i> ).                                                                                                                                                                                                                                   |
| <i>unconfigure</i> | Performs hardware specific operations that logically remove an occupant's hardware resources from the system. The occupant must currently be configured and its hardware resources must not be in use by Solaris.                                                                                                                                                                                                                                                                                                                                                         |

State transition functions can fail due to the condition of the attachment point or other hardware dependent considerations. All state change *functions* in the direction of adding resources, (*insert*, *connect* and *configure*) are passed onto the hardware specific library when the attachment point is in the *ok* or *unknown* condition. All other conditions require the use of the *force* option to allow these *functions* to be passed on to the hardware specific library. Attachment point condition does not prevent a hardware specific library being called for related to the removal (*remove*, *disconnect* and *unconfigure*), of hardware resources from the system. Hardware specific libraries can reject state change *functions* if the attachment point is in the *unknown* condition.

The condition of an attachment point is not necessarily changed by the state change functions, however errors during state change operations can change the attachment point condition. An attempt to override a condition and force a state change that would otherwise fail can be made by specifying the *force* option (*-f*). Hardware specific safety and integrity checks can prevent the *force* option from having any effect.

*-f*

Forces the specified action to occur. Typically, this is a hardware dependent override of a safety feature. Forcing a state change operation can allow use of the hardware resources of occupant that is not in the *ok* or *unknown* conditions, at the discretion of any hardware dependent safety checks.

*-h [ap\_id | ap\_type ...]*

Prints out the help message text. If *ap\_id* or *ap\_type* is specified, the help routine of the hardware specific library for the attachment point indicated by the argument is called.

*-l [ap\_id | ap\_type ...]*

Lists the state and condition of attachment points specified. Attachment points can be filtered by using the *-s* option and *select* sub-option. Invoking *cfgadm* without one of the action options is equivalent to *-l* without an argument. The format of the list display is controlled by the *-v* and *-s* options. When the *-a* option is specified attachment points are dynamically expanded.

*-n*

Suppress any interactive confirmation and assume that the answer is *no*. If neither *-n* or *-y* is specified, interactive confirmation is obtained through the standard error output and the standard input. If either of these standard channels does not correspond to a terminal (as determined by *isatty(3C)*) then the *-n* option is assumed.

*-o hardware\_options*

Supplies hardware specific options to the main command option. The format and content of the hardware option string is completely hardware specific. The option string *hardware\_options* conforms to the *get.subopt(3C)* syntax convention.

*-s listing\_options*

Supplies listing options to the list (-l) command. *listing\_options* conforms to the getsubopt(3C) syntax convention. The sub-options are used to specify the attachment point selection criteria ( *select=select\_string*), the type of matching desired (*match=match\_type*), order of listing (*sort=field\_spec*), the data that is displayed (*cols=field\_spec* and *cols2=field\_spec*), the column delimiter (*delim=string*) and whether to suppress column headings (*noheadings*).

When the *select* sub-option is specified, only attachment points which match the specified criteria will be listed. The *select* suboption has the following syntax:

```
cfgadm -s select=attr1(value1):attr2(value2)...
```

where an *attr* is one of *ap\_id*, *class* or *type*. *ap\_id* refers to the logical *ap\_id* field, *class* refers to attachment point class and *type* refers to the type field.

*value1*, *value2*, etc. are the corresponding values to be matched. The type of match can be specified by the *match* sub-option as follows:

```
cfgadm -s match=match_type,select=attr1(value1)...
```

where *match\_type* can be either *exact* or *partial*. The default value is *exact*.

Arguments to the *select* suboption can be quoted to protect them from the shell.

A *field\_spec* is one or more *data-fields* concatenated using colon (:), as in *data-field:data-field:data-field*. A *data-field* is one of *ap\_id*, *physid*, *r\_state*, *o\_state*, *condition*, *type*, *busy*, *status\_time*, *status\_time\_p*, *class*, and *info*. The *ap\_id* field output is the logical name for the attachment point, while the *physid* field contains the physical name. The *r\_state* field can be *empty*, *disconnected* or *connected*. The *o\_state* field can be *configured* or *unconfigured*. The *busy* field can be either *y* if the attachment point is busy, or *n* if it is not. The *type* and *info* fields are hardware specific. The *status\_time\_p* field is a parsable version of the *status\_time* field. If an attachment point has an associated class, the *class* field lists the class name. If an attachment point does not have an associated class, the *class* field lists *none*.

The order of the fields in *field\_spec* is significant: For the *sort* sub-option, the first field given is the primary sort key. For the *cols* and *cols2* sub-options, the fields are printed in the order requested. The order of sorting on a *data-field* can be reversed by placing a minus (-) before the *data-field* name within the *field\_spec* for the *sort* sub-option. The default value for *sort* is *ap\_id*. The default values for *cols* and *cols2* depend on whether the *-v* option is given: Without it *cols* is *ap\_id:r\_state:o\_state:condition* and *cols2* is not set. With *-v* *cols* is *ap\_id:r\_state:o\_state:condition:info* and *cols2* is *status\_time:type:busy:physid:.* The default value for *delim* is a single space. The value of *delim* can be a string of arbitrary length. The delimiter cannot include comma (,) character, see getsubopt(3C). These listing options can be used to create parsable output. See NOTES.

-t

Performs a test of one or more attachment points. The test function is used to re-evaluate the condition of the attachment point. Without a test level specifier in *hardware\_options*, the fastest test that identifies hard faults is used.

More comprehensive tests are hardware specific and are selected using the *hardware\_options*.

The results of the test is used to update the condition of the specified occupant to either `ok` if no faults are found, `failing` if recoverable faults are found or `failed` if any unrecoverable faults are found.

If a test is interrupted, the attachment point's condition can be restored to its previous value or set to `unknown` if no errors were found or `failing` if only recoverable errors were found or to `failed` if any unrecoverable errors were found. The attachment point should only be set to `ok` upon normal completion of testing with no errors.

-v

Executes in verbose mode. For the `-c`, `-t` and `-x` options outputs a message giving the results of each attempted operation. Outputs detailed help information for the `-h` option. Outputs verbose information for each attachment point for the `-l` option.

-x *hardware\_function*

Performs hardware specific functions. Private hardware specific functions can change the state of a receptacle or occupant. Attachment point conditions can change as the result of errors encountered during private hardware specific functions. The format and content of the *hardware\_function* string is completely hardware specific. The option string *hardware\_function* conforms to the `getsubopt(3C)` syntax convention.

-y

Suppresses any interactive confirmation and assume that the answer is yes.

**USAGE** The required privileges to use this command are hardware dependent. Typically, a default system configuration restricts all but the list option to the superuser.

**EXAMPLES** **EXAMPLE 1** Listing attachment points in the device tree

The following example lists all attachment points except dynamic attachment points.

```
example# cfgadm
```

| Ap_Id        | Type      | Receptacle   | Occupant     | Cond     |
|--------------|-----------|--------------|--------------|----------|
| system:slot0 | cpu/mem   | connected    | configured   | ok       |
| system:slot1 | sbus-upa  | connected    | configured   | ok       |
| system:slot2 | cpu/mem   | connected    | configured   | ok       |
| system:slot3 | unknown   | connected    | unconfigured | unknown  |
| system:slot4 | dual-sbus | connected    | configured   | failing  |
| system:slot5 | cpu/mem   | connected    | configured   | ok       |
| system:slot6 | unknown   | disconnected | unconfigured | unusable |

**EXAMPLE 1** Listing attachment points in the device tree (Continued)

```
system:slot7 unknown empty unconfigured ok
c0 scsi-bus connected configured unknown
c1 scsi-bus connected configured unknown
```

**EXAMPLE 2** Listing all configurable hardware information

The following example lists all current configurable hardware information, including those represented by dynamic attachment points:

```
example# cfgadm -al
```

| Ap_Id           | Type      | Receptacle   | Occupant     | Cond     |
|-----------------|-----------|--------------|--------------|----------|
| system:slot0    | cpu/mem   | connected    | configured   | ok       |
| system:slot1    | sbus-upa  | connected    | configured   | ok       |
| system:slot2    | cpu/mem   | connected    | configured   | ok       |
| system:slot3    | unknown   | connected    | unconfigured | unknown  |
| system:slot4    | dual-sbus | connected    | configured   | failing  |
| system:slot5    | cpu/mem   | connected    | configured   | ok       |
| system:slot6    | unknown   | disconnected | unconfigured | unusable |
| system:slot7    | unknown   | empty        | unconfigured | ok       |
| c0              | scsi-bus  | connected    | configured   | unknown  |
| c0::dsk/c0t14d0 | disk      | connected    | configured   | unknown  |
| c0::dsk/c0t11d0 | disk      | connected    | configured   | unknown  |
| c0::dsk/c0t8d0  | disk      | connected    | configured   | unknown  |
| c0::rmt/0       | tape      | connected    | configured   | unknown  |
| c1              | scsi-bus  | connected    | configured   | unknown  |

**EXAMPLE 3** Selective listing based on attachment point attributes

The following example lists all attachment points whose class begins with `scsi`, `ap_id` begins with `c` and `type` field begins with `scsi`. The argument to the `-s` option is quoted to protect it from the shell.

```
example# cfgadm -s "match=partial,select=class(scsi):ap_id(c):type(scsi)"
```

| Ap_Id | Type     | Receptacle | Occupant   | Cond    |
|-------|----------|------------|------------|---------|
| c0    | scsi-bus | connected  | configured | unknown |
| c1    | scsi-bus | connected  | configured | unknown |

**EXAMPLE 4** Listing current configurable hardware information in verbose mode.

The following example lists current configurable hardware information for *ap-type* system in verbose mode:

```
example# cfgadm -v -l system
```

| Ap_Id        | Type     | Receptacle | Occupant                           | Condition | Information    |
|--------------|----------|------------|------------------------------------|-----------|----------------|
| When         | Type     | Busy       | Phys_Id                            |           |                |
| system:slot1 |          | connected  | configured                         | ok        |                |
| Apr 4 23:50  | sbus-upa | n          | /devices/central/fhc/sysctrl:slot1 |           |                |
| system:slot3 |          | connected  | configured                         | ok        | non-detachable |
| Apr 17 11:20 | cpu/mem  | n          | /devices/central/fhc/sysctrl:slot3 |           |                |

**EXAMPLE 4** Listing current configurable hardware information in verbose mode.  
(Continued)

```
system:slot5 connected configured ok
Apr 4 23:50 cpu/mem n /devices/central/fhc/sysctrl:slot5
system:slot7 connected configured ok
Apr 4 23:50 dual-sbus n /devices/central/fhc/sysctrl:slot7
```

**EXAMPLE 5** The hardware specific extended test.

The following example tests two occupants using the hardware specific extended test:

```
example# cfgadm -v -o extended -t system:slot3 system:slot5
Testing attachment point system:slot3 ... ok
Testing attachment point system:slot5 ... ok
```

**EXAMPLE 6** The force option.

The following example configures an occupant in the failing state to the system using the force option:

```
example# cfgadm -f -c configure system:slot3
```

**EXAMPLE 7** Unconfiguring an occupant from the system.

The following example unconfigures an occupant from the system:

```
example# cfgadm -c unconfigure system:slot4
```

**EXAMPLE 8** Configuring an occupant at an attachment point

The following example configures an occupant:

```
example# cfgadm -c configure c0::dsk/c0t0d0
```

**ENVIRONMENT VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `cfgadm`: `LC_TIME`, `LC_MESSAGES`, `NLSPATH` and `TZ`.

- `LC_MESSAGES` Determines how `cfgadm` displays column headings and error messages. Listing output data is not affected by the setting of this variable.
- `LC_TIME` Determines how `cfgadm` displays human readable status changed time (`status_time`).
- `TZ` Specifies the timezone used when converting the status changed time. This applies to both the human readable (`status_time`) and parsable (`status_time_p`) formats.

**EXIT STATUS**

The following exit values are returned:

## cfgadm(1M)

- 0 Successful completion.
- 1 An error occurred.
- 2 Configuration administration not supported on specified target.
- 3 Usage error.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `cfgadm_pci(1M)`, `cfgadm_sbd(1M)`, `cfgadm_scsi(1M)`, `ifconfig(1M)`, `mount(1M)`, `prtdiag(1M)`, `psradm(1M)`, `syslogd(1M)`, `config_admin(3CFGADM)`, `getopt(3C)`, `getsubopt(3C)`, `isatty(3C)`, `attributes(5)`, `environ(5)`,

**DIAGNOSTICS** Diagnostic messages appear on the standard error output. Other than options and usage errors, the following are diagnostic messages produced by this utility:

`cfgadm: Configuration administration not supported on ap_id`

`cfgadm: No library found for ap_id`

`cfgadm: ap_id is ambiguous`

`cfgadm: operation: Insufficient privileges`

`cfgadm: Attachment point is busy, try again`

`cfgadm: No attachment points with specified attributes found`

`cfgadm: System is busy, try again`

`cfgadm: operation: Operation requires a service interruption`

`cfgadm: operation: Data error: error_text`

`cfgadm: operation: Hardware specific failure: error_text`

See `config_admin(3CFGADM)` for additional details regarding error messages.

**NOTES** Hardware resources enter the unconfigured pool in a hardware specific manner. This can occur at various times such as: system initialization or as a result of an unconfigure operation. An occupant that is in the unconfigured state is not available for use by the system until specific intervention occurs. This intervention can be manifested as an operator initiated command or it can be by way of an automatic configuring mechanism.

The listing option of the `cfgadm` command can be used to provide parsable input for another command, for example within a shell script. For parsable output, the `-s`

option must be used to select the fields required. The `-s` option can also be used to suppress the column headings. The following fields always produce parsable output: `ap_id`, `physid`, `r_state`, `o_state`, `condition`, `busy`, `status_time_p`, `class`, and `type`. Parsable output never has white-space characters embedded in the field value.

The following shell script fragment finds the first good unconfigured occupant of type CPU.

```
found=
cfgadm -l -s "noheadings,cols=ap_id:r_state:condition:type" | \
while read ap_id r_state cond type
do
 if ["$r_state" = unconfigured -a "$cond" = ok -a "$type" = CPU]
 then
 if [-z "$found"]
 then
 found=$ap_id
 fi
 fi
done
if [-n "$found"]
then
 echo "Found CPU $found"
fi
```

The format of the parsable time field (`status_time_p`) is `YYYYMMDDhhmmss`, giving the year, month, day, hour, minute and second in a form suitable for string comparison.

Reference should be made to the hardware specific documentation for details of System Configuration Administration support.

| <b>DESCRIPTION</b> | <p>The ac hardware specific library <code>/usr/platform/sun4u/lib/cfgadm/cfgadm_ac.so.1</code> provides the functionality for configuring and unconfiguring memory banks on E6X00, E5X00, E4X00 and E3X00 systems as part of the Dynamic Reconfiguration of CPU/Memory boards using <code>cfgadm_sysctrl(1M)</code>.</p> <p>Memory banks appear as attachment points in the device tree. For each CPU/Memory board, two attachment points are published, one for each bank on the board: <code>bank0</code> and <code>bank1</code>. If the bank is unpopulated, the receptacle state is <code>empty</code>. If the bank is populated, the receptacle state is <code>connected</code>. The receptacle state of a memory bank can never be disconnected. The occupant state of a connected memory bank can be configured or unconfigured. If the occupant state is configured, the memory is in use by Solaris, if unconfigured it is not.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>OPTIONS</b>     | <p>Refer to <code>cfgadm(1M)</code> for complete descriptions of the command options.</p> <p>The following options are supported:</p> <p><code>-c configure   unconfigure</code></p> <p>Change the occupant state. The <code>configure</code> argument ensures that the memory is initialized and adds the memory to the Solaris memory pool. The <code>unconfigure</code> argument removes the memory from use by Solaris. When a CPU/Memory board is to be removed from a system, both banks of memory must be unconfigured.</p> <p><code>cfgadm</code> refuses the <code>configure</code> operation if the memory on the board is marked <code>disabled-at-boot</code> (see <code>info</code> field), unless either the <code>-f</code> (force) option or the enable at boot flag, (<code>-o enable-at-boot</code>), is given. The <code>configure</code> operation takes a short time proportional to the size of memory that must be initialized.</p> <p><code>cfgadm</code> refuses the <code>unconfigure</code> operation if there is not enough uncommitted memory in the system (<code>VM viability error</code>) or if the bank to be unconfigured has memory that can't be removed (<code>non-relocatable pages error</code>). The presence of non-relocatable pages is indicated by the word <code>permanent</code> in the <code>info</code> listing field. Removing memory from use by Solaris may take a significant time due to factors such as system load and how much paging to secondary storage is required.</p> |

The `unconfigure` operation can be cancelled at any time and the memory returned to the fully configured state by interrupting the command invocation with a signal. The `unconfigure` operation self-cancels if no memory can be removed within a timeout period. The default timeout period of 60 seconds can be changed using the `-o timeout=#` option, with a value of 0 disabling the timeout.

`-f`

Force option. Use this option to override the block on configuring a memory bank marked as disabled at boot in the non-volatile `disabled-memory-list` variable. See *Platform Notes:Sun Enterprise 6x00/5x00/4x00/3x00 Systems*

`-l`

List option. This option is supported as described in `cfgadm(1M)`.

The `type` field is always `memory`.

The `info` field has the following information for empty banks:

```
slot# empty
```

The `slot#` indicates the system slot into which the CPU/Memory board is inserted. For example, if this were `slot11` the attachment point for use with `cfgadm` to manipulate the associated board would be `sysctrl0:slot11`. The `info` field has the following information for connected banks:

```
slot# sizeMb|sizeGb [(sizeMb|sizeGb used)] base 0x###
 [interleaved #-way] [disabled at boot] [permanent]
```

The size of the bank is given in Mb or Gb as appropriate. If the memory is less than completely used, the used size is reported. The physical base address is given in hexadecimal. If the memory bank is interleaved with some other bank, the interleave factor is reported. If the memory on the board is disabled at boot using the non-volatile `disabled-memory-list` variable, this is reported. If the bank has memory that cannot be removed this is reported as permanent.

`-o disable-at-boot | enable-at-boot`

These options allow the state of the non-volatile `disabled-memory-list` variable to be modified. These options can be used in conjunction with the issuing of a `-c` option or with the explicit or implied listing command, `-l`, if no command is required. Use of `-o enable-at-boot` with the `configure` command to override the block on configuring memory on a board in the disabled memory list.

`-o extended | normal | quick`

Use with the `-t` option to specify test level.

The `normal` test level ensures that each memory cell stores both a 0 and a 1, and checks that all cells are separately addressable. The `quick` test level only does the 0s and 1s test, and typically misses address line problems. The `extended` test uses patterns to test for adjacent cell interference problems. The default test level is `normal`. See `-t` option.

## cfgadm\_ac(1M)

- o max\_errors=#  
Use with the `-t` option to specify the maximum number of allowed errors. If not specified, a default of 32 is assumed.
- o timeout=#  
Use with the `unconfigure` command to set the self-cancelling timeout. The default value is 60 and the unit is seconds. A value of 0 means no timeout.
- t  
Test an unconfigured bank of memory. Specify the test level using the `-o quick | normal | extended` option.  
  
`cfgadm` exits with a 0 (success) if the *test* was able to run on the memory bank. The result of the test is available in the condition for the attachment point.
- v  
Verbose option. Use this option in combination with the `-t` option to display detailed progress and results of tests.
- x relocate-test  
For all pages of memory in use on the specified memory bank, a relocation operation as used in the `unconfigure` command is attempted. The success of this operation does not guarantee that the bank can be unconfigured. Failure indicates that it probably cannot be unconfigured. This option is for test purposes only.

**OPERANDS** The following operand is supported:

*ac#:**bank#*

The attachment points for memory banks are published by instances of the address controller (ac) driver (*ac#*). One instance of the ac driver is created for each system board, but only those instances associated with CPU/Memory boards publish the two bank attachment points, bank0 and bank1.

This form conforms to the logical `ap_id` specification given in `cfgadm(1M)`. The corresponding physical `ap_ids` are listed in the **FILES** section.

The ac driver instance numbering has no relation to the slot number for the corresponding board. The full physical attachment point identifier has the slot number incorporated into it as twice the slot number in hexadecimal directly following the `fhc@` part.

**FILES** `/devices/fhc@*,f8800000/ac@0,1000000:bank?`  
attachment points

`/usr/platform/sun4u/lib/cfgadm/cfgadm_ac.so.1`  
hardware specific library file

| <b>DESCRIPTION</b> | <p>The PCI hardware specific library <code>/usr/lib/cfgadm/pci.so.1</code> provides the support for hot plugging pci adapter cards into pci hot pluggible slots in a system that is hot plug capable, through <code>cfgadm(1M)</code>. See <code>cfgadm(1M)</code>.</p> <p>For PCI Hot Plug, each hot plug slot on a specific PCI bus is represented by an attachment point of that specific PCI bus.</p> <p>An attachment point consist of two parts: a receptacle and an occupant. The receptacle under PCI hot plug is usually referred to as the physical hotpluggible slot; and the occupant is usually referred to as the PCI adapter card that plugs into the slot.</p> <p>Attachment points are named through <code>ap_ids</code>. There are two types of <code>ap_ids</code>: logical and physical. The physical <code>ap_id</code> is based on the physical pathname, that is, <code>/devices/pci@1/hpc0_slot3</code>, whereas the logical <code>ap_id</code> is a shorter, and more user-friendly name. For PCI hot pluggible slots, the logical <code>ap_id</code> is usually the corresponding hot plug controller driver name plus the logical slot number, that is, <code>pci0:hpc0slot1</code>; pci nexus driver, with hot plug controller driver named <code>hpc</code> and slot number <code>1</code>. The <code>ap_type</code> for Hot plug PCI is <code>pci</code>.</p> <p>See the <i>System Administration Guide, Volume I</i> for a detailed description of the hot plug procedure.</p> |           |                                                             |         |                              |            |                                       |        |                                                                        |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-c function</code></p> <p>The following <i>functions</i> are supported for PCI hot pluggible slots:</p> <table><tr><td>configure</td><td>Configure the PCI device in the slot to be used by Solaris.</td></tr><tr><td>connect</td><td>Connect the slot to PCI bus.</td></tr><tr><td>disconnect</td><td>Disconnect the slot from the PCI bus.</td></tr><tr><td>insert</td><td>Perform operations required to allow manual insertion of a PCI device.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | configure | Configure the PCI device in the slot to be used by Solaris. | connect | Connect the slot to PCI bus. | disconnect | Disconnect the slot from the PCI bus. | insert | Perform operations required to allow manual insertion of a PCI device. |
| configure          | Configure the PCI device in the slot to be used by Solaris.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |           |                                                             |         |                              |            |                                       |        |                                                                        |
| connect            | Connect the slot to PCI bus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |           |                                                             |         |                              |            |                                       |        |                                                                        |
| disconnect         | Disconnect the slot from the PCI bus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |           |                                                             |         |                              |            |                                       |        |                                                                        |
| insert             | Perform operations required to allow manual insertion of a PCI device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |           |                                                             |         |                              |            |                                       |        |                                                                        |

- remove            Perform operations required to allow manual removal of a PCI device.
  - unconfigure      Logically remove the PCI device's resources from the system.
  - f  
Not supported.
  - h *ap\_id* | *ap\_type*  
Print out PCI hot plug specific help message.
  - l *list*  
List the values of PCI Hot Plug slots.
  - o *hardware\_options*  
No hardware specific options are currently defined.
  - s *listing\_options*  
Same as the generic `cfgadm(1M)`.
  - t *ap\_id*  
This command is only supported on platform which supports testing capability on the slot.
  - v  
Execute in verbose mode.
- When `-v` is used with `-l` option the `cfgadm` command outputs information about the attachment point. For PCI Hot Plug, the `Information` field will be the slot's system label. This string will be obtained from the `slot-name` property of the slot's bus node. The `occupant Type` field will describe the contents of the slot. There are 2 possible values:
- |                       |                                                                             |
|-----------------------|-----------------------------------------------------------------------------|
| NULL                  | The slot is empty                                                           |
| <i>subclass,board</i> | The card in the slot is either a single- function or multi-function device. |
- subclass* is a string representing the subclass code of the device, for example, SCSI, ethernet, pci-isa, and so forth. If the card is a multi-functional device, MULT will get printed instead.
- board* is a string representing the board type of the device, for example, HP for PCI Hot Plug adapter, HS for Hot Swap Board, NHS for Non—Hot Swap cPCI Board, BHS for Basic Hot Swap cPCI Board, FHS for Full Hot Swap cPCI Board.
- x *hardware\_function*  
Perform hardware specific function. These hardware specific functions should not normally change the state of a receptacle or occupant.

## cfgadm\_pci(1M)

The following *hardware\_functions* are supported:

`enable_slot` | `disable_slot`

Change the state of the slot and preserve the state of slot across reboot. Not all platforms support this feature.

`enable_slot` enables the addition of hardware to this slot for hot plugging and at boot time.

`disable_slot` disables the addition of hardware to this slot for hot plugging and at boot time.

`enable_autoconfig` | `disable_autoconfig`

Change the ability to autoconfigure the occupant of the slot. Only platforms that support auto configuration support this feature.

`enable_autoconfig` enables the ability to autoconfigure the slot.

`diabile_autoconfig` disables the ability to autoconfigure the slot.

`led=[led_sub_arg],mode=[mode_sub_arg]`

Without sub-arguments, print a list of the current LED settings. With sub-arguments, set the mode of a specific LED for a slot.

Specify `led_sub_arg` as `fault`, `power`, `att`, or `active`.

Specify `mode_sub_arg` as `on`, `off` or `blink`.

Changing the state of the LED does not change the state of the receptacle or occupant. Normally, the LEDs are controlled by the hot plug controller, no user intervention is necessary. Use this command for testing purposes.

*Caution:* Changing the state of the LED can misrepresent the state of occupant or receptacle.

The following command prints the values of LEDs:

```
example# cfgadm -x led pci0:hpc0_slot1Ap_Id Led
pci0:hpc0_slot1 power=on, fault=off, active=off, attn=off
```

The following command turns on the Fault LED:

```
example# cfgadm -x led=fault,mode=on pci0:hpc0_slot1
```

The following command turns off the Power LED:

```
example# cfgadm -x led=power,mode=off pci0:hpc0_slot0
```

The following command sets the *active* LED to blink to indicate the location of the slot:

```
example# cfgadm -x led=active,mode=on pci0:hpc0_slot3
```

**EXAMPLES**    **EXAMPLE 1** Printing out the value of each slot

The following command prints out the values of each slot:

```
example# cfgadm -l
Ap_Id Type Receptacle Occupant Condition
pci1:hpc0_slot0 unknown empty unconfigured unknown
pci1:hpc0_slot1 unknown empty unconfigured unknown
pci1:hpc0_slot2 unknown empty unconfigured unknown
pci1:hpc0_slot3 HP/SCSI connected configured ok
pci1:hpc0_slot4 unknown empty unconfigured unknown
```

**EXAMPLE 2** Printing out PCI hot plug specific commands

The following command prints out PCI hot plug specific commands:

```
example# cfgadm -h pci
Usage:
cfgadm [-f] [-y|-n] [-v] [-o hardware_opts]
 -c function ap_id [ap_id...]
cfgadm [-f] [-y|-n] [-v] [-o hardware_opts]
 -x function ap_id [ap_id...]
cfgadm [-v] [-s listing_options] [-o hardware_opts]
 [-a] [-l [ap_id|ap_type...]]
cfgadm [-v] [-o hardware_opts] -t ap_id [ap_id...]
cfgadm [-v] [-o hardware_opts] -h [ap_id|ap_type...]

PCI hotplug specific commands:
-c [connect|disconnect|configure|unconfigure|insert|remove]
 ap_id [ap_id...]
-x enable_slot ap_id [ap_id...]
-x disable_slot ap_id [ap_id...]
-x enable_autoconfig ap_id [ap_id...]
-x disable_autoconfig ap_id [ap_id...]
-x led[=[fault|power|active|attn],mode=[on|off|blink]]
 ap_id [ap_id...]
```

**FILES**    /usr/lib/cfgadm/libpci.so.1            Hardware specific library for PCI hot plugging.

**ATTRIBUTES**    See attributes(5) for descriptions of the following attributes:

| <b>NAME</b>                 | cfgadm_sbd – cfgadm commands for system board administration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |           |                                               |            |                                                                          |              |                                                                              |
| <b>SYNOPSIS</b>             | <pre><b>cfgadm</b> -l [-a] [-o parsable] <i>ap_id...</i> <b>cfgadm</b> -c <i>function</i> [-f] [-y   -n] [-o unassign   nopoweroff] [-v] <i>ap_id...</i> <b>cfgadm</b> -t [-v] <i>ap_id...</i> <b>cfgadm</b> -x [-f] [-v] <i>function ap_id...</i></pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |           |                                               |            |                                                                          |              |                                                                              |
| <b>DESCRIPTION</b>          | <p>The <code>cfgadm_sbd</code> plugin provides dynamic reconfiguration functionality for connecting, configuring, unconfiguring, and disconnecting class <code>sbd</code> system boards. It also enables you to connect or disconnect a system board from a running system without having to reboot the system.</p> <p>The <code>cfgadm</code> command resides in <code>/usr/sbin</code>. See <code>cfgadm(1M)</code>. The <code>cfgadm_sbd</code> plugin resides <code>/usr/platform/sun4u/lib/cfgadm</code>.</p> <p>Each board slot appears as a single attachment point in the device tree. Each component appears as a dynamic attachment point. You can view the type, state, and condition of each component, and the states and condition of each board slot by using the <code>-a</code> option.</p> <p>The <code>cfgadm</code> options perform differently depending on the platform. Additionally, the form of the attachment points is different depending on the platform. See the <code>Platform Notes</code> section for more information.</p> |           |                                               |            |                                                                          |              |                                                                              |
| <b>Component Conditions</b> | <p>The following are the names and descriptions of the component conditions:</p> <table><tr><td>failed</td><td>The component failed testing.</td></tr><tr><td>ok</td><td>The component is operational.</td></tr><tr><td>unknown</td><td>The component has not been tested.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | failed    | The component failed testing.                 | ok         | The component is operational.                                            | unknown      | The component has not been tested.                                           |

**Dynamic System Domains**

Platforms based on dynamic system domains (DSDs, referred to as domains in this document) divide the slots in the chassis into electrically isolated hardware partitions (that is, DSDs). Platforms that are not based on DSDs assign all slots to the system permanently.

A slot can be empty or populated, and it can be assigned or available to any number of domains. The number of slots available to a given domain is controlled by an available component list (ACL) that is maintained on the system controller. The ACL is not the access control list provided by the Solaris operating environment.

A slot is visible to a domain only if the slot is in the domain's ACL and if it is not assigned to another domain. An unassigned slot is visible to all domains that have the slot in their ACL. After a slot has been assigned to a domain, the slot is no longer visible to any other domain.

A slot that is visible to a domain, but not assigned, must first be assigned to the domain before any other state changing commands are applied. The assign can be done explicitly using `-x assign` or implicitly as part of a connect. A slot must be unassigned from a domain before it can be used by another domain. The unassign is always explicit, either directly using `-x unassign` or as an option to disconnect using `-o unassign`.

## cfgadm\_sbd(1M)

### State Change Functions

Functions that change the state of a board slot or a component on the board can be issued concurrently against any attachment point. Only one state changing operation is permitted at a given time. A Y in the Busy field in the state changing information indicates an operation is in progress.

The following list contains the functions that change the state:

- configure
- unconfigure
- connect
- disconnect

### Availability Change Functions

Commands that change the availability of a board can be issued concurrently against any attachment point. Only one availability change operation is permitted at a given time. These functions also change the information string in the `cfgadm -l` output. A Y in the Busy field indicates that an operation is in progress.

The following list contains the functions that change the availability:

- assign
- unassign

### Condition Change Functions

Functions that change the condition of a board slot or a component on the board can be issued concurrently against any attachment point. Only one condition change operation is permitted at a given time. These functions also change the information string in the `cfgadm -l` output. A Y in the Busy field indicates an operation is in progress.

The following list contains the functions that change the condition:

- poweron
- poweroff
- test

### Unconfigure Process

This section contains a description of the unconfigure process, and illustrates the states of source and target boards at different stages during the process of moving permanent memory.

In the following code examples, the permanent memory on board 0 must be moved to another board in the domain. Thus, board 0 is the source, and board 1 is the target.

A status change operation cannot be initiated on a board while it is marked as busy. For brevity, the CPU information has been removed from the code examples.

The process is started with the following command:

```
cfgadm -c unconfigure -y SB0::memory &
```

First, the memory on board 1 in the same address range as the permanent memory on board 0 must be deleted. During this phase, the source board, the target board, and the memory attachment points are marked as busy. You can display the status with the following command:

```
cfgadm -a -s cols=ap_id:type:r_state:o_state:busy SB0 SB1
```

| Ap_Id       | Type   | Receptacle | Occupant   | Busy |
|-------------|--------|------------|------------|------|
| SB0         | CPU    | connected  | configured | y    |
| SB0::memory | memory | connected  | configured | y    |
| SB1         | CPU    | connected  | configured | y    |
| SB1::memory | memory | connected  | configured | y    |

After the memory has been deleted on board 1, it is marked as unconfigured. The memory on board 0 remains configured, but it is still marked as busy, as in the following example.

| Ap_Id       | Type   | Receptacle | Occupant     | Busy |
|-------------|--------|------------|--------------|------|
| SB0         | CPU    | connected  | configured   | y    |
| SB0::memory | memory | connected  | configured   | y    |
| SB1         | CPU    | connected  | configured   | y    |
| SB1::memory | memory | connected  | unconfigured | n    |

The memory from board 0 is then copied to board 1. After it has been copied, the occupant state for the memory is switched. The memory on board 0 becomes unconfigured, and the memory on board 1 becomes configured. At this point in the process, only board 0 remains busy, as in the following example.

| Ap_Id       | Type   | Receptacle | Occupant     | Busy |
|-------------|--------|------------|--------------|------|
| SB0         | CPU    | connected  | configured   | y    |
| SB0::memory | memory | connected  | unconfigured | n    |
| SB1         | CPU    | connected  | configured   | n    |
| SB1::memory | memory | connected  | configured   | n    |

After the entire process has been completed, the memory on board 0 remains unconfigured, and the attachment points are not busy, as in the following example.

| Ap_Id       | Type   | Receptacle | Occupant     | Busy |
|-------------|--------|------------|--------------|------|
| SB0         | CPU    | connected  | configured   | n    |
| SB0::memory | memory | connected  | unconfigured | n    |
| SB1         | CPU    | connected  | configured   | n    |
| SB1::memory | memory | connected  | configured   | n    |

The permanent memory has been moved, and the memory on board 0 has been unconfigured. At this point, you can initiate a new state changing operation on either board.

## Platform-Specific Options

You can specify platform-specific options that follow the options interpreted by the system board plugin. All platform-specific options must be preceded by the

platform keyword. The following example contains the general format of a command with platform-specific options:

```
command -o sbd_options,platform=platform_options
```

## OPTIONS

This man page does not include the `-v`, `-a`, `-s`, or `-h` options for the `cfgadm` command. See `cfgadm(1M)` for descriptions of those options. The following options are supported by the `cfgadm_sbd` plugin:

`-c function` Performs a state change function. You can use the following functions:

### unconfigure

Changes the occupant state to unconfigured. This function applies to system board slots and to all of the components on the system board.

The `unconfigure` function removes the CPUs from the CPU list and deletes the physical memory from the system memory pool. If any device is still in use, the `cfgadm` command fails and reports the failure to the user. You can retry the command as soon as the device is no longer busy. If a CPU is in use, you must ensure that it is off line before you proceed. See `pbind(1M)`, `psradm(1M)` and `psrinfo(1M)`.

The `unconfigure` function moves the physical memory to another system board before it deletes the memory from the board you want to unconfigure. Depending of the type of memory being moved, the command fails if it cannot find enough memory on another board or if it cannot find an appropriate physical memory range.

For permanent memory, the operating system must be suspended (that is, quiesced) while the memory is moved and the memory controllers are reprogrammed. If the operating system must be suspended, you will be prompted to proceed with the operation. You can use the `-y` or `-n` options to always answer yes or no respectively.

Moving memory can take several minutes to complete, depending on the amount of memory and the system load. You can monitor the progress of the operation by issuing a status command against the memory attachment point. You can also interrupt the memory operation by stopping the `cfgadm` command. The deleted memory is returned to the system memory pool.

### disconnect

Changes the receptacle state to disconnected. This function applies only to system board slots.

If the occupant state is configured, the `disconnect` function attempts to unconfigure the occupant. It then powers off the system board. At this point, the board can be removed from the slot.

This function leaves the board in the assigned state on platforms that support dynamic system domains.

If you specify `-o nopoweroff`, the `disconnect` function leaves the board powered on. If you specify `-o unassign`, the `disconnect` function unassigns the board from the domain.

If you unassign a board from a domain, you can assign it to another domain. However, if it is assigned to another domain, it is not available to the domain from which it was unassigned.

#### configure

Changes the occupant state to configured. This function applies to system board slots and to any components on the system board.

If the receptacle state is disconnected, the `configure` function attempts to connect the receptacle. It then walks the tree of devices that is created by the `connect` function, and attaches the devices if necessary. Running this function configures all of the components on the board, except those that have already been configured.

For CPUs, the `configure` function adds the CPUs to the CPU list. For memory, the `configure` function ensures that the memory is initialized then adds the memory to the system memory pool. The CPUs and the memory are ready for use after the `configure` function has been completed successfully.

For I/O devices, you must use the `mount` and the `ifconfig` commands before the devices can be used. See `ifconfig(1M)` and `mount(1M)`.

#### connect

Changes the receptacle state to connected. This function applies only to system board slots.

If the board slot is not assigned to the domain, the `connect` function attempts to assign the slot to the domain. Next, it powers on and tests the board, then it connects the board electronically to the system bus and probes the components.

After the `connect` function is completed successfully, you can use the `-a` option to view the status of the components on the

## cfgadm\_sbd(1M)

board. The `connect` function leaves all of the components in the unconfigured state.

The assignment step applies only to platforms that support dynamic system domains.

`-f` Overrides software state changing constraints.

The `-f` option never overrides fundamental safety and availability constraints of the hardware and operating system.

`-l` Lists the state and condition of attachment points specified in the format controlled by the `-s`, `-v`, and `-a` options as specified in `cfgadm(1M)`. The `cfgadm_sbd` plugin provides specific information in the `info` field as described below. The format of this information may be altered by the `-o parsable` option.

The parsable `info` field is composed of the following:

### cpu

The `cpu` type displays the following information:

`cpuid=#` Where # is a number, representing the ID of the CPU.

`speed=#` Where # is a number, representing the speed of the CPU in MHz.

`ecache=#` Where # is a number, representing the size of the ecache in MBytes.

### memory

The `memory` type displays the following information, as appropriate:

`address=#` Where # is a number, representing the base physical address.

`size=#` Where # is a number, representing the size of the memory in KBytes.

`permanent=#` Where # is a number, representing the size of permanent memory in KBytes.

`unconfigurable` An operating system setting that prevents the memory from being unconfigured.

|                        |                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------|
| inter-board-interleave | The board is participating in interleaving with other boards.                                   |
| source= <i>ap_id</i>   | Represents the source attachment point.                                                         |
| target= <i>ap_id</i>   | Represents the target attachment point.                                                         |
| deleted=#              | Where # is a number, representing the amount of memory that has already been deleted in KBytes. |
| remaining=#            | Where # is a number, representing the amount of memory to be deleted in KBytes.                 |

io

The `io` type displays the following information:

|                     |                                                    |
|---------------------|----------------------------------------------------|
| device= <i>path</i> | Represents the physical path to the I/O component. |
| referenced          | The I/O component is referenced.                   |

board

The `board` type displays the following boolean names. If they are not present, then the opposite applies.

|            |                                      |
|------------|--------------------------------------|
| assigned   | The board is assigned to the domain. |
| powered-on | The board is powered on.             |

The same items appear in the `info` field in a more readable format if the `-o parsable` option is not specified.

`-o parsable`

Returns the information in the `info` field as a boolean *name* or a set of `name=value` pairs, separated by a space character.

The `-o parsable` option can be used in conjunction with the `-s` option. See the `cfgadm(1M)` man page for more information about the `-s` option.

`-t`

Tests the board.

Before a board can be connected, it must pass the appropriate level of testing.

## cfgadm\_sbd(1M)

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <p>Use of this option always attempts to test the board, even if it has already passed the appropriate level of testing. Testing is also performed when a <code>-c connect</code> state change function is issued, in which case the test step can be skipped if the board already shows an appropriate level of testing. Thus the <code>-t</code> option can be used to explicitly request that the board be tested.</p>                                                                                                                                                                                                                                                                                                                 |
| <code>-x function</code> | <p>Performs an sbd-class function. You can use the following functions:</p> <p><b>assign</b><br/>Assigns a board to a domain.</p> <p>The receptacle state must be disconnected or empty. The board must also be listed in the domain available component list. | Receptacle <i>ap_id</i>  | <p>For the Sun Fire 15K, the receptacle attachment point ID takes the form <code>SBX</code> or <code>IOX</code>, where <code>X</code> equals the slot number.</p> <p>The exact format depends on the platform and typically corresponds to the physical labelling on the machine. See the platform specific information in the NOTES section.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| Component <i>ap_id</i>   | <p>The component attachment point ID takes the form <code>component_typeX</code>, where <code>component_type</code> equals one of the component types described in "Component Types" and <code>X</code> equals the component number. The component number is a board-relative unit number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |

The above convention does not apply to memory components. Any DR action on a memory attachment point affects all of the memory on the system board.

**EXAMPLES** The following examples show user input and system output on a Sun Fire 15K system. User input — specifically references to attachment points — and system output may differ on other Sun systems. Refer to the Platform Notes for specific information about using the `cfgadm_sbd` plugin on other models.

**EXAMPLE 1** Listing All of the System Board

```
cfgadm -a -s "select=class(sbd) "
```

| Ap_Id       | Type    | Receptacle   | Occupant     | Condition |
|-------------|---------|--------------|--------------|-----------|
| SB0         | CPU     | connected    | configured   | ok        |
| SB0::cpu0   | cpu     | connected    | configured   | ok        |
| SB0::memory | memory  | connected    | configured   | ok        |
| IO1         | HPCI    | connected    | configured   | ok        |
| IO1::pci0   | io      | connected    | configured   | ok        |
| IO1::pci1   | io      | connected    | configured   | ok        |
| SB2         | CPU     | disconnected | unconfigured | failed    |
| SB3         | CPU     | disconnected | unconfigured | unusable  |
| SB4         | unknown | empty        | unconfigured | unknown   |

This example demonstrates the mapping of the following conditions:

- The board in Slot 2 failed testing.
- Slot 3 is unusable; thus, you cannot hot plug a board into that slot.

**EXAMPLE 2** Listing All of the CPUs on the System Board

```
cfgadm -a -s "select=class(sbd):type(cpu) "
```

| Ap_Id     | Type | Receptacle | Occupant   | Condition |
|-----------|------|------------|------------|-----------|
| SB0::cpu0 | cpu  | connected  | configured | ok        |
| SB0::cpu1 | cpu  | connected  | configured | ok        |
| SB0::cpu2 | cpu  | connected  | configured | ok        |
| SB0::cpu3 | cpu  | connected  | configured | ok        |

**EXAMPLE 3** Displaying the CPU Information Field

```
cfgadm -l -s noheadings,cols=info SB0::cpu0
```

```
cpuid 16, speed 400 MHz, ecache 8 Mbytes
```

**EXAMPLE 4** Displaying the CPU Information Field in Parsable Format

```
cfgadm -l -s noheadings,cols=info -o parsable SB0::cpu0
```

```
cpuid=16 speed=400 ecache=8
```

## cfgadm\_sbd(1M)

### EXAMPLE 5 Displaying the Devices on an I/O Board

```
cfgadm -a -s noheadings,cols=ap_id:info -o parsable IO1

IO1 powered-on assigned
IO1::pci0 device=/devices/saf@0/pci@0,2000 referenced
IO1::pci1 device=/devices/saf@0/pci@1,2000 referenced
```

### EXAMPLE 6 Monitoring an Unconfigure Operation

In the following example, the memory sizes are displayed in Kbytes.

```
cfgadm -c unconfigure -y SB0::memory &
cfgadm -l -s noheadings,cols=info -o parsable SB0::memory SB1::memory

address=0x0 size=2097152 permanent=752592 target=SB1::memory
deleted=1273680 remaining=823472
address=0x1000000 size=2097152 source=SB0::memory
```

### EXAMPLE 7 Assigning a Slot to a Domain

```
cfgadm -x assign SB2
```

### EXAMPLE 8 Unassigning a Slot from a Domain

```
cfgadm -x unassign SB3
```

**ATTRIBUTES** See attributes(5) for a description of the following attribute:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWkvm.u       |

**SEE ALSO** [cfgadm\(1M\)](#), [devfsadm\(1M\)](#), [ifconfig\(1M\)](#), [mount\(1M\)](#), [pbind\(1M\)](#), [psradm\(1M\)](#), [psrinfo\(1M\)](#), [config\\_admin\(3CFGADM\)](#), [attributes\(5\)](#)

**NOTES** This section contains information on how to monitor the progress of a memory delete operation. It also contains platform specific information.

**Memory Delete Monitoring** The following shell script can be used to monitor the progress of a memory delete operation.

```
cfgadm -c unconfigure -y SB0::memory &
watch_memdel SB0

#!/bin/sh
This is the watch_memdel script.

if [-z "$1"]; then
 printf "usage: %s board_id\n" `basename $0`
 exit 1
```

```

fi

board_id=$1

cfgadm_info='cfgadm -s noheadings,cols=info -o parsable'

eval ` $cfgadm_info $board_id::memory `

if [-z "$remaining"]; then
 echo no memory delete in progress involving $board_id
 exit 0
fi

echo deleting target $target

while true
do
 eval ` $cfgadm_info $board_id::memory `

 if [-n "$remaining" -a "$remaining" -ne 0]
 then
 echo $deleted KBytes deleted, $remaining KBytes remaining
 remaining=
 else
 echo memory delete is done
 exit 0
 fi
 sleep 1
done
exit 0

```

### Sun Enterprise 10000 Platform Notes

The following syntax is used to refer to Platform Notes attachment points on the Sun Enterprise 10000 system:

*board* : : *component*

where *board* refers to the system board; and *component* refers to the individual component. System boards can range from SB0 (zero) to SB15. A maximum of sixteen system boards are available.

The DR 3.0 model running on a Sun Enterprise 10000 domain supports a limited subset of the functionality provided by the `cfgadm_sbd` plugin. The only supported operation is to view the status of attachment points in the domain. This corresponds to the `-l` option and all of its associated options.

Attempting to perform any other operation from the domain will result in an error that states that the operation is not supported. All operations to add or remove a system board must be initiated from the System Service Processor.

### Sun Fire 15K Platform Notes

The following syntax is used to refer to attachment points on the Sun Fire 15K system:

*board* : : *component*

## cfgadm\_sbd(1M)

where *board* refers to the system board or I/O board; and *component* refers to the individual component.

Depending on the system's configuration, system boards can range from SB0 (zero) through SB17, and I/O boards can range from IO0 (IO zero) through IO17. (A maximum of eighteen system and I/O boards are available).

The `-t` and `-x` options behave differently on the Sun Fire 15K platform. The following list describes their behavior:

`-t` The system controller uses a CPU to test system boards by running LPOST, sequenced by the `hpost` command. To test I/O boards, the driver starts the testing in response to the `-t` option, and the test runs automatically without user intervention. The driver unconfigures a CPU and a stretch of contiguous physical memory. Then, it sends a command to the system controller to test the board. The system controller uses the CPU and memory to test the I/O board from inside of a transaction/error cage.

`-x assign | unassign` In the Sun Fire 15K system administration model, the platform administrator controls the platform hardware through the use of an available component list for each domain. This information is maintained on the system controller. Only the platform administrator can modify the available component list for a domain.

The domain administrator is only allowed to assign or unassign a board if it is in the available component list for that domain. The platform administrator does not have this restriction, and can assign or unassign a board even if it is not in the available component list for a domain.

### Sun Fire 15K Component Types

The following are the names and descriptions of the component types:

|                     |            |
|---------------------|------------|
| <code>cpu</code>    | CPU        |
| <code>io</code>     | I/O device |
| <code>memory</code> | Memory     |

**Note:** An operation on a memory component affects all of the memory components on the board.

**NAME** | `cfgadm_scsi` – SCSI hardware specific commands for `cfgadm`

**SYNOPSIS** | `/usr/sbin/cfgadm [-f] [-y | -n ] [-v] [-o hardware_option] -c function ap_id...`

| `/usr/sbin/cfgadm [-f] [-y | -n ] [-v] [-o hardware_option] -x hardware_function ap_id...`

| `/usr/sbin/cfgadm [-v] [-a] [-s listing_option] [-o hardware_option] [-l [ap_id | ap_type ... ]]`

| `/usr/sbin/cfgadm [-v] [-o hardware_option] -t ap_id...`

| `/usr/sbin/cfgadm [-v] [-o hardware_option] -h [ap_id...]`

**DESCRIPTION** | The SCSI hardware specific library `/usr/lib/cfgadm/scsi.so.1` provides the functionality for SCSI hot-plugging through the `cfgadm(1M)` command. `cfgadm` operates on attachment points, which are locations in the system where hardware resources can be dynamically reconfigured. Refer to `cfgadm(1M)` for information regarding attachment points.

For SCSI hot-plugging, each SCSI controller is represented by an attachment point in the device tree. In addition, each SCSI device is represented by a dynamic attachment point. Attachment points are named through `ap_ids`. Two types of `ap_ids` are defined: logical and physical. The physical `ap_id` is based on the physical pathname, whereas the logical `ap_id` is a shorter more user-friendly name. For SCSI controllers, the logical `ap_id` is usually the corresponding disk controller number. For example, a typical logical `ap_id` would be `c0`.

SCSI devices are named relative to the controller `ap_id`. Thus if a disk device is attached to controller `c0`, its `ap_id` can be:

```
c0::dsk/c0t0d0
```

where `dsk/c0t0d0` identifies the specific device. In general, the device identifier is derived from the corresponding logical link for the device in `/dev`. For example, a SCSI tape drive logical `ap_id` could be `c0::rmt/0`. Here `c0` is the logical `ap_id` for the SCSI controller and `rmt/0` is derived from the logical link for the tape drive in `/dev/rmt`. If an identifier can not be derived from the link in `/dev`, a unique identifier will be assigned to it. For example, if the tape device has no link in `/dev`, it can be assigned an `ap_id` of the form `c0::st3` where `st3` is a unique internally generated identifier.

A simple listing of attachment points in the system will include attachment points at SCSI controllers but not SCSI devices. Use the `-a` flag to the list option (`-l`) to list SCSI devices as well. For example:

```
cfgadm -l
Ap_Id Type Receptacle Occupant Condition
c0 scsi-bus connected configured unknown
sysctrl10:slot0 cpu/mem connected configured ok
sysctrl10:slot1 sbus-upa connected configured ok
```

## cfgadm\_scsi(1M)

To list SCSI devices in addition to SCSI controllers:

```
cfgadm -al

Ap_Id Type Receptacle Occupant Condition
c0 scsi-bus connected configured unknown
c0::dsk/c0t14d0 disk connected configured unknown
c0::dsk/c0t11d0 disk connected configured unknown
c0::dsk/c0t8d0 disk connected configured unknown
c0::dsk/c0t0d0 disk connected configured unknown
c0::rmt/0 tape connected configured unknown
sysctrl0:slot0 cpu/mem connected configured ok
sysctrl0:slot1 sbus-upa connected configured ok
```

Refer to `cfgadm(1M)` for more information regarding listing attachment points. The receptacle and occupant state for attachment points at the SCSI controller have the following meanings:

empty

not applicable

disconnected

bus quiesced (I/O activity on bus is suspended)

connected

bus active

configured

one or more devices on the bus is configured

unconfigured

no device on the bus is configured

The corresponding states for individual SCSI devices are:

empty

not applicable

disconnected

bus to which the device is attached is quiesced

connected

bus to which device is attached is active

configured

device is configured

unconfigured

device is not configured

### OPTIONS

`cfgadm` defines several types of operations besides listing (-l). These operations include testing, (-t), invoking configuration state changes, (-c), invoking hardware specific functions (-x), and obtaining configuration administration help messages (-h).

*-c function* The following generic commands are defined for the SCSI hardware specific library:

For SCSI controller attachment points, the following configuration state change operations are supported:

|             |                                                                        |
|-------------|------------------------------------------------------------------------|
| connect     | Unquiesce the SCSI bus.                                                |
| disconnect  | Quiesce the bus (suspend I/O activity on bus).                         |
|             | Incorrect use of this command can cause the system to hang. See NOTES. |
| configure   | Configure new devices on SCSI bus.                                     |
| unconfigure | Unconfigure all devices connected to bus.                              |

The following generic commands are defined for SCSI devices:

|             |                               |
|-------------|-------------------------------|
| configure   | configure a specific device   |
| unconfigure | unconfigure a specific device |

*-f* When used with the `disconnect` command, forces a quiesce of the SCSI bus, if supported by hardware.

Incorrect use of this command can cause the system to hang. See NOTES.

*-h ap\_id* SCSI specific help can be obtained by using the help option with any SCSI attachment point.

*-o hardware\_option* No hardware specific options are currently defined.

*-s listing\_option* Attachment points of class `scsi` can be listed by using the `select` sub-option. Refer to the `cfgadm(1M)` man page for additional information.

*-t ap\_id* No test commands are available at present.

*-x hardware\_function* Some of the following commands can only be used with SCSI controllers and some only with SCSI devices.

In the following, *controller\_ap\_id* refers to an `ap_id` for a SCSI controller, for example, `c0`. *device\_ap\_id* refers to an `ap_id` for a SCSI device, for example: `c0::disk/c0dt3d0`.

The following hardware specific functions are defined:

## cfgadm\_scsi(1M)

`insert_device controller_ap_id`

Add a new device to the SCSI controller, `controller_ap_id`.

This command is intended for interactive use only.

`remove_device device_ap_id`

Remove device `device_ap_id`.

This command is intended for interactive use only.

`replace_device device_ap_id`

Remove device `device_ap_id` and replace it with another device of the same kind.

This command is intended for interactive use only.

`reset_device device_ap_id`

Reset `device_ap_id`.

`reset_bus controller_ap_id`

Reset bus `controller_ap_id` without resetting any devices attached to the bus.

`reset_all controller_ap_id`

Reset bus `controller_ap_id` and all devices on the bus.

### EXAMPLES

#### EXAMPLE 1 Configuring a Disk

The following command configures a disk attached to controller `c0`:

```
cfgadm -c configure c0::dsk/c0t3d0
```

#### EXAMPLE 2 Unconfiguring a Disk

The following command unconfigures a disk attached to controller `c0`:

```
cfgadm -c unconfigure c0::dsk/c0t3d0
```

#### EXAMPLE 3 Adding a New Device

The following command adds a new device to controller `c0`:

```
cfgadm -x insert_device c0
```

The system responds with the following:

```
Adding device to SCSI HBA: /devices/sbus@1f,0/SUNW,fas@e,8800000
This operation will suspend activity on SCSI bus c0
Continue (yes/no)?
```

Enter:

```
y
```

**EXAMPLE 3** Adding a New Device (Continued)

The system responds with the following:

```
SCSI bus quiesced successfully.
It is now safe to proceed with hotplug operation.
Enter y if operation is complete or n to abort (yes/no)?
```

Enter:

y

**EXAMPLE 4** Replacing a Device

The following command replaces a device attached to controller c0:

```
cfgadm -x replace_drive c0::dsk/c0t3d0
```

The system responds with the following:

```
Replacing SCSI device: /devices/sbus@1f,0/SUNW,fas@e,8800000/sd@3,0
This operation will suspend activity on SCSI bus: c0
Continue (yes/no)?
```

Enter:

y

The system responds with the following:

```
SCSI bus quiesced successfully.
It is now safe to proceed with hotplug operation.
Enter y if operation is complete or n to abort (yes/no)?
```

Enter:

y

**EXAMPLE 5** Encountering a Mounted File system While Unconfiguring a Disk

The following command illustrates encountering a mounted file system while unconfiguring a disk:

```
cfgadm -c unconfigure c1::dsk/clt0d0
```

The system responds with the following:

```
cfgadm: Component system is busy, try again: failed to offline:
/devices/pci@1f,4000/scsi@3,1/sd@1,0
 Resource Information

/dev/dsk/clt0d0s0 mounted filesystem "/mnt"
```

## cfgadm\_scsi(1M)

**FILES** /usr/lib/cfgadm/scsi.so.1 hardware specific library for generic SCSI hot-plugging

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE   |
|----------------|-------------------|
| Availability   | SUNWcs1 (32-bit)  |
|                | SUNWcs1x (64-bit) |

**SEE ALSO** cfgadm(1M), luxadm(1M), config\_admin(3CFGADM), libcfgadm(3LIB), attributes(5)

**NOTES** The disconnect (quiesce) operation is not supported on controllers which control disks containing critical partitions such as root (/), /usr, swap, or /var. The disconnect operation should not be attempted on such controllers. Incorrect usage can result in a system hang and require a reboot.

Hotplugging operations are not supported by all SCSI controllers.

**WARNINGS** The connectors on some SCSI devices do not confirm to SCSI hotplug specification. Performing hotplug operations on such devices can cause damage to the hardware on the SCSI bus. Refer to your hardware manual for information.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>DESCRIPTION</b> | <p>The <code>sysctrl</code> hardware specific library <code>/usr/platform/sun4u/lib/cfgadm/sysctrl.so.1</code> provides dynamic reconfiguration functionality for configuring and disconnecting system boards on E6X00, E5X00, E4X00, and E3X00 systems. You can insert both I/O and CPU boards into a slot on a running system that is configured for Solaris without rebooting. You can also disconnect and remove both types of boards from a running system without rebooting.</p> <p>System slots appear as attachment points in the device tree, one attachment point for each actual slot in the system chassis. If a board is not in a slot, the receptacle state is empty. If a board is powered-off and ready to remove, the receptacle state is disconnected. If a board is powered-on and is connected to the system bus, the receptacle state is connected.</p> <p>The occupant state is unconfigured when the receptacle state is empty or disconnected. The occupant state is either unconfigured or configured when the receptacle state is connected.</p> <p>In the configured state the devices on a board are available for use by Solaris. In the unconfigured state, the devices on the board are not.</p> <p>Inserting a board changes the receptacle state from empty to disconnected. Removing a board changes the receptacle state from disconnected to empty. Removing a board that is in the connected state crashes the operating system and can result in permanent damage to the system.</p> |
| <b>OPTIONS</b>     | <p>Refer to <code>cfgadm(1M)</code> for a more complete description options.</p> <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-c <i>function</i><br/>Perform the state change function. Specify <i>function</i> as connect, disconnect, configure or unconfigure.</li> <li>configure<br/>Change the occupant state to configure.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## cfgadm\_sysctrl(1M)

If the receptacle state is `disconnected`, the `configure` function first attempts to connect the receptacle. The `configure` function walks the OBP device tree created as part of the `connect` function and creates the Solaris device tree nodes, attaching devices as required. For CPU/Memory boards, `configure` adds CPUs to the CPU list in the `powered-off` state. These are visible to the `psrinfo(1M)` and `psradm(1M)` commands. Two memory attachment points are published for CPU/memory boards. Use `mount(1M)` and `difconfig(1M)` to use I/O devices on the new board. To use CPUs, use `psradm -n` to on-line the new processors. Use `cfgadm_ac(1M)` to test and configure the memory banks.

### connect

Change the receptacle state to `connected`.

Changing the receptacle state requires that the system bus be frozen while the bus signals are connected and the board tested. The bus is frozen by running a `quiesce` operation which stops all process activity and suspends all drivers. Because the `quiesce` operation and the subsequent resume can be time consuming, and are not supported by all drivers, the `-x quiesce-test` is provided. While the system bus is frozen, the board being connected is tested by firmware. This operation takes a short time for I/O boards and a significant time for CPU/Memory boards due to CPU external cache testing. This does not provide memory testing. The user is prompted for confirmation before proceeding with the `quiesce`. Use the `-y` or `-n` option to override the prompt. The `connect` operation is refused if the board is marked as `disabled-at-boot`, unless either the force flag, `-f`, or the enable at boot flag, `-o enable-at-boot`, is given. See `-l`.

### disconnect

Change the receptacle state to `disconnected`.

If the occupant state is `configure`, the `disconnect` function first attempts to unconfigure the occupant. The `disconnect` operation does not require a `quiesce` operation and operates quickly. The board is powered-off ready for removal.

### unconfigure

Change the occupant state to `unconfigured`.

Devices on the board are made invisible to Solaris during this process. The I/O devices on an I/O board are removed from the Solaris device tree. Any device that is still in use stops the `unconfigure` process and be reported as in use. The `unconfigure` operation must be retried after the device is made non-busy. For CPU/Memory boards, the memory must have been changed to the `unconfigured` state prior to issuing the board `unconfigure` operation. The CPUs on the board are off-lined, powered off and removed from the Solaris CPU list. CPUs that have processes bound to them cannot be off-lined. See `psradm(1M)`, `psrinfo(1M)`, `pbind(1M)`, and `andp_online(2)` for more information on off-lining CPUs.

- f  
Force a block on connecting a board marked as `disabled-at-boot` in the non-volatile `disabled-board-list` variable. See *Platform Notes:Sun Enterprise 6x00/5x00/4x00/3x00 Systems*
- l  
List options. Supported as described in `cfgadm(1M)cfgadm(1M)`.  
  
The *type* field can be one of `cpu/mem`, `mem`, `dual-sbus`, `sbus-upa`, `dual-pci`, `soc+sbus`, `soc+upa`, `disk` or `unknown`.  
  
The hardware-specific info field is set as follows: `[disabled at boot]`  
`[non-detachable] [100 MHz capable]`  
  
For `sbus-upa` and `soc+upa` type boards, the following additional information appears first: `[single buffered ffb|double buffered ffb|no ffb installed]` For disk type boards, the following additional information appears first: `{target: # | no disk} {target: # | no disk}`
- o `disable-at-boot` | `enable-at-boot`  
Modify the state of the non-volatile `disabled-board-list` variable. Use this the `-o` option in conjunction with the `-c function` or `-l` option.  
  
Use `-o enable-at-boot` with the `-c connect` to override a block on connecting a `disabled-at-boot` board.
- x `insert-test` | `remove-test`  
Perform a test.  
  
Specify `remove-test` to change the driver state for the specified slot from `disconnected` to `empty` without the need for physically removing the board during automated test sequences.  
  
Specify `insert-test` to change the driver state of a slot made to appear empty using the `remove-test` command to the `disconnected` state as if it had been inserted.
- x `quiesce-test sysctrl0:slot1`  
Perform a test.  
  
Allows the `quiesce` operation required for board connect operations to be exercised. The execution of this test confirms that, with the current software and hardware configuration, it is possible to quiesce the system. If a device or process cannot be quiesced, its name is printed in an error message. Any valid board attachment point can be used with this command, but since all systems have a `slot1` the given form is recommended.
- x `set-condition-test=#`  
Perform a test.

## cfgadm\_sysctrl(1M)

Allows the the condition of a system board attachment point to be set for testing the policy logic for state change commands. The new setting is given as a number indicating one of the following condition values:

- 0 unknown
- 1 ok
- 2 failing
- 3 failed
- 4 unusable

**OPERANDS** The following operand is supported:

`sysctrl0:slot#` The attachment points for boards on EXX00 systems are published by instance 0 of the `sysctrl` driver (`sysctrl0`). The names of the attachment points are numbered from `slot0` through `slot15`. Specify # as a number between 0 and 15, indicating the slot number. This form conforms to the logical `ap_id` specification given in `cfgadm(1M)`. The corresponding physical `ap_ids` are listed in the **FILES** section.

**FILES** `/usr/platform/sun4u/lib/cfgadm/sysctrl.so.1`  
Hardware specific library  
`/devices/central@1f,0/fhc@0,f8800000/clock-board@0,900000:slot*`  
Attachment Points

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWkvm.u       |

**SEE ALSO** `cfgadm(1M)`, `cfgadm_ac(1M)`, `ifconfig(1M)`, `mount(1M)`, `pbind(1M)`, `psradm(1M)`, `psrinfo(1M)`, `config_admin(3CFGADM)`, `attributes(5)`

| NAME        | cfsadmin – administer disk space used for caching file systems with the Cache File-System (CacheFS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SYNOPSIS    | <pre> <b>cfsadmin</b> -c [-o <i>cacheFS-parameters</i>] <i>cache_directory</i> <b>cfsadmin</b> -d {<i>cache_ID</i>   <i>all</i>} <i>cache_directory</i> <b>cfsadmin</b> -l <i>cache_directory</i> <b>cfsadmin</b> -s {<i>mntpt1 ...</i>}   <i>all</i> <b>cfsadmin</b> -u [-o <i>cacheFS-parameters</i>] <i>cache_directory</i> </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DESCRIPTION | <p>The <code>cfsadmin</code> command provides the following functions:</p> <ul style="list-style-type: none"> <li>■ cache creation</li> <li>■ deletion of cached file systems</li> <li>■ listing of cache contents and statistics</li> <li>■ resource parameter adjustment when the file system is unmounted.</li> </ul> <p>For each form of the command except <code>-s</code>, you must specify a cache directory, that is, the directory under which the cache is actually stored. A path name in the front file system identifies the cache directory. For the <code>-s</code> form of the command, you must specify a mount point.</p> <p>You can specify a cache ID when you mount a file system with CacheFS, or you can let the system generate one for you. The <code>-l</code> option includes the cache ID in its listing of information. You must know the cache ID to delete a cached file system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OPTIONS     | <pre> -c      Create a cache under the directory specified by <i>cache_directory</i>. This         directory must not exist prior to cache creation.  -d      Remove the file system whose cache ID you specify and release its         resources, or remove all file systems in the cache by specifying <i>all</i>. After         deleting a file system from the cache, you must run the         <code>fscck_cacheFS(1M)</code> command to correct the resource counts for the cache.  -l      List file systems stored in the specified cache, as well as statistics about         them. Each cached file system is listed by cache ID. The statistics document         resource utilization and cache resource parameters.  -s      Request a consistency check on the specified file system (or all <code>cacheFS</code>         mounted file systems). The <code>-s</code> option will only work if the cache file         system was mounted with <code>demandconst</code> enabled (see         <code>mount_cacheFS(1M)</code>). Each file in the specified cache file system is         checked for consistency with its corresponding file in the back file system.         Note that the consistency check is performed file by file as files are         accessed. If no files are accessed, no checks are performed. Use of this         option will not result in a sudden "storm" of consistency checks.  -u      Update resource parameters of the specified cache directory. Parameter         values can only be increased. To decrease the values, you must remove the         cache and recreate it. All file systems in the cache directory must be </pre> |

**CacheFS Resource Parameters**

unmounted when you use this option. Changes will take effect the next time you mount any file system in the specified cache directory. The `-u` option with no `-o` option sets all parameters to their default values.

You can specify the following CacheFS resource parameters as arguments to the `-o` option. Separate multiple parameters with commas.

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>maxblocks=<i>n</i></code>    | Maximum amount of storage space that CacheFS can use, expressed as a percentage of the total number of blocks in the front file system. If CacheFS does not have exclusive use of the front file system, there is no guarantee that all the space the <code>maxblocks</code> parameter allows will be available. The default is 90.                                                                                     |
| <code>minblocks=<i>n</i></code>    | Minimum amount of storage space, expressed as a percentage of the total number of blocks in the front file system, that CacheFS is always allowed to use without limitation by its internal control mechanisms. If CacheFS does not have exclusive use of the front file system, there is no guarantee that all the space the <code>minblocks</code> parameter attempts to reserve will be available. The default is 0. |
| <code>threshblocks=<i>n</i></code> | A percentage of the total blocks in the front file system beyond which CacheFS cannot claim resources once its block usage has reached the level specified by <code>minblocks</code> . The default is 85.                                                                                                                                                                                                               |
| <code>maxfiles=<i>n</i></code>     | Maximum number of files that CacheFS can use, expressed as a percentage of the total number of inodes in the front file system. If CacheFS does not have exclusive use of the front file system, there is no guarantee that all the inodes the <code>maxfiles</code> parameter allows will be available. The default is 90.                                                                                             |
| <code>minfiles=<i>n</i></code>     | Minimum number of files, expressed as a percentage of the total number of inodes in the front file system, that CacheFS is always allowed to use without limitation by its internal control mechanisms. If CacheFS does not have exclusive use of the front file system, there is no guarantee that all the inodes the <code>minfiles</code> parameter attempts to reserve will be available. The default is 0.         |
| <code>threshfiles=<i>n</i></code>  | A percentage of the total inodes in the front file system beyond which CacheFS cannot claim inodes once its usage has reached the level specified by <code>minfiles</code> . The default is 85.                                                                                                                                                                                                                         |
| <code>maxfilesize=<i>n</i></code>  | Largest file size, expressed in megabytes, that CacheFS is allowed to cache. The default is 3. You cannot                                                                                                                                                                                                                                                                                                               |

| <b>USAGE</b>    | See <code>largefile(5)</code> for the description of the behavior of <code>cfsadmin</code> when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                       |
| <b>EXAMPLES</b> | <p><b>EXAMPLE 1</b> Creating a cache directory.</p> <p>The following example creates a cache directory named <code>/cache</code>:</p> <pre>example# cfsadmin -c /cache</pre> <p><b>EXAMPLE 2</b> Creating a cache specifying <code>maxblocks</code>, <code>minblocks</code> and <code>threshblocks</code>.</p> <p>The following example creates a cache named <code>/cache1</code> that can claim a maximum of 60 percent of the blocks in the front file system, can use 40 percent of the front file system blocks without interference by CacheFS internal control mechanisms, and has a threshold value of 50 percent. The threshold value indicates that after CacheFS reaches its guaranteed minimum, it cannot claim more space if 50 percent of the blocks in the front file system are already used.</p> <pre>example# cfsadmin -c -o maxblocks=60,minblocks=40, threshblocks=50 /cache1</pre> <p><b>EXAMPLE 3</b> Changing the <code>maxfilesize</code> parameter.</p> <p>The following example changes the <code>maxfilesize</code> parameter for the cache directory <code>/cache2</code> to 2 megabytes:</p> <pre>example# cfsadmin -u -o maxfilesize=2 /cache2</pre> <p><b>EXAMPLE 4</b> Listing the contents of a cache directory.</p> <p>The following example lists the contents of a cache directory named <code>/cache3</code> and provides statistics about resource utilization:</p> <pre>example# cfsadmin -l /cache3</pre> <p><b>EXAMPLE 5</b> Removing a cached file system.</p> <p>The following example removes the cached file system with cache ID 23 from the cache directory <code>/cache3</code> and frees its resources (the cache ID is part of the information returned by <code>cfsadmin -l</code>):</p> |                                                                                                                                                       |

## cfsadmin(1M)

**EXAMPLE 5** Removing a cached file system.     *(Continued)*

```
example# cfsadmin -d 23 /cache3
```

**EXAMPLE 6** Removing all cached file systems.

The following example removes all cached file systems from the cache directory /cache3:

```
example# cfsadmin -d all /cache3
```

**EXAMPLE 7** Checking for consistency in file systems.

The following example checks for consistency all file systems mounted with demandconst enabled. No errors will be reported if no demandconst file systems were found.

```
example# cfsadmin -s all
```

**EXIT STATUS**     The following exit values are returned:

0            Successful completion.

1            An error occurred.

**ATTRIBUTES**     See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>NAME</b>        | cg14config – configure the cgfourteen device                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | <code>/usr/platform/ platform-name /sbin/cg14config [-d device] [-r resolution] [-g gammavalue] [-G gammafile] [-u degammavalue] [-U degammafile]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | <p>cg14config sets up state on the selected cgfourteen device. <i>platform-name</i> can be found using the <code>-i</code> option of <code>uname(1)</code>.</p> <p>cg14config is supported only on Desktop SPARCsystems with SX graphics option.</p> <p>The interface, output, and command location are uncommitted and subject to change in future releases.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>OPTIONS</b>     | <p><code>-d device</code> Use <i>device</i> as the cgfourteen device to configure. Default is <code>/dev/fb</code>.</p> <p><code>-r resolution</code> Use <i>resolution</i> as the desired screen resolution. Resolution is specified in terms of screen width and height (in pixels), and vertical refresh (in hz). Available resolutions are:</p> <pre> 1024x768@60 1024x768@66 1024x768@70 1152x900@66 1152x900@76 1280x1024@66 1280x1024@76 1600x1280@66 1920x1080@72 </pre> <p>The default is the value read from the monitor sense codes. Note that some or all of the resolutions above may not be supported by any given monitor. If a programmed resolution is outside of the range of allowable values for a monitor, unpredictable results can occur, including damage to the monitor. Thus, care should be taken when programming the resolution. See <i>Openboot Command Reference</i> for a description of how to reset the console device to the default value if it becomes unusable from programming an unsupported resolution.</p> <p>The <code>-r</code> option is not available when the window system is running.</p> <p><code>-g gammavalue</code> Each entry of the gamma lookup table will be loaded with entry<sup>1/gammavalue</sup>. The gamma lookup table has 256 entries. Default <i>gammavalue</i> is 2.2.</p> <p><code>-G filename</code> Initialize the gamma lookup table with the contents of <i>filename</i>. The format of <i>filename</i> is 256 triplets (red green</p> |

## cg14config(1M)

blue) of non-negative integers separated by NEWLINE characters. The integers must be in the range 0 to 1023, inclusive.

**-u *degammavalue*** Each entry of the degamma lookup table will be loaded with entry<sup>^</sup>(*degammavalue*). The degamma lookup table has 256 entries. Default *degammavalue* is 2 . 2.

**-U *filename*** Initialize the degamma lookup table with the contents of *filename*. The format of *filename* is 256 entries of non-negative integers separated by NEWLINE characters. The integers must be in the range 0 to 255, inclusive.

**EXIT STATUS** cg14config returns 0 on success and a positive integer on failure.

- 1 Selected device is not a cgfourteen device.
- 2 Requested action failed.
- 3 Unsupported resolution.
- 4 Gamma or degamma value out of range.

| <b>NAME</b>        | chat – automated conversational exchange tool                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>SYNOPSIS</b>    | <b>chat</b> [ <i>options</i> ] <i>script</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b> | <p>The chat program implements a conversational text-based exchange between the computer and any serial device, including (but not limited to) a modem, an ISDN TA, and the remote peer itself, establishing a connection between the Point-To-Point Protocol daemon (pppd) and the remote pppd process.</p> <p>The chat command is part of Solaris PPP 4.0, an implementation of the Point-to-Point Protocol (PPP) that is based on the Australian National University PPP. For information on licensing terms, refer to the incorporated materials at <code>/var/sadm/pkg/SUNWpppdu/install/copyright</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>OPTIONS</b>     | <p>The chat command supports the following options:</p> <ul style="list-style-type: none"> <li>-f &lt;<i>chat file</i>&gt;                    Read the chat script from the chat file. This option is mutually exclusive with the chat script parameters. You must have read access to use the file. Multiple lines are permitted in the file. Use the space or horizontal tab characters to separate the strings.</li> <li>-t &lt;<i>timeout</i>&gt;                        Set the timeout for the expected string to be received. If the string is not received within the time limit, the reply string is not sent. If specified, a 'subexpect' (alternate reply) string can be sent. Otherwise, if no alternate reply strings remain, the chat script fails.. A failed script will cause the chat program to terminate with a non-zero error code.</li> <li>-r &lt;<i>report file</i>&gt;                    Set the file for output of the report strings. If you use the keyword REPORT, the resulting strings are written to this file. If the -r option is not used and you use the REPORT keyword, the stderr file is used for the report strings.</li> <li>-e                                        Start with the echo option turned on. You turn echo on or off at specific points in the chat script using the ECHO keyword. When echoing is enabled, all output from the modem is echoed to stderr.</li> <li>-E                                        Enables environment variable substitution within chat scripts using the standard \$xxx syntax.</li> <li>-v                                        Request that the chat script execute in a verbose mode. The chat program logs the execution state of the chat script as well as all text received from the modem and output strings sent to the modem. The default is to log through syslog(3C) with facility local2; the logging method is alterable using the -s and -s options.</li> </ul> |

|                     |                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -V                  | Request that the <code>chat</code> script be executed in a <code>stderr</code> verbose mode. The <code>chat</code> program logs all text received from the modem and output strings sent to the modem to <code>stderr</code> . <code>stderr</code> is usually the local console at the station running the <code>chat</code> or <code>pppd</code> program. |
| -s                  | Use <code>stderr</code> . Log messages from <code>-v</code> and error messages are sent to <code>stderr</code> .                                                                                                                                                                                                                                           |
| -S                  | Do not use <code>syslog</code> . By default, error messages are set to <code>syslog</code> . This option prevents log messages from <code>-v</code> and error messages from being sent to <code>syslog</code> .                                                                                                                                            |
| -T <phone number>   | Pass in an arbitrary string (usually a telephone number) that will be substituted for the <code>\T</code> substitution metacharacter in a send string.                                                                                                                                                                                                     |
| -U <phone number 2> | Pass in a second string (usually a telephone number) that will be substituted for the <code>\U</code> substitution metacharacter in a send string. This is useful when dialing an ISDN terminal adapter that requires two numbers.                                                                                                                         |
| script              | If the script is not specified in a file with the <code>-f</code> option, the script is included as parameters to the <code>chat</code> program.                                                                                                                                                                                                           |

### Chat Script

The `chat` script defines communications. A script consists of one or more "expect-send" pairs of strings separated by spaces, with an optional "subexpect-sendsend" string pair, separated by a dash (as in the following example):

```
ogin:-BREAK-ogin: ppp ssword: hello2u2
```

The example indicates that the `chat` program should expect the string "ogin:". If it fails to receive a login prompt within the time interval allotted, it sends a break sequence to the remote and then expects the string "ogin:". If the first "ogin:" is received, the break sequence is not generated.

Upon receiving the login prompt, the `chat` program sends the string "ppp" and then expects the prompt "ssword:". When the password prompt is received, it sends the password hello2u2.

A carriage return is normally sent following the reply string. It is not expected in the "expect" string unless it is specifically requested by using the `\r` character sequence.

The expect sequence should contain only what is needed to identify the received data. Because it's stored on a disk file, it should not contain variable information. Generally it is not acceptable to look for time strings, network identification strings, or other variable pieces of data as an expect string.

To correct for characters that are corrupted during the initial sequence, look for the string "ogin:" rather than "login:". The leading "l" character may be received in error, creating problems in finding the string. For this reason, scripts look for "ogin:" rather than "login:" and "ssword:" rather than "password:".

An example of a simple script follows:

```
ogin: ppp ssword: hello2u2
```

The example can be interpreted as: expect ogin:, send ppp, expect ...ssword:, send hello2u2.

When login to a remote peer is necessary, simple scripts are rare. At minimum, you should include sub-expect sequences in case the original string is not received. For example, consider the following script:

```
ogin:--ogin: ppp ssword: hello2u2
```

This script is more effective than the simple one used earlier. The string looks for the same login prompt; however, if one is not received, a single return sequence is sent and then the script looks for login: again. If line noise obscures the first login prompt, send the empty line to generate a login prompt again.

#### Comments

Comments can be embedded in the chat script. Comment lines are ignored by the chat program. A comment starts with the hash ("#") character in column one. If a # character is expected as the first character of the expect sequence, quote the expect string. If you want to wait for a prompt that starts with a # character, write something like this:

```
Now wait for the prompt and send logout string
'# ' logout
```

#### Sending Data From A File

If the string to send begins with an at sign ("@"), the remainder of the string is interpreted as the name of the file that contains the string. If the last character of the data read is a newline, it is removed. The file can be a named pipe (or fifo) instead of a regular file. This enables chat to communicate with another program, for example, a program to prompt the user and receive a password typed in.

#### Abort

Many modems report the status of a call as a string. These status strings are often "CONNECTED" or "NO CARRIER" or "BUSY." If the modem fails to connect to the remote, you can terminate the script. Abort strings may be specified in the script using the ABORT sequence. For example:

```
ABORT BUSY ABORT 'NO CARRIER' '' ATZ OK ATDT5551212 CONNECT
```

This sequence expects nothing and sends the string ATZ. The expected response is the string OK. When OK is received, the string ATDT5551212 dials the telephone. The expected string is CONNECT. If CONNECT is received, the remainder of the script is executed. When the modem finds a busy telephone, it sends the string BUSY, causing

chat(1M)

the string to match the abort character sequence. The script fails because it found a match to the abort string. If the NO CARRIER string is received, it aborts for the same reason.

**Clr\_Abort** The CLR\_ABORT sequence clears previously set ABORT strings. ABORT strings are kept in an array of a pre-determined size; CLR\_ABORT reclaims the space for cleared entries, enabling new strings to use that space.

**Say** The SAY string enables the script to send strings to a user at a terminal via standard error. If chat is being run by pppd and pppd is running as a daemon (detached from its controlling terminal), standard error is normally redirected to the /etc/ppp/connect-errors file.

SAY strings must be enclosed in single or double quotes. If carriage return and line feed are required for the output, you must explicitly add them to your string.

The SAY string can provide progress messages to users even with "ECHO OFF." For example, add a line similar to the following to the script:

```
ABORT BUSY
ECHO OFF
SAY "Dialing your ISP...\n"
'' ATDT5551212
TIMEOUT 120
SAY "Waiting up to 2 minutes for connection ..."
CONNECT ''
SAY "Connected, now logging in ...\n"
ogin: account
s sword: pass
$ \c
SAY "Logged in OK ... \n"
```

This sequence hides script detail while presenting the SAY string to the user. In this case, you will see:

```
Dialing your ISP...
Waiting up to 2 minutes for connection...Connected, now logging in...
Logged in OK ...
```

**Report** REPORT is similar to the ABORT string. With REPORT, however, strings and all characters to the next control character (such as a carriage return), are written to the report file.

REPORT strings can be used to isolate a modem's transmission rate from its CONNECT string and return the value to the chat user. Analysis of the REPORT string logic occurs in conjunction with other string processing, such as looking for the expect string. It's possible to use the same string for a REPORT and ABORT sequence, but probably not useful.

Report strings may be specified in the script using the REPORT sequence. For example:

```
REPORT CONNECT
ABORT BUSY
ATDT5551212 CONNECT
ogin: account
```

The above sequence expects nothing, then sends the string ATDT5551212 to dial the telephone. The expected string is CONNECT. If CONNECT is received, the remainder of the script is executed. In addition, the program writes the string CONNECT to the report file (specified by `-r`) in addition to any characters that follow.

**Clr\_Report**

CLR\_REPORT clears previously set REPORT strings. REPORT strings are kept in an array of a pre-determined size; CLR\_REPORT reclaims the space for cleared entries so that new strings can use that space.

**Echo**

ECHO determines if modem output is echoed to `stderr`. This option may be set with the `-e` option, but can also be controlled by the ECHO keyword. The "expect-send" pair ECHO ON enables echoing, and ECHO OFF disables it. With ECHO, you can select which parts of the conversation should be visible. In the following script:

```
ABORT 'BUSY'
ABORT 'NO CARRIER'
"" AT&F
OK\r\n ATD1234567
\r\n \c
ECHO ON
CONNECT \c
ogin: account
```

All output resulting from modem configuration and dialing is not visible, but output is echoed beginning with the CONNECT (or BUSY) message.

**Hangup**

The HANGUP option determines if a modem hangup is considered as an error. HANGUP is useful for dialing systems that hang up and call your system back. HANGUP can be ON or OFF. When HANGUP is set to OFF and the modem hangs up (for example, following the first stage of logging in to a callback system), chat continues running the script (for example, waiting for the incoming call and second stage login prompt). When the incoming call is connected, use the HANGUP ON string to reinstall normal hang up signal behavior. An example of a simple script follows:

```
ABORT 'BUSY'
"" AT&F
OK\r\n ATD1234567
\r\n \c
CONNECT \c
'Callback login:' call_back_ID
HANGUP OFF
ABORT "Bad Login"
'Callback Password:' Call_back_password
TIMEOUT 120
CONNECT \c
HANGUP ON
ABORT "NO CARRIER"
```

|                         | <pre>ogin:--BREAK--ogin: real_account</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <b>Timeout</b>          | <p>The initial timeout value is 45 seconds. Use the <code>-t</code> parameter to change the initial timeout value.</p> <p>To change the timeout value for the next expect string, the following example can be used:</p> <pre>'' "AT&amp;F OK ATDT5551212 CONNECT \c TIMEOUT 10 ogin:--ogin: username TIMEOUT 5 assword: hello2u2</pre> <p>The example changes the timeout to ten seconds when it expects the login: prompt. The timeout is changed to five seconds when it looks for the password prompt.</p> <p>Once changed, the timeout value remains in effect until it is changed again.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <b>EOT</b>              | <p>The EOT special reply string instructs the chat program to send an EOT character to the remote. This is equivalent to using <code>^D\c</code> as the reply string. The EOT string normally indicates the end-of-file character sequence. A return character is not sent following the EOT. The EOT sequence can be embedded into the send string using the sequence <code>^D</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <b>BREAK</b>            | <p>The BREAK special reply string sends a break condition. The break is a special transmitter signal. Many UNIX systems handle break by cycling through available bit rates, and sending break is often needed when the remote system does not support autobaud. BREAK is equivalent to using <code>\K\c</code> as the reply string. You embed the break sequence into the send string using the <code>\K</code> sequence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <b>Escape Sequences</b> | <p>Expect and reply strings can contain escape sequences. Reply strings accept all escape sequences, while expect strings accept most sequences. A list of escape sequences is presented below. Sequences that are not accepted by expect strings are indicated.</p> <table><tr><td><code>''</code></td><td>Expects or sends a null string. If you send a null string, chat sends the return character. If you expect a null string, chat proceeds to the reply string without waiting. This sequence can be a pair of apostrophes or quote mark characters.</td></tr><tr><td><code>\b</code></td><td>Represents a backspace character.</td></tr><tr><td><code>\c</code></td><td>Suppresses the newline at the end of the reply string. This is the only method to send a string without a trailing return character. This sequence must be at the end of the send string. For example, the sequence <code>hello\c</code> will simply send the characters h, e, l, l, o. (Not valid in expect.)</td></tr><tr><td><code>\d</code></td><td>Delay for one second. The program uses <code>sleep(1)</code> which delays to a maximum of one second. (Not valid in expect.)</td></tr></table> | <code>''</code> | Expects or sends a null string. If you send a null string, chat sends the return character. If you expect a null string, chat proceeds to the reply string without waiting. This sequence can be a pair of apostrophes or quote mark characters. | <code>\b</code> | Represents a backspace character. | <code>\c</code> | Suppresses the newline at the end of the reply string. This is the only method to send a string without a trailing return character. This sequence must be at the end of the send string. For example, the sequence <code>hello\c</code> will simply send the characters h, e, l, l, o. (Not valid in expect.) | <code>\d</code> | Delay for one second. The program uses <code>sleep(1)</code> which delays to a maximum of one second. (Not valid in expect.) |
| <code>''</code>         | Expects or sends a null string. If you send a null string, chat sends the return character. If you expect a null string, chat proceeds to the reply string without waiting. This sequence can be a pair of apostrophes or quote mark characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <code>\b</code>         | Represents a backspace character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <code>\c</code>         | Suppresses the newline at the end of the reply string. This is the only method to send a string without a trailing return character. This sequence must be at the end of the send string. For example, the sequence <code>hello\c</code> will simply send the characters h, e, l, l, o. (Not valid in expect.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |
| <code>\d</code>         | Delay for one second. The program uses <code>sleep(1)</code> which delays to a maximum of one second. (Not valid in expect.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 |                                                                                                                                                                                                                                                  |                 |                                   |                 |                                                                                                                                                                                                                                                                                                                |                 |                                                                                                                              |

| \p   | Pause for 1/10th of a second. (Not valid in expect.)                                                                                                                         |
| \q   | Suppress writing the string to syslog. The string ?????? is written to the log in its place. (Not valid in expect.)                                                          |
| \r   | Send or expect a carriage return.                                                                                                                                            |
| \s   | Represents a space character in the string. Can be used when it is not desirable to quote the strings which contains spaces. The sequence 'HI TIM' and HI\sTIM are the same. |
| \t   | Send or expect a tab character.                                                                                                                                              |
| \T   | Send the phone number string as specified with the -T option. (Not valid in expect.)                                                                                         |
| \U   | Send the phone number 2 string as specified with the -U option. (Not valid in expect.)                                                                                       |
| \\   | Send or expect a backslash character.                                                                                                                                        |
| \ddd | Collapse the octal digits (ddd) into a single ASCII character and send that character. (\000 is not valid in an expect string.)                                              |
| ^C   | Substitute the sequence with the control character represented by C. For example, the character DC1 (17) is shown as ^Q. (Some characters are not valid in expect.)          |

## ENVIRONMENT VARIABLES

Environment variables are available within `chat` scripts if the `-E` option is specified on the command line. The metacharacter `$` introduces the name of the environment variable to substitute. If the substitution fails because the requested environment variable is not set, nothing is replaced for the variable.

## EXIT STATUS

The `chat` program terminates with the following completion codes:

|   |                                                                                                                                                                     |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 | Normal program termination. Indicates that the script was executed without error to normal conclusion.                                                              |
| 1 | One or more of the parameters are invalid or an expect string was too large for the internal buffers. Indicates that the program was not properly executed.         |
| 2 | An error occurred during the execution of the program. This may be due to a read or write operation failing or <code>chat</code> receiving a signal such as SIGINT. |
| 3 | A timeout event occurred when there was an expect string without having a "-subsend" string. This indicates that you may not have programmed the                    |

## chat(1M)

script correctly for the condition or that an unexpected event occurred and the expected string could not be found.

- 4 The first string marked as an ABORT condition occurred.
- 5 The second string marked as an ABORT condition occurred.
- 6 The third string marked as an ABORT condition occurred.
- 7 The fourth string marked as an ABORT condition occurred.
- . . . The other termination codes are also strings marked as an ABORT condition.

To determine which event terminated the script, use the termination code. It is possible to decide if the string "BUSY" was received from the modem versus "NO DIALTONE." While the first event may be retried, the second probably will not succeed during a retry.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWpppdu       |
| Interface Stability | Evolving        |

**SEE ALSO** `sleep(1)`, `uucp(1C)`, `pppd(1M)`, `uucico(1M)`, `syslog(3C)`, `attributes(5)`

Additional information on chat scripts are available with UUCP documentation. The chat script format was taken from scripts used by the `uucico` program.

- NAME** check-hostname – check if sendmail can determine the system’s fully-qualified host name
- SYNOPSIS** `/usr/lib/mail/sh/check-hostname`
- DESCRIPTION** The check-hostname script is a migration aid for sendmail(1M). This script tries to determine the local host’s fully-qualified host name (FQHN) in a manner similar to sendmail(1M). If check-hostname is able to determine the FQHN of the local host, it reports success. Otherwise, check-hostname reports how to reconfigure the system so that the FQHN can be properly determined.

| <b>SYNOPSIS</b>    | <code>/usr/lib/mail/sh/check-permissions</code> [ <i>login</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |           |
| <b>DESCRIPTION</b> | <p>The <code>check-permissions</code> script is intended as a migration aid for <code>sendmail(1M)</code>. It checks the <code>/etc/mail/sendmail.cf</code> file for all configured alias files, and checks the alias files for <code>:include:</code> files. It also checks for certain <code>.forward</code> files. For each file that <code>check-permissions</code> checks, it verifies that none of the parent directories are group- or world-writable. If any directories are overly permissive, it is reported. Otherwise it reports that no unsafe directories were found.</p> <p>As to which <code>.forward</code> files are checked, it depends on the arguments included on the command line. If no argument is given, the current user's home directory is checked for the presence of a <code>.forward</code> file. If any arguments are given, they are assumed to be valid logins, and the home directory of each one is checked.</p> <p>If the special argument <code>ALL</code> is given, the <code>passwd</code> entry in the <code>/etc/nsswitch.conf</code> file is checked, and all password entries that can be obtained through the <code>switch</code> file are checked. In large domains, this can be time-consuming.</p> |                |                 |              |           |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>login</i>                Where <i>login</i> is a valid user name, checks the home directory for <i>login</i>.</p> <p><code>ALL</code>                Checks the home directory of <i>all</i> users.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |           |

| <b>DESCRIPTION</b> | <p>chown changes the owner of the <i>filenames</i> to <i>owner</i>. The owner may be either a decimal user ID (UID) or a login name found in the password file. An optional <i>group</i> may also be specified. The group may be either a decimal group ID (GID) or a group name found in the GID file.</p> <p>Only the super-user of the machine where the file is physically located can change owner, in order to simplify accounting procedures.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-f            Do not report errors.</p> <p>-R            Recursively descend into directories setting the ownership of all files in each directory encountered. When symbolic links are encountered, their ownership is changed, but they are not traversed.</p>                                                                                                                                                                                      |                |                 |              |         |
| <b>FILES</b>       | <code>/etc/passwd</code> password file                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                 |              |         |

| <b>SYNOPSIS</b>      | <code>/usr/sbin/chroot newroot command</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |
| <b>DESCRIPTION</b>   | <p>The <code>chroot</code> utility causes <i>command</i> to be executed relative to <i>newroot</i>. The meaning of any initial slashes ( <code> </code> ) in the path names is changed to <i>newroot</i> for <i>command</i> and any of its child processes. Upon execution, the initial working directory is <i>newroot</i>.</p> <p>Notice that redirecting the output of <i>command</i> to a file,</p> <pre>chroot newroot command &gt;x</pre> <p>will create the file <code>x</code> relative to the original root of <i>command</i>, not the new one.</p> <p>The new root path name is always relative to the current root. Even if a <code>chroot</code> is currently in effect, the <i>newroot</i> argument is relative to the current root of the running process.</p> <p>This command can be run only by the super-user.</p> |                |                 |              |         |
| <b>RETURN VALUES</b> | The exit status of <code>chroot</code> is the return value of <i>command</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |         |
| <b>EXAMPLES</b>      | <p><b>EXAMPLE 1</b> Using the <code>chroot</code> utility.</p> <p>The <code>chroot</code> utility provides an easy way to extract <code>tar</code> files (see <code>tar(1)</code>) written with absolute filenames to a different location:</p> <pre>example# cp /usr/sbin/static/tar /tmp example# dd if=/dev/nrst0   chroot /tmp tar xvf -</pre> <p>Note that <code>tar</code> is statically linked, so it is not necessary to copy any shared libraries to the <i>newroot</i> filesystem.</p>                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |
| <b>ATTRIBUTES</b>    | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |         |

| <b>SYNOPSIS</b>       | <code>/usr/sadm/bin/cimworkshop</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                    |                                                                                   |                       |                                                                                                                   |                     |                                                             |                   |                                                                                     |
| <b>DESCRIPTION</b>    | <p>The <code>cimworkshop</code> command starts Sun WBEM CIM WorkShop, a graphical user interface that enables you to create, modify, and view the classes and instances that describe the managed resources on your system.</p> <p>Managed resources are described using a standard information model called Common Information Model (CIM). A CIM class is a computer representation, or model, of a type of managed resource, such as a printer, disk drive, or CPU. A CIM instance is a particular managed resource that belongs to a particular class. Instances contain actual data. Objects can be shared by any WBEM-enabled system, device, or application. CIM objects are grouped into meaningful collections called schema. One or more schemas can be stored in directory-like structures called namespaces.</p> <p>The CIM WorkShop application displays a Login dialog box. Context help is displayed on the left side of the CIM WorkShop dialog boxes. When you click on a field, the help content changes to describe the selected field.</p> <p>By default, CIM WorkShop uses the RMI protocol to connect to the CIM Object Manager on the local host, in the default namespace, <code>root\cimv2</code>. You can select HTTP if you want to communicate to a CIM Object Manager using the standard XML/HTTP protocol from the Desktop Management Task Force. When a connection is established, all classes contained in the default namespace are displayed in the left side of the CIM WorkShop window.</p> <p>The name of the current namespace is listed in the tool bar. All programming operations are performed within a namespace. Four namespaces are created in a <code>root</code> namespace during installation:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;"><code>cimv2</code></td> <td>Contains the default CIM classes that represent managed resources on your system.</td> </tr> <tr> <td><code>security</code></td> <td>Contains the security classes used by the CIM Object Manager to represent access rights for users and namespaces.</td> </tr> <tr> <td><code>system</code></td> <td>Contains properties for configuring the CIM Object Manager.</td> </tr> <tr> <td><code>snmp</code></td> <td>Contains pre-defined SNMP-related classes and all SNMP MOF files that are compiled.</td> </tr> </table> <p>The <code>cimworkshop</code> application allows you to perform the following tasks:</p> <p>Create, view, and change namespaces.<br/> Use the CIM WorkShop application to view all namespaces. A namespace is a directory-like structure that can store CIM classes and instances.</p> <p>Create, delete, and view CIM classes.<br/> You cannot modify the unique attributes of the classes that make up the CIM and Solaris Schema. You can create a new instance or subclass of the class and modify the desired attributes in that instance or subclass.</p> | <code>cimv2</code> | Contains the default CIM classes that represent managed resources on your system. | <code>security</code> | Contains the security classes used by the CIM Object Manager to represent access rights for users and namespaces. | <code>system</code> | Contains properties for configuring the CIM Object Manager. | <code>snmp</code> | Contains pre-defined SNMP-related classes and all SNMP MOF files that are compiled. |
| <code>cimv2</code>    | Contains the default CIM classes that represent managed resources on your system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                    |                                                                                   |                       |                                                                                                                   |                     |                                                             |                   |                                                                                     |
| <code>security</code> | Contains the security classes used by the CIM Object Manager to represent access rights for users and namespaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                    |                                                                                   |                       |                                                                                                                   |                     |                                                             |                   |                                                                                     |

| <code>snmp</code>     | Contains pre-defined SNMP-related classes and all SNMP MOF files that are compiled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                    |                                                                                   |                       |                                                                                                                   |                     |                                                             |                   |                                                                                     |

## cimworkshop(1M)

Create, modify, delete, and view CIM instances.

You can add instances to a class and modify its inherited properties or create new properties. You can also change the property values of a CIM instance.

Invoke methods.

You can set input values for a parameter of a method and invoke the method.

When CIM WorkShop connects to the CIM Object Manager in a particular namespace, all subsequent operations occur within that namespace. When you connect to a namespace, you can access the classes and instances in that namespace (if they exist) and in any namespaces contained in that namespace.

When you use CIM WorkShop to view CIM data, the WBEM system validates your login information on the current host. By default, a validated WBEM user is granted read access to the CIM Schema. The CIM Schema describes managed objects on your system in a standard format that all WBEM-enabled systems and applications can interpret.

**Read Only** Allows read-only access to CIM Schema objects. Users with this privilege can retrieve instances and classes, but cannot create, delete, or modify CIM objects.

**Read/Write** Allows full read, write, and delete access to all CIM classes and instances.

**Write** Allows write and delete, but not read access to all CIM classes and instances.

**None** Allows no access to CIM classes and instances.

**USAGE** The `cimworkshop` command is not a tool for a distributed environment. Rather, this command is used for local administration on the machine on which the CIM Object Manager is running.

**EXIT STATUS** The `cimworkshop` utility terminates with exit status 0.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| <b>SYNOPSIS</b>    | <code>/usr/sbin/clear_locks [-s] hostname</code>                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The <code>clear_locks</code> command removes all file, record, and share locks created by the <i>hostname</i> and held on the current host, regardless of which process created or owns the locks.</p> <p>This command can be run only by the super-user.</p> <p>This command should only be used to repair the rare case of a client crashing and failing to clear held locks. Clearing locks held by an active client may cause applications to fail in an unexpected manner.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p><code>-s</code> Remove all locks created by the current machine and held by the server <i>hostname</i>.</p>                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>hostname</i> name of host server</p>                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |              |         |
| <b>EXIT STATUS</b> | <p>0 Successful operation.</p> <p>1 If not root.</p> <p>2 Usage error.</p> <p>3 If unable to contact server ( RPC ).</p>                                                                                                                                                                                                                                                                                                                                                               |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>clinfo</b> [-nh]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The <code>clinfo</code> command displays cluster configuration information about the node from which the command is executed.</p> <p>Without arguments, <code>clinfo</code> returns an exit status of 0 if the node is configured and booted as part of a cluster. Otherwise, <code>clinfo</code> returns an exit status of 1.</p>                                                                                                                                                                                                                              |                |                 |              |         |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p>-h            Prints the highest node number in the cluster configuration.</p> <p>              This value is not necessarily the same as the number of nodes in the cluster as not all nodes need to be defined. For example, it is possible to have a cluster with two nodes: numbered 1 and 5. In this case, the highest node number is 5, but there are only two nodes defined in the cluster configuration.</p> <p>-n            Prints the number of the node from which <code>clinfo</code> is executed.</p> |                |                 |              |         |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0            Successful completion.</p> <p>1            An error occurred.</p> <p>              This is usually because the node is not configured or booted as part of a cluster.</p>                                                                                                                                                                                                                                                                                                                           |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>clri</b> [-F <i>FSType</i> ] [-V] <i>special</i> <i>i-number</i><br><b>dcopy</b> [-F <i>FSType</i> ] [-V] <i>special</i> <i>i-number</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>clri writes zeros on the inodes with the decimal <i>i-number</i> on the file system stored on <i>special</i>. After clri, any blocks in the affected file show up as missing in an fsck(1M) of <i>special</i>.</p> <p>Read and write permission is required on the specified file system device. The inode becomes allocatable.</p> <p>The primary purpose of this routine is to remove a file that for some reason appears in no directory. If it is used to zap an inode that does appear in a directory, care should be taken to track down the entry and remove it. Otherwise, when the inode is reallocated to some new file, the old entry will still point to that file. At that point, removing the old entry will destroy the new file. The new entry will again point to an unallocated inode, so the whole cycle is likely to be repeated again and again.</p> <p>dcopy is a symbolic link to clri.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-F <i>FSType</i>            Specify the <i>FSType</i> on which to operate. The <i>FSType</i> should either be specified here or be determinable from /etc/vfstab by matching <i>special</i> with an entry in the table, or by consulting /etc/default/fs.</p> <p>-V                      Echo the complete command line, but do not execute the command. The command line is generated by using the options and arguments provided by the user and adding to them information derived from /etc/vfstab. This option should be used to verify and validate the command line.</p>                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |
| <b>USAGE</b>       | See largefile(5) for the description of the behavior of clri and dcopy when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |

| <b>NAME</b>                   | consadm – select or display devices used as auxiliary console devices                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                               |                                                                                                                                                                                |                               |                                                                                                                                                                                         |                 |                                                                              |
| <b>SYNOPSIS</b>               | <pre>/usr/sbin/consadm<br/>/usr/sbin/consadm [-a <i>device</i> . . .] [-p]<br/>/usr/sbin/consadm [-d <i>device</i> . . .] [-p]<br/>/usr/sbin/consadm [-p]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                               |                                                                                                                                                                                |                               |                                                                                                                                                                                         |                 |                                                                              |
| <b>DESCRIPTION</b>            | <p>consadm selects the hardware <i>device</i> or devices to be used as auxiliary console devices, or displays the current device. Only superusers are allowed to make or display auxiliary console device selections.</p> <p>Auxiliary console devices receive copies of <code>console</code> messages, and can be used as the console during <code>single</code> user mode. In particular, they receive kernel messages and messages directed to <code>/dev/sysmsg</code>. On Solaris or IA based systems they can also be used for interaction with the bootstrap.</p> <p>By default, selecting a display device to be used as an auxiliary console device selects that device for the duration the system remains up. If the administrator needs the selection to persist across reboots the <code>-p</code> option can be specified.</p> <p>consadm runs a daemon in the background, monitoring auxiliary console devices. Any devices that are disconnected (hang up, lose carrier) are removed from the auxiliary console device list, though not from the persistent list. While auxiliary console devices may have been removed from the device list receiving copies of <code>console</code> messages, those messages will always continue to be displayed by the default console device.</p> <p>The daemon will not run if it finds there are not any auxiliary devices configured to monitor. Likewise, after the last auxiliary console is removed, the daemon will shut itself down. Therefore the daemon persists for only as long as auxiliary console devices remain active.</p> |                               |                                                                                                                                                                                |                               |                                                                                                                                                                                         |                 |                                                                              |
| <b>OPTIONS</b>                | <p>The following options are supported:</p> <table><tr><td><code>-a <i>device</i></code></td><td>Adds <i>device</i> to the list of auxiliary console devices. Specify <i>device</i> as the path name to the device or devices to be added to the auxiliary console device list.</td></tr><tr><td><code>-d <i>device</i></code></td><td>Removes <i>device</i> from the list of auxiliary console devices. Specify <i>device</i> as the path name to the device or devices to be removed from the auxiliary console device list.</td></tr><tr><td><code>-p</code></td><td>Prints the list of auxiliary consoles that will be auxiliary across reboots.</td></tr></table> <p>When invoked with the <code>-a</code> or <code>-d</code> options , tells the application to make the change persist across reboot.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <code>-a <i>device</i></code> | Adds <i>device</i> to the list of auxiliary console devices. Specify <i>device</i> as the path name to the device or devices to be added to the auxiliary console device list. | <code>-d <i>device</i></code> | Removes <i>device</i> from the list of auxiliary console devices. Specify <i>device</i> as the path name to the device or devices to be removed from the auxiliary console device list. | <code>-p</code> | Prints the list of auxiliary consoles that will be auxiliary across reboots. |
| <code>-a <i>device</i></code> | Adds <i>device</i> to the list of auxiliary console devices. Specify <i>device</i> as the path name to the device or devices to be added to the auxiliary console device list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                               |                                                                                                                                                                                |                               |                                                                                                                                                                                         |                 |                                                                              |
| <code>-d <i>device</i></code> | Removes <i>device</i> from the list of auxiliary console devices. Specify <i>device</i> as the path name to the device or devices to be removed from the auxiliary console device list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                               |                                                                                                                                                                                |                               |                                                                                                                                                                                         |                 |                                                                              |
| <code>-p</code>               | Prints the list of auxiliary consoles that will be auxiliary across reboots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                               |                                                                                                                                                                                |                               |                                                                                                                                                                                         |                 |                                                                              |

**EXAMPLES** **EXAMPLE 1** Adding to the list of devices that will receive console messages

The following command adds `/dev/term/a` to the list of devices that will receive console messages.

```
example# consadm -a /dev/term/a
```

**EXAMPLE 2** Removing from the list of devices that will receive console messages

The following command removes `/dev/term/a` from the list of devices that will receive console messages. This includes removal from the persistent list.

```
example# consadm -d -p /dev/term/a
```

**EXAMPLE 3** Printing the list of devices selected as auxiliary console devices

The following command prints the name or names of the device or devices currently selected as auxiliary console devices.

```
example# consadm
```

**ENVIRONMENT VARIABLES**

See `environ(5)` for descriptions of the following environment variables that affect the execution of `consadm`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

**EXIT STATUS**

The following exit values are returned:

```
0 Successful completion.
>0 An error occurred.
```

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE  | ATTRIBUTE VALUE |
|-----------------|-----------------|
| Availability    | SUNWcsu         |
| Stability Level | Evolving        |

**SEE ALSO**

`eeprom(1M)`, `syslogd(1M)`, `kadb(1M)`, `environ(5)`, `attributes(5)`, `sysmsg(7d)`, `console(7d)`

**NOTES**

Auxiliary console devices are not usable for `kadb` or firmware I/O, do not receive panic messages, and do not receive output directed to `/dev/console`.

## conv\_lp(1M)

**NAME** conv\_lp – convert LP configuration

**SYNOPSIS** `conv_lp [-d dir] [-f file]`

**DESCRIPTION** conv\_lp reads LP printer configuration information from a directory and converts it to an output file for use with print client software.

**OPTIONS** The following options are supported:

- `-d dir` The root (' / ') directory from which LP configuration information is read. The default is root (' / ').
- `-f file` The output file to which conv\_lp writes the converted LP configuration information. The default is `/etc/printers.conf`.

**EXAMPLES**

**EXAMPLE 1** Default directory and file for converting LP configuration information.

The following example converts LP configuration information from directory root (/) to file `/etc/printers.conf`.

```
example% conv_lp
```

**EXAMPLE 2** Specified directory and file for converting LP configuration information.

The following example converts LP configuration information from directory `/export/root/client` to file `/export/root/client/etc/printers.conf`.

```
example% conv_lp -d /export/root/client -f /export/root/client/etc/printers.conf
```

**EXIT STATUS** The following exit values are returned:

- 0 Successful completion.
- non-zero An error occurred.

**FILES** `/etc/printers.conf` System printer configuration database.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWpcu         |

**SEE ALSO** `lpset(1M)`, `printers.conf(4)`, `attributes(5)`

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                           |                                                                                                                                                                                  |          |                                               |

| <b>SYNOPSIS</b>           | <b>conv_lpd</b> [-c printers   -c printcap] [-n] <i>file</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                           |                                                                                                                                                                                  |          |                                               |
| <b>DESCRIPTION</b>        | conv_lpd converts LPD printer configuration information from <i>file</i> to a printers.conf or a printcap file (see printers.conf(4)). <i>file</i> specifies the name of the input file, and can be either in printers.conf or printcap format. If <i>file</i> is in printers.conf format, it converts it to a printcap file. If <i>file</i> is in printcap format, it converts it to a printers.conf file.                                                                                                                                                                                                                                                                                                                                                        |                           |                                                                                                                                                                                  |          |                                               |
| <b>OPTIONS</b>            | <p>The following options are supported:</p> <table border="0"> <tr> <td style="vertical-align: top;">-c printers   -c printcap</td> <td>Specifies the type of output file produced by the conversion. -c printers converts to a printers.conf file. -c printcap converts to a printcap file. -c printers is the default.</td> </tr> <tr> <td style="vertical-align: top;">-n</td> <td>Preserves the namelist during the conversion.</td> </tr> </table>                                                                                                                                                                                                                                                                                                            | -c printers   -c printcap | Specifies the type of output file produced by the conversion. -c printers converts to a printers.conf file. -c printcap converts to a printcap file. -c printers is the default. | -n       | Preserves the namelist during the conversion. |
| -c printers   -c printcap | Specifies the type of output file produced by the conversion. -c printers converts to a printers.conf file. -c printcap converts to a printcap file. -c printers is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                           |                                                                                                                                                                                  |          |                                               |
| -n                        | Preserves the namelist during the conversion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                           |                                                                                                                                                                                  |          |                                               |
| <b>OPERANDS</b>           | <p>The following operands are supported:</p> <p><i>file</i>            The file to be converted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                           |                                                                                                                                                                                  |          |                                               |

| <b>NAME</b>        | coreadm – core file administration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                 |            |                 |                   |                 |                    |                 |                      |                 |                                            |                 |                                        |                 |                                       |                 |                        |
| <b>SYNOPSIS</b>    | <pre>coreadm [-g <i>pattern</i>] [-i <i>pattern</i>] [-d <i>option...</i>] [-e <i>option...</i>] coreadm [-p <i>pattern</i>] [<i>pid...</i>] coreadm -u</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                 |            |                 |                   |                 |                    |                 |                      |                 |                                            |                 |                                        |                 |                                       |                 |                        |
| <b>DESCRIPTION</b> | <p>The <code>coreadm</code> command is used to specify the name and location of core files produced by abnormally-terminating processes. See <code>core(4)</code>.</p> <p>The first form shown in the synopsis can be executed only by the super-user and is used to configure system-wide core file options, including a global core file name pattern and a per-process core file name pattern for the <code>init(1M)</code> process. All such settings are saved in <code>coreadm</code>'s configuration file <code>/etc/coreadm.conf</code> for setting on reboot. See <code>init(1M)</code></p> <p>The second form can be executed by non-privileged users and is used to specify the file name pattern to be used by the operating system when generating a per-process core file.</p> <p>The third form can be executed only by the super-user and is used to update all system-wide core file options based on the contents of <code>/etc/coreadm.conf</code>. Normally this option is used only on reboot by the startup script <code>/etc/init.d/coreadm</code>.</p> <p>A core file name pattern is a normal file system path name with embedded variables, specified with a leading <code>%</code> character, that are expanded from values in effect when a core file is generated by the operating system. The possible variables are:</p> <table border="0"> <tr><td><code>%p</code></td><td>process-ID</td></tr> <tr><td><code>%u</code></td><td>effective user-ID</td></tr> <tr><td><code>%g</code></td><td>effective group-ID</td></tr> <tr><td><code>%f</code></td><td>executable file name</td></tr> <tr><td><code>%n</code></td><td>system node name (<code>uname -n</code>)</td></tr> <tr><td><code>%m</code></td><td>machine name (<code>uname -m</code>)</td></tr> <tr><td><code>%t</code></td><td>decimal value of <code>time(2)</code></td></tr> <tr><td><code>%%</code></td><td>literal <code>%</code></td></tr> </table> <p>For example, the core file name pattern:</p> <pre>/var/core/core.%f.%p</pre> <p>would result, for command <code>foo</code> with process-ID 1234, in the core file name:</p> <pre>/var/core/core.foo.1234</pre> <p>The <code>coreadm</code> command with no arguments reports the current system configuration, for example:</p> | <code>%p</code> | process-ID | <code>%u</code> | effective user-ID | <code>%g</code> | effective group-ID | <code>%f</code> | executable file name | <code>%n</code> | system node name ( <code>uname -n</code> ) | <code>%m</code> | machine name ( <code>uname -m</code> ) | <code>%t</code> | decimal value of <code>time(2)</code> | <code>%%</code> | literal <code>%</code> |
| <code>%p</code>    | process-ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |            |                 |                   |                 |                    |                 |                      |                 |                                            |                 |                                        |                 |                                       |                 |                        |

## coreadm(1M)

```
$ coreadm
 global core file pattern: /var/core/core.%f.%p
 init core file pattern: core
 global core dumps: enabled
 per-process core dumps: enabled
 global setid core dumps: enabled
per-process setid core dumps: disabled
 global core dump logging: disabled
```

The `coreadm` command with only a list of process-IDs reports each process's per-process core file name pattern, for example:

```
$ coreadm 278 5678
 278: core.%f.%p
 5678: /home/george/cores/%f.%p.%t
```

Only the owner of a process or the super-user can interrogate a process in this manner.

When a process is dumping core, the operating system will generate two possible core files, the global core file and the per-process core file. Both files, one or the other, or no file will be generated, based on the system options in effect at the time.

When generated, a global core file will be created mode `600` and will be owned by the super-user. Non-privileged users cannot examine such files.

Ordinary per-process core files are created mode `600` under the credentials of the process. The owner of the process can examine such files.

A process that is or ever has been `setuid` or `setgid` since its last `exec(2)`, including a process that began life with super-user privileges and gave up that privilege by way of `setuid(2)`, presents security issues with respect to dumping core, as it may contain sensitive information in its address space to which the current non-privileged owner of the process should not have access. If `setid` core files are enabled, they will be created mode `600` and will be owned by the super-user.

### OPTIONS

The following options are supported:

- `-g pattern` Set the global core file name pattern to *pattern*. The pattern must start with a `/` and can contain any of the special `%` variables described in the DESCRIPTION.  
Only super-users can use this option.
- `-i pattern` Set the per-process core file name *pattern* for `init(1M)` to *pattern*. This is the same as `coreadm -p pattern 1` except that the setting will be persistent across reboot.  
Only super-users can use this option.
- `-e option...` Enable the specified core file option. Specify *option* as one of the following:
  - `global` Allow core dumps using global core pattern

|                           |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                           | global-setid | Allow set-id core dumps using global core pattern                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                           | proc-setid   | Allow set-id core dumps using per-process core pattern                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                           | log          | Generate a <code>syslog(3C)</code> message when generation of a global core file is attempted. Multiple <code>-e</code> and <code>-d</code> options can be specified on the command line. Only super-users can use this option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <code>-d option...</code> |              | Disable the specified core file option. See the <code>-e option</code> for descriptions of possible options.<br><br>Multiple <code>-e</code> and <code>-d</code> options can be specified on the command line. Only super-users can use this option.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>-p pattern</code>   |              | Set the per-process core file name pattern to <i>pattern</i> for each of the specified process-IDs. The pattern can contain any of the special % variables described in the <code>DESCRIPTION</code> and need not begin with <code>/</code> . If it does not begin with <code>/</code> , it will be evaluated relative to the current directory in effect when the process generates a core file.<br><br>A non-privileged user can apply the <code>-p</code> option only to processes owned by that user. The super-user can apply it to any process. The per-process core file name pattern will be inherited by future child processes of the affected processes. See <code>fork(2)</code> . |
| <code>-u</code>           |              | Update system-wide core file options from the contents of the configuration file <code>/etc/coreadm.conf</code> . If the configuration file is missing or contains invalid values, default values are substituted. Following the update, the configuration file is resynchronized with the system core file configuration. Only super-users can use this option.                                                                                                                                                                                                                                                                                                                               |

**OPERANDS** The following operands are supported:

*pid* process-ID

**EXIT STATUS** The following exit values are returned:

0 Successful completion.  
 1 A fatal error occurred while either obtaining or modifying the system core file configuration.  
 2 Invalid command line options were specified.

**EXAMPLES** **EXAMPLE 1** Setting the core file name pattern

When executed from a user's `$HOME/.profile` or `$HOME/.login`, the following command sets the core file name pattern for all processes run during the login session:

## coreadm(1M)

### **EXAMPLE 1** Setting the core file name pattern *(Continued)*

```
example$ coreadm -p core.%f.%p $$
```

\$\$ is the process-id of the currently running shell. The per-process core file name pattern is inherited by all child processes.

### **EXAMPLE 2** Dumping user's files into a subdirectory

The following command dumps all of the user's core dumps into the `corefiles` subdirectory of the home directory, discriminated by the system node name. This is useful for users who use many different machines but have a shared home directory.

```
example$ coreadm -p $HOME/corefiles/%n.%f.%p $$
```

**FILES** /etc/init.d/coreadm

/etc/coreadm.conf

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `gcore(1)`, `init(1M)`, `exec(2)`, `fork(2)`, `setuid(2)`, `time(2)`, `syslog(3C)`, `core(4)`, `attributes(5)`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>NAME</b>        | cpustat – monitor system behavior using CPU performance counters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>SYNOPSIS</b>    | <b>cpustat</b> -c <i>eventspec</i> [-c <i>eventspec</i> ]... [-ntD] [ <i>interval</i> [ <i>count</i> ]]<br><b>cpustat</b> -h                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DESCRIPTION</b> | <p>The <code>cpustat</code> utility allows CPU performance counters to be used to monitor the overall behavior of the CPUs in the system.</p> <p>If <i>interval</i> is specified, <code>cpustat</code> samples activity every <i>interval</i> seconds, repeating forever. If a <i>count</i> is specified, the statistics are repeated <i>count</i> times. If neither are specified, an interval of five seconds is used, and there is no limit to the number of samples that will be taken.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-c <i>eventspec</i>      Specify a set of events for the CPU performance counters to monitor. The syntax of these event specification can be determined using the -h option to cause the usage message to be generated. The semantics of these event specifications can be determined by reading the CPU manufacturers documentation for the events. See <code>cpc_strtoevent(3CPC)</code> for a description of the syntax.</li> <li>                    Multiple -c options may be specified, in which case the command cycles between the different event settings on each sample.</li> <li>-D                    Enable debug mode.</li> <li>-h                    Print an extensive help message on how to use the utility and how to program the processor-dependent counters.</li> <li>-n                    Omit all header output (useful if <code>cpustat</code> is the beginning of a pipeline).</li> <li>-t                    Print an additional column of processor cycle counts, if available on the current architecture.</li> </ul> |
| <b>USAGE</b>       | <p>A closely related utility, <code>cputrack(1)</code>, can be used to monitor the behavior of individual applications with little or no interference from other activities on the system.</p> <p>The <code>cpustat</code> utility must be run by the super-user, as there is an intrinsic conflict between the use of the CPU performance counters system-wide by <code>cpustat</code> and the use of the CPU performance counters to monitor an individual process (for example, by <code>cputrack</code>.)</p> <p>Once any instance of this utility has started, no further per-process or per-LWP use of the counters is allowed until the last instance of the utility terminates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## cpustat(1M)

The times printed by the command correspond to the wallclock time when the hardware counters were actually sampled, instead of when the program told the kernel to sample them. The time is derived from the same timebase as `gethrtime(3C)`.

The processor cycle counts enabled by the `-t` option always apply to both user and system modes, regardless of the settings applied to the performance counter registers.

The output of `cpustat` is designed to be readily parseable by `nawk(1)` and `perl(1)`, thereby allowing performance tools to be composed by embedding `cpustat` in scripts. Alternatively, tools may be constructed directly using the same APIs that `cpustat` is built upon using the facilities of `libcpc(3LIB)`. See `cpc(3CPC)`.

The `cpustat` utility only monitors the CPUs that are accessible to it in the current processor set. Thus several instances of the utility can be running on the CPUs in different processor sets. See `psrset(1M)` for more information about processor sets.

Because `cpustat` uses LWPs bound to CPUs, the utility may have to be terminated before the configuration of the relevant processor can be changed.

**WARNING** By running the `cpustat` command, the superuser will forcibly invalidate all existing performance counter context. This may in turn cause all invocations of the `cputrack` command, and other users of performance counter context, to exit prematurely with unspecified errors.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWcpcu        |
| Interface Stability | Evolving        |

| <b>DESCRIPTION</b>      | The <code>crash</code> command is used to examine the system memory image of a running or a crashed system by formatting and printing control structures, tables, and other information. Command line arguments to <code>crash</code> are <i>dumpfile</i> , <i>namelist</i> , and <i>output-file</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>OPTIONS</b>          | <p>The following options are supported:</p> <p>-d <i>dumpfile</i>      Specify <i>dumpfile</i> as the file containing the system memory image. The default <i>dumpfile</i> is <code>/dev/mem</code>. The system image can also be the pathname of a dump file generated by the <code>savecore(1M)</code> utility.</p> <p>-n <i>namelist</i>      Specify the text file <i>namelist</i> which contains the symbol table information needed for symbolic access to the system memory image to be examined. The default <i>namelist</i> is <code>/dev/ksyms</code>. Note: It is recommended that <code>crash</code> dumps be analyzed on a machine having the same kernel architecture as the machine from which the dump was taken.</p> <p>-w <i>output-file</i>    When the <code>crash</code> command is invoked, a session is initiated. The output from a <code>crash</code> session is directed to <i>output-file</i>. The default <i>output-file</i> is the standard output.</p> |
| <b>USAGE</b>            | <p>Input during a <code>crash</code> session is of the form:</p> <p><i>function</i> [ <i>argument</i>. . . ]</p> <p>where <i>function</i> is one of the <code>crash</code> functions described in the <code>Functions</code> subsection of this manual page, and <i>arguments</i> are qualifying data that indicate which items of the system image are to be printed.</p> <p>The default for process-related items is the current process for a running system or the process that was running at the time of the crash for a crashed system. Similarly, the default for thread-related items is the current thread for a running system or the thread that was running at the time of the crash for a crash system. If the contents of a table are being dumped, the default is all active table entries.</p>                                                                                                                                                                      |
| <b>Function Options</b> | <p>The following function options are available to <code>crash</code> functions wherever they are semantically valid. Valid function options are shown in <code>Functions</code>.</p> <p>-e                    Display every entry in a table.</p> <p>-f                    Display the full structure.</p> <p>-p                    Interpret all address arguments in the command line as physical addresses. If the addresses specified are not physical addresses, results are inconsistent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## crash(1M)

- s *process*           Specify a process slot other than the default.
- w *filename*         Redirect the output of a function to *filename*.

Output from `crash` functions may be piped to another program in the following way:

```
function [argument. . .] ! shell_command
```

The redirection option `-w` cannot be used with this feature.

Depending on the context of the function, numeric arguments are assumed to be in a specific radix. Counts are assumed to be decimal. Addresses are always hexadecimal. Table address arguments larger than the size of the function table are interpreted as hexadecimal addresses; those smaller are assumed to be decimal slots in the table. Default bases on all arguments may be overridden. The C conventions for designating the bases of numbers are recognized. A number that is usually interpreted as decimal is interpreted as hexadecimal if it is preceded by `0x` and as octal if it is preceded by `0`. Decimal override is designated by `0d`, and binary by `0b`.

Aliases for functions may be any uniquely identifiable initial substring of the function name. Traditional aliases of one letter, such as `b` for `buffer`, remain valid.

Many functions accept different forms of entry for the same argument. Requests for table information accept a table entry number, a physical address, a virtual address, a symbol, a range, or an expression. A range of slot numbers may be specified in the form `a-b` where `a` and `b` are decimal numbers. An expression consists of two operands and an operator. An operand may be an address, a symbol, or a number; the operator may be `+`, `-`, `*`, `/`, `&`, or `|`. An operand that is a number should be preceded by a radix prefix if it is not a decimal number (`0` for octal, `0x` for hexadecimal, `0b` for binary). The expression must be enclosed in parentheses. Other functions accept any of these argument forms that are meaningful.

Two abbreviated arguments to `crash` functions are used throughout. Both accept data entered in several forms. They may be expanded into the following:

```
table_entry = slot number | address | symbol | range | expression
```

```
start_addr = address | symbol | expression
```

### Functions

```
? [-w filename]
```

List available functions.

```
! command
```

Escape to the shell and execute `command`.

```
base [-w filename] number. . .
```

Print `number` in binary, octal, decimal, and hexadecimal. A number in a radix other than decimal should be preceded by a prefix that indicates its radix as follows: `0x`, hexadecimal; `0`, octal; and `0b`, binary.

```
buffer [-w filename] [-format] buffer slot
buffer [-w filename] [-format] [-p] start_addr
 Alias: b
```

Print the contents of a buffer in the designated format. The following *format* designations are recognized: -b, byte; -c, character; -d, decimal; -x, hexadecimal; -o, octal; and, -i, inode. If no format is given, the previous format is used. The default format at the beginning of a *crash* session is hexadecimal.

```
bufhdr [-f] [-w filename] [[-p] table_entry...]
 Alias: buf
```

Print system buffer headers.

```
callout [-l] [-w filename]
 Alias: c
```

Print the *callout* table. If the -l option is specified, the contents of the locks pertaining to the *callout* structure are also displayed.

```
class [-w filename] [table_entry...]
 Print information about process scheduler classes.
```

```
help [-w filename] function...
 Print a description of the named function, including syntax and aliases.
```

```
kmalog [-w filename] [slab | fail]
```

Display events in a kernel memory allocator transaction log. Events are displayed in time-reverse order, with the most recent event displayed first. For each event, *kmalog* displays the time relative to the most recent event in T-minus notation (for example, T-0.000151879), the *bufctl*, the buffer address, the *kmem* cache name, and the stack trace at the time of the event.

Without arguments, *kmalog* displays the *kmem* transaction log, which is present only if *KMF\_AUDIT* is set in *kmem\_flags*.

*kmalog fail* displays the allocation failure log, which is always present; this can be useful in debugging drivers that don't cope with allocation failure correctly.

*kmalog slab* displays the slab create log, which is always present. *kmalog slab* can be useful when searching for memory leaks.

```
kmastat [-w filename]
 Print kernel memory allocator statistics.
```

```
kmausers [-e] [-f] [-w filename] [cachename...]
```

Print the information about the medium and large users of the kernel memory allocator that have current memory allocations. The output consists of one entry for each unique stack trace specifying the total amount of memory and number of allocations that was made with that stack trace.

## crash(1M)

This function is only available if the kernel has the `KMF_AUDIT` flag set in `kmem_flags`. (See NOTES.)

If one or more cache names (for example, `kmem_alloc_256`) are specified, the scan of memory usage is restricted to those caches. By default all caches are included.

If the `-e` option is used, the small users of the allocator are included. The small users are allocations that total less than 1024 bytes of memory or for which there are less than 10 allocations with the same stack trace.

If the `-f` option is used, the stack traces are printed for each individual allocation.

```
lck [-e] [-w filename] [[-p] lock_addr. . .]
Alias: l
```

Print record locking information. If the `-e` option is used or lock address arguments are given, the record lock list is printed. If no argument is entered, information on locks relative to UFS inodes is printed.

```
mb1k [-e] [-f] [-w filename] [[-p] table_entry. . .]
Print allocated streams message block and data block headers.
```

```
mount [-f] [-w filename] [[-p] table_entry. . .]
Alias: m, vfs
```

Print information about mounted filename systems.

```
nm [-w filename] symbol. . .
Print value and type for the given symbol.
```

```
od [-p] [-w filename] [-format] [-mode] [-s process] start_addr [count]
Alias: rd
```

Print *count* values starting at *start\_addr* in one of the following formats: character (`-c`), decimal (`-d`), hexadecimal (`-x`), octal (`-o`), ASCII (`-a`), or hexadecimal/character (`-h`), and one of the following modes: long (`-l`), short (`-t`), or byte (`-b`). The default mode for character and ASCII formats is byte; the default mode for decimal, hexadecimal, and octal formats is long. The format `-h` prints both hexadecimal and character representations of the addresses dumped; no mode needs to be specified. When format or mode is omitted, the previous value is used. At the start of a `crash` session, the format is hexadecimal and the mode is long. If no count is entered, 1 is assumed.

```
proc [-e] [-f] [-l] [-w filename] [[-p] [-a] table_entry. . . | #procid. . .]
proc [-e] [-f] [-l] [-w filename] [-r]
Alias: p
```

Print the process table. Process table information may be specified in two ways. First, any mixture of table entries and process IDs may be entered. Each process ID must be preceded by a `#`. Alternatively, process table information for runnable

processes may be specified with the runnable option `-r`. If the `-l` option is specified, all relevant locking information is displayed.

`snode [-e] [-f] [-l] [-w filename] [[-p] table_entry...]`

Print information about open special filenames. If the `-l` option is specified, all relevant locking information is also displayed.

`strstat [-w filename]`

Print STREAMS statistics.

`tsdptbl [-w filename] [table_entry...]`

Print the time-sharing dispatcher parameter table. See `ts_dptbl(4)`.

`uinode [-d] [-e] [-f] [-l] [-r] [-w filename] [[-p] table_entry...]`

Alias: `ui`

Print the UFS inode table. The `-d` option will list the address and i-number of all UFS inodes in use and on the free list. If the `-l` option is specified, all relevant locking information is also displayed. The `-r` option will display all free UFS inodes.

`var [-w filename]`

Alias: `v`

Print the tunable system parameters.

`vfs [-e] [-w filename] [[-p] address...]`

Alias: `m, mount`

Print information about mounted filename systems.

`vfssw [-f] [-w filename] [[-p] table_entry...]`

Alias: `fs`

Print information about configured filename system types.

`vnode [-w filename] [-l] [-p] vnode_addr...]`

Print information about vnodes.

`vtop [-w filename] [-s process] start_addr...]`

Print the physical address translation of the virtual address `start_addr`.

### Large File Behavior

See `largefile(5)` for the description of the behavior of `crash` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

### EXIT STATUS

The following exit values are returned:

- 0 Successful completion.
- 1 An error occurred.

### FILES

`/dev/mem` system image of currently running system  
`/dev/ksyms` system namelist

crash(1M)

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE                       |
|----------------|---------------------------------------|
| Availability   | SUNWcsu (32-bit)<br>SUNWcsxu (64-bit) |

**SEE ALSO** `adb(1)`, `mdb(1)`, `kadb(1M)`, `savecore(1M)`, `soconfig(1M)`, `rt_dptbl(4)`, `ts_dptbl(4)`, `attributes(5)`, `largefile(5)`

**NOTES** The `crash` utility may not be present in versions of the Solaris operating environment after Solaris 8. The `crash` command is a utility for examining system crash dump files, whose functionality is superseded by the new `mdb(1)` utility. The `crash` command's interface was structured around implementation details, such as slots, that have no relation to the Solaris operating environment implementation. Solaris 8 will include documentation that explains the `mdb` syntax that is equivalent to each `crash` subcommand to enable the transition.

Kernel core dumps should be examined on the same platform on which they were created.

The `kmausers` and `mblkusers` commands require that `KMF_AUDIT` is set in `kmem_flags`. To do this, perform the following steps:

1. Add the following line to `/etc/system`:

```
set kmem_flags=1
```

2. Reboot.

`kmem` auditing is quite expensive in both memory consumption and CPU time because it records a complete stack trace for every allocation.

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                          |                                  |                               |                     |                                |                                             |                            |                                       |

| <b>NAME</b>                    | cron – clock daemon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                          |                                  |                               |                     |                                |                                             |                            |                                       |
| <b>SYNOPSIS</b>                | <code>/usr/sbin/cron</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                          |                                  |                               |                     |                                |                                             |                            |                                       |
| <b>DESCRIPTION</b>             | <p>The <code>cron</code> command starts a process that executes commands at specified dates and times. Regularly scheduled commands can be specified according to instructions found in <code>crontab</code> files in the directory <code>/var/spool/cron/crontabs</code>. Users can submit their own <code>crontab</code> file using the <code>crontab(1)</code> command. Commands which are to be executed only once may be submitted using the <code>at(1)</code> command.</p> <p><code>cron</code> only examines <code>crontab</code> or <code>at</code> command files during its own process initialization phase and when the <code>crontab</code> or <code>at</code> command is run. This reduces the overhead of checking for new or changed files at regularly scheduled intervals.</p> <p>Since <code>cron</code> never exits, it should be executed only once. This is done routinely through <code>/etc/rc2.d/S75cron</code> at system boot time. The file <code>/etc/cron.d/FIFO</code> is used (among other things) as a lock file to prevent the execution of more than one instance of <code>cron</code>.</p> <p><code>cron</code> captures the output of the job's <code>stdout</code> and <code>stderr</code> streams, and, if it is non-empty, mails the output to the user. If the job does not produce output, no mail is sent to the user (unless the job is an <code>at(1)</code> job and the <code>-m</code> option was specified when the job was submitted).</p> |                          |                                  |                               |                     |                                |                                             |                            |                                       |
| <b>Setting cron Defaults</b>   | <p>To keep a log of all actions taken by <code>cron</code>, <code>CRONLOG=YES</code> (by default) must be specified in the <code>/etc/default/cron</code> file. If <code>CRONLOG=NO</code> is specified, no logging is done. Keeping the log is a user configurable option since <code>cron</code> usually creates huge log files.</p> <p>The <code>PATH</code> for user <code>cron</code> jobs can be set using <code>PATH=</code> in <code>/etc/default/cron</code>. The <code>PATH</code> for <code>root</code> <code>cron</code> jobs can be set using <code>SUPATH=</code> in <code>/etc/default/cron</code>. The security implications of setting <code>PATH</code> and <code>SUPATH</code> should be carefully considered.</p> <p>Example <code>/etc/default/cron</code> file:</p> <pre>CRONLOG=YES PATH=/usr/bin:/usr/ucb:</pre> <p>This example enables logging and sets the default <code>PATH</code> used by non-root jobs to <code>/usr/bin:/usr/ucb:.</code> Root jobs will continue to use <code>/usr/sbin:/usr/bin</code>.</p> <p><code>/etc/cron.d/logchecker</code> is a script that checks to see if the log file has exceeded the system <code>ulimit</code>. If so, the log file is moved to <code>/var/cron/olog</code>.</p>                                                                                                                                                                                                                                          |                          |                                  |                               |                     |                                |                                             |                            |                                       |

| <b>SYNOPSIS</b>    | <code>/platform/platform_name/cvcd</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | <p>The virtual console daemon, <code>cvcd</code>, is a server process that supports the network console provided on some platforms. The <code>cvcd</code> daemon accepts network console connections from a remote host (only one host at any given time). Console input is read from this connection and forwarded to <code>cvc(7D)</code> by way of <code>cvcredir(7D)</code>.</p> <p>Similarly, console output is read from <code>cvcredir(7D)</code> and forwarded across the network console connection. If <code>cvcd</code> dies, console traffic is automatically rerouted through an internal hardware interface.</p> <p>The <code>cvcd</code> daemon normally starts at system boot time. Each domain supports only one <code>cvcd</code> process at a time.</p> <p><b>Caution:</b> On Sun Enterprise 10000 domains, <code>cvcd</code> uses a configuration file (<code>/etc/ssphostname</code>) to determine the name of the host from which network console connections are allowed. If the remote console host is renamed, you must edit the configuration file to reflect that change.</p> |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>platform_name</i> The official Sun platform name used in packaging and code. For example, for Sun Fire 15000 servers, the <i>platform_name</i> would be <code>SUNW, Sun-Fire-15000</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>NAME</b>        | dcsh – domain configuration server                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SYNOPSIS</b>    | <code>/usr/lib/dcs [-s sessions]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b> | <p>The domain configuration server (DCS) is a daemon process that runs on Sun servers that support remote dynamic reconfiguration (DR) clients. It is started by <code>inetd(1M)</code> when the first DR request is received from a client connecting to the network service <code>sun-dr</code>. After the DCS accepts a DR request, it uses the <code>libcfgadm(3LIB)</code> interface to execute the DR operation. After the operation is performed, the results are returned to the client.</p> <p>The DCS listens on the network service labeled <code>sun-dr</code>. Its underlying protocol is TCP, and it is invoked as an <code>inetd</code> server using the TCP transport. The entries for the DCS in the <code>/etc/inet/inetd.conf</code> file are as follows:</p> <pre>sun-dr stream tcp wait root /usr/lib/dcs dcs sun-dr stream tcp6 wait root /usr/lib/dcs dcs</pre> <p>These entries enable remote DR operations. Removing them does not negatively impact the server; however, all DR operations initiated from a remote host would fail.</p> |
| <b>OPTIONS</b>     | <p><code>-s sessions</code> Sets the number of active sessions that the DCS allows at any one time. When the limit is reached, the DCS stops accepting connections until active sessions complete the execution of their DR operation. If this option is not specified, a default value of 128 is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>ERRORS</b>      | <p>The DCS uses <code>syslog(3C)</code> to report status and error messages. All of the messages are logged with the <code>LOG_DAEMON</code> facility. Error messages are logged with the <code>LOG_ERR</code> and <code>LOG_NOTICE</code> priorities, and informational messages are logged with the <code>LOG_INFO</code> priority. The default entries in the <code>/etc/syslog.conf</code> file log all of the DCS error messages to the <code>/var/adm/messages</code> log.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>NAME</b>        | dd – convert and copy a file                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>SYNOPSIS</b>    | <code>/usr/bin/dd</code> [ <i>operand=value...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b> | <p>dd copies the specified input file to the specified output with possible conversions. The standard input and output are used by default. The input and output block sizes may be specified to take advantage of raw physical I/O. Sizes are specified in bytes; a number may end with <i>k</i>, <i>b</i>, or <i>w</i> to specify multiplication by 1024, 512, or 2, respectively. Numbers may also be separated by <i>x</i> to indicate multiplication.</p> <p>dd will read the input one block at a time, using the specified input block size; it then will process the block of data actually returned, which could be smaller than the requested block size. dd will apply any conversions that have been specified and write the resulting data to the output in blocks of the specified output block size.</p> <p><i>cbs</i> is used only if <i>ascii</i>, <i>asciib</i>, <i>unblock</i>, <i>ebcdic</i>, <i>ebcdicb</i>, <i>ibm</i>, <i>ibmb</i>, or <i>block</i> conversion is specified. In the first two cases, <i>cbs</i> characters are copied into the conversion buffer, any specified character mapping is done, trailing blanks are trimmed, and a NEWLINE is added before sending the line to output. In the last three cases, characters up to NEWLINE are read into the conversion buffer and blanks are added to make up an output record of size <i>cbs</i>. ASCII files are presumed to contain NEWLINE characters. If <i>cbs</i> is unspecified or 0, the <i>ascii</i>, <i>asciib</i>, <i>ebcdic</i>, <i>ebcdicb</i>, <i>ibm</i>, and <i>ibmb</i> options convert the character set without changing the input file's block structure; the <i>unblock</i> and <i>block</i> options become a simple file copy.</p> <p>After completion, dd reports the number of whole and partial input and output blocks.</p> |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>if=file</i><br/>Specify the input path; standard input is the default.</p> <p><i>of=file</i><br/>Specify the output path; standard output is the default. If the <i>seek=expr</i> conversion is not also specified, the output file will be truncated before the copy begins, unless <i>conv=notrunc</i> is specified. If <i>seek=expr</i> is specified, but <i>conv=notrunc</i> is not, the effect of the copy will be to preserve the blocks in the output file over which dd seeks, but no other portion of the output file will be preserved. (If the size of the seek plus the size of the input file is less than the previous size of the output file, the output file will be shortened by the copy.)</p> <p><i>ibs=n</i><br/>Specify the input block size in <i>n</i> bytes (default is 512).</p> <p><i>obs=n</i><br/>Specify the output block size in <i>n</i> bytes (default is 512).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## dd(1M)

### `bs=n`

Set both input and output block sizes to *n* bytes, superseding `ibs=` and `obs=`. If no conversion other than `sync`, `noerror`, and `notrunc` is specified, each input block will be copied to the output as a single block without aggregating short blocks.

### `cbs=n`

Specify the conversion block size for `block` and `unblock` in bytes by *n* (default is 0). If `cbs=` is omitted or given a value of 0, using `block` or `unblock` produces unspecified results.

This option is used only if ASCII or EBCDIC conversion is specified. For the `ascii` and `asciib` operands, the input is handled as described for the `unblock` operand except that characters are converted to ASCII before the trailing SPACE characters are deleted. For the `ebcdic`, `ebcdicb`, `ibm`, and `ibmb` operands, the input is handled as described for the `block` operand except that the characters are converted to EBCDIC or IBM EBCDIC after the trailing SPACE characters are added.

### `files=n`

Copy and concatenate *n* input files before terminating (makes sense only where input is a magnetic tape or similar device).

### `skip=n`

Skip *n* input blocks (using the specified input block size) before starting to copy. On seekable files, the implementation will read the blocks or seek past them; on non-seekable files, the blocks will be read and the data will be discarded.

### `iseek=n`

Seek *n* blocks from beginning of input file before copying (appropriate for disk files, where `skip` can be incredibly slow).

### `oseek=n`

Seek *n* blocks from beginning of output file before copying.

### `seek=n`

Skip *n* blocks (using the specified output block size) from beginning of output file before copying. On non-seekable files, existing blocks will be read and space from the current end-of-file to the specified offset, if any, filled with null bytes; on seekable files, the implementation will seek to the specified offset or read the blocks as described for non-seekable files.

### `count=n`

Copy only *n* input blocks.

### `conv=value[, value. . .]`

Where *values* are comma-separated symbols from the following list:

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <code>ascii</code>  | Convert EBCDIC to ASCII.                                             |
| <code>asciib</code> | Convert EBCDIC to ASCII using BSD-compatible character translations. |

|                      |                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ebcdic</code>  | Convert ASCII to EBCDIC. If converting fixed-length ASCII records without NEWLINES, set up a pipeline with <code>dd conv=unblock</code> beforehand.                                                               |
| <code>ebcdicb</code> | Convert ASCII to EBCDIC using BSD-compatible character translations. If converting fixed-length ASCII records without NEWLINES, set up a pipeline with <code>dd conv=unblock</code> beforehand.                   |
| <code>ibm</code>     | Slightly different map of ASCII to EBCDIC. If converting fixed-length ASCII records without NEWLINES, set up a pipeline with <code>dd conv=unblock</code> beforehand.                                             |
| <code>ibmb</code>    | Slightly different map of ASCII to EBCDIC using BSD-compatible character translations. If converting fixed-length ASCII records without NEWLINES, set up a pipeline with <code>dd conv=unblock</code> beforehand. |

The `ascii` (or `asciib`), `ebcdic` (or `ebcdicb`), and `ibm` (or `ibmb`) values are mutually exclusive.

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>block</code>   | Treat the input as a sequence of NEWLINE-terminated or EOF-terminated variable-length records independent of the input block boundaries. Each record is converted to a record with a fixed length specified by the conversion block size. Any NEWLINE character is removed from the input line; SPACE characters are appended to lines that are shorter than their conversion block size to fill the block. Lines that are longer than the conversion block size are truncated to the largest number of characters that will fit into that size; the number of truncated lines is reported. |
| <code>unblock</code> | Convert fixed-length records to variable length. Read a number of bytes equal to the conversion block size (or the number of bytes remaining in the input, if less than the conversion block size), delete all trailing SPACE characters, and append a NEWLINE character.                                                                                                                                                                                                                                                                                                                   |

The `block` and `unblock` values are mutually exclusive.

|                    |                                                                                                                                                                                                                                |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>lcase</code> | Map upper-case characters specified by the <code>LC_CTYPE</code> keyword <code>tolower</code> to the corresponding lower-case character. Characters for which no mapping is specified will not be modified by this conversion. |
| <code>ucase</code> | Map lower-case characters specified by the <code>LC_CTYPE</code> keyword <code>toupper</code> to the corresponding upper-case character. Characters for which no mapping is specified will not be modified by this conversion. |

The `lcase` and `ucase` symbols are mutually exclusive.

## dd(1M)

|         |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| swab    | Swap every pair of input bytes. If the current input record is an odd number of bytes, the last byte in the input record is ignored.                                                                                                                                                                                                                                                                                   |
| noerror | Do not stop processing on an input error. When an input error occurs, a diagnostic message will be written on standard error, followed by the current input and output block counts in the same format as used at completion. If the <code>sync</code> conversion is specified, the missing input will be replaced with null bytes and processed normally; otherwise, the input block will be omitted from the output. |
| notrunc | Do not truncate the output file. Preserve blocks in the output file not explicitly written by this invocation of <code>dd</code> . (See also the preceding <code>of=file</code> operand.)                                                                                                                                                                                                                              |
| sync    | Pad every input block to the size of the <code>ibs=</code> buffer, appending null bytes. (If either <code>block</code> or <code>unblock</code> is also specified, append SPACE characters, rather than null bytes.)                                                                                                                                                                                                    |

If operands other than `conv=` are specified more than once, the last specified operand=*value* will be used.

For the `bs=`, `cbs=`, `ibs=`, and `obs=` operands, the application must supply an expression specifying a size in bytes. The expression, `expr`, can be:

1. a positive decimal number
2. a positive decimal number followed by `k`, specifying multiplication by 1024
3. a positive decimal number followed by `b`, specifying multiplication by 512
4. two or more positive decimal numbers (with or without `k` or `b`) separated by `x`, specifying the product of the indicated values.

All of the operands will be processed before any input is read.

**USAGE** See `largefile(5)` for the description of the behavior of `dd` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

**EXAMPLES** **EXAMPLE 1** Copying From Tape Drive 0 to Tape Drive 1:

The following example copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

```
example% dd if=/dev/rmt/0h of=/dev/rmt/1h
```

**EXAMPLE 2** Stripping the First 10 bytes From Standard Input

The following example strips the first 10 bytes from standard input.

```
example% dd ibs=10 skip=1
```

**EXAMPLE 2** Stripping the First 10 bytes From Standard Input *(Continued)*

**EXAMPLE 3** Reading a Tape Into an ASCII File

This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the ASCII file `x` :

```
example% dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase
```

**EXAMPLE 4** Using `conv=sync` to Write to Tape

The following example uses `conv=sync` when writing to a tape:

```
example% tar cvf - . | compress | dd obs=1024k of=/dev/rmt/0 conv=sync
```

## ENVIRONMENT VARIABLES

See `environ(5)` for descriptions of the following environment variables that affect the execution of `dd`: `LC_CTYPE`, `LC_MESSAGES`, and `NLSPATH`.

## EXIT STATUS

The following exit values are returned:

0           The input file was copied successfully.  
>0          An error occurred.

If an input error is detected and the `noerror` conversion has not been specified, any partial output block will be written to the output file, a diagnostic message will be written, and the copy operation will be discontinued. If some other error is detected, a diagnostic message will be written and the copy operation will be discontinued.

## ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

## SEE ALSO

`cp(1)`, `sed(1)`, `tr(1)`, `attributes(5)`, `environ(5)`, `largefile(5)`

## DIAGNOSTICS

`f+p records in(out)`      numbers of full and partial blocks read(written)

## NOTES

Do not use `dd` to copy files between file systems having different block sizes.

Using a blocked device to copy a file will result in extra nulls being added to the file to pad the final block to the block boundary.

When `dd` reads from a pipe, using the `ibs=X` and `obs=Y` operands, the output will always be blocked in chunks of size `Y`. When `bs=Z` is used, the output blocks will be whatever was available to be read from the pipe at the time.

## dd(1M)

When using `dd` to copy files to a tape device, the file size must be a multiple of the device sector size (for example, 512 Kbyte). To copy files of arbitrary size to a tape device, use `tar(1)` or `cpio(1)`.

For `SIGINT`, `dd` will write status information to standard error before exiting. It will take the standard action for all other signals.

| <b>NAME</b>        | deallocate – device deallocation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                                                                                            |              |                                         |                  |                                                                                                                                                                                                |    |                                                                                                                                                                                                                  |

| <b>SYNOPSIS</b>    | <pre><b>deallocate</b> [-s] <i>device</i> <b>deallocate</b> [-s] [-F] <i>device</i> <b>deallocate</b> [-s] -I</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                                                                                            |              |                                         |                  |                                                                                                                                                                                                |    |                                                                                                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>deallocate deallocates a <i>device</i> allocated to the evoking user. <i>device</i> can be a device defined in <code>device_allocate(4)</code> or one of the device special files associated with the device. It resets the ownership and the permission on all device special files associated with <i>device</i>, disabling the user's access to that device. This option can be used by an authorized user to remove access to the device by another user. The required authorization is <code>solaris.device.allocate</code>.</p> <p>When deallocation or forced deallocation is performed, the appropriate device cleaning program is executed, based on the contents of <code>device_allocate(4)</code>. These cleaning programs are normally stored in <code>/etc/security/lib</code>.</p> |                |                                                                                            |              |                                         |                  |                                                                                                                                                                                                |    |                                                                                                                                                                                                                  |
| <b>OPTIONS</b>     | <table border="0"> <tr> <td style="padding-right: 20px;"><i>device</i></td> <td>Deallocate the device associated with the device special file specified by <i>device</i>.</td> </tr> <tr> <td>-s</td> <td>Silent. Suppress any diagnostic output.</td> </tr> <tr> <td>-F <i>device</i></td> <td>Force deallocation of the device associated with the file specified by <i>device</i>. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option.</td> </tr> <tr> <td>-I</td> <td>Force deallocation of all allocatable devices. Only a user with the <code>solaris.devices.revoke</code> authorization is permitted to use this option. This option should only be used at system initialization.</td> </tr> </table>                                   | <i>device</i>  | Deallocate the device associated with the device special file specified by <i>device</i> . | -s           | Silent. Suppress any diagnostic output. | -F <i>device</i> | Force deallocation of the device associated with the file specified by <i>device</i> . | <b>SYNOPSIS</b>    | <b>devattr</b> [-v] <i>device</i> [ <i>attribute...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                |                 |              |         |
| <b>DESCRIPTION</b> | devattr displays the values for a device's attributes. The display can be presented in two formats. Used without the -v option, only the attribute values are shown. Used with the -v option, the attributes are shown in an <i>attribute=value</i> format. When no attributes are given on the command line, all attributes for the specified device are displayed in alphabetical order by attribute name. If attributes are given on the command line, only those attributes are shown, displayed in command line order. |                |                 |              |         |
| <b>OPTIONS</b>     | The following options are supported:<br>-v        Specifies verbose format. Attribute values are displayed in an <i>attribute=value</i> format.                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |         |
| <b>OPERANDS</b>    | The following operands are supported:<br><i>device</i> Defines the device whose attributes should be displayed. Can be the pathname of the device or the device alias.<br><i>attribute</i> Defines which attribute, or attributes, should be shown. Default is to show all attributes for a device. See the putdev(1M) manual page for a complete listing and description of available attributes.                                                                                                                          |                |                 |              |         |
| <b>EXIT STATUS</b> | The following exit values are returned:<br>0        successful completion.<br>1        Command syntax was incorrect, invalid option was used, or an internal error occurred.<br>2        Device table could not be opened for reading.<br>3        Requested device could not be found in the device table.<br>4        Requested attribute was not defined for the specified device.                                                                                                                                       |                |                 |              |         |
| <b>FILES</b>       | /etc/device.tab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |         |

| <b>NAME</b>        | devconfig – configure device attributes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>SYNOPSIS</b>    | <b>devconfig</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | <p>devconfig is an interactive editor for device driver hardware configuration files and the OpenWindows configuration file.</p> <p>Devices that are not self-identifying require that correct information be supplied in the hardware configuration file in order for the device to be recognized. Devconfig is designed to ease the task of maintaining correct device information in the configuration files.</p> <p>Prototype configuration information files stored in <code>/usr/lib/devconfig</code> are used to check user input to ensure that the values provided for each attribute are of the correct type and fall within legal bounds. See <code>device.cfinfo(4)</code> for a description of the format of configuration information files. The location for the <code>cfinfo</code> files can be set by the <code>DEVCONFIGHOME</code> environment variable.</p> <p>After making changes to a hardware configuration file that has a driver associated with it, an attempt is made to reload the driver to verify the attributes. Some drivers may not be unloadable. In this case, a system reboot must be initiated before the new attributes can take effect. If necessary, <code>devconfig</code> also updates the OpenWindows configuration file, <code>OWconfig</code> (see the <i>OpenWindows Desktop Reference Manual</i>). <code>devconfig</code> makes a backup copy of a modified file in a <code>.bak</code> file. In addition, the first version of <code>OWconfig</code> is saved in <code>OWconfig.save</code>. This is because the original version of <code>OWconfig</code> contains helpful prototype information that may be referred to in case <code>OWconfig</code> needs to be edited manually.</p> <p>If the default location for configuration files is not writable (as is the case during installation) <code>devconfig</code> writes the updated files in the same location relative to the directory <code>/tmp/root</code>. No attempt is made to reload the driver in this case.</p> <p><code>devconfig</code> is controlled by a simple menu system. The Up/Down arrow keys move the cursor to different items in a menu. The Left/Right arrow keys move the cursor to different items in a field. The Enter key selects an item. (Note that the Enter key may be labeled Return on some keyboards.) See the online help for more guidance.</p> |
| <b>Operation</b>   | <p><code>devconfig</code> first displays a list of configured devices in the system. Selecting a configured device allows you to view its attributes or unconfigure it. Self-identifying devices can not be unconfigured by <code>devconfig</code>.</p> <p>When you add a new device, <code>devconfig</code> displays the supported device categories. After choosing a device category, <code>devconfig</code> displays the devices supported in that category. Self-identifying devices cannot be added with <code>devconfig</code> and they are not displayed in the list of the devices. After you have selected the device to be added, <code>devconfig</code> displays the list of the device attributes. Once you have chosen the proper values for the attributes and applied them by using the Apply button, the device is added to the list of configured devices. You may cancel an operation by using the Cancel button.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**FILES** /kernel/drv/\*.conf  
hardware configuration files

/usr/lib/devconfig/\*.cfinfo  
configuration information files

| <b>DESCRIPTION</b> | <p>devfree releases devices from exclusive use. Exclusive use is requested with the command devreserv.</p> <p>When devfree is invoked with only the <i>key</i> argument, it releases all devices that have been reserved for that <i>key</i>. When called with <i>key</i> and <i>device</i> arguments, devfree releases the specified devices that have been reserved with that <i>key</i>.</p>                                                                              |                |                 |              |         |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>key</i>        Designates the unique key on which the device was reserved.</p> <p><i>device</i>     Defines device that this command will release from exclusive use. <i>device</i> can be the pathname of the device or the device alias.</p>                                                                                                                                                                            |                |                 |              |         |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0            Successful completion.</p> <p>1            Command syntax was incorrect, an invalid option was used, or an internal error occurred.</p> <p>2            Device table or device reservation table could not be opened for reading.</p> <p>3            Reservation release could not be completely fulfilled because one or more of the devices was not reserved or was not reserved on the specified key.</p> |                |                 |              |         |
| <b>FILES</b>       | <p>/etc/device.tab</p> <p>/etc/devlkfile</p>                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |         |

| <b>NOTES</b>       | <p>The commands devreserv and devfree are used to manage the availability of devices on a system. These commands do not place any constraints on the access to the device. They serve only as a centralized bookkeeping point for those who wish to use them. Processes that do not use devreserv may concurrently use a device with a process that has reserved that device.</p>                                                                                            |                |                 |              |         |

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>NAME</b>        | devfsadm, devfsadmd – administration command for /dev and /devices                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <pre> /usr/sbin/devfsadm [-C] [-c <i>device_class</i>] [-i <i>driver_name</i>] [-n] [-r     <i>root_dir</i>] [-s] [-t <i>table_file</i>] [-v]  /usr/lib/devfsadm/devfsadmd </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DESCRIPTION</b> | <p>devfsadm(1M) maintains the /dev and /devices namespaces. It replaces the previous suite of devfs administration tools including drvconfig(1M), disks(1M), tapes(1M), ports(1M), audlinks(1M), and devlinks(1M).</p> <p>The default operation is to attempt to load every driver in the system and attach to all possible device instances. devfsadm then creates device special files in /devices and logical links in /dev.</p> <p>devfsadmd(1M) is the daemon version of devfsadm(1M). The daemon is started by the /etc/rc* scripts during system startup and is responsible for handling both reconfiguration boot processing and updating /dev and /devices in response to dynamic reconfiguration event notifications from the kernel.</p> <p>For compatibility purposes, drvconfig(1M), disks(1M), tapes(1M), ports(1M), audlinks(1M), and devlinks(1M) are implemented as links to devfsadm.</p> <p>In addition to managing /dev and /devices, devfsadm also maintains the path_to_inst(4) database.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-C Cleanup mode. Prompts devfsadm to invoke cleanup routines that are not normally invoked to remove dangling logical links. If -c is also used, devfsadm only cleans up for the listed devices' classes.</li> <li>-c <i>device_class</i> Restrict operations to devices of class <i>device_class</i>. Solaris defines the following values for <i>device_class</i>: disk, tape, port, audio, and pseudo. This option may be specified more than once to specify multiple device classes.</li> <li>-i <i>driver_name</i> Configure only the devices for the named driver, <i>driver_name</i>.</li> <li>-n Do not attempt to load drivers or add new nodes to the kernel device tree.</li> <li>-s Suppress any changes to /dev or /devices. This is useful with the -v option for debugging.</li> <li>-t <i>table_file</i> Read an alternate devlink.tab file. devfsadm normally reads /etc/devlink.tab.</li> </ul>               |

## devfsadm(1M)

`-r root_dir` Presume that the `/dev` and `/devices` directory trees are found under `root_dir`, not directly under `root (/)`. No other use or assumptions are made about `root_dir`.

`-v` Print changes to `/dev` and `/devices` in verbose mode.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

1 An error occurred.

**FILES**

| <b>SYNOPSIS</b>    | <code>/usr/sbin/devinfo -i device</code><br><code>/usr/sbin/devinfo -p device</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |         |
| <b>DESCRIPTION</b> | The <code>devinfo</code> command is used to print device specific information about disk devices on standard out. The command can only be used by the superuser.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |         |
| <b>OPTIONS</b>     | <p><code>-i</code> Prints the following device information:</p> <ul style="list-style-type: none"> <li>■ Device name</li> <li>■ Software version (not supported and prints as 0)</li> <li>■ Drive id number (not supported and prints as 0)</li> <li>■ Device blocks per cylinder</li> <li>■ Device bytes per block</li> <li>■ Number of device partitions with a block size greater than zero</li> </ul> <p><code>-p</code> Prints the following device partition information:</p> <ul style="list-style-type: none"> <li>■ Device name</li> <li>■ Device major and minor numbers (in hexadecimal)</li> <li>■ Partition start block</li> <li>■ Number of blocks allocated to the partition</li> <li>■ Partition flag</li> <li>■ Partition tag</li> </ul> <p>This command is used by various other commands to obtain device specific information for the making of file systems and determining partition information. If the device cannot be opened, an error message is reported.</p> |                |                 |              |         |

| <b>NAME</b>        | devlinks – adds /dev entries for miscellaneous devices and pseudo-devices                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                   |                                                                                                                                                                                                                                                                                   |             |                                                                                     |             |                                                                                                                              |                |                                                                                                                                                                                                                                                                                                                                       |
| <b>SYNOPSIS</b>    | <code>/usr/sbin/devlinks [-d] [-r <i>rootdir</i>] [-t <i>table-file</i>]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                   |                                                                                                                                                                                                                                                                                   |             |                                                                                     |             |                                                                                                                              |                |                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | <p>devfsadm(1M) is now the preferred command for /dev and /devices and should be used instead of devlinks.</p> <p>devlinks creates symbolic links from the /dev directory tree to the actual block- and character-special device nodes under the /devices directory tree. The links are created according to specifications found in the <i>table-file</i> (by default /etc/devlink.tab).</p> <p>devlinks is called each time the system is reconfiguration-booted, and can only be run after drvconfig(1M) is run, since drvconfig(1M) builds the kernel data structures and the /devices tree.</p> <p>The <i>table-file</i> (normally /etc/devlink.tab) is an ASCII file, with one line per record. Comment lines, which must contain a hash character ('#') as their first character, are allowed. Each entry must contain at least two fields, but may contain three fields. Fields are separated by single TAB characters.</p> <p>The fields are:</p> <table><tr><td><i>devfs-spec</i></td><td>Specification of devinfo nodes that will have links created for them. This specification consists of one or more keyword-value pairs, where the keyword is separated from the value by an equal-sign ('='), and keyword-value pairs are separated from one another by semicolons.</td></tr></table> <p>The possible keywords are:</p> <table><tr><td><i>type</i></td><td>The devinfo device type. Possible values are specified in ddi_create_minor_node(9F)</td></tr><tr><td><i>name</i></td><td>The name of the node. This is the portion of the /devices tree entry name that occurs before the first '@' or ':' character.</td></tr><tr><td><i>addr[n]</i></td><td>The address portion of a node name. This is the portion of a node name that occurs between the '@' and the ':' characters. It is possible that a node may have a name without an address part, which is the case for many of the pseudo-device nodes. If a number is given after the <i>addr</i> it specifies a match of a particular</td></tr></table> | <i>devfs-spec</i> | Specification of devinfo nodes that will have links created for them. This specification consists of one or more keyword-value pairs, where the keyword is separated from the value by an equal-sign ('='), and keyword-value pairs are separated from one another by semicolons. | <i>type</i> | The devinfo device type. Possible values are specified in ddi_create_minor_node(9F) | <i>name</i> | The name of the node. This is the portion of the /devices tree entry name that occurs before the first '@' or ':' character. | <i>addr[n]</i> | The address portion of a node name. This is the portion of a node name that occurs between the '@' and the ':' characters. It is possible that a node may have a name without an address part, which is the case for many of the pseudo-device nodes. If a number is given after the <i>addr</i> it specifies a match of a particular |
| <i>devfs-spec</i>  | Specification of devinfo nodes that will have links created for them. This specification consists of one or more keyword-value pairs, where the keyword is separated from the value by an equal-sign ('='), and keyword-value pairs are separated from one another by semicolons.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                   |                                                                                                                                                                                                                                                                                   |             |                                                                                     |             |                                                                                                                              |                |                                                                                                                                                                                                                                                                                                                                       |
| <i>type</i>        | The devinfo device type. Possible values are specified in ddi_create_minor_node(9F)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                   |                                                                                                                                                                                                                                                                                   |             |                                                                                     |             |                                                                                                                              |                |                                                                                                                                                                                                                                                                                                                                       |
| <i>name</i>        | The name of the node. This is the portion of the /devices tree entry name that occurs before the first '@' or ':' character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                   |                                                                                                                                                                                                                                                                                   |             |                                                                                     |             |                                                                                                                              |                |                                                                                                                                                                                                                                                                                                                                       |
| <i>addr[n]</i>     | The address portion of a node name. This is the portion of a node name that occurs between the '@' and the ':' characters. It is possible that a node may have a name without an address part, which is the case for many of the pseudo-device nodes. If a number is given after the <i>addr</i> it specifies a match of a particular                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                   |                                                                                                                                                                                                                                                                                   |             |                                                                                     |             |                                                                                                                              |                |                                                                                                                                                                                                                                                                                                                                       |

devlinks(1M)

comma-separated subfield of the address field: *addr1* matches the first subfield, *addr2* matches the second, and so on. *addr0* is the same as *addr* and matches the whole field.

*minor[n]* The minor portion of a node name – the portion of the name after the ‘:’. As with *addr* above, a number after the *minor* keyword specifies a subfield to match.

Of these four specifications, only the *type* specification must always be present.

*name*

Specification of the `/dev` links that correspond to the devinfo nodes. This field allows `devlinks` to determine matching `/dev` names for the `/devices` nodes it has found. The specification of this field uses escape-sequences to allow portions of the `/devices` name to be included in the `/dev` name, or to allow a counter to be used in creating node names. If a counter is used to create a name, the portion of the name before the counter must be specified absolutely, and all names in the `/dev/-`subdirectory that match (up to and including the counter) are considered to be subdevices of the same device. This means that they should all point to the same directory, name and address under the `/devices/-tree`

The possible escape-sequences are:

- `\D` Substitute the `device-name` (name) portion of the corresponding devinfo node-name.
- `\An` Substitute the *n*th component of the address component of the corresponding devinfo node name. Sub-components are separated by commas, and sub-component 0 is the whole address component.
- `\Mn` Substitute the *n*th sub-component of the minor component of the corresponding devinfo node name. Sub-components are separated by commas, and sub-component 0 is the whole minor component.

## devlinks(1M)

|                |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <code>\Nm</code>           | <p>Substitute the value of a 'counter' starting at <i>n</i>. There can be only one counter for each dev-spec, and counter-values will be selected so they are as low as possible while not colliding with already-existing link names.</p> <p>In a dev-spec the counter sequence should not be followed by a digit, either explicitly or as a result of another escape-sequence expansion. If this occurs, it would not be possible to correctly match already-existing links to their counter entries, since it would not be possible to unambiguously parse the already-existing /dev-name.</p> |
|                | <i>extra-dev-link</i>      | <p>Optional specification of an extra /dev link that points to the initial /dev link (specified in field 2). This field may contain a counter escape-sequence (as described for the <i>dev-spec</i> field) but may not contain any of the other escape-sequences. It provides a way to specify an alias of a particular /dev name.</p>                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b> | <code>-d</code>            | <p>Debugging mode – print out all devinfo nodes found, and indicate what links would be created, but do not do anything.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                | <code>-r rootdir</code>    | <p>Use <i>rootdir</i> as the root of the /dev and /devices directories under which the device nodes and links are created. Changing the root directory does not change the location of the /etc/devlink.tab default table, nor is the root directory applied to the filename supplied to the <code>-t</code> option.</p>                                                                                                                                                                                                                                                                          |
|                | <code>-t table-file</code> | <p>Set the table file used by devlinks to specify the links that must be created. If this option is not given, /etc/devlink.tab is used. This option gives a way to instruct devlinks just to perform a particular piece of work, since just the links-types that devlinks is supposed to create can be specified in a command-file and fed to devlinks.</p>                                                                                                                                                                                                                                      |
| <b>ERRORS</b>  |                            | <p>If devlinks finds an error in a line of the <i>table-file</i> it prints a warning message on its standard output and goes on to the next line in the <i>table-file</i> without performing any of the actions specified by the erroneous rule.</p> <p>If it cannot create a link for some filesystem-related reason it prints an error-message and continues with the current rule.</p> <p>If it cannot read necessary data it prints an error message and continues with the next <i>table-file</i> line.</p>                                                                                  |

**EXAMPLES** **EXAMPLE 1** Examples of `/etc/devlink.tab` fields

Example `/etc/devlink.tab` fields are:

```
type=pseudo;name=win win\M0
type=ddi_display framebuffer/\M0 fb\N0
```

The first example states that all devices of type `pseudo` with a name component of `win` will be linked to `/dev/winx`, where `x` is the minor-component of the *devinfo-name* (this is always a single-digit number for the `win` driver).

The second example states that all *devinfo* nodes of type `ddi_display` will be linked to entries under the `/dev/framebuffer` directory, with names identical to the entire minor component of the `/devices` name. In addition an extra link will be created pointing from `/dev/fbn` to the entry under `/dev/framebuffer`. This entry will use a counter to end the name.

|              |                               |                                                       |
|--------------|-------------------------------|-------------------------------------------------------|
| <b>FILES</b> | <code>/dev</code>             | entries for the miscellaneous devices for general use |
|              | <code>/devices</code>         | device nodes                                          |
|              | <code>/etc/devlink.tab</code> | the default rule-file                                 |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `devfsadm(1M)`, `ddi_create_minor_node(9F)`, `disks(1M)`, `drvconfig(1M)`, `ports(1M)`, `tapes(1M)`, `attributes(5)`

**BUGS** It is very easy to construct mutually-contradictory link specifications, or specifications that can never be matched. The program does not check for these conditions.

## devnm(1M)

- NAME** devnm – device name
- SYNOPSIS** `/usr/sbin/devnm name [name...]`
- DESCRIPTION** The devnm command identifies the special file associated with the mounted file system where the argument *name* resides. One or more *name* can be specified.
- EXAMPLES** The command:  
`/usr/sbin/devnm /usr`  
  
produces:  
`/dev/dsk/c0t3d0s6 /usr`  
  
if `/usr` is mounted on `/dev/dsk/c0t3d0s6`.
- FILES** `/dev/dsk/*`  
`/etc/mnttab`
- ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

- SEE ALSO** `mnttab(4)`, `attributes(5)`

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>SYNOPSIS</b>    | <b>devreserv</b> [ <i>key</i> [ <i>device-list...</i> ]]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DESCRIPTION</b> | <p>devreserv reserves devices for exclusive use. When the device is no longer required, use devfree to release it.</p> <p>devreserv reserves at most one device per <i>device-list</i>. Each list is searched in linear order until the first available device is found. If a device cannot be reserved from each list, the entire reservation fails.</p> <p>When devreserv is invoked without arguments, it lists the devices that are currently reserved and shows to which key it was reserved. When devreserv is invoked with only the <i>key</i> argument, it lists the devices that are currently reserved to that key.</p>                                                                                                     |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>key</i>                      Designates a unique key on which the device will be reserved. The key must be a positive integer.</p> <p><i>device-list</i>              Defines a list of devices that devreserv will search to find an available device. The list must be formatted as a single argument to the shell.</p>                                                                                                                                                                                                                                                                                                                                                          |
| <b>EXAMPLES</b>    | <p><b>EXAMPLE 1</b> Reserving a floppy disk and a cartridge tape.</p> <p>This example reserves a floppy disk and a cartridge tape:</p> <pre>\$ key=\$\$ \$ echo "The current Process ID is equal to: \$key" The Current Process ID is equal to: 10658 \$ devreserv \$key diskette1 ctape1</pre> <p><b>EXAMPLE 2</b> Listing all devices currently reserved.</p> <p>This example lists all devices currently reserved:</p> <pre>\$ devreserv disk1            2423 diskette1       10658 ctape1           10658</pre> <p><b>EXAMPLE 3</b> Listing all devices currently reserved to a particular key.</p> <p>This example lists all devices currently reserved to a particular key:</p> <pre>\$ devreserv \$key diskette1 ctape1</pre> |
| <b>EXIT STATUS</b> | The following exit values are returned:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## devreserv(1M)

- 0 Successful completion.
- 1 Command syntax was incorrect, an invalid was option used, or an internal error occurred.
- 2 Device table or device reservation table could not be opened for reading.
- 3 Device reservation request could not be fulfilled.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `devfree(1M)`, `attributes(5)`

**NOTES** The commands `devreserv` and `devfree` are used to manage the availability of devices on a system. Their use is on a participatory basis and they do not place any constraints on the actual access to the device. They serve as a centralized bookkeeping point for those who wish to use them. Devices which have been reserved cannot be used by processes which utilize the device reservation functions until the reservation has been canceled. However, processes that do not use device reservation may use a device that has been reserved since such a process would not have checked for its reservation status.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>DESCRIPTION</b> | <p>The <code>df</code> command displays the amount of disk space occupied by mounted or unmounted file systems, the amount of used and available space, and how much of the file system's total capacity has been used. The file system is specified by device, or by referring to a file or directory on the specified file system.</p> <p>Used without operands or options, <code>df</code> reports on all mounted file systems.</p> <p><code>df</code> may not be supported for all <i>FSTypes</i>.</p> <p>If <code>df</code> is run on a networked mount point that the automounter has not yet mounted, the file system size will be reported as zero. As soon as the automounter mounts the file system, the sizes will be reported correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>OPTIONS</b>     | <p>The following options are supported for both <code>/usr/bin/df</code> and <code>/usr/xpg4/bin/df</code>:</p> <ul style="list-style-type: none"> <li>-a Report on all file systems including ones whose entries in <code>/etc/mnttab</code> (see <code>mnttab(4)</code>) have the <code>ignore</code> option set.</li> <li>-b Print the total number of kilobytes free.</li> <li>-e Print only the number of files free.</li> <li>-F <i>FSType</i> Specify the <i>FSType</i> on which to operate. The <code>-F</code> option is intended for use with unmounted file systems. The <i>FSType</i> should be specified here or be determinable from <code>/etc/vfstab</code> (see <code>vfstab(4)</code>) have the <code>by</code> matching the <i>directory</i>, <i>block_device</i>, or <i>resource</i> with an entry in the table, or by consulting <code>/etc/default/fs</code>. See <code>default_fs(4)</code>.</li> <li>-g Print the entire <code>statvfs(2)</code> structure. This option is used only for mounted file systems. It cannot be used with the <code>-o</code> option. This option overrides the <code>-b</code>, <code>-e</code>, <code>-k</code>, <code>-n</code>, <code>-P</code>, and <code>-t</code> options.</li> <li>-k Print the allocation in kbytes. The output consists of one line of information for each specified file system. This information includes the file system name, the total space allocated in the file system, the amount of space allocated to existing files, the total amount of space available for the creation of new files by unprivileged users, and the percentage of normally</li> </ul> |

## df(1M)

|                                         |                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                         | available space that is currently allocated to all files on the file system. This option overrides the <code>-b</code> , <code>-e</code> , <code>-n</code> , and <code>-t</code> options.                                                                                                                                                                                       |
| <code>-l</code>                         | Report on local file systems only. This option is used only for mounted file systems. It cannot be used with the <code>-o</code> option.                                                                                                                                                                                                                                        |
| <code>-n</code>                         | Print only the <i>FSType</i> name. Invoked with no operands, this option prints a list of mounted file system types. This option is used only for mounted file systems. It cannot be used with the <code>-o</code> option.                                                                                                                                                      |
| <code>-o FSType-specific_options</code> | Specify <i>FSType-specific</i> options. These options are comma-separated, with no intervening spaces. See the manual page for the <i>FSType-specific</i> command for details.                                                                                                                                                                                                  |
| <code>-t</code>                         | Print full listings with totals. This option overrides the <code>-b</code> , <code>-e</code> , and <code>-n</code> options.                                                                                                                                                                                                                                                     |
| <code>-V</code>                         | Echo the complete set of file system specific command lines, but do not execute them. The command line is generated by using the options and operands provided by the user and adding to them information derived from <code>/etc/mnttab</code> , <code>/etc/vfstab</code> , or <code>/etc/default/fs</code> . This option may be used to verify and validate the command line. |
| <code>/usr/xpg4/bin/df</code>           | The following option is supported for <code>/usr/xpg4/bin/df</code> only:                                                                                                                                                                                                                                                                                                       |
| <code>-P</code>                         | Same as <code>-k</code> except in 512-byte units.                                                                                                                                                                                                                                                                                                                               |
| <b>OPERANDS</b>                         | <code>df</code> interprets operands according to the following precedence: <i>block_device</i> , <i>directory</i> , <i>file</i> . The following operands are supported:                                                                                                                                                                                                         |
| <i>block_device</i>                     | represents a block special device (for example, <code>/dev/dsk/c1d0s7</code> ); the corresponding file system need not be mounted.                                                                                                                                                                                                                                              |
| <i>directory</i>                        | represents a valid directory name. <code>df</code> reports on the file system that contains <i>directory</i> .                                                                                                                                                                                                                                                                  |
| <i>file</i>                             | represents a valid file name. <code>df</code> reports on the file system that contains <i>file</i> .                                                                                                                                                                                                                                                                            |
| <i>resource</i>                         | represents an NFS resource name.                                                                                                                                                                                                                                                                                                                                                |
| <b>USAGE</b>                            | See <code>largefile(5)</code> for the description of the behavior of <code>df</code> when encountering files greater than or equal to 2 Gbyte ( $2^{31}$ bytes).                                                                                                                                                                                                                |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>EXAMPLES</b>              | <p><b>EXAMPLE 1</b> Writing Portable Information About the /usr File System Using the df Command.</p> <p>The following example writes portable information about the /usr file system:</p> <pre>example% /usr/xpg4/bin/df -P /usr</pre> <p><b>EXAMPLE 2</b> Writing Portable Information About the /usr File System Using the df Command, When /usr/src is Part of the /usr File System</p> <p>Assuming that /usr/src is part of the /usr file system, the following example writes portable information :</p> <pre>example% /usr/xpg4/bin/df -P /usr/src</pre> <p><b>EXAMPLE 3</b> Using df to Display Inode Usage on All ufs File Systems</p> <p>The following example displays inode usage on all ufs file systems:</p> <pre>example% /usr/bin/df -F ufs -o i</pre> |
| <b>ENVIRONMENT VARIABLES</b> | <p><b>SYSV3</b> This variable is used to override the default behavior of df and provide compatibility with INTERACTIVE UNIX System and SCO UNIX installation scripts. As the SYSV3 variable is provided for compatibility purposes only, it should not be used in new scripts.</p> <p>When set, any header which normally displays “files” will now display “nodes”. See environ(5) for descriptions of the following environment variables that affect the execution of df: LC_CTYPE, LC_MESSAGES, and NLSPATH.</p>                                                                                                                                                                                                                                                  |
| <b>EXIT STATUS</b>           | <p>The following exit values are returned:</p> <p>0 Successful completion.</p> <p>&gt;0 An error occurred.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>FILES</b>                 | <p>/dev/dsk/* disk devices</p> <p>/etc/default/fs default local file system type. Default values can be set for the following flags in /etc/default/fs. For example: LOCAL=ufs, where LOCAL is the default partition for a command if no FSType is specified.</p> <p>/etc/mnttab mount table</p> <p>/etc/vfstab list of default parameters for each file system</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ATTRIBUTES</b>            | <p>See attributes(5) for descriptions of the following attributes:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**NOTES** If UFS logging is enabled on a file system, the disk space used for the log is reflected in the `df` report. The log is allocated from free blocks on the file system, and it is sized approximately 1 Mbyte per 1 Gbyte of file system, up to a maximum of 64 Mbytes.

|                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |

| <b>NAME</b>                | dfmounts – display mounted resource information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>            | <b>dfmounts</b> [-F <i>FSType</i> ] [-h] [-o <i>specific_options</i> ] [ <i>restriction...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |
| <b>DESCRIPTION</b>         | <p>dfmounts shows the local resources shared through a distributed file system <i>FSType</i> along with a list of clients that have the resource mounted. If <i>restriction</i> is not specified, dfmounts shows file systems that are currently shared on any NFS server. <i>specific_options</i> as well as the availability and semantics of <i>restriction</i> are specific to particular distributed file system types.</p> <p>If dfmounts is entered without arguments, all remote resources currently mounted on the local system are displayed, regardless of file system type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |
| <b>dfmounts Output</b>     | <p>The output of dfmounts consists of an optional header line (suppressed with the -h flag) followed by a list of lines containing whitespace-separated fields. For each resource, the fields are:</p> <p><i>resource server pathname clients ...where:</i></p> <table border="0" style="margin-left: 2em;"> <tr> <td style="padding-right: 1em;"><i>resource</i></td> <td>Specifies the resource name that must be given to the mount(1M) command.</td> </tr> <tr> <td><i>server</i></td> <td>Specifies the system from which the resource was mounted.</td> </tr> <tr> <td><i>pathname</i></td> <td>Specifies the pathname that must be given to the share(1M) command.</td> </tr> <tr> <td><i>clients</i></td> <td>Is a comma-separated list of systems that have mounted the resource. Clients are listed in the form <i>domain.</i>, <i>domain.system</i>, or <i>system</i>, depending on the file system type.</td> </tr> </table> <p>A field may be null. Each null field is indicated by a hyphen (-) unless the remainder of the fields on the line are also null; in which case, the hyphen may be omitted.</p> <p>Fields with whitespace are enclosed in quotation marks (" ").</p> | <i>resource</i>  | Specifies the resource name that must be given to the mount(1M) command.                                                                       | <i>server</i> | Specifies the system from which the resource was mounted. | <i>pathname</i>            | Specifies the pathname that must be given to the share(1M) command.                                             | <i>clients</i> | Is a comma-separated list of systems that have mounted the resource. Clients are listed in the form <i>domain.</i> , <i>domain.system</i> , or <i>system</i> , depending on the file system type. |
| <i>resource</i>            | Specifies the resource name that must be given to the mount(1M) command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |
| <i>server</i>              | Specifies the system from which the resource was mounted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |
| <i>pathname</i>            | Specifies the pathname that must be given to the share(1M) command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |
| <i>clients</i>             | Is a comma-separated list of systems that have mounted the resource. Clients are listed in the form <i>domain.</i> , <i>domain.system</i> , or <i>system</i> , depending on the file system type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |                                                                                                                                                |               |                                                           |                            |                                                                                                                 |                |                                                                                                                                                                                                   |

| <b>SYNOPSIS</b>    | <b>dfmounts</b> [-F <i>nfs</i> ] [-h] [ <i>server...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>dfmounts shows the local resources shared through NFS, along with the list of clients that have mounted the resource. The -F flag may be omitted if NFS is the only file system type listed in the file /etc/dfs/fstypes.</p> <p>dfmounts without options, displays all remote resources mounted on the local system, regardless of file system type.</p> <p>The output of dfmounts consists of an optional header line (suppressed with the -h flag) followed by a list of lines containing whitespace-separated fields. For each resource, the fields are:</p> <p><i>resource server pathname clients ...where</i></p> <p><i>resource</i> Does not apply to NFS. Printed as a hyphen (-).</p> <p><i>server</i> Specifies the system from which the resource was mounted.</p> <p><i>pathname</i> Specifies the pathname that must be given to the share(1M) command.</p> <p><i>clients</i> Is a comma-separated list of systems that have mounted the resource.</p> |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-F <i>nfs</i> Specifies the <i>nfs</i>-FSType.</p> <p>-h Suppress header line in output.</p> <p><i>server</i> Displays information about the resources mounted from each server, where <i>server</i> can be any system on the network. If no server is specified, the <i>server</i> is assumed to be the local system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |         |

dfshares(1M)

**NAME** dfshares – list available resources from remote or local systems

**SYNOPSIS** **dfshares** [-F *FSType*] [-h] [-o *specific\_options*] [*server...*]

**DESCRIPTION** *dfshares* provides information about resources available to the host through a distributed file system of type *FSType*. *specific\_options* as well as the semantics of *server* are specific to particular distributed file systems.

If *dfshares* is entered without arguments, all resources currently shared on the local system are displayed, regardless of file system type.

The output of *dfshares* consists of an optional header line (suppressed with the *-h* flag) followed by a list of lines containing whitespace-separated fields. For each resource, the fields are:

*resource server access transport*

where

*resource* Specifies the resource name that must be given to the *mount(1M)* command.

*server* Specifies the name of the system that is making the resource available.

*access* Specifies the access permissions granted to the client systems, either *ro* (for read-only) or *rw* (for read/write). If *dfshares* cannot determine access permissions, a hyphen (-) is displayed.

*transport* Specifies the transport provider over which the resource is shared.

A field may be null. Each null field is indicated by a hyphen (-) unless the remainder of the fields on the line are also null; in which case, the hyphen may be omitted.

**OPTIONS**

-F *FSType* Specify filesystem type. Defaults to the first entry in */etc/dfs/fstypes*.

-h Suppress header line in output.

-o *specific\_options* Specify options specific to the filesystem provided by the -F option.

**FILES** */etc/dfs/fstypes*

**ATTRIBUTES** See *attributes(5)* for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|

| <b>NAME</b>        | dfshares_nfs – list available NFS resources from remote systems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                 |                                                                          |               |                                                             |               |                                                                                                                                                                                    |                  |                                                                                                                                                                                               |
| <b>SYNOPSIS</b>    | <b>dfshares</b> [-F nfs] [-h] [server...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                 |                                                                          |               |                                                             |               |                                                                                                                                                                                    |                  |                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>dfshares provides information about resources available to the host through NFS. The -F flag may be omitted if NFS is the first file system type listed in the file <code>/etc/dfs/fstypes</code>.</p> <p>The query may be restricted to the output of resources available from one or more servers.</p> <p>dfshares without arguments displays all resources shared on the local system, regardless of file system type.</p> <p>Specifying <i>server</i> displays information about the resources shared by each server. <i>Server</i> can be any system on the network. If no server is specified, then <i>server</i> is assumed to be the local system.</p> <p>The output of dfshares consists of an optional header line (suppressed with the -h flag) followed by a list of lines containing whitespace-separated fields. For each resource, the fields are:</p> <pre>resource server access transport</pre> <p>where</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;"><i>resource</i></td> <td>Specifies the resource name that must be given to the mount(1M) command.</td> </tr> <tr> <td><i>server</i></td> <td>Specifies the system that is making the resource available.</td> </tr> <tr> <td><i>access</i></td> <td>Specifies the access permissions granted to the client systems; however, dfshares cannot determine this information for an NFS resource and populates the field with a hyphen (-).</td> </tr> <tr> <td><i>transport</i></td> <td>Specifies the transport provider over which the <i>resource</i> is shared; however, dfshares cannot determine this information for an NFS resource and populates the field with a hyphen (-).</td> </tr> </table> <p>A field may be null. Each null field is indicated by a hyphen (-) unless the remainder of the fields on the line are also null; in which case, the hyphen may be omitted.</p> | <i>resource</i> | Specifies the resource name that must be given to the mount(1M) command. | <i>server</i> | Specifies the system that is making the resource available. | <i>access</i> | Specifies the access permissions granted to the client systems; however, dfshares cannot determine this information for an NFS resource and populates the field with a hyphen (-). | <i>transport</i> | Specifies the transport provider over which the <i>resource</i> is shared; however, dfshares cannot determine this information for an NFS resource and populates the field with a hyphen (-). |
| <i>resource</i>    | Specifies the resource name that must be given to the mount(1M) command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                 |                                                                          |               |                                                             |               |                                                                                                                                                                                    |                  |                                                                                                                                                                                               |
| <i>server</i>      | Specifies the system that is making the resource available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                 |                                                                          |               |                                                             |               |                                                                                                                                                                                    |                  |                                                                                                                                                                                               |
| <i>access</i>      | Specifies the access permissions granted to the client systems; however, dfshares cannot determine this information for an NFS resource and populates the field with a hyphen (-).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                 |                                                                          |               |                                                             |               |                                                                                                                                                                                    |                  |                                                                                                                                                                                               |
| <i>transport</i>   | Specifies the transport provider over which the <i>resource</i> is shared; however, dfshares cannot determine this information for an NFS resource and populates the field with a hyphen (-).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                 |                                                                          |               |                                                             |               |                                                                                                                                                                                    |                  |                                                                                                                                                                                               |

| <b>SYNOPSIS</b>    | <b>df</b> -F ufs [ <i>generic_options</i> ] [-o i] [ <i>directory</i>   <i>special</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |                   |
| <b>DESCRIPTION</b> | df displays the amount of disk space occupied by ufs file systems, the amount of used and available space, and how much of the file system’s total capacity has been used. The amount of space reported as used and available is less than the amount of space in the file system; this is because the system reserves a fraction of the space in the file system to allow its file system allocation routines to work well. The amount reserved is typically about 10%; this may be adjusted using tuneufs(1M). When all the space on the file system except for this reserve is in use, only the superuser can allocate new files and data blocks to existing files. When the file system is overallocated in this way, df may report that the file system is more than 100% utilized. If neither <i>directory</i> nor <i>special</i> is specified, df displays information for all mounted ufs file systems. |                |                 |              |                   |
| <b>OPTIONS</b>     | The following options are supported:<br><i>generic_options</i> Options supported by the generic df command. See df(1M) for a description of these options.<br>-o                      Specify ufs file system specific options. The available option is:<br>i                      Report the number of used and free inodes. This option may not be used with <i>generic_options</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |                   |
| <b>FILES</b>       | /etc/mnttab      list of file systems currently mounted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |                   |
| <b>ATTRIBUTES</b>  | See attributes(5) for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                |                 |              |                   |

| <b>NOTES</b>       | df calculates its results differently for mounted and unmounted file systems. For unmounted systems, the numbers reflect the 10% reservation mentioned above; this reservation is not reflected in df output for mounted file systems. For this reason, the available space reported by the generic command may differ from the available space reported by this module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |                   |

| <b>NAME</b>        | dhcpcagent – Dynamic Host Configuration Protocol (DHCP) client daemon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <b>dhcpcagent</b> [-a] [ -d n] [-f] [-v]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>dhcpcagent implements the client half of the Dynamic Host Configuration Protocol (DHCP) for machines running Solaris software.</p> <p>The dhcpcagent daemon obtains configuration parameters for the client (local) machine's network interfaces from a DHCP server. These parameters may include a lease on an IP address, which gives the client machine use of the address for the period of the lease, which may be infinite. If the client wishes to use the IP address for a period longer than the lease, it must negotiate an extension using DHCP. For this reason, dhcpcagent must run as a daemon, terminating only when the client machine powers down.</p> <p>The dhcpcagent daemon is controlled through ifconfig(1M) in much the same way that the init(1M) daemon is controlled by telinit(1M). dhcpcagent may be invoked as a user process, albeit one requiring root privileges, but this is not necessary, as ifconfig(1M) will start it automatically.</p> <p>When invoked, dhcpcagent enters a passive state while it awaits instructions from ifconfig(1M). When it receives a command to configure an interface, it starts DHCP. Once DHCP is complete, dhcpcagent may be queried for the values of the various network parameters. In addition, if DHCP was used to obtain a lease on an address for an interface, the interface is configured and brought up. When a lease is obtained, it is automatically renewed as necessary. If the lease cannot be renewed, dhcpcagent will take the interface down at the end of the lease. If the configured interface is found to have a different IP address, subnet mask or broadcast address from those obtained from DHCP, the interface is abandoned from DHCP control.</p> <p>In addition to DHCP, dhcpcagent also supports BOOTP. See <i>RFC 951, Bootstrap Protocol</i>. Configuration parameters obtained from a BOOTP server are treated identically to those received from a DHCP server, except that the IP address received from a BOOTP server always has an infinite lease.</p> <p>DHCP also acts as a mechanism to configure other information needed by the client, for example, the domain name and addresses of routers. Aside from the IP address, netmask, broadcast address and default router, the agent does not directly configure the workstation, but instead acts as a database which may be interrogated by other programs, and in particular by dhcpinfo(1).</p> <p>On clients with a single interface, this is quite straightforward. Clients with multiple interfaces may present difficulties, as it is possible that some information arriving on different interfaces may need to be merged, or may be inconsistent. Furthermore, the configuration of the interfaces is asynchronous, so requests may arrive while some or all of the interfaces are still unconfigured. To handle these cases, one interface may be designated as primary, which makes it the authoritative source for the values of DHCP parameters in the case where no specific interface is requested. See dhcpinfo(1) and ifconfig(1M) for details.</p> |

The `dhcpcagent` daemon can be configured to request a particular host name. See the `REQUEST_HOSTNAME` description in the `FILES` section. When first configuring a client to request a host name, you must perform the following steps as root to ensure that the full DHCP negotiation takes place:

```
pkill dhcpcagent
rm /etc/dhcp/interface.dhc
reboot
```

**Messages**

The `dhcpcagent` daemon writes information and error messages in five categories:

|               |                                                                                                                                                                                                                                                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| critical      | Critical messages indicate severe conditions that prevent proper operation.                                                                                                                                                                                                                                    |
| errors        | Error messages are important, sometimes unrecoverable events due to resource exhaustion and other unexpected failure of system calls; ignoring errors may lead to degraded functionality.                                                                                                                      |
| warnings      | Warnings indicate less severe problems, and in most cases, describe unusual or incorrect datagrams received from servers, or requests for service that cannot be provided.                                                                                                                                     |
| informational | Informational messages provide key pieces of information that can be useful to debugging a DHCP configuration at a site. Informational messages are generally controlled by the <code>-v</code> option. However, certain critical pieces of information, such as the IP address obtained, are always provided. |
| debug         | Debugging messages, which may be generated at two different levels of verbosity, are chiefly of benefit to persons having access to source code, but may be useful as well in debugging difficult DHCP configuration problems. Debugging messages are only generated when using the <code>-d</code> option.    |

When `dhcpcagent` is run without the `-f` option, all messages are sent to the system logger `syslog(3C)` at the appropriate matching priority and with a facility identifier `LOG_DAEMON`. When `dhcpcagent` is run with the `-f` option, all messages are directed to standard error.

**OPTIONS**

The following options are supported:

|                   |                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-a</code>   | Adopt a configured interface. This option is for use with diskless DHCP clients. In the case of diskless DHCP, DHCP has already been performed on the network interface providing the operating system image prior to running <code>dhcpcagent</code> . This option instructs the agent to take over control of the interface. It is intended primarily for use in boot scripts. |
| <code>-d n</code> | Set debug level to <i>n</i> . Two levels of debugging are currently available, 1 and 2; the latter is more verbose.                                                                                                                                                                                                                                                              |
| <code>-f</code>   | Run in the foreground instead of as a daemon process. When this option is used, messages are sent to standard error instead of to <code>syslog(3C)</code> .                                                                                                                                                                                                                      |

## dhcpage(1M)

-v Provide verbose output useful for debugging site configuration problems.

### FILES

/etc/dhcp/if.dhc

Contains the configuration for interface. The mere existence of this file does not imply that the configuration is correct, since the lease may have expired.

/etc/default/dhcpage

Contains default values for tunable parameters. All values may be qualified with the interface they apply to by prepending the interface name and a period (".") to the interface parameter name. The parameters include:

RELEASE\_ON\_SIGTERM

Indicates that a RELEASE rather than a DROP should be performed on managed interfaces when the agent terminates.

OFFER\_WAIT

Indicates how long to wait between checking for valid OFFERS after sending a DISCOVER.

ARP\_WAIT

Indicates how long to wait for clients to respond to an ARP request before concluding the address in the ARP request is unused.

IGNORE\_FAILED\_ARP

Specifies whether or not the agent should assume an address is available, in the unlikely event that ARP cannot be performed on that address.

CLIENT\_ID

Indicates the value that should be used to uniquely identify the client to the server.

PARAM\_REQUEST\_LIST

Specifies a list of comma-separated integer values of options for which the client would like values.

REQUEST\_HOSTNAME

Indicates the client requests the DHCP server to map the client's leased IP address to the host name associated with the network interface that performs DHCP on the client. The host name must be specified in the /etc/hostname.*interface* file for the relevant interface on a line of the form

*inet hostname*

where *hostname* is the host name requested.

### ATTRIBUTES

See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWcsr         |
| Interface Stability | Evolving        |

dhcpageant(1M)

Droms, R., *Dynamic Host Configuration Protocol*, RFC 2131, Network Working Group, March 1997.

**NOTES** Currently, configurations where more than one interface is attached to the same physical network are unsupported. This precludes use of virtual interfaces.

## dhcpconfig(1M)

| <b>NAME</b>                                               | dhcpconfig – DHCP service configuration utility                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                    |               |                   |          |                                |              |                |                                                               |              |                |                                                        |                |

| <b>DESCRIPTION</b>                                        | <p>The <code>dhcpconfig</code> command is used to configure and manage the Dynamic Host Configuration Protocol (DHCP) service or BOOTP relay services. It is intended for use by experienced Solaris system administrators and is designed for ease of use in scripts. The <code>dhcpcmgr</code> utility is recommended for less experienced administrators or those preferring a graphical utility to configure and manage the DHCP service or BOOTP relay service.</p> <p>The <code>dhcpconfig</code> command can be run by root, or by other users assigned to the DHCP Management profile. See <code>rbac(5)</code> and <code>user_attr(4)</code>.</p> <p><code>dhcpconfig</code> requires one of the following function flags: <code>-D</code>, <code>-R</code>, <code>-U</code>, <code>-N</code>, <code>-C</code>, <code>-X</code>, or <code>-I</code>.</p> <p>The <code>dhcpconfig</code> menu driven mode is supported in Solaris 8 and previous versions of Solaris.</p>                    |                    |               |                   |          |                                |              |                |                                                               |              |                |                                                        |                |
| <b>Where dhcpconfig Obtains Configuration Information</b> | <p><code>dhcpconfig</code> scans various configuration files on your Solaris machine for information it can use to assign values to options contained in macros it adds to the <code>dhcptab</code> configuration table. The following table lists information <code>dhcpconfig</code> needs, the source used, and how the information is used:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;"><i>Information</i></th> <th style="text-align: center;"><i>Source</i></th> <th style="text-align: center;"><i>Where Used</i></th> </tr> </thead> <tbody> <tr> <td>Timezone</td> <td>System date, timezone settings</td> <td>Locale macro</td> </tr> <tr> <td>DNS parameters</td> <td><code>nsswitch.conf</code>,<br/><code>/etc/resolv.conf</code></td> <td>Server macro</td> </tr> <tr> <td>NIS parameters</td> <td>System domainname,<br/><code>nsswitch.conf</code>, NIS</td> <td>Network macros</td> </tr> </tbody> </table> | <i>Information</i> | <i>Source</i> | <i>Where Used</i> | Timezone | System date, timezone settings | Locale macro | DNS parameters | <code>nsswitch.conf</code> ,<br><code>/etc/resolv.conf</code> | Server macro | NIS parameters | System domainname,<br><code>nsswitch.conf</code> , NIS | Network macros |
| <i>Information</i>                                        | <i>Source</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <i>Where Used</i>  |               |                   |          |                                |              |                |                                                               |              |                |                                                        |                |
| Timezone                                                  | System date, timezone settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Locale macro       |               |                   |          |                                |              |                |                                                               |              |                |                                                        |                |

| Subnetmask | Network interface, <code>netmasks</code> table in <code>nameservice</code> | Network macros |
|------------|----------------------------------------------------------------------------|----------------|

If you have not set these parameters on your server machine, you should do so before configuring the DHCP server with `dhcpconfig`. Note that if you specify options with the `dhcpconfig -D` command line, the values you supply override the values obtained from the system files.

**OPTIONS** The following options are supported:

- C Convert to using a new data store, recreating the DHCP data tables in a format appropriate to the new data store, and setting up the DHCP server to use the new data store.  
 The following sub-options are required:
  - p *path\_to\_data* The paths for `SUNWfiles` and `SUNWbinfiles` must be absolute UNIX pathnames. The path for `SUNWnisplus` must be a fully specified NIS+ directory (including the trailing period.) See `dhcp_modules(5)`.
  - r *data\_resource* New data store resource. One of the following must be specified: `SUNWfiles`, `SUNWbinfiles`, or `SUNWnisplus`. See `dhcp_modules(5)`.
 The following sub-options are optional:
  - f Do not prompt for confirmation. If `-f` is not used, a warning and confirmation prompt are issued before the conversion starts.
  - k Keep the old DHCP data tables after successful conversion. If any problem occurs during conversion, tables will not be deleted even if `-k` sub-option is not specified.
  - u *uninterpreted* Data which will be ignored by `dhcpconfig`, but passed on to the datastore for interpretation. This might be used for a database account name or other authentication or authorization

parameters required by a particular data store. The `-u` sub-option is not used with the `SUNWfiles`, `SUNWbinfiles`, and `SUNWnisplus` data stores. See `dhcp_modules(5)`.

-D

Configure the DHCP service.

The following sub-options are required:

`-r data_resource`

One of the following must be specified: `SUNWfiles`, `SUNWbinfiles`, or `SUNWnisplus`. Other data stores may be available. See `dhcp_modules(5)`.

`-p path`

The paths for `SUNWfiles` and `SUNWbinfiles` must be absolute UNIX pathnames. The path for `SUNWnisplus` must be a fully specified NIS+ directory (including the trailing period.) See `dhcp_modules(5)`.

The following sub-options are optional:

`-a DNS_servers`

IP addresses of DNS servers, separated with commas.

`-d DNS_domain`

DNS domain name.

`-h hosts_resource`

Resource in which to place hosts data. Usually, the name service in use on the server. Valid values are `nisplus`, `files`, or `dns`.

`-l seconds`

Lease length used for addresses not having a specified lease length, in seconds.

`-n`

Non-negotiable leases

`-y hosts_domain`

DNS or NIS+ domain name to be used for hosts data. Valid only if `dns` or `nisplus` is specified for `-h` sub-option.

`-u uninterpreted`

Data which will be ignored by `dhcpconfig`, but passed on to the data store for interpretation. This

might be used for a database account name or other authentication or authorization parameters required by a particular data store. The `-u` sub-option is not used with the `SUNWfiles`, `SUNWbinfiles`, and `SUNWnisplus` data stores. See `dhcp_modules(5)`.

`-I filename`

Import data from *filename*, containing data previously exported from a Solaris DHCP server. Note that after importing, you may have to edit macros to specify the correct domain names, and edit network tables to change the owning server of addresses in imported networks. Use `dhtadm` and `pntadm` to do this.

The following sub-option is supported:

`-f` Replace any conflicting data with the data being imported.

`-N net_address`

Configure an additional network for DHCP service.

The following sub-options are supported:

`-a NIS_server_addresses` List of IP addresses of NIS servers.

`-b` Network is a point-to-point (PPP) network, therefore no broadcast address should be configured. If `-b` is not used, the network is assumed to be a LAN, and the broadcast address is determined using the network address and subnet mask.

`-m xxx.xxx.xxx.xxx` Subnet mask for the network; if `-m` is not used, subnet mask is obtained from netmasks.

`-t router_addresses` List of router IP addresses; if not specified, router discovery flag will be set.

`-y NIS_domain_name` If NIS is used on this network, specify the NIS domain name.

`-R server_addresses`

Configure the BOOTP relay service. BOOTP or DHCP requests are forwarded to the list of servers specified.

## dhcpconfig(1M)

-U Unconfigure the DHCP service or BOOTP relay service.

The following sub-options are supported:

- f Do not prompt for confirmation. If -f is not used, a warning and confirmation prompt is issued.
- h Delete hosts entries from name service.
- x Delete the `dhcptab` and network tables.

-x *filename* Export data from the DHCP data tables, saving to *filename*, to move the data to another Solaris DHCP server.

The following sub-options are optional:

- a *networks\_to\_export* List of networks whose addresses should be exported, or the keyword ALL to specify all networks. If -a is not specified, no networks are exported.
- m *macros\_to\_export* List of macros to export, or the keyword ALL to specify all macros. If -m is not specified, no macros are exported.
- o *options\_to\_export* List of options to export, or the keyword ALL to specify all options. If -o is not specified, no options are exported.
- x Delete the data from this server after it is exported. If -x is not specified you are in effect copying the data.

### EXAMPLES

#### EXAMPLE 1 Configuring DHCP Service with Binary Files Data Store

The following command configures DHCP service, using the binary files data store, in the DNS domain `acme.eng`, with a lease time of 28800 seconds (8 hours),

```
example# dhcpconfig -D -r SUNWbinfiles -p /var/dhcp -l 28800 -d acme.eng
-a 120.30.33.4 -h dns -y acme.eng
```

**EXAMPLE 2** Configuring BOOTP Relay Agent

The following command configures the DHCP daemon as a BOOTP relay agent, which will forward BOOTP and DHCP requests to the servers having the IP addresses 120.30.33.7 and 120.30.42.132:

```
example# dhcpconfig -R 120.30.33.7,120.30.42.132
```

**EXAMPLE 3** Unconfiguring DHCP Service

The following command unconfigures the DHCP service, with confirmation, and deletes the DHCP data tables and host table entries:

```
example# dhcpconfig -U -x -h
```

**EXAMPLE 4** Configuring a Network for DHCP Service

The following command configures an additional LAN network for DHCP service, specifying that clients should use router discovery and providing the NIS domain name and NIS server address:

```
example# dhcpconfig -N 120.30.171.0 -y east.acme.eng.com -a 120.30.33.4
```

**EXAMPLE 5** Converting to SUNWnisplus Data Store

The following command converts a DHCP server from using a text or binary files data store to a NIS+ data store, deleting the old data store's DHCP tables:

```
example# dhcpconfig -C -r SUNWnisplus -p whatever.com.
```

**EXAMPLE 6** Exporting a Network, Macros, and Options from a DHCP Server

The following command exports one network (120.30.171.0) and its addresses, the macro 120.30.171.0, and the options motd and PSptr from a DHCP server, saves the exported data in file /export/var/120301710\_data, and deletes the exported data from the server.

```
example# dhcpconfig -X /var/dhcp/120301710_export
-a 120.30.171.0 -m 120.30.171.0 -o motd,PSptr
```

**EXAMPLE 7** Importing Data on a DHCP Server

The following command imports DHCP data from a file, /net/golduck/export/var/120301710\_data, containing data previously exported from a Solaris DHCP server, and overwrites any conflicting data on the importing server:

```
example# dhcpconfig -I /net/golduck/export/var/120301710_data -f
```

dhcpconfig(1M)

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWdhcsu       |
| Interface Stability | Evolving        |

| <b>NAME</b>        | dhcpcmgr – graphical interface for managing DHCP service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <code>/usr/sadm/admin/bin/dhcpcmgr</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b> | dhcpcmgr is a graphical user interface which enables you to manage the Dynamic Host Configuration Protocol (DHCP) service on the local system. It performs the functions of the <code>dhcpcconfig</code> , <code>dhtadm</code> , and <code>pntadm</code> command line utilities. You must be <code>root</code> to use <code>dhcpcmgr</code> . The <code>dhcpcmgr Help</code> , available from the <code>Help</code> menu, contains detailed information about using the tool.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>USAGE</b>       | <p>You can perform the following tasks using <code>dhcpcmgr</code>:</p> <p>Configure DHCP service<br/>Use <code>dhcpcmgr</code> to configure the DHCP daemon as a DHCP server, and select the data store to use for storing network configuration tables..</p> <p>Configure BOOTP relay service<br/>Use <code>dhcpcmgr</code> to configure the DHCP daemon as a BOOTP relay.</p> <p>Manage DHCP or BOOTP relay service<br/>Use <code>dhcpcmgr</code> to start, stop, enable, disable or unconfigure the DHCP service or BOOTP relay service, or change DHCP server parameters.</p> <p>Manage DHCP addresses<br/>Use <code>dhcpcmgr</code> to add, modify, or delete IP addresses leased by the DHCP service.</p> <p>Manage DHCP macros<br/>Use <code>dhcpcmgr</code> to add, modify or delete macros used to supply configuration parameters to DHCP clients.</p> <p>Manage DHCP options<br/>Use <code>dhcpcmgr</code> to add, modify or delete options used to define parameters deliverable through DHCP.</p> <p>Convert to a new DHCP data store<br/>Use <code>dhcpcmgr</code> to configure the DHCP server to use a different data store, and convert the DHCP data to the format used by the new data store.</p> <p>Move DHCP data to another server<br/>Use <code>dhcpcmgr</code> to export data from one Solaris DHCP server and import data onto another Solaris DHCP server.</p> |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <p>0                   Successful completion.</p> <p>non-zero           An error occurred.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>DESCRIPTION</b> | <p>dhtadm manages the Dynamic Host Configuration Protocol (DHCP) service configuration table, <code>dhcptab</code>. You can use it to add, delete, or modify DHCP configuration macros or options or view the table. For a description of the table format, see <code>dhcptab(4)</code>.</p> <p>The <code>dhtadm</code> command can be run by root, or by other users assigned to the DHCP Management profile. See <code>rbac(5)</code> and <code>user_attr(4)</code>.</p> <p>After you make changes with <code>dhtadm</code>, you should issue a <code>SIGHUP</code> to the DHCP server, causing it to read the <code>dhcptab</code> and pick up the changes. Do this using the command using the <code>kill -HUP in.dhcpd</code> command. See <code>in.dhcpd(1M)</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                 |                                                                     |
| <b>OPTIONS</b>     | <p>One of the following function flags must be specified with the <code>dhtadm</code> command: <code>-A</code>, <code>-B</code>, <code>-C</code>, <code>-D</code>, <code>-M</code>, <code>-P</code> or <code>-R</code>.</p> <p>The following options are supported:</p> <table border="0" style="width: 100%;"> <tr> <td style="vertical-align: top; padding-right: 20px;"><code>-A</code></td> <td>Add a symbol or macro definition to the <code>dhcptab</code> table.</td> </tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <code>-A</code> | Add a symbol or macro definition to the <code>dhcptab</code> table. |
| <code>-A</code>    | Add a symbol or macro definition to the <code>dhcptab</code> table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |                                                                     |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>-M</b> | Modify an existing symbol or macro definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

The following sub-options are required:

**-d** *definition*

Specify a macro or symbol definition to modify.

The definition must be enclosed in single quotation marks. For macros, use the form -d

'*symbol=value:symbol=value:*'. For symbols, the definition is a series of fields that define a symbol's characteristics. The fields are separated by commas.

Use the form -d

'*context,code,type,granularity,maximum*'. See `dhcptab(4)` for information about these fields.

**-e**

This sub-option uses the *symbol=value* argument.

Use it to edit a *symbol/value* pair within a macro. To add a symbol which does not have an associate value, enter:

*symbol=NULL\_VALUE* To delete a symbol definition from a macro, enter:

*symbol=*

**-m**

This sub-option uses the *macro\_name* argument. The -n, -d, or -e sub-options are legal companions for this sub-option..

**-n**

This sub-option uses the *new\_name* argument and modifies the name of the object specified by the -m or -s sub-option. It is not limited to macros. Use it to specify a new macro name or symbol name.

**-s**

This sub-option uses the *symbol\_name* argument. Use it to specify a symbol. The -d sub-option is a legal companion.

**-p** *path*

Override the `dhcpsvc.conf(4)` configuration value for `PATH=` with *path*. See `dhcpsvc.conf(4)` for more details regarding *path*. See `dhcp_modules(5)` for information regarding data storage modules for the DHCP service.

**-P**

Print (display) the `dhcptab` table.

**-r** *data\_store\_resource*

Override the `dhcpsvc.conf(4)` configuration value for `RESOURCE=` with the *data\_store\_resource* specified.

## dhtadm(1M)

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <code>-R</code>                      | Remove the <code>dhcptab</code> table.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <code>-u <i>uninterpreted</i></code> | Data which will be ignored by <code>dhtadm</code> , but passed to currently configured public module, to be interpreted by the data store. This might be used for a database account name or other authentication or authorization parameters required by a particular data store. Uninterpreted data is stored within <code>RESOURCE_CONFIG</code> keyword of <code>dhcpsvc.conf(4)</code> . See <code>dhcp_modules(5)</code> for information regarding data storage modules for the DHCP service. |

### EXAMPLES

#### EXAMPLE 1 Creating the DHCP Service Configuration Table

The following command creates the DHCP service configuration table, `dhcptab`:

```
dhtadm -C
```

#### EXAMPLE 2 Adding a Symbol Definition

The following command adds a Vendor option symbol definition for a new symbol called `MySym` to the `dhcptab` table in the `SUNWfiles` resource in the `/var/mydhcp` directory:

```
dhtadm -A -s MySym
 -d 'Vendor=SUNW.PCW.LAN,20,IP,1,0'
 -r SUNWfiles -p /var/mydhcp
```

#### EXAMPLE 3 Adding a Macro Definition

The following command adds the `aruba` macro definition to the `dhcptab` table. Note that symbol/value pairs are bracketed with colons (:).

```
dhtadm -A -m aruba
 -d ':Timeserv=10.0.0.10 10.0.0.11:DNSserv=10.0.0.1:'
```

#### EXAMPLE 4 Modifying a Macro Definition

The following command modifies the `Locale` macro definition, setting the value of the `UTCOffst` symbol to 18000 seconds. Note that any macro definition which includes the definition of the `Locale` macro will inherit this change.

```
dhtadm -M -m Locale -e 'UTCOffst=18000'
```

**EXAMPLE 4** Modifying a Macro Definition *(Continued)***EXAMPLE 5** Deleting a Symbol

The following command deletes the `Timeserv` symbol from the `aruba` macro. Note that any macro definition which includes the definition of the `aruba` macro will inherit this change.

```
dhtadm -M -m aruba -e 'Timeserv='
```

**EXAMPLE 6** Adding a Symbol to a Macro

The following command adds the `Hostname` symbol to the `aruba` macro. Note that the `Hostname` symbol takes no value, and thus requires the special value `_NULL_VALUE_`. Note also that any macro definition which includes the definition of the `aruba` macro will inherit this change.

```
dhtadm -M -m aruba -e 'Hostname=_NULL_VALUE_'
```

**EXAMPLE 7** Renaming a Macro

The following command renames the `Locale` macro to `MyLocale`. Note that any `Include` statements in macro definitions which include the `Locale` macro will also need to be changed.

```
dhtadm -M -m Locale -n MyLocale
```

**EXAMPLE 8** Deleting a Symbol Definition

The following command deletes the `MySym` symbol definition. Note that any macro definitions which use `MySym` will need to be modified.

```
dhtadm -D -s MySym
```

**EXAMPLE 9** Removing a `dhcptab`

The following command removes the `dhcptab` table in the NIS+ directory specified.

```
dhtadm -R -r SUNWnisplus -p Test.Nis.Plus.
```

**EXAMPLE 10** Printing a `dhcptab`

The following command prints to standard output the contents of the `dhcptab` that is located in the data store and path indicated in the `dhcpsvc.conf` file:

```
dhtadm -P
```

## dhtadm(1M)

**EXAMPLE 10** Printing a dhcptab (Continued)

**EXAMPLE 11** Executing dhtadm in Batch Mode

The following command runs a series of dhtadm commands contained in a batch file:

```
dhtadm -B addmacros
```

**EXIT STATUS**

|   |                        |
|---|------------------------|
| 0 | Successful completion. |
| 1 | Object already exists. |
| 2 | Object does not exist. |
| 3 | Non-critical error.    |
| 4 | Critical error.        |

**FILES** /etc/inet/dhcpsvc.conf

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWdhcsu       |
| Interface Stability | Evolving        |

| <b>NAME</b>                     | disks – creates /dev entries for hard disks attached to the system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SYNOPSIS</b>                 | <code>/usr/sbin/disks [-C] [-r rootdir]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b>              | <p>devfsadm(1M) is now the preferred command for /dev and /devices and should be used instead of disks.</p> <p>disks creates symbolic links in the /dev/dsk and /dev/rdisk directories pointing to the actual disk device special files under the /devices directory tree. It performs the following steps:</p> <ol style="list-style-type: none"> <li>1. disks searches the kernel device tree to see what hard disks are attached to the system. It notes the /devices pathnames for the slices on the drive and determines the physical component of the corresponding /dev/dsk or /dev/rdisk name.</li> <li>2. The /dev/dsk and /dev/rdisk directories are checked for disk entries – that is, symbolic links with names of the form <code>cN[tN]dNsN</code>, or <code>cN[tN]dNpN</code>, where <i>N</i> represents a decimal number. <i>cN</i> is the logical controller number, an arbitrary number assigned by this program to designate a particular disk controller. The first controller found on the first occasion this program is run on a system, is assigned number 0. <i>tN</i> is the bus-address number of a subsidiary controller attached to a peripheral bus such as SCSI or IPI (the <i>target</i> number for SCSI, and the <i>facility</i> number for IPI controllers). <i>dN</i> is the number of the disk attached to the controller. <i>sN</i> is the <i>slice</i> number on the disk. <i>pN</i> is the FDISK partition number used by fdisk(1M). (IA Only)</li> <li>3. If only some of the disk entries are found in /dev/dsk for a disk that has been found under the /devices directory tree, disks creates the missing symbolic links. If none of the entries for a particular disk are found in /dev/dsk, disks checks to see if any entries exist for other disks attached to the same controller, and if so, creates new entries using the same controller number as used for other disks on the same controller. If no other /dev/dsk entries are found for slices of disks belonging to the same physical controller as the current disk, disks assigns the lowest-unused controller number and creates entries for the disk slices using this newly-assigned controller number.</li> </ol> <p>disks is run automatically each time a reconfiguration-boot is performed or when add_drv(1M) is executed. When invoking disks(1M) manually, first run drvconfig(1M) to ensure /devices is consistent with the current device configuration.</p> |
| <b>Notice to Driver Writers</b> | <p>disks considers all devices with a node type of DDI_NT_BLOCK, DDI_NT_BLOCK_CHAN, DDI_NT_CD, DDI_NT_BLOCK_WWN or DDI_NT_CD_CHAN to be disk devices. disks(1M) requires the minor name of disk devices obey the following format conventions.</p> <p>The minor name for block interfaces consists of a single lowercase ASCII character, a through u. The minor name for character (raw) interfaces consists of a single lowercase ASCII character, a through u, followed by , raw.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## disks(1M)

`disks` translates `a` through `p` to `s0` through `s15`, while it translates `q` through `u` to `p0` through `p4`. SPARC drivers should only use the first 8 slices: `a` through `h`, while IA drivers can use `a` through `u`, with `q` through `u` corresponding to `fdisk(1M)` partitions. `q` represents the entire disk, while `r`, `s`, `t`, and `u` represent up to 4 additional partitions.

To prevent `disks` from attempting to automatically generate links for a device, drivers must specify a private node type and refrain from using a node type: `DDI_NT_BLOCK`, `DDI_NT_BLOCK_CHAN`, `DDI_NT_CD`, or `DDI_NT_CD_CHAN` when calling `ddi_create_minor_node(9F)`.

**OPTIONS**

- `-C` Causes `disks` to remove any invalid links after adding any new entries to `/dev/dsk` and `/dev/rdisk`. Invalid links are links which refer to non-existent disk nodes that have been removed, powered off, or are otherwise inaccessible.
- `-r rootdir` Causes `disks` to presume that the `/dev/dsk`, `/dev/rdisk` and `/devices` directory trees are found under `rootdir`, not directly under `/`.

**ERRORS** If `disks` finds entries of a particular logical controller linked to different physical controllers, it prints an error message and exits without making any changes to the `/dev` directory, since it cannot determine which of the two alternative logical-to-physical mappings is correct. The links should be manually corrected or removed before another reconfiguration-boot is performed.

**EXAMPLES** **EXAMPLE 1** Creating The Block And Character Minor Devices From Within The `xkdisk` Driver's `attach(9E)` Function.

The following example demonstrates creating the block and character minor devices from within the `xkdisk` driver's `attach(9E)` function.

```
#include <sys/dkio.h>
/*
 * Create the minor number by combining the instance number
 * with the slice number.
 */
#define MINOR_NUM(i, s) ((i) << 4 | (s))

int
xkdiskattach(dev_info_t *dip, ddi_attach_cmd_t cmd)
{
 int instance, slice;
 char name[8];

 /* other stuff in attach... */

 instance = ddi_get_instance(dip);
 for (slice = 0; slice < V_NUMPAR; slice++) {
 /*
 * create block device interface
 */
 sprintf(name, "%c", slice + 'a');
```

**EXAMPLE 1** Creating The Block And Character Minor Devices From Within The `xkdisk` Driver's `attach(9E)` Function. (Continued)

```

 ddi_create_minor_node(dip, name, S_IFBLK,
 MINOR_NUM(instance, slice), DDI_NT_BLOCK_CHAN, 0);

/*
 * create the raw (character) device interface
 */
sprintf(name,"%c,raw", slice + 'a');
ddi_create_minor_node(dip, name, S_IFCHR,
 MINOR_NUM(instance, slice), DDI_NT_BLOCK_CHAN, 0);
 }
}

```

Installing the `xkdisk` disk driver on a SPARCstation 20, with the driver controlling a SCSI disk (target 3 attached to an `esp(7D)` SCSI HBA) and performing a reconfiguration-boot (causing disks to be run) creates the following special files in `/devices`.

```

ls -l /devices/iommu@f,e0000000/sbus@f,e0001000/espdma@f,400000/esp@f,800000/
brw-r----- 1 root sys 32, 16 Aug 29 00:02 xkdisk@3,0:a
crw-r----- 1 root sys 32, 16 Aug 29 00:02 xkdisk@3,0:a,raw
brw-r----- 1 root sys 32, 17 Aug 29 00:02 xkdisk@3,0:b
crw-r----- 1 root sys 32, 17 Aug 29 00:02 xkdisk@3,0:b,raw
brw-r----- 1 root sys 32, 18 Aug 29 00:02 xkdisk@3,0:c
crw-r----- 1 root sys 32, 18 Aug 29 00:02 xkdisk@3,0:c,raw
brw-r----- 1 root sys 32, 19 Aug 29 00:02 xkdisk@3,0:d
crw-r----- 1 root sys 32, 19 Aug 29 00:02 xkdisk@3,0:d,raw
brw-r----- 1 root sys 32, 20 Aug 29 00:02 xkdisk@3,0:e
crw-r----- 1 root sys 32, 20 Aug 29 00:02 xkdisk@3,0:e,raw
brw-r----- 1 root sys 32, 21 Aug 29 00:02 xkdisk@3,0:f
crw-r----- 1 root sys 32, 21 Aug 29 00:02 xkdisk@3,0:f,raw
brw-r----- 1 root sys 32, 22 Aug 29 00:02 xkdisk@3,0:g
crw-r----- 1 root sys 32, 22 Aug 29 00:02 xkdisk@3,0:g,raw
brw-r----- 1 root sys 32, 23 Aug 29 00:02 xkdisk@3,0:h
crw-r----- 1 root sys 32, 23 Aug 29 00:02 xkdisk@3,0:h,raw

```

`/dev/dsk` will contain the disk entries to the block device nodes in `/devices`

```

ls -l /dev/dsk
/dev/dsk/c0t3d0s0 -> ../../devices/[...]/xkdisk@3,0:a
/dev/dsk/c0t3d0s1 -> ../../devices/[...]/xkdisk@3,0:b
/dev/dsk/c0t3d0s2 -> ../../devices/[...]/xkdisk@3,0:c
/dev/dsk/c0t3d0s3 -> ../../devices/[...]/xkdisk@3,0:d
/dev/dsk/c0t3d0s4 -> ../../devices/[...]/xkdisk@3,0:e
/dev/dsk/c0t3d0s5 -> ../../devices/[...]/xkdisk@3,0:f
/dev/dsk/c0t3d0s6 -> ../../devices/[...]/xkdisk@3,0:g
/dev/dsk/c0t3d0s7 -> ../../devices/[...]/xkdisk@3,0:h

```

and `/dev/rdisk` will contain the disk entries for the character device nodes in `/devices`

```

ls -l /dev/rdisk
/dev/rdisk/c0t3d0s0 -> ../../devices/[...]/xkdisk@3,0:a,raw

```

## disks(1M)

| <b>SYNOPSIS</b>    | <b>diskscan</b> [-W] [-n] [-y] <i>raw_device</i>                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |    |              |         |
| <b>DESCRIPTION</b> | diskscan is used by the system administrator to perform surface analysis on a portion of a hard disk. The disk portion may be a raw partition or slice; it is identified using its raw device name. By default, the specified portion of the disk is read (non-destructive) and errors reported on standard error. In addition, a progress report is printed on standard out. The list of bad blocks should be saved in a file and later fed into addbadsec(1M), which will remap them. |                |                 |              |    |              |         |
| <b>OPTIONS</b>     | The following options are supported: <ul style="list-style-type: none"> <li>-n Causes diskscan to suppress linefeeds when printing progress information on standard out.</li> <li>-W Causes diskscan to perform write and read surface analysis. This type of surface analysis is destructive and should be invoked with caution.</li> <li>-y Causes diskscan to suppress the warning regarding destruction of existing data that is issued when -W is used.</li> </ul>                 |                |                 |              |    |              |         |
| <b>OPERANDS</b>    | The following operands are supported: <p><i>raw_device</i> The address of the disk drive (see FILES).</p>                                                                                                                                                                                                                                                                                                                                                                               |                |                 |              |    |              |         |
| <b>FILES</b>       | The raw device should be /dev/rdisk/c? [t?] d? [ps] ?. See disks(1M) for an explanation of SCSI and IDE device naming conventions.                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |    |              |         |
| <b>ATTRIBUTES</b>  | See attributes(5) for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |    |              |         |

| <b>NOTES</b>       | The format(1M) utility is available to format, label, analyze, and repair SCSI disks. This utility is included with the diskscan, addbadsec(1M), fdisk(1M), and fmthard(1M) commands available for IA. To format an IDE disk, use the DOS format utility; however, to label, analyze, or repair IDE disks on IA systems, use the Solaris format(1M) utility.                                                                                                                            |                |                 |              |    |              |         |

| <b>NAME</b>        | dispadmin – process scheduler administration                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>    | <b>dispadmin</b> -l<br><b>dispadmin</b> -c <i>class</i> -g [-r <i>res</i> ]<br><b>dispadmin</b> -c <i>class</i> -s <i>file</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>DESCRIPTION</b> | <p>The <code>dispadmin</code> command displays or changes process scheduler parameters while the system is running.</p> <p><code>dispadmin</code> does limited checking on the values supplied in <i>file</i> to verify that they are within their required bounds. The checking, however, does not attempt to analyze the effect that the new values have on the performance of the system. Inappropriate values can have a negative effect on system performance. (See <i>System Administration Guide, Volume 1</i>)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>OPTIONS</b>     | <p>-l Lists the scheduler classes currently configured in the system.</p> <p>-c <i>class</i> Specifies the class whose parameters are to be displayed or changed. Valid <i>class</i> values are: RT for the real-time class, TS for the time-sharing class, and IA for the inter-active class. The time-sharing and inter-active classes share the same scheduler, so changes to the scheduling parameters of one will change those of the other.</p> <p>-g Gets the parameters for the specified class and writes them to the standard output. Parameters for the real-time class are described in <code>rt_dptbl(4)</code>. Parameters for the time-sharing and inter-active classes are described in <code>ts_dptbl(4)</code>.</p> <p>-r <i>res</i> When using the -g option you may also use the -r option to specify a resolution to be used for outputting the time quantum values. If no resolution is specified, time quantum values are in milliseconds. If <i>res</i> is specified it must be a positive integer between 1 and 1000000000 inclusive, and the resolution used is the reciprocal of <i>res</i> in seconds. For example, a <i>res</i> value of 10 yields time quantum values expressed in tenths of a second; a <i>res</i> value of 1000000 yields time quantum values expressed in microseconds. If the time quantum cannot be expressed as an integer in the specified resolution, it is rounded up to the next integral multiple of the specified resolution.</p> <p>-s <i>file</i> Sets scheduler parameters for the specified class using the values in <i>file</i>. These values overwrite the current values in memory—they become the parameters that control scheduling of processes in the specified class. The values in <i>file</i> must be in the format output by the -g option. Moreover, the values must describe a table that is the same size (has same number of priority levels) as the table being overwritten. Super-user privileges are required in order to use the -s option.</p> |

Note: The `-g` and `-s` options are mutually exclusive: you may not retrieve the table at the same time you are overwriting it.

**EXAMPLES**

**EXAMPLE 1** Retrieving the current scheduler parameters for the real-time class.

The following command retrieves the current scheduler parameters for the real-time class from kernel memory and writes them to the standard output. Time quantum values are in microseconds.

```
dispadmin -c RT -g -r 1000000
```

**EXAMPLE 2** Overwriting the current scheduler parameters for the real-time class.

The following command overwrites the current scheduler parameters for the real-time class with the values specified in `rt.config`.

```
dispadmin -c RT -s rt.config
```

**EXAMPLE 3** Retrieving the current scheduler parameters for the time-sharing class.

The following command retrieves the current scheduler parameters for the time-sharing class from kernel memory and writes them to the standard output. Time quantum values are in nanoseconds.

```
dispadmin -c TS -g -r 1000000000
```

**EXAMPLE 4** Overwriting the current scheduler parameters for the time-sharing class.

The following command overwrites the current scheduler parameters for the time-sharing class with the values specified in `ts.config`.

```
dispadmin -c TS -s ts.config
```

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO**

`priocntl(1)`, `priocntl(2)`, `rt_dptbl(4)`, `ts_dptbl(4)`, `attributes(5)`

*System Administration Guide, Volume 1 System Interface Guide*

**DIAGNOSTICS**

`dispadmin` prints an appropriate diagnostic message if it fails to overwrite the current scheduler parameters due to lack of required permissions or a problem with the specified input file.

dmesg(1M)

**NAME** dmesg – collect system diagnostic messages to form error log

**SYNOPSIS** /usr/bin/dmesg  
/usr/sbin/dmesg

**DESCRIPTION** dmesg is made obsolete by syslogd(1M) for maintenance of the system error log.  
dmesg looks in a system buffer for recently printed diagnostic messages and prints them on the standard output.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE                       |
|----------------|---------------------------------------|
| Availability   | SUNWesu (32-bit)<br>SUNWesxu (64-bit) |

| <b>DESCRIPTION</b> | dminfo reports and updates information about the <code>device_maps(4)</code> file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>OPTIONS</b>     | <p><b>-v</b> Verbose. Print the requested entry or entries, one line per entry, on the standard output. If no entries are specified, all are printed.</p> <p><b>-a</b> Succeed if any of the requested entries are found. If used with <b>-v</b>, all entries that match the requested case(s) are printed.</p> <p><b>-f <i>pathname</i></b> Use a <code>device_maps</code> file with <i>pathname</i> instead of <code>/etc/security/device_maps</code>.</p> <p><b>-n <i>dev-name</i></b> Search by <i>dev-name</i>. Search <code>device_maps(4)</code> for a <code>device_name</code> field matching <i>dev-name</i>. This option cannot be used with <b>-d</b>, <b>-t</b> or <b>-u</b>.</p> <p><b>-d <i>dev-path</i></b> Search by <i>dev-path</i>. Search <code>device_maps(4)</code> for a device special pathname in the <code>device_list</code> field matching the <i>dev-path</i> argument. This option cannot be used with <b>-n</b>, <b>-t</b> or <b>-u</b>.</p> <p><b>-t <i>dev-type</i></b> Search by <i>dev-type</i>. Search <code>device_maps(4)</code> for a <code>device_type</code> field matching the given <i>dev-type</i>. This option cannot be used with <b>-d</b>, <b>-n</b> or <b>-u</b>.</p> <p><b>-u <i>dm-entry</i></b> Update the <code>device_maps(4)</code> file. This option is provided to add entries to the <code>device_maps(4)</code> file. The <i>dm-entry</i> must be a complete <code>device_maps(4)</code> file entry. The <i>dm-entry</i> has fields, as in the <code>device_maps</code> file. It uses the colon (:) as a field separator, and white space as the <code>device_list</code> subfield separators. The <i>dm-entry</i> is not made if any fields are missing, or if the <i>dm-entry</i> would be a duplicate. The default device maps file can be updated only by the super user.</p> |
| <b>DIAGNOSTICS</b> | dminfo returns an exit code of 0 if successful, 1 if the request failed, and 2 if the invocation syntax was incorrect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>DESCRIPTION</b> | The DMI Service Provider, <code>dmispd</code> , is the core of the DMI solution. Management applications and Component instrumentations communicate with each other through the Service Provider. The Service Provider coordinates and arbitrates requests from the management application to the specified component instrumentations. The Service Provider handles runtime management of the Component Interface (CI) and the Management Interface (MI), including component installation, registration at the MI and CI level, request serialization and synchronization, event handling for CI, and general flow control and housekeeping. |                |                 |              |           |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-c <i>config-dir</i></code> Specify the full path of the directory containing the <code>dmispd.conf</code> configuration file. The default directory is <code>/etc/dmi/conf</code>.</p> <p><code>-d <i>debug-level</i></code> Debug. Levels from 0 to 5 are supported, giving various levels of debug information. The default is 0, meaning no debug information is given.</p> <p>If this option is omitted, then <code>dmispd</code> is run as a daemon process.</p> <p><code>-h</code> Help. Print the command line usage.</p>                                                         |                |                 |              |           |
| <b>EXIT STATUS</b> | <p>The following error values are returned:</p> <p>0 Successful completion.</p> <p>1 An error occurred.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |           |

| <b>NAME</b>        | dnskeygen – generate public, private, and shared secret keys for DNS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>SYNOPSIS</b>    | <b>dnskeygen</b> [ [-DHR] <i>size</i> ] [-F] [-zhu] [-a] [-c] [-p <i>num</i> ] [-s <i>num</i> ] -n <i>name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>DESCRIPTION</b> | <p>The <code>dnskeygen</code> utility is a tool to generate and maintain keys for DNS security with the Domain Name System (“DNS”). Use <code>dnskeygen</code> to generate public and private keys to authenticate zone data or shared secret keys for request and transaction signatures.</p> <p><code>dnskeygen</code> stores each key in two files:</p> <pre>K&lt;name&gt;+&lt;algorithm&gt;+&lt;footprint&gt;.private</pre> <p>and</p> <pre>K&lt;name&gt;+&lt;algorithm&gt;+&lt;footprint&gt;.key</pre> <p>The key is stored in a portable format within <code>K&lt;name&gt;+&lt;alg&gt;+&lt;footprint&gt;.private</code>. The public key is stored in <code>K&lt;name&gt;+&lt;alg&gt;+&lt;footprint&gt;.private</code> in the DNS zone file format:</p> <pre>&lt;name&gt; IN KEY &lt;flags&gt;&lt;algorithm&gt;&lt;protocol&gt;&lt;exponent modulus&gt;</pre> <p>The underlying cryptographic math is done by the DNSSAFE and Foundation Toolkit libraries.</p> |
| <b>OPTIONS</b>     | <p>The <code>dnskeygen</code> utility supports the following options:</p> <ul style="list-style-type: none"><li>-D Generate a DSA/DSS key. The value of <i>size</i> must be one of the following: 512, 576, 640, 704, 768, 832, 896, 960 or 1024.</li><li>-F Use a large exponent for key generation. Use for RSA only.</li><li>-H Generate a HMAC-MD5 key. The value of <i>size</i> must be between 128 and 504.</li><li>-R Generate an RSA key. The value of <i>size</i> must be between 512 and 4096.</li><li>-a Cannot use key for authentication.</li><li>-c Cannot use key for encryption.</li><li>-h Generate host or service key.</li><li>-n <i>name</i> Set the key’s name to <i>name</i>.</li><li>-p <i>num</i> Set the key’s protocol field to <i>num</i>. The values for <i>num</i> are as follows:<ul style="list-style-type: none"><li>3 If -z or -h is specified (DNSSEC), this is the default value.</li></ul></li></ul>                             |

dnskeygen(1M)

- 2 Unless specified, the default value for all other options.
- 1 Use this value for TLS.
- 4 Use this value for IPSEC.
- 255 Use this value for ANY.
- s *num* Set the key's strength field to *num*. The default value of *num* is 0.
- u Generate User key, for example, for email.
- z Generate Zone key for DNS validation.

domainname(1M)

**NAME** domainname – set or display name of the current domain

**SYNOPSIS** **domainname** [*name-of-domain*]

**DESCRIPTION** Without an argument, domainname displays the name of the current domain, which typically encompasses a group of hosts or passwd entries under the same administration. The domainname command is used by various components of Solaris to resolve names for types such as passwd, hosts and aliases. By default, various naming services such as NIS, NIS+, the Internet Domain Name Service (DNS) and sendmail(1M) use this domainname to resolve names. The domainname is normally a valid Internet domain name.

The domainname for various naming services can also be set by other means. For example, ypinit can be used to specify a different domain for all NIS calls. The file /etc/resolv.conf can be used to specify a different domain for DNS lookups. For sendmail, the domainname can be specified through the *sendmail\_vars* entry in the /etc/nsswitch.conf file, or through the /etc/mail/sendmail.cf file. Only the superuser can set the name of the domain by specifying the new domainname as an argument. The domain name of the machine is usually set during boot-time through the domainname command in the /etc/init.d/inetinit file. If the new domain name is not saved in the /etc/defaultdomain file, the machine will revert back to the old domain after rebooting.

**FILES** /etc/defaultdomain  
/etc/init.d/inetinit  
/etc/mail/sendmail.cf  
/etc/nsswitch.conf  
/etc/resolv.conf

| <b>DESCRIPTION</b>               | <p>The <code>dr_daemon</code> is a Remote Procedure Call (RPC) program that provides the interface to the Sun Enterprise 10000 Dynamic Reconfiguration (DR) driver, <code>dr(7D)</code>.</p> <p>There are several applications that run on the SSP that provide a user interface to DR: <code>hostview</code>, the <code>dr</code> shell, and <code>ADR</code> commands (<code>addboard</code>, <code>deleteboard</code>, <code>moveboard</code>, and <code>showusage</code>). See <code>dr(7D)</code>. See <code>hostview(1M)</code> in the <i>Sun Enterprise 10000 SSP 3.5 Reference Manual</i> and <code>dr(1M)</code> in the <i>Sun Enterprise 10000 Dynamic Reconfiguration Reference Manual</i>.</p> <p>This daemon runs only on domains that are running DR version 2.0. To check the DR version that is running on a domain, use the <code>domain_status -m</code> command on the System Service Processor (SSP) 3.5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |           |
| <b>OPTIONS</b>                   | <p>The following options are supported:</p> <p><code>-a</code>        Disable communications with the Alternate Pathing (AP) daemon. See <code>ap_daemon(1M)</code> in the <i>Sun Enterprise Server Alternate Pathing Reference Manual</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |                 |              |           |
| <b>CONFIGURATION INFORMATION</b> | <p>The <code>/platform/SUNW,Ultra-Enterprise-10000/lib/dr_daemon</code> RPC program name is <code>DRPROG</code>, its RPC program number is <code>300326</code>, and its underlying protocol is TCP. It is invoked as an <code>inetd</code> server using the TCP transport. The UID required for access to the daemon is <code>ssp</code>. This UID can be a non-login UID. The entry for the daemon in the <code>/etc/inetd.conf</code> file is:</p> <pre>300326/4 tli rpc/tcp wait root \     /platform/SUNW,Ultra-Enterprise-10000/lib/dr_daemon</pre> <p>The daemon's only clients are <code>Hostview</code> and <code>DR</code>. <code>Hostview</code> provides a GUI interface; <code>dr(1M)</code> is a command-line interface for non-windowing environments. The <code>DR</code> daemon uses <code>syslog(3)</code> to report status and error messages. These error messages are logged with the <code>LOG_DAEMON</code> facility and the <code>LOG_ERR</code> and <code>LOG_NOTICE</code> priorities. <code>dr_daemon</code> communicates by way of RPC with the Alternate Pathing (AP) daemon to notify the AP software when controllers are attached to and detached from the system, or to gather information about the system configuration. See <code>ap_daemon(1M)</code> in the <i>Sun Enterprise Server Alternate Pathing Reference Manual</i>.</p> |                |                 |              |           |

| <b>NAME</b>                 | drvconfig – configure the /devices directory                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>SYNOPSIS</b>             | <b>drvconfig</b> [-bn] [-a <i>alias_name</i> ] [-c <i>class_name</i> ] [-i <i>drivername</i> ]<br>[-m <i>major_num</i> ] [-r <i>rootdir</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DESCRIPTION</b>          | <p>devfsadm(1M) is now the preferred command for /dev and /devices and should be used instead of drvconfig.</p> <p>The default operation of drvconfig is to create the /devices directory tree that describes, in the filesystem namespace, the hardware layout of a particular machine. Hardware devices present on the machine and powered on as well as pseudo-drivers are represented under /devices. Normally this command is run automatically after a new driver has been installed (with add_drv(1M)) and the system has been rebooted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>/etc/minor_perm file</b> | <p>drvconfig reads the /etc/minor_perm file to obtain permission information and applies the permissions only to nodes that it has just created. It does not change permissions on already existing nodes. The format of the /etc/minor_perm file is as follows:</p> <p><i>name</i> : <i>minor_name</i> <i>permissions</i> <i>owner</i> <i>group</i></p> <p><i>minor_name</i> may be the actual name of the minor node, or contain shell metacharacters to represent several minor nodes (see sh(1)).</p> <p>For example:</p> <pre>sd:* 0640 root sys zs:[a-z],cu 0600 uucp uucp mm:kmem 0640 root bin</pre> <p>The first line sets all devices exported by the sd node to 0640 permissions, owned by root, with group sys. In the second line, devices such as a, cu and z, cu exported by the zs driver are set to 0600 permission, owned by uucp, with group uucp. In the third line the kmem device exported by the mm driver is set to 0640 permission, owned by root, with group bin.</p> |
| <b>OPTIONS</b>              | <p>The following options may be of use to system administrators and driver developers:</p> <p><b>-i <i>drivername</i></b> Only configure the devices for the named driver. The following options are used by the implementation of add_drv(1M) and rem_drv(1M), and may not be supported in future versions of Solaris:</p> <p><b>-b</b> Add a new major number to name binding into the kernel's internal name_to_major tables. This option is not normally used directly, but is used by other utilities such as add_drv(1M). Use of the -b option requires that -i and -m be used also. No /devices entries are created.</p> <p><b>-n</b> Do not try to load and attach any drivers, or if the -i option is given, do not try to attach the driver named <i>drivername</i>.</p>                                                                                                                                                                                                              |

## drvconfig(1M)

- a *alias\_name*      Add the name *alias\_name* to the list of aliases that this driver is known by. This option, if used, must be used with the -m *major\_num*, the -b and the -i *drivername* options.
- c *class\_name*      The driver being added to the system exports the class *class\_name*. This option is not normally used directly, but is used by other utilities. It is only effective when used with the -b option.
- m *major\_num*      Specify the major number *major\_num* for this driver to add to the kernel's name\_to\_major binding tables.
- r *rootdir*          Build the device tree under the directory specified by *rootdir* instead of the default /devices directory.

**EXIT STATUS**

|          |                        |
|----------|------------------------|
| 0        | Successful completion. |
| non-zero | An error occurred.     |

**FILES**

|                     |                           |
|---------------------|---------------------------|
| /devices            | device nodes directory    |
| /etc/minor_perm     | minor mode permissions    |
| /etc/name_to_major  | major number binding      |
| /etc/driver_classes | driver class binding file |

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** sh(1), add\_drv(1M), devlinks(1M), disks(1M), modinfo(1M), modload(1M), modunload(1M), ports(1M), rem\_drv(1M), tapes(1M), path\_to\_inst(4), attributes(5)

**NOTES** This document does not constitute an API. /etc/minor\_perm, /etc/name\_to\_major, /etc/driver\_classes, and /devices may not exist or may have different contents or interpretations in a future release. The existence of this notice does not imply that any other documentation that lacks this notice constitutes an API.

**NAME** dsvclockd – DHCP service lock daemon

**SYNOPSIS** `/usr/lib/inet/dsvclockd [-d 1 | 2] [-f ] [-v]`

**DESCRIPTION** `dsvclockd` is a daemon that works in conjunction with the Dynamic Host Configuration Protocol (DHCP) Data Service Library (`libdhcpsvc`) to provide synchronization guarantees for DHCP data store modules that want to utilize its services. The daemon is started on demand by `libdhcpsvc`. The `dsvclockd` daemon should be started manually only if command line options need to be specified.

**OPTIONS** The following options are supported:

- `-d 1 | 2` Set debug level. Two levels of debugging are currently available, 1 and 2. Level 2 is more verbose.
- `-f` Run in the foreground instead of as a daemon process. When this option is used, messages are sent to standard error instead of to `syslog(3C)`.
- `v` Provide verbose output.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWdhcsu       |
| Interface Stability | Unstable        |

**SEE ALSO** `syslog(3C)`, `attributes(5)`

| <b>NAME</b>                   | du – summarize disk usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>               | <code>/usr/bin/du [-adkLr] [-o   -s] [file...]</code><br><code>/usr/xpg4/bin/du [-a   -s] [-krx] [file...]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DESCRIPTION</b>            | <p>The <code>du</code> utility writes to standard output the size of the file space allocated to, and the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the specified files. The size of the file space allocated to a file of type directory is defined as the sum total of space allocated to all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.</p> <p>Files with multiple links will be counted and written for only one entry. The directory entry that is selected in the report is unspecified. By default, file sizes are written in 512-byte units, rounded up to the next 512-byte unit.</p>                                                                                                                                                                                 |
| <code>/usr/xpg4/bin/du</code> | When <code>du</code> cannot obtain file attributes or read directories (see <code>stat(2)</code> ), it will report an error condition and the final exit status will be affected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>OPTIONS</b>                | <p>The following options are supported for <code>/usr/bin/du</code> and <code>/usr/xpg4/bin/du</code>:</p> <ul style="list-style-type: none"><li><code>-a</code> In addition to the default output, report the size of each file not of type directory in the file hierarchy rooted in the specified file. Regardless of the presence of the <code>-a</code> option, non-directories given as <i>file</i> operands will always be listed.</li><li><code>-k</code> Write the files sizes in units of 1024 bytes, rather than the default 512-byte units.</li><li><code>-s</code> Instead of the default output, report only the total sum for each of the specified files.</li></ul>                                                                                                                                                                                                            |
| <code>/usr/bin/du</code>      | <p>The following options are supported for <code>/usr/bin/du</code> only:</p> <ul style="list-style-type: none"><li><code>-d</code> Do not cross filesystem boundaries. For example, <code>du -d /</code> reports usage only on the root partition.</li><li><code>-L</code> Process symbolic links by using the file or directory which the symbolic link references, rather than the link itself.</li><li><code>-o</code> Do not add child directories' usage to a parent's total. Without this option, the usage listed for a particular directory is the space taken by the files in that directory, as well as the files in all directories beneath it. This option does nothing if <code>-s</code> is used.</li><li><code>-r</code> Generate messages about directories that cannot be read, files that cannot be opened, and so forth, rather than being silent (the default).</li></ul> |
| <code>/usr/xpg4/bin/du</code> | <p>The following options are supported for <code>/usr/xpg4/bin/du</code> only:</p> <ul style="list-style-type: none"><li><code>-r</code> By default, generate messages about directories that cannot be read, files that cannot be opened, and so forth.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                              | -x                                                                                                                                                                                                                                                                                                                                | When evaluating file sizes, evaluate only those files that have the same device as the file specified by the <i>file</i> operand. |                |                 |              |          |     |         |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|----------|-----|---------|
| <b>OPERANDS</b>              | The following operand is supported:                                                                                                                                                                                                                                                                                               |                                                                                                                                   |                |                 |              |          |     |         |
|                              | <i>file</i>                                                                                                                                                                                                                                                                                                                       | The path name of a file whose size is to be written. If no <i>file</i> is specified, the current directory is used.               |                |                 |              |          |     |         |
| <b>OUTPUT</b>                | The output from <i>du</i> consists of the amount of the space allocated to a file and the name of the file.                                                                                                                                                                                                                       |                                                                                                                                   |                |                 |              |          |     |         |
| <b>USAGE</b>                 | See <i>largefile(5)</i> for the description of the behavior of <i>du</i> when encountering files greater than or equal to 2 Gbyte (2 <sup>31</sup> bytes).                                                                                                                                                                        |                                                                                                                                   |                |                 |              |          |     |         |
| <b>ENVIRONMENT VARIABLES</b> | See <i>environ(5)</i> for descriptions of the following environment variables that affect the execution of <i>du</i> : LC_CTYPE, LC_MESSAGES, and NLS_PATH.                                                                                                                                                                       |                                                                                                                                   |                |                 |              |          |     |         |
| <b>EXIT STATUS</b>           | The following exit values are returned:                                                                                                                                                                                                                                                                                           |                                                                                                                                   |                |                 |              |          |     |         |
|                              | 0                                                                                                                                                                                                                                                                                                                                 | Successful completion.                                                                                                            |                |                 |              |          |     |         |

| <b>NAME</b>        | dumpadm – configure operating system crash dump                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>SYNOPSIS</b>    | <code>/usr/sbin/dumpadm [-nuy] [-c content-type] [-d dump-device] [-m min k   min m   min%] [-s savecore-dir] [-r root-dir]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DESCRIPTION</b> | <p>The dumpadm program is an administrative command that manages the configuration of the operating system crash dump facility. A crash dump is a disk copy of the physical memory of the computer at the time of a fatal system error. When a fatal operating system error occurs, a message describing the error is printed to the console. The operating system then generates a crash dump by writing the contents of physical memory to a predetermined dump device, which is typically a local disk partition. The dump device can be configured by way of dumpadm. Once the crash dump has been written to the dump device, the system will reboot.</p> <p>Fatal operating system errors can be caused by bugs in the operating system, its associated device drivers and loadable modules, or by faulty hardware. Whatever the cause, the crash dump itself provides invaluable information to your support engineer to aid in diagnosing the problem. As such, it is vital that the crash dump be retrieved and given to your support provider. Following an operating system crash, the savecore(1M) utility is executed automatically during boot to retrieve the crash dump from the dump device, and write it to a pair of files in your file system named <i>unix.X</i> and <i>vmcore.X</i>, where X is an integer identifying the dump. Together, these data files form the <i>saved crash dump</i>. The directory in which the crash dump is saved on reboot can also be configured using dumpadm.</p> <p>By default, the dump device is configured to be an appropriate swap partition. Swap partitions are disk partitions reserved as virtual memory backing store for the operating system, and thus no permanent information resides there to be overwritten by the dump. See swap(1M). To view the current dump configuration, execute dumpadm with no arguments:</p> <pre>example# dumpadm  Dump content: kernel pages Dump device: /dev/dsk/c0t0d0s1 (swap) Savecore directory: /var/crash/saturn Savecore enabled: yes</pre> <p>When no options are specified, dumpadm prints the current crash dump configuration. The example shows the set of default values: the dump content is set to kernel memory pages only, the dump device is a swap disk partition, the directory for savecore files is set to <i>/var/crash/hostname</i>, and savecore is set to run automatically on reboot.</p> <p>When one or more options are specified, dumpadm verifies that your changes are valid, and if so, reconfigures the crash dump parameters and displays the resulting configuration. You must be root to view or change dump parameters.</p> |
| <b>OPTIONS</b>     | The following options are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -c <i>content-type</i>         | <p>Modify the dump configuration so that the crash dump consists of the specified dump content. The content should be one of the following:</p> <p><i>kernel</i>            Kernel memory pages only.</p> <p><i>all</i>                 All memory pages.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| -d <i>dump-device</i>          | <p>Modify the dump configuration to use the specified dump device. The dump device may one of the following:</p> <p><i>dump-device</i>        A specific dump device specified as an absolute pathname, such as <i>/dev/dsk/cNtNdNsN</i>.</p> <p><i>swap</i>                If the special token <i>swap</i> is specified as the dump device, <i>dumpadm</i> examines the active swap entries and selects the most appropriate entry to configure as the dump device. See <i>swap(1M)</i>. Refer to the NOTES below for details of the algorithm used to select an appropriate swap entry. When the system is first installed, <i>dumpadm</i> uses <i>swap</i> to determine the initial dump device setting.</p>                                                                                                                                                                                                                                                                                                |
| -m <i>min k   min m   min%</i> | <p>Create a <i>minfree</i> file in the current <i>savecore</i> directory indicating that <i>savecore</i> should maintain at least the specified amount of free space in the file system where the <i>savecore</i> directory is located. The <i>min</i> argument can be one of the following:</p> <p><i>k</i>                    A positive integer suffixed with the unit <i>k</i> specifying kilobytes.</p> <p><i>m</i>                    A positive integer suffixed with the unit <i>m</i> specifying megabytes.</p> <p><i>%</i>                    A % symbol, indicating that the <i>minfree</i> value should be computed as the specified percentage of the total current size of the file system containing the <i>savecore</i> directory. The <i>savecore</i> command will consult the <i>minfree</i> file, if present, prior to writing the dump files. If the size of these files would decrease the amount of free disk space below the <i>minfree</i> threshold, no dump files are written and</p> |

## dumpadm(1M)

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | <p>an error message is logged. The administrator should immediately clean up the <code>savecore</code> directory to provide adequate free space, and re-execute the <code>savecore</code> command manually. The administrator can also specify an alternate directory on the <code>savecore</code> command-line.</p>                                                                                                                                                                                                                                                                                             |
| <code>-n</code>              | <p>Modify the dump configuration to not run <code>savecore</code> automatically on reboot. This is not the recommended system configuration; if the dump device is a swap partition, the dump data will be overwritten as the system begins to swap. If <code>savecore</code> is not executed shortly after boot, crash dump retrieval may not be possible.</p>                                                                                                                                                                                                                                                  |
| <code>-r root-dir</code>     | <p>Specify an alternate root directory relative to which <code>dumpadm</code> should create files. If no <code>-r</code> argument is specified, the default root directory "/" is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>-s savecore-dir</code> | <p>Modify the dump configuration to use the specified directory to save files written by <code>savecore</code>. The directory should be an absolute path and exist on the system. If upon reboot the directory does not exist, it will be created prior to the execution of <code>savecore</code>. See the <b>NOTES</b> section below for a discussion of security issues relating to access to the <code>savecore</code> directory. The default <code>savecore</code> directory is <code>/var/crash/hostname</code> where is the output of the <code>-n</code> option to the <code>uname(1)</code> command.</p> |
| <code>-u</code>              | <p>Forcibly update the kernel dump configuration based on the contents of <code>/etc/dumpadm.conf</code>. Normally this option is used only on reboot by the startup script <code>/etc/init.d/savecore</code>, when the <code>dumpadm</code> settings from the previous boot must be restored. Your dump configuration is saved in the configuration file for this purpose. If the configuration file is missing or contains invalid values for any dump properties, the default values are substituted. Following the update, the configuration file is resynchronized with the kernel dump configuration.</p>  |
| <code>-y</code>              | <p>Modify the dump configuration to automatically run <code>savecore</code> on reboot. This is the default for this dump setting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### EXAMPLES

#### **EXAMPLE 1** Reconfiguring The Dump Device To A Dedicated Dump Device:

```
example# dumpadm -d /dev/dsk/c0t2d0s2
```

```
Dump content: kernel pages
Dump device: /dev/dsk/c0t2d0s2 (dedicated)
```

**EXAMPLE 1** Reconfiguring The Dump Device To A Dedicated Dump Device: (Continued)

```
Savecore directory: /var/crash/saturn
Savecore enabled: yes
```

**EXIT STATUS** The following exit values are returned:

- 0 Dump configuration is valid and the specified modifications, if any, were made successfully.
- 1 A fatal error occurred in either obtaining or modifying the dump configuration.
- 2 Invalid command line options were specified.

**FILES** /dev/dump  
 /etc/init.d/savecore  
 /etc/dumpadm.conf  
 savecore-directory/minfree

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsr         |

**SEE ALSO** uname(1), savecore(1M), swap(1M), attributes(5)

**Dump Device Selection** When the special swap token is specified as the argument to dumpadm -d the utility will attempt to configure the most appropriate swap device as the dump device. dumpadm configures the largest swap block device as the dump device; if no block devices are available for swap, the largest swap entry is configured as the dump device. If no swap entries are present, or none can be configured as the dump device, a warning message will be displayed. While local and remote swap files can be configured as the dump device, this is not recommended.

**Dump Device/Swap Device Interaction** In the event that the dump device is also a swap device, and the swap device is deleted by the administrator using the swap -d command, the swap command will automatically invoke dumpadm -d swap in order to attempt to configure another appropriate swap device as the dump device. If no swap devices remain or none can be configured as the dump device, the crash dump will be disabled and a warning message will be displayed. Similarly, if the crash dump is disabled and the administrator adds a new swap device using the swap -a command, dumpadm -d swap will be invoked to re-enable the crash dump using the new swap device.

Once dumpadm -d swap has been issued, the new dump device is stored in the configuration file for subsequent reboots. If a larger or more appropriate swap device

## dumpadm(1M)

is added by the administrator, the dump device is not changed; the administrator must re-execute `dumpadm -d swap` to reselect the most appropriate device from the new list of swap devices.

### Minimum Free Space

If the `dumpadm -m` option is used to create a `minfree` file based on a percentage of the total size of the file system containing the `savecore` directory, this value is not automatically recomputed if the file system subsequently changes size. In this case, the administrator must re-execute `dumpadm -m` to recompute the `minfree` value. If no such file exists in the `savecore` directory, `savecore` will default to a free space threshold of one megabyte. If no free space threshold is desired, a `minfree` file containing size 0 can be created.

### Security Issues

If, upon reboot, the specified `savecore` directory is not present, it will be created prior to the execution of `savecore` with permissions 0700 (read, write, execute by owner only) and owner `root`. It is recommended that alternate `savecore` directories also be created with similar permissions, as the operating system crash dump files themselves may contain secure information.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>NAME</b>        | edquota – edit user quotas for ufs file system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>SYNOPSIS</b>    | <b>edquota</b> [-p <i>proto_user</i> ] <i>username...</i><br><b>edquota</b> -t                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>edquota is a quota editor. One or more users may be specified on the command line. For each user a temporary file is created with an ASCII representation of the current disk quotas for that user for each mounted ufs file system that has a <code>quotas</code> file, and an editor is then invoked on the file. The quotas may then be modified, new quotas added, etc. Upon leaving the editor, edquota reads the temporary file and modifies the binary quota files to reflect the changes made.</p> <p>The editor invoked is <code>vi(1)</code> unless the <code>EDITOR</code> environment variable specifies otherwise.</p> <p>Only the super-user may edit quotas. In order for quotas to be established on a file system, the root directory of the file system must contain a file, owned by root, called <code>quotas</code>. (See <code>quotaon(1M)</code>.)</p> <p><i>proto_user</i> and <i>username</i> can be numeric, corresponding to the UID of a user. Unassigned UIDs may be specified; unassigned names may not. In this way, default quotas can be established for users who are later assigned a UID.</p> <p>If no options are specified, the temporary file created will have one or more lines of the form</p> <pre>fs <i>mount_point</i> blocks (soft =<i>number</i>, hard =<i>number</i>) inodes (soft =<i>number</i>, hard =<i>number</i>)</pre> <p>Where a block is considered to be a 1024 byte (1K) block.</p> <p>The <i>number</i> fields may be modified to reflect desired values.</p> |
| <b>OPTIONS</b>     | <p>-p Duplicate the quotas of the <i>proto_user</i> specified for each <i>username</i> specified. This is the normal mechanism used to initialize quotas for groups of users.</p> <p>-t Edit the soft time limits for each file system. If the time limits are zero, the default time limits in <code>/usr/include/sys/fs/ufs_quota.h</code> are used. The temporary file created will have one or more lines of the form</p> <pre>fs <i>mount_point</i> blocks time limit = <i>number</i> <i>tmunit</i>, files time limit = <i>number</i> <i>tmunit</i></pre> <p><i>tmunit</i> may be one of “month”, “week”, “day”, “hour”, “min” or “sec”; characters appended to these keywords are ignored, so you may write “months” or “minutes” if you prefer. The <i>number</i> and <i>tmunit</i> fields may be modified to set desired values. Time limits are printed in the greatest possible time unit such that the value is greater than</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## edquota(1M)

or equal to one. If "default" is printed after the *tmunit*, this indicates that the value shown is zero (the default).

**USAGE** See `largefile(5)` for the description of the behavior of `edquota` when encountering files greater than or equal to 2 Gbyte (  $2^{31}$  bytes).

**FILES** `quotas` quota file at the file system root  
`/etc/mnttab` table of mounted file systems

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `vi(1)`, `quota(1M)`, `quotacheck(1M)`, `quotaon(1M)`, `repquota(1M)`, `attributes(5)`, `largefile(5)`, `quotactl(7I)`

**NOTES** `quotacheck(1M)` *must* be invoked when setting initial quota limits for users; if not, the quota limit remains 0 and no changes made with `edquota` will take effect.

Users with a UID greater than 67108864 cannot be given quotas.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                 |

| <b>DESCRIPTION</b> | <p>eeprom displays or changes the values of parameters in the EEPROM. It processes parameters in the order given. When processing a <i>parameter</i> accompanied by a <i>value</i>, eeprom makes the indicated alteration to the EEPROM; otherwise it displays the <i>parameter's</i> value. When given no parameter specifiers, eeprom displays the values of all EEPROM parameters. A '-' (hyphen) flag specifies that parameters and values are to be read from the standard input (one <i>parameter</i> or <i>parameter =value</i> per line).</p> <p>Only the super-user may alter the EEPROM contents.</p> <p>eeprom verifies the EEPROM checksums and complains if they are incorrect.</p> <p><i>platform-name</i> is the name of the platform implementation and can be found using the -i option of uname(1).</p> |                                                                                                                                                                                                                                                                 |
| <b>SPARC</b>       | SPARC based systems implement firmware password protection with eeprom using the <i>security-mode</i> , <i>security-password</i> and <i>security-#badlogins</i> properties.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                 |
| <b>IA</b>          | <p>EEPROM storage is simulated using a file residing in the platform specific boot area. The <code>/platform/platform-name/boot/solaris/bootenv.rc</code> file simulates EEPROM storage.</p> <p>Because IA based systems typically implement password protection in the system BIOS, there is no support for password protection in the eeprom program. While it is possible to set the <i>security-mode</i>, <i>security-password</i> and <i>security-#badlogins</i> properties on IA based systems, these properties have no special meaning or behavior on IA based systems.</p>                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                 |
| <b>OPTIONS</b>     | <code>-f device</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Use <i>device</i> as the EEPROM device.                                                                                                                                                                                                                         |
| <b>IA Only</b>     | <code>-I</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Initialize boot properties on an IA based system. Only <code>init(1M)</code> run-level initialization scripts should use this option.                                                                                                                           |
| <b>IA Only</b>     | <code>acpi-user-options</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | A configuration variable that controls the use of ACPI. A value of 0x0 attempts to use ACPI if it is available on the system. A value of 0x2 disables the use of ACPI. The default value is 0x0.                                                                |
|                    | <code>mmu-modlist</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | A colon-separated list of candidate modules that implement memory management. If <i>mmu-modlist</i> is defined, it overrides the default list derived from the memory configuration on IA based systems. Instead, the first module in the list that is found in |

|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Not all OpenBoot systems support all parameters. Defaults may vary depending on the system and the PROM revision.                                                                                                                                                                                                                                                                                                                                     |
| auto-boot?     | If <code>true</code> , boot automatically after power-on or reset. Defaults to <code>true</code> .                                                                                                                                                                                                                                                                                                                                                    |
| ansi-terminal? | Configuration variable used to control the behavior of the terminal emulator. The value <code>false</code> makes the terminal emulator stop interpreting ANSI escape sequences, instead just echoing them to the output device. Default value: <code>true</code> .                                                                                                                                                                                    |
| boot-command   | Command executed if <code>auto-boot?</code> is <code>true</code> . Default value is <code>boot</code> .                                                                                                                                                                                                                                                                                                                                               |
| boot-device    | Device from which to boot. <i>boot-device</i> may contain 0 or more device specifiers separated by spaces. Each device specifier may be either a prom device alias or a prom device path. The boot prom will attempt to open each successive device specifier in the list beginning with the first device specifier. The first device specifier which opens successfully will be used as the device to boot from. Defaults to <code>disk net</code> . |
| boot-file      | File to boot (an empty string lets the secondary booter choose default). Defaults to empty string.                                                                                                                                                                                                                                                                                                                                                    |
| boot-from      | Boot device and file (OpenBoot PROM version 1.x only). Defaults to <code>vmunix</code> .                                                                                                                                                                                                                                                                                                                                                              |
| boot-from-diag | Diagnostic boot device and file (OpenBoot PROM version 1.x only). Defaults to <code>le( )unix</code> .                                                                                                                                                                                                                                                                                                                                                |
| comX-noprobe   | Where <i>X</i> is the number of the serial port, prevents device probe on serial port <i>X</i> .                                                                                                                                                                                                                                                                                                                                                      |
| diag-device    | Diagnostic boot source device. Defaults to <code>net</code> .                                                                                                                                                                                                                                                                                                                                                                                         |
| diag-file      | File from which to boot in diagnostic mode. Defaults to empty string.                                                                                                                                                                                                                                                                                                                                                                                 |
| diag-level     | Diagnostics level. Values include <code>off</code> , <code>min</code> , <code>max</code> and <code>menus</code> . There may be additional platform-specific values. When set to <code>off</code> , POST is not called. If POST is called, the value is made available as an argument to, and is interpreted by POST. The default value is platform-dependent.                                                                                         |
| diag-switch?   | If <code>true</code> , run in diagnostic mode. Defaults to <code>true</code> .                                                                                                                                                                                                                                                                                                                                                                        |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| load-base            | Default load address for client programs. Default value is 16384.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| local-mac-address?   | If <code>true</code> , network drivers use their own MAC address, not system's. Defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| mfg-mode             | Manufacturing mode argument for POST. Possible values include <code>off</code> or <code>chamber</code> . The value is passed as an argument to POST. Default value: <code>off</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| mfg-switch?          | If <code>true</code> , repeat system self-tests until interrupted with STOP-A. Defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| nvrामrc              | Contents of NVRAMRC. Defaults to empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| oem-banner           | Custom OEM banner (enabled by setting <code>oem-banner?</code> to <code>true</code> ). Defaults to empty string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| oem-banner?          | If <code>true</code> , use custom OEM banner. Defaults to <code>false</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                                  |                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>oem-logo</code>            | Byte array custom OEM logo (enabled by setting <code>oem-logo?</code> to <code>true</code> ). Displayed in hexadecimal.                                                                                                                                                                                                                                        |
| <code>oem-logo?</code>           | If <code>true</code> , use custom OEM logo (else, use Sun logo). Defaults to <code>false</code> .                                                                                                                                                                                                                                                              |
| <code>output-device</code>       | Output device used at power-on (usually <code>screen</code> , <code>ttya</code> , or <code>ttyb</code> ). Defaults to <code>screen</code> .                                                                                                                                                                                                                    |
| <code>redmode-reboot?</code>     | Specify <code>true</code> to reboot after a redmode reset trap. Defaults to <code>true</code> . (Sun Enterprise 10000 only.)                                                                                                                                                                                                                                   |
| <code>redmode-sync?</code>       | Specify <code>true</code> to invoke OpenBoot PROM's sync word after a redmode reset trap. Defaults to <code>false</code> . (Sun Enterprise 10000 only.)                                                                                                                                                                                                        |
| <code>sbus-probe-list</code>     | Which SBus slots are probed and in what order. Defaults to <code>0123</code> .                                                                                                                                                                                                                                                                                 |
| <code>screen-#columns</code>     | Number of on-screen columns (characters/line). Defaults to <code>80</code> .                                                                                                                                                                                                                                                                                   |
| <code>screen-#rows</code>        | Number of on-screen rows (lines). Defaults to <code>34</code> .                                                                                                                                                                                                                                                                                                |
| <code>scsi-initiator-id</code>   | SCSI bus address of host adapter, range 0-7. Defaults to <code>7</code> .                                                                                                                                                                                                                                                                                      |
| <code>sd-targets</code>          | Map SCSI disk units (OpenBoot PROM version 1.x only). Defaults to <code>31204567</code> , which means that unit 0 maps to target 3, unit 1 maps to target 1, and so on.                                                                                                                                                                                        |
| <code>security-#badlogins</code> | Number of incorrect security password attempts.<br><br>This property has no special meaning or behavior on IA based systems.                                                                                                                                                                                                                                   |
| <code>security-mode</code>       | Firmware security level (options: <code>none</code> , <code>command</code> , or <code>full</code> ). If set to <code>command</code> or <code>full</code> , system will prompt for PROM security password. Defaults to <code>none</code> .<br><br>This property has no special meaning or behavior on IA based systems.                                         |
| <code>security-password</code>   | Firmware security password (never displayed). Can be set only when <code>security-mode</code> is set to <code>command</code> or <code>full</code> .<br><br>This property has no special meaning or behavior on IA based systems.<br><br><code>example# eeprom security-password=<br/>Changing PROM password:<br/>New password:<br/>Retype new password:</code> |

|                    |                                                                                                                                                                                       |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| selftest-#megs     | Megabytes of RAM to test. Ignored if <code>diag-switch?</code> is <code>true</code> . Defaults to 1.                                                                                  |
| sir-sync?          | Specify <code>true</code> to invoke OpenBoot PROM's <code>sync</code> word after a software-initiated reset (SIR) trap. Defaults to <code>false</code> . (Sun Enterprise 10000 only.) |
| skip-vme-loopback? | If <code>true</code> , POST does not do VMEbus loopback tests. Defaults to <code>false</code> .                                                                                       |
| st-targets         | Map SCSI tape units (OpenBoot PROM version 1.x only). Defaults to 45670123, which means that unit 0 maps to target 4, unit 1 maps to target 5, and so on.                             |
| sunmon-compat?     | If <code>true</code> , display Restricted Monitor prompt ( <code>&gt;</code> ). Defaults to <code>false</code> .                                                                      |
| testarea           | One-byte scratch field, available for read/write test. Defaults to 0.                                                                                                                 |
| tpe-link-test?     | Enable 10baseT link test for built-in twisted pair Ethernet. Defaults to <code>true</code> .                                                                                          |
| ttya-mode          | TTYA (baud rate, #bits, parity, #stop, handshake). Defaults to 9600, 8, n, 1, -.                                                                                                      |
|                    | Fields, in left-to-right order, are:                                                                                                                                                  |
|                    | baud rate: 110, 300, 1200, 4800, 9600 . . .                                                                                                                                           |
|                    | data bits: 5, 6, 7, 8                                                                                                                                                                 |
|                    | parity: n(none), e(even), o(odd), m(mark), s(space)                                                                                                                                   |
|                    | stop bits: 1, 1.5, 2                                                                                                                                                                  |
|                    | handshake: -(none), h(hardware:rts/cts), s(software:xon/xoff)                                                                                                                         |
| ttyb-mode          | TTYB (baud rate, #bits, parity, #stop, handshake). Defaults to 9600, 8, n, 1, -.                                                                                                      |
|                    | Fields, in left-to-right order, are:                                                                                                                                                  |
|                    | baud rate: 110, 300, 1200, 4800, 9600 . . .                                                                                                                                           |
|                    | data bits: 5, 6, 7, 8                                                                                                                                                                 |
|                    | stop bits: 1, 1.5, 2                                                                                                                                                                  |
|                    | parity: n(none), e(even), o(odd), m(mark), s(space)                                                                                                                                   |
|                    | handshake: -(none), h(hardware:rts/cts), s(software:xon/xoff)                                                                                                                         |

## eeeprom(1M)

|                               |                                                                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ttya-ignore-cd</code>   | If <code>true</code> , operating system ignores carrier-detect on TTYA. Defaults to <code>true</code> .                                                               |
| <code>tyb-ignore-cd</code>    | If <code>true</code> , operating system ignores carrier-detect on TTYB. Defaults to <code>true</code> .                                                               |
| <code>ttya-rts-dtr-off</code> | If <code>true</code> , operating system does not assert DTR and RTS on TTYA. Defaults to <code>false</code> .                                                         |
| <code>tyb-rts-dtr-off</code>  | If <code>true</code> , operating system does not assert DTR and RTS on TTYB. Defaults to <code>false</code> .                                                         |
| <code>use-nvramrc?</code>     | If <code>true</code> , execute commands in NVRAMRC during system start-up. Defaults to <code>false</code> .                                                           |
| <code>version2?</code>        | If <code>true</code> , hybrid (1.x/2.x) PROM comes up in version 2.x. Defaults to <code>true</code> .                                                                 |
| <code>watchdog-reboot?</code> | If <code>true</code> , reboot after watchdog reset. Defaults to <code>false</code> .                                                                                  |
| <code>watchdog-sync?</code>   | Specify <code>true</code> to invoke OpenBoot PROM's <code>sync</code> word after a watchdog reset trap. Defaults to <code>false</code> . (Sun Enterprise 10000 only.) |
| <code>xir-sync?</code>        | Specify <code>true</code> to invoke OpenBoot PROM's <code>sync</code> word after an XIR trap. Defaults to <code>false</code> . (Sun Enterprise 10000 only.)           |

### EXAMPLES

#### EXAMPLE 1 Changing the number of megabytes of RAM.

The following example demonstrates the method for changing from one to two the number of megabytes of RAM that the system will test.

```
example# eeeprom selftest-#megs
selftest-#megs=1

example# eeeprom selftest-#megs=2

example# eeeprom selftest-#megs
selftest-#megs=2
```

#### EXAMPLE 2 Setting the `auto-boot?` parameter to `true`.

The following example demonstrates the method for setting the `auto-boot?` parameter to `true`.

```
example# eeeprom auto-boot?=true
```

When the `eeeprom` command is executed in user mode, the parameters with a trailing question mark (?) need to be enclosed in double quotation marks (" ") to prevent the shell from interpreting the question mark. Preceding the question mark with an escape character (\) will also prevent the shell from interpreting the question mark.

**EXAMPLE 2** Setting the `auto-boot?` parameter to `true`. (Continued)

```
example% eeprom "auto-boot?"=true
```

**FILES** /dev/openprom  
device file

/usr/platform/*platform-name*/sbin/eeprom  
Platform-specific version of eeprom. Use `uname -i` to obtain *platform-name*.

## efdaemon(1M)

| <b>NAME</b>        | efdaemon – embedded FCode interpreter daemon                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |                                          |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|------------------------------------------|
| <b>SYNOPSIS</b>    | <code>/usr/lib/efcode/sparcv9/efdaemon [-d]</code>                                                                                                                                                                                                                                                                                                                                                               |                |                 |              |                                          |
| <b>DESCRIPTION</b> | <p>efdaemon, the embedded FCode interpreter daemon, invokes the embedded FCode interpreter when the daemon receives an interpretation request. A new session of the interpreter is started for each unique request by invoking the script <code>/usr/lib/efcode/efcode</code>.</p> <p>efdaemon is used on selected platforms as part of the processing of some dynamic reconfiguration events.</p>               |                |                 |              |                                          |
| <b>OPTIONS</b>     | <p>The following option is supported:</p> <p><code>-d</code> Set debug output. Log debug messages as LOG_DEBUG level messages by using <code>syslog()</code>. See <code>syslog(3C)</code>.</p>                                                                                                                                                                                                                   |                |                 |              |                                          |

**NAME** fbconfig – Frame Buffer configuration utility

**SYNOPSIS** **fbconfig** [-list | -help ]

**fbconfig** [-dev *device\_filename*] [-prconf] [-propt] [-res]

**fbconfig** [-dev *device\_filename*] [-res *resolution-specification*]  
*device\_specifie\_options*

**DESCRIPTION** fbconfig is the generic command line interface to query and configure frame buffer attributes.

The following form of fbconfig is the interface for the device independent operations performed by fbconfig:

**fbconfig** [-list | -help ]

The following form of fbconfig is the interface for configuring a frame buffer:

**fbconfig** [-dev *device\_filename*] [-prconf] [-propt] [-res]

If the -dev option is omitted, the default frame buffer (/dev/fb or /dev/fb0) is assumed. In the absence of specific options, the response will depend upon the device specific configuration program and how it responds to no options

**OPTIONS** The following options are supported:

- dev *device\_filename*  
Specify the FFB special file. The default is /dev/fbs/ffb0.
- help  
Print the fbconfig command usage summary. This is the default option.
- list  
Print the list of installed frame buffers and associated device specific configuration routines.

| Device Filename | Specific Config Program |
|-----------------|-------------------------|
| -----           | -----                   |
| /dev/fbs/ffb0   | SUNWffb_config          |
| /dev/fbs/ffb1   | SUNWffb_config          |
| /dev/fbs/m640   | SUNWm64_config          |
| /dev/fbs/cgsix0 | not configurable        |

- prconf  
Print the current hardware configuration.
- propt  
Print the current software configuration.

**OPERANDS** The following operands are supported:

*device\_specific\_options*                      *device\_specific\_options* are specified in the format shown by the -help output, or the corresponding

## fbconfig(1M)

device-specific man page.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWfbc         |

**SEE ALSO** `afbconfig(1M)`, `ffbconfig(1M)`, `attributes(5)`

**LIMITATIONS** Because of limitations in the `m64` kernel driver and related software, `fbconfig` (with the `-prconf` option) is unable to distinguish between a current depth of 24 or 8+24. The `-propt` option returns the depth specified in the `OWconfig` file, which will be in effect following the next restart of the window system. The `xwininfo` utility, usually shipped in the package containing frame buffer software (such as `SUNWxwplt`), reports current depth of a specified window.

| <b>NAME</b>        | fdetach – detach a name from a STREAMS-based file descriptor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>fdetach</b> <i>path</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>The <code>fdetach</code> command detaches a STREAMS-based file descriptor from a name in the file system. Use the <i>path</i> operand to specify the path name of the object in the file system name space, which was previously attached. See <code>fattach(3C)</code>.</p> <p>The user must be the owner of the file or a user with the appropriate privileges. All subsequent operations on <i>path</i> will operate on the underlying file system entry and not on the STREAMS file. The permissions and status of the entry are restored to the state they were in before the STREAMS file was attached to the entry.</p> |                |                 |              |         |
| <b>OPERANDS</b>    | <p>The following operands are supported:</p> <p><i>path</i> Specifies the the path name of the object in the file system name space, which was previously attached.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |                 |              |         |

| <b>DESCRIPTION</b>  | <p>This command is used to create and modify the partition table, and to install the master boot (IA only) record that is put in the first sector of the fixed disk. This table is used by the first-stage bootstrap (or firmware) to identify parts of the disk reserved for different operating systems, and to identify the partition containing the second-stage bootstrap (the <i>active</i> Solaris partition). The <i>rdevice</i> argument must be used to specify the raw device associated with the fixed disk, for example, <code>/dev/rdisk/c0t0d0p0</code>.</p> <p>The program can operate in three different modes. The first is interactive mode. In interactive mode, the program displays the partition table as it exists on the disk, and then presents a menu allowing the user to modify the table. The menu, questions, warnings, and error messages are intended to be self-explanatory.</p> <p>In interactive mode, if there is no partition table on the disk, the user is given the options of creating a default partitioning or specifying the initial table values. The default partitioning allocates the entire disk for the Solaris system and makes the Solaris system partition active. In either case, when the initial table is created, <code>fdisk</code> also writes out the first-stage bootstrap (IA only) code along with the partition table.</p> <p>The second mode of operation is used for automated entry addition, entry deletion, or replacement of the entire <code>fdisk</code> table. This mode can add or delete an entry described on the command line. In this mode the entire <code>fdisk</code> table can be read in from a file replacing the original table. <code>fdisk</code> can also be used to create this file. There is a command line option that will cause <code>fdisk</code> to replace any <code>fdisk</code> table with the default of the whole disk for the Solaris system.</p> <p>The third mode of operation is used for disk diagnostics. In this mode, a section of the disk can be filled with a user specified pattern, and mode sections of the disk can also be read or written.</p> |
| <b>Menu Options</b> | <p>The menu options for interactive mode given by the <code>fdisk</code> program are:</p> <p>Create a partition</p> <p>This option allows the user to create a new partition. The maximum number of partitions is 4. The program will ask for the type of the partition (SOLARIS, MS-DOS, UNIX, or other). It will then ask for the size of the partition as a percentage of the disk. The user may also enter the letter <code>c</code> at this point, in which case the program will ask for the starting cylinder number and size of the partition in cylinders. If a <code>c</code> is not entered, the program will determine the starting cylinder number where the partition will fit. In either case, if the partition would overlap an existing partition or will not fit, a message is displayed and the program returns to the original menu.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Change Active (Boot from) partition

This option allows the user to specify the partition where the first-stage bootstrap will look for the second-stage bootstrap, otherwise known as the *active* partition.

Delete a partition

This option allows the user to delete a previously created partition. Note that this will destroy all data in that partition.

Use the following options to include your modifications to the partition table at this time or to cancel the session without modifying the table:

Exit

This option writes the new version of the table created during this session with `fdisk` out to the fixed disk, and exits the program.

Cancel

This option exits without modifying the partition table.

## OPTIONS

The following options apply to `fdisk`:

`-A id:act:bhead:bsect:bcyl:ehhead:esect:ecyl:rsect:numsect`

Add a partition as described by the argument (see the `-F` option below for the format). Use of this option will zero out the VTOC on the Solaris partition if the `fdisk` table changes.

`-b master_boot`

Specify the file `master_boot` as the master boot program. The default master boot program is `/usr/lib/fs/ufs/mboot`.

`-B`

Default to one Solaris partition that uses the whole disk.

`-d`

Turn on verbose *debug* mode. This will cause `fdisk` to print its state on `stderr` as it is used. The output from this option should not be used with `-F`.

`-D id:act:bhead:bsect:bcyl:ehhead:esect:ecyl:rsect:numsect`

Delete a partition as described by the argument (see the `-F` option below for the format). Note that the argument must be an exact match or the entry will not be deleted! Use of this option will zero out the VTOC on the Solaris partition if the `fdisk` table changes.

`-F fdisk_file`

Use `fdisk` file `fdisk_file` to initialize table. Use of this option will zero out the VTOC on the Solaris partition if the `fdisk` table changes.

The `fdisk_file` contains up to four specification lines. Each line is delimited by a new-line character (`\n`). If the first character of a line is an asterisk (`*`), the line is treated as a comment. Each line is composed of entries that are position-dependent, are separated by "white space" or colons, and have the following format:

```
id act bhead bsect bcyl ehhead esect ecyl rsect numsect
```

## fdisk(1M)

where the entries have the following values:

|                |                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i>      | This is the type of partition and the correct numeric values may be found in <code>fdisk.h</code> .                                                                  |
| <i>act</i>     | This is the active partition flag; 0 means not active and 128 means active.                                                                                          |
| <i>bhead</i>   | This is the head where the partition starts. If this is set to 0, <code>fdisk</code> will correctly fill this in from other information.                             |
| <i>bsect</i>   | This is the sector where the partition starts. If this is set to 0, <code>fdisk</code> will correctly fill this in from other information.                           |
| <i>bcyl</i>    | This is the cylinder where the partition starts. If this is set to 0, <code>fdisk</code> will correctly fill this in from other information.                         |
| <i>ehhead</i>  | This is the head where the partition ends. If this is set to 0, <code>fdisk</code> will correctly fill this in from other information.                               |
| <i>esect</i>   | This is the sector where the partition ends. If this is set to 0, <code>fdisk</code> will correctly fill this in from other information.                             |
| <i>ecyl</i>    | This is the cylinder where the partition ends. If this is set to 0, <code>fdisk</code> will correctly fill this in from other information.                           |
| <i>rsect</i>   | The relative sector from the beginning of the disk where the partition starts. This must be specified and can be used by <code>fdisk</code> to fill in other fields. |
| <i>numsect</i> | The size in sectors of this disk partition. This must be specified and can be used by <code>fdisk</code> to fill in other fields.                                    |

- g Get the label geometry for disk and display on stdout (see the `-S` option for the format).
- G Get the physical geometry for disk and display on stdout (see the `-S` option for the format).
- h Issue verbose message; message will list all options and supply an explanation for each.
- I Forgo device checks. This is used to generate a file image of what would go on a disk without using the device. Note that you must use `-S` with this option (see above).
- n Don't update `fdisk` table unless explicitly specified by another option. If no other options are used, `-n` will only write the master boot record to the disk. In addition, note that `fdisk` will not come up in interactive mode if the `-n` option is specified.

- o *offset*  
Block offset from start of disk. This option is used for -P, -r, and -w. Zero is assumed when this option is not used.
- P *fill\_patt*  
Fill disk with pattern *fill\_patt*. *fill\_patt* can be decimal or hex and is used as number for constant long word pattern. If *fill\_patt* is #, then pattern is block # for each block. Pattern is put in each block as long words and fills each block (see -o and -s).
- r  
Read from disk and write to stdout. See -o and -s, which specify the starting point and size of the operation.
- R  
Treat disk as read-only. This is for testing purposes.
- s *size*  
Number of blocks to perform operation on (see -o).
- S *geom\_file*  
Set the label geometry to the content of the *geom\_file*. The *geom\_file* contains one specification line. Each line is delimited by a new-line character (\n). If the first character of a line is an asterisk (\*), the line is treated as a comment. Each line is composed of entries that are position-dependent, are separated by white space, and have the following format:  
  
*pcyl ncyl acyl bcyl nheads nsectors sectsiz*  
  
where the entries have the following values:  
  
*pcyl*                    This is the number of physical cylinders for the drive.  
*ncyl*                    This is the number of usable cylinders for the drive.  
*acyl*                    This is the number of alt cylinders for the drive.  
*bcyl*                    This is the number of offset cylinders for the drive (should be zero).  
*nheads*                 The number of heads for this drive.  
*nsectors*               The number of sectors per track.  
*sectsiz*                The size in bytes of a sector.
- t  
Adjust incorrect slice table entries so that they will not cross partition table boundaries.
- T  
Remove incorrect slice table entries that span partition table boundaries.

## fdisk(1M)

- v  
Output the HBA (virtual) geometry dimensions. This option must be used in conjunction with the -w flag. This option will work for platforms which support virtual geometry. (IA only)
- w  
Write to disk and read from stdin. See -o and -s, which specify the starting point and size of the operation.
- W -  
Output the disk table to stdout.
- w *fdisk\_file*  
Create an fdisk file *fdisk\_file* from disk table. This can be used with the -F option below.

**FILES** /dev/rdisk/c0t0d0p0      Raw device associated with the fixed disk.  
/usr/lib/fs/ufs/mboot      Default master boot program.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Architecture   | IA              |
| Availability   | SUNWcsu         |

**SEE ALSO** `uname(1)`, `fmthard(1M)`, `prtvtoc(1M)` `attributes(5)`

**DIAGNOSTICS** Most messages will be self-explanatory. The following may appear immediately after starting the program:

Fdisk: cannot open <device>

This indicates that the device name argument is not valid.

Fdisk: unable to get device parameters for device <device>

This indicates a problem with the configuration of the fixed disk, or an error in the fixed disk driver.

Fdisk: error reading partition table

This indicates that some error occurred when trying initially to read the fixed disk. This could be a problem with the fixed disk controller or driver, or with the configuration of the fixed disk.

Fdisk: error writing boot record

This indicates that some error occurred when trying to write the new partition table out to the fixed disk. This could be a problem with the fixed disk controller, the disk itself, the driver, or the configuration of the fixed disk.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>NAME</b>        | ff – list file names and statistics for a file system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SYNOPSIS</b>    | <b>ff</b> [-F <i>FSType</i> ] [-V] [ <i>generic_options</i> ] [-o <i>specific_options</i> ] <i>special</i> ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>ff prints the pathnames and inode numbers of files in the file system which resides on the special device <i>special</i>. Other information about the files may be printed using options described below. Selection criteria may be used to instruct ff to only print information for certain files. If no selection criteria are specified, information for all files considered will be printed (the default); the -i option may be used to limit files to those whose inodes are specified.</p> <p>Output is sorted in ascending inode number order. The default line produced by ff is:</p> <pre><i>path-name</i> i-number</pre> <p>The maximum information the command will provide is:</p> <pre><i>path-name</i> i-number size uid</pre>                                                                                                                                                                                                                                                                                                                                                            |
| <b>OPTIONS</b>     | <p>-F Specify the <i>FSType</i> on which to operate. The <i>FSType</i> should either be specified here or be determinable from <i>/etc/vfstab</i> by matching the <i>special</i> with an entry in the table, or by consulting <i>/etc/default/fs</i>.</p> <p>-V Echo the complete command line, but do not execute the command. The command line is generated by using the options and arguments provided by the user and adding to them information derived from <i>/etc/vfstab</i>. This option may be used to verify and validate the command line.</p> <p><i>generic_options</i> Options that are supported by most <i>FSType</i>-specific modules of the command. The following options are available:</p> <ul style="list-style-type: none"> <li>-I Do not print the i-node number after each path name.</li> <li>-l Generate a supplementary list of all path names for multiply-linked files.</li> <li>-p <i>prefix</i> The specified <i>prefix</i> will be added to each generated path name. The default is '.' (dot).</li> <li>-s Print the file size, in bytes, after each path name.</li> </ul> |

ff(1M)

- u Print the owner's login name after each path name.
- a -n Select if the file has been accessed in *n* days.
- m -n Select if the file has been written or created in *n* days.
- c -n Select if file's status has been changed in *n* days.
- n *file* Select if the file has been modified more recently than the argument *file*.
- i *i-node-list* Generate names for only those i-nodes specified in *i-node-list*. *i-node-list* is a list of numbers separated by commas (with no intervening spaces).
- o Specify *FSType*-specific options in a comma separated (without spaces) list of suboptions and keyword-attribute pairs for interpretation by the *FSType*-specific module of the command.

**OPERANDS** *special* A special device.

**USAGE** See *largefile*(5) for the description of the behavior of *ff* when encountering files greater than or equal to 2 Gbyte (2<sup>31</sup> bytes).

**FILES** */etc/default/fs* default local file system type. Default values can be set for the following flags in */etc/default/fs*. For example: LOCAL=ufs

LOCAL The default partition for a command if no *FSType* is specified.

*/etc/vfstab* list of default parameters for each file system

**ATTRIBUTES** See *attributes*(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** *find*(1), *ncheck*(1M), *stat*(2), *vfstab*(4), *attributes*(5), *largefile*(5) Manual pages for the *FSType*-specific modules of *ff*.

**NOTES** This command may not be supported for all *FSTypes*.

ff(1M)

The `-a`, `-m`, and `-c` flags examine the `st_atime`, `st_mtime`, and `st_ctime` fields of the `stat` structure respectively. (See `stat(2)`.)

## ffbconfig(1M)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>DESCRIPTION</b> | <p>ffbconfig configures the FFB Graphics Accelerator and some of the X11 window system defaults for FFB.</p> <p>The first form of <code>ffbconfig</code> stores the specified options in the OWconfig file. These options will be used to initialize the FFB device the next time the window system is run on that device. Updating options in the OWconfig file provides persistence of these options across window system sessions and system reboots.</p> <p>The second and third forms of <code>ffbconfig</code>, which invoke only the <code>-prconf</code>, <code>-propt</code>, <code>-help</code>, and <code>-res ?</code> options do not update the OWconfig file. Additionally, for the third form all other options are ignored.</p> <p>Options may be specified for only one FFB device at a time. Specifying options for multiple FFB devices requires multiple invocations of <code>ffbconfig</code>.</p> <p>Only FFB-specific options can be specified through <code>ffbconfig</code>. The normal window system options for specifying default depth, default visual class and so forth are still specified as device modifiers on the <code>openwin</code> command line. See the <i>OpenWindows Desktop Reference Manual</i> for details.</p> <p>The user can also specify the OWconfig file that is to be updated. By default, the machine-specific file in the <code>/etc/openwin</code> directory tree is updated. The <code>-file</code> option can be used to specify an alternate file to use. For example, the system-global OWconfig file in the <code>/usr/openwin</code> directory tree can be updated instead.</p> <p>Both of these standard OWconfig files can only be written by root. Consequently, the <code>ffbconfig</code> program, which is owned by the root user, always runs with <code>setuid</code> root permission.</p> |
| <b>OPTIONS</b>     | <pre><b>-dev</b> <i>device-filename</i>   Specifies the FFB special file. The default is <code>/dev/fbs/ffb0</code>.  <b>-file</b> <i>machine</i>   <i>system</i>   Specifies which OWconfig file to update. If <i>machine</i>, the machine-specific OWconfig file in the <code>/etc/openwin</code> directory tree is used. If <i>system</i>, the global OWconfig file in the <code>/usr/openwin</code> directory tree is used. If the file does not exist, it is created.</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

`-res video-mode [now | try [noconfirm | nocheck]]`

Specifies the video mode used to drive the monitor connected to the specified FFB device.

*video-mode* has the format of *widthxheightxrate* where *width* is the screen width in pixels, *height* is the screen height in pixels, and *rate* is the vertical frequency of the screen refresh.

The *s* suffix, as in `960x680x112s` and `960x680x108s`, indicates stereo video modes. The *i* suffix, as in `640x480x60i` and `768x575x50i`, indicates interlaced video timing. If absent, non-interlaced timing will be used.

`-res` (the third form in the SYNOPSIS) also accepts formats with @ (at sign) in front of the refresh rate instead of x. `1280x1024@76` is an example of this format.

Some video-modes are supported only on certain revisions of FFB. Also, some video-modes, supported by FFB, may not be supported by the monitor. The list of video-modes supported by the FFB device and the monitor can be obtained by running `ffbconfig` with the `-res ?` option.

The following table lists all possible video modes supported on FFB:

| Name         | Description  |
|--------------|--------------|
| 1024x768x60  |              |
| 1024x768x70  |              |

## ffbconfig(1M)

| Name          | Description  |
|---------------|--------------|
| 768x575x50i   | (interlaced) |
| 1440x900x76   | (hi-res)     |
| 1600x1000x66  | (hi-res)     |
| 1600x1000x76i | (hi-res)     |
| 1600x1280x76  | (hi-res)     |
| 1920x1080x72  | (hi-res)     |
| 1920x1200x70  | (hi-res)     |

### Symbolic names

For convenience, some video modes have symbolic names defined for them. Instead of the form *widthxheightxrate*, one of these names may be supplied as the argument to `-res`. The meaning of the symbolic name `none` is that when the window system is run the screen resolution will be the video mode that is currently programmed in the device.

| Name   | Corresponding Video Mode                    |
|--------|---------------------------------------------|
| svga   | 1024x768x60                                 |
| 1152   | 1152x900x76                                 |
| 1280   | 1280x1024x76                                |
| stereo | 960x680x112s                                |
| ntsc   | 640x480x60i                                 |
| pal    | 768x575x50i                                 |
| none   | (video mode currently programmed in device) |

The `-res` option also accepts additional, optional arguments immediately following the video mode specification. Any or all of these may be present.

### `now`

Specifies that the FFB device will be immediately programmed to display this video mode, in addition to updating the video mode in the `OWconfig` file. This option is useful for changing the video mode before starting the window system.

It is inadvisable to use this suboption with `ffbconfig` while the configured device is being used (for example, while running the window system); unpredictable results may occur. To run `ffbconfig` with the `now` suboption, first bring the

window system down. If the `now` suboption is used within a window system session, the video mode will be changed immediately, but the width and height of the affected screen won't change until the window system is exited and re-entered. In addition, the system may not recognize changes in stereo mode. Consequently, this usage is strongly discouraged.

**noconfirm**

Instructs `ffconfig` to bypass confirmation and warning messages and to program the requested video mode anyway.

Using the `-res` option, the user could potentially put the system into an usable state, a state where there is no video output. This can happen if there is ambiguity in the monitor sense codes for the particular code read. To reduce the chance of this, the default behavior of `ffconfig` is to print a warning message to this effect and to prompt the user to find out if it is okay to continue. This option is useful when `ffconfig` is being run from a shell script.

**nocheck**

Suspends normal error checking based on the monitor sense code. The video mode specified by the user will be accepted regardless of whether it is appropriate for the currently attached monitor. This option is useful if a different monitor is to be connected to the FFB device. Note: Use of this option implies `noconfirm` as well.

**try**

Programs the specified video mode on a trial basis. The user will be asked to confirm the video mode by typing `y` within 10 seconds. The user may also terminate the trial before 10 seconds are up by typing any character. Any character other than `y` or RETURN is considered a `no` and the previous video mode will be restored and `ffconfig` will not change the video mode in the `OWconfig` file and other options specified will still take effect. If a RETURN is pressed, the user is prompted for a yes or no answer on whether to keep the new video mode. This option implies the `now` suboption (see the warning note on the `now` suboption).

**-deflinear true | false**

FFB possesses two types of visuals: linear and nonlinear. Linear visuals are gamma corrected and nonlinear visuals are not. There are two visuals that have both linear and nonlinear versions: 24-bit TrueColor and 8-bit StaticGray.

`-deflinear true` sets the default visual to the linear visual that satisfies other specified default visual selection options. Specifically, the default visual selection options are those set by the Xsun (1) `defdepth` and `defclass` options. See *OpenWindows Desktop Reference Manual* for details.

`-deflinear false` (or if there is no linear visual that satisfies the other default visual selection options) sets the default visual to the non-linear visual as the default.

This option cannot be used when the `-defoverlay` option is present, because FFB does not possess a linear overlay visual.

## ffbconfig(1M)

`-defoverlay true | false`

FFB provides an 8-bit PseudoColor visual whose pixels are disjoint from the rest of the FFB visuals. This is called the overlay visual. Windows created in this visual will not damage windows created in other visuals. The converse, however, is not true. Windows created in other visuals will damage overlay windows. This visual has 256 maxwids of opaque color values. See `-maxwids` in `OPTIONS`.

If `-defoverlay` is `true`, the overlay visual will be made the default visual. If `-defoverlay` is `false`, the nonoverlay visual that satisfies the other default visual selection options, such as `defdepth` and `defclass`, will be chosen as the default visual. See the *OpenWindows Desktop Reference Manual* for details.

Whenever `-defoverlay true` is used, the default depth and class chosen on the `openwin` command line must be 8-bit PseudoColor. If not, a warning message will be printed and the `-defoverlay` option will be treated as `false`. This option cannot be used when the `-deflinear` option is present, because FFB doesn't possess a linear overlay visual.

`-linearorder first | last`

If `first`, linear visuals will come before their non-linear counterparts on the X11 screen visual list for the FFB screen. If `last`, the nonlinear visuals will come before the linear ones.

`-overlayorder first | last`

If `true`, the depth 8 PseudoColor Overlay visual will come before the non-overlay visual on the X11 screen visual list for the FFB screen. If `false`, the non-overlay visual will come before the overlay one.

`-expvis enable | disable`

If enabled, OpenGL Visual Expansion will be activated. Multiple instances of selected visual groups (8-bit PseudoColor, 24-bit TrueColor and so forth) can be found in the screen visual list.

`-sov enable | disable`

Advertises the root window's `SERVER_OVERLAY_VISUALS` property. SOV visuals will be exported and their transparent types, values and layers can be retrieved through this property. If `-sov disable` is specified, the `SERVER_OVERLAY_VISUALS` property will not be defined. SOV visuals will not be exported.

`-maxwids n`

Specifies the maximum number of FFB X channel pixel values that are reserved for use as window sIDs (WIDs). The remainder of the pixel values in overlay colormaps are used for normal X11 opaque color pixels. The reserved WIDs are allocated on a first-come first-serve basis by 3D graphics windows (such as XGL), MBX windows, and windows that have a non-default visual. The X channel codes 0 to  $(255-n)$  will be opaque color pixels. The X channel codes  $(255-n+1)$  to 255 will be reserved for use as WIDs. Legal values on FFB, FFB2 are: 1, 2, 4, 8, 16, and 32. Legal values on FFB2+ are: 1, 2, 4, 8, 16, 32, and 64.

`-extovl enable | disable`

This option is available only on FFB2+. If enabled, extended overlay is available. The overlay visuals will have 256 opaque colors. The SOV visuals will have 255 opaque colors and 1 transparent color. This option enables hardware supported transparency which provides better performance for windows using the SOV visuals.

`-g gamma-correction value`

This option is available only on FFB2+. This option allows changing the gamma correction value. All linear visuals provide gamma correction. By default the gamma correction value is 2.22. Any value less than zero is illegal. The gamma correction value is applied to the linear visual, which then has an effective gamma value of 1.0, which is the value returned by `XSolarisGetVisualGamma(3)`. See `XSolarisGetVisualGamma(3)` for a description of that function.

This option can be used while the window system is running. Changing the gamma correction value will affect all the windows being displayed using the linear visuals.

`-gfile gamma-correction file`

This option is available only on FFB2+. This option loads gamma correction table from the specified file. This file should be formatted to provide the gamma correction values for R, G and B channels on each line. This file should provide 256 triplet values, each in hexadecimal format and separated by at least 1 space. Following is an example of this file:

```
0x00 0x00 0x00
0x01 0x01 0x01
0x02 0x02 0x02
...
...
0xff 0xff 0xff
```

Using this option, the gamma correction table can be loaded while the window system is running. The new gamma correction will affect all the windows being displayed using the linear visuals. Note, when gamma correction is being done using user specified table, the gamma correction value is undefined. By default, the window system assumes a gamma correction value of 2.22 and loads the gamma table it creates corresponding to this value.

`-defaults`

Resets all option values to their default values.

`-propt`

Prints the current values of all FFB options in the OWconfig file specified by the `-file` option for the device specified by the `-dev` option. Prints the values of options as they will be in the OWconfig file after the call to `ffbconfig` completes. The following is a typical display using the `-propt` option:

```
--- OpenWindows Configuration for /dev/fbs/ffb0 ---
OWconfig: machine
Video Mode: NONE
```

## ffbconfig(1M)

```
Default Visual: Non-Linear Normal Visual
Visual Ordering: Linear Visuals are last
 Overlay Visuals are last
OpenGL Visuals: disabled
SOV: disabled
Allocated WIDs: 32
```

### -prconf

Prints the FFB hardware configuration. The following is a typical display using the -prconf option:

```
--- Hardware Configuration for /dev/fbs/ffb0 ---
Type: double-buffered FFB2 with Z-buffer
Board: rev x
PROM Information: @(#)ffb2.fth x.x xx/xx/xx
FBC: version x
DAC: Brooktree 9068, version x
3DRAM: Mitsubishi 1309, version x
EDID Data: Available - EDID version 1 revision x
Monitor Sense ID: 4 (Sun 37x29cm RGB color monitor)
Monitor possible resolutions: 1024x768x60, 1024x768x70,
 1024x768x75, 1152x900x66, 1152x900x76,
 1280x1024x67, 1280x1024x76, 960x680x112s,
 640x480x60
Current resolution setting: 1280x1024x76
```

### -help

Prints a list of the ffbconfig command line options, along with a brief explanation of each.

## DEFAULTS

For a given invocation of ffbconfig command line if an option does not appear on the command line, the corresponding OWconfig option is not updated; it retains its previous value.

When the window system is run, if an FFB option has never been specified via ffbconfig, a default value is used. The option defaults are listed in the following table:

| Option       | Default       |
|--------------|---------------|
| -dev         | /dev/fbs/ffb0 |
| -file        | machine       |
| -res         | none          |
| -deflinear   | false         |
| -defoverlay  | false         |
| -linearorder | last          |

| Option        | Default |
|---------------|---------|
| -overlayorder | last    |
| -expvis       | enabled |
| -sov          | enabled |
| -maxwids      | 32      |

The default for the `-res` option of none means that when the window system is run the screen resolution will be the video mode that is currently programmed in the device.

This provides compatibility for users who are used to specifying the device resolution through the PROM. On some devices (for example, GX) this is the only way of specifying the video mode. This means that the PROM ultimately determines the default FFB video mode.

**EXAMPLES**    **EXAMPLE 1** Changing The Monitor Type

The following example switches the monitor type to the resolution of 1280 × 1024 at 76 Hz:

```
example% /usr/sbin/ffconfig -res 1280x1024x76
```

**FILES**    /dev/fbs/ffb0    device special file

**ATTRIBUTES**    See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

*OpenWindows Desktop Reference Manual*

ff\_ufs(1M)

- NAME** ff\_ufs – list file names and statistics for a ufs file system
- SYNOPSIS** **ff** -F ufs [*generic\_options*] [-o a,m,s] *special*...
- DESCRIPTION** ff prints the pathnames and inode numbers of files in the file system which resides on the special device *special*. ff is described in ff(1M); ufs-specific options are described below.
- OPTIONS**
- o Specify ufs file system specific options. The options available are:
    - a Print the '.' and '..' directory entries.
    - m Print mode information. This option must be specified in conjunction with the -i *i-node-list* option (see ff(1M)).
    - s Print only special files and files with set-user-ID mode.
- ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** find(1), ff(1M), ncheck(1M), attributes(5)

| <b>NAME</b>               | firmware – bootable firmware programs and firmware commands                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                           |                                                                                                                                                                                                                                       |                           |                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>DESCRIPTION</b>        | <p>Between the time most computers are turned on and the boot program is loaded to bootstrap the machine, the computer is in an operating state known as the firmware state. In the firmware state, a small program in non-volatile memory is running on the machine, and the user can perform certain system operations usually unavailable from single- or multi-user operating states.</p> <p>There are two basic kinds of firmware operations: running firmward commands and running bootable programs.</p> <table border="0"> <tr> <td style="vertical-align: top;">Running firmware commands</td> <td>These commands include commands for displaying the Equipped Device Table, performing a system memory dump, displaying the firmware version, creating a floppy key, and so forth. These commands are executed by the firmware program.</td> </tr> <tr> <td style="vertical-align: top;">Running bootable programs</td> <td>These programs include the operating system and other bootable programs (for example, a program to fill the Equipped Device Table). These programs are located in the <code>/stand</code> file system. When a bootable program is requested from firmware, the firmware program loads and executes the program, passing control of the system to the bootable program.</td> </tr> </table> <p>Some firmware programs, allow you to request the configuration of a new bootable operating system from firmware by specifying the name of a configuration file (usually <code>/stand/system</code>) as the name of the program to boot; see <code>system(4)</code>.</p> <p>See the hardware guide that accompanies your computer for descriptions of the firmware commands and programs available with your machine.</p> | Running firmware commands | These commands include commands for displaying the Equipped Device Table, performing a system memory dump, displaying the firmware version, creating a floppy key, and so forth. These commands are executed by the firmware program. | Running bootable programs | These programs include the operating system and other bootable programs (for example, a program to fill the Equipped Device Table). These programs are located in the <code>/stand</code> file system. When a bootable program is requested from firmware, the firmware program loads and executes the program, passing control of the system to the bootable program. |
| Running firmware commands | These commands include commands for displaying the Equipped Device Table, performing a system memory dump, displaying the firmware version, creating a floppy key, and so forth. These commands are executed by the firmware program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                           |                                                                                                                                                                                                                                       |                           |                                                                                                                                                                                                                                                                                                                                                                        |
| Running bootable programs | These programs include the operating system and other bootable programs (for example, a program to fill the Equipped Device Table). These programs are located in the <code>/stand</code> file system. When a bootable program is requested from firmware, the firmware program loads and executes the program, passing control of the system to the bootable program.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                           |                                                                                                                                                                                                                                       |                           |                                                                                                                                                                                                                                                                                                                                                                        |

firmware(1M)

**WARNINGS**

The firmware program typically does not know if a requested program is bootable or not; requesting a program that is not bootable from firmware can lead to unpredictable results.

| <b>DESCRIPTION</b> | <p>The <code>flar</code> command is used to administer flash archives. A flash archive is an easily transportable version of a reference configuration of the Solaris operating environment, plus optional other software. Such an archive is used for the rapid installation of Solaris on large numbers of machines.</p> <p>The <code>flar</code> command includes subcommands for extracting information, splitting archives, and combining them. Subcommands are indicated by the first option in a <code>flar</code> command line. These options are as follows:</p> <ul style="list-style-type: none"> <li>-i Extract information on an archive. This subcommand is analogous to <code>pkginfo</code>.</li> <li>-s Split an archive into one file for each section of the archive. Each section is copied into a separate file in <i>dir</i>, if <i>dir</i> is specified (see <code>-d</code> option below), or the current directory if it is not. The files resulting from the split are named after the sections. The archive cookie is stored in a file named <code>cookie</code>. If <i>section</i> is specified (see <code>-u</code> option below), only the named section is copied.</li> <li>-c Combine the individual sections that make up an archive into the archive. If <i>dir</i> is specified (see <code>-d</code> option below), the sections will be gathered from <i>dir</i>; otherwise, they will be gathered from the current directory. Each section is assumed to be in a separate file, the names of which are the section names. At a minimum, the archive cookie (<code>cookie</code>), archive identification (<code>identification</code>), and archive files (<code>archive</code>) sections must be present. If <i>archive</i> is a directory, its contents are archived using <code>cpio</code> prior to inclusion in the archive. If so specified in the <code>identification</code> section, the contents are compressed.</li> </ul> <p>Note that no validation is performed on any of the sections. In particular, no fields in the <code>identification</code> section are validated or updated. See <code>flash_archive(4)</code> for a description of the archive sections.</p> <p>The options for each subcommand are described below.</p> |
| <b>OPTIONS</b>     | <p>The options for <code>flar -i</code> (extract info) subcommand are as follows:</p> <ul style="list-style-type: none"> <li>-k <i>keyword</i> Only the value of the keyword <i>keyword</i> is returned.</li> <li>-l List all files in the archive. Does not process content from any sections other than the <code>archive</code> section.</li> </ul> <p>The following are <code>flar -i</code> options used with tape archives:</p> <ul style="list-style-type: none"> <li>-t The archive to be analyzed is located on a tape device. The path to the device is specified by <i>outfile</i> (see OPERANDS).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## flar(1M)

- p *posn* Specifies the position on the tape device where the archive should be created. If not specified, the current position of the tape device is examined.
- b *blocksize* The block size to be used when creating the archive. If not specified, a default block size of 64K is used.

The options for `flar -s` and `-c` (split and combine archives) subcommands are as follows:

- u *section* Appends *section* to the list of sections to be included. The default list includes the `cookie`, `identification`, and `archive` sections. *section* can be a single section name or a space-separated list of section names.
- d *dir* Retrieve sections from *dir*, rather than from the current directory.
- f (Used with `-s` only.) Extract the `archive` section into directory called *archive*, rather than placing it in a file of the same name as the section.
- S *section* (Used with `-s` only.) Extract only the section named *section* from the archive.

The following options are used with tape archives (with both `-c` and `-s`):

- t Create an archive on or read an archive from a tape device. The *outfile* operand (see OPERANDS) is assumed to be the name of the tape device.
- p *posn* Used only with `-t`. Specifies the position on the tape device where the archive should be created. If not specified, the current position of the tape device is used.
- b *blocksize* The block size to be used when creating the archive. If not specified, a default block size of 64K is used.

**OPERANDS** The following operand is supported:

*outfile* Path to tape device if the `-t` option was used.  
Otherwise, the path to a flash archive.

**EXIT STATUS** The following exit values are returned for the `-c` and `-s` subcommands:

- 0 Successful completion.
- >0 An error occurred.

The following exit values are returned for the `-i` subcommand:

- 0 Successful completion.
- 1 Command failed. If the `-k` option is used and the requested keyword is not found, `flar` returns 2.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

flar(1M)

[-d <i>dir</i> ]] [-U<br><i>key=val</i> ...] [-f [ <i>filelist</i>   -] [-F]] [-a <i>author</i> ] [-e <i>descr</i>   -E<br><i>descr_file</i> ] [-T <i>type</i> ] <i>outfile</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |
| <b>DESCRIPTION</b>   | <p>The <code>flarcreate</code> command creates a flash archive from a master system. A master system is one that contains a reference configuration, which is a particular configuration of the Solaris operating environment, plus optional other software. A flash archive is an easily transportable version of the reference configuration.</p> <p>You can run <code>flarcreate</code> in multi- or single-user mode. You can also use the command when the master system is booted from the first Solaris software CD or from a Solaris net image.</p> <p>Archive creation should be performed when the master system is in as stable a state as possible.</p> <p>See <code>flash_archive(4)</code> for a description of the flash archive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |
| <b>OPTIONS</b>       | <p>The <code>flarcreate</code> command has the following general options:</p> <table><tr><td>-c</td><td>Compress the archive using <code>compress(1)</code></td></tr><tr><td>-f <i>filelist</i></td><td>Use the contents of <i>filelist</i> as a list of files to include in the archive. The files are included in addition to the normal file list, unless -F is specified (see below). If <i>filelist</i> is -, the list is taken from standard input.</td></tr><tr><td>-F</td><td>Include only files in the list specified by -f. This option makes -f <i>filelist</i> an absolute list, rather than a list that is appended to the normal file list.</td></tr><tr><td>-R <i>root</i></td><td>Create the archive from the filesystem tree rooted at <i>root</i>. If you do not specify this option, <code>flarcreate</code> creates an archive from a filesystem rooted at /.</td></tr><tr><td>-S</td><td>Do not include sizing information in the archive.</td></tr><tr><td>-H</td><td>Do not generate hash identifier.</td></tr><tr><td>-x <i>exclude</i></td><td>Exclude the directory <i>exclude</i> from the archive. Note that the <i>exclude</i> directory is assumed to be relative to the alternate root specified using -R.</td></tr><tr><td>-U <i>key=val...</i></td><td>Include the user-defined keyword(s) and values in the archive identification section</td></tr></table> <p>Use the following options with user-defined sections.</p> | -c | Compress the archive using <code>compress(1)</code> | -f <i>filelist</i> | Use the contents of <i>filelist</i> as a list of files to include in the archive. The files are included in addition to the normal file list, unless -F is specified (see below). If <i>filelist</i> is -, the list is taken from standard input. | -F | Include only files in the list specified by -f. This option makes -f <i>filelist</i> an absolute list, rather than a list that is appended to the normal file list. | -R <i>root</i> | Create the archive from the filesystem tree rooted at <i>root</i> . If you do not specify this option, <code>flarcreate</code> creates an archive from a filesystem rooted at /. | -S | Do not include sizing information in the archive. | -H | Do not generate hash identifier. | -x <i>exclude</i> | Exclude the directory <i>exclude</i> from the archive. Note that the <i>exclude</i> directory is assumed to be relative to the alternate root specified using -R. | -U <i>key=val...</i> | Include the user-defined keyword(s) and values in the archive identification section |
| -c                   | Compress the archive using <code>compress(1)</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |
| -f <i>filelist</i>   | Use the contents of <i>filelist</i> as a list of files to include in the archive. The files are included in addition to the normal file list, unless -F is specified (see below). If <i>filelist</i> is -, the list is taken from standard input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |
| -F                   | Include only files in the list specified by -f. This option makes -f <i>filelist</i> an absolute list, rather than a list that is appended to the normal file list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |
| -R <i>root</i>       | Create the archive from the filesystem tree rooted at <i>root</i> . If you do not specify this option, <code>flarcreate</code> creates an archive from a filesystem rooted at /.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |

Note that the <i>exclude</i> directory is assumed to be relative to the alternate root specified using -R.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |
| -U <i>key=val...</i> | Include the user-defined keyword(s) and values in the archive identification section                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |    |                                                     |                    |                                                                                                                                                                                                                                                   |    |                                                                                                                                                                     |                |                                                                                                                                                                                  |    |                                                   |    |                                  |                   |                                                                                                                                                                   |                      |                                                                                      |

- u *section* ... Included the user-defined section located in the file *section* in the archive. *section* must be a blank-separated list of section names as described in flar(1M).
- d *dir* Retrieve the section file specified with -u from *dir*.

Use the following options with tape archives.

- t Create an archive on a tape device. The *outfile* operand (see OPERANDS) is assumed to be the name of the tape device.
- p *posn* Used only with -t. Specifies the position on the tape device where the archive should be created. If not specified, the current position of the tape device is used.
- b *blocksize* The block size to be used when creating the archive. If not specified, a default block size of 64K is used.

The following options are used for archive identification.

- n *name* This option is required if you are using flarcreate for archive identification. The value of *name* is used to identify the archive. It is also used as the value of the `content_name` archive identification flag.
- i *date* By default, the value for the `creation_date` field in the identification section is generated automatically, based on the current system time and date. If you specify the -i option, *date* is used instead.
- m *master* By default, the value for the `creation_master` field in the identification section is the name of the system on which you run flarcreate, as reported by `uname -n`. If you specify -m, *master* is used instead.
- e *descr* The description to be included in the archive as the value of the `content_description` archive identification key. This option is incompatible with -E.
- E *descr\_file* The description to be used as the value of the archive identification `content_description` key is retrieved from the file *descr\_file*. This option is incompatible with -e.
- a *author* *author* is used to provide an author name for the archive identification section. If you do not specify -a, no author name is included in the identification section.
- T *type* Content type included in the archive as the value of the `content_type` archive identification key. If you do not specify -T, the `content_type` keyword is not included.

**OPERANDS** The following operands are supported:

flarcreate(1M)

*outfile* Name of the tape device if the `-t` option is used.  
Otherwise, the path to the flash archive.

**EXIT STATUS** The following exit values are returned:

0 Successful completion.

>0 An error occurred.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWinst        |

| <b>DESCRIPTION</b> | <p>The <code>fmthard</code> command updates the VTOC (Volume Table of Contents) on hard disks and, on IA systems, adds boot information to the Solaris <code>fdisk</code> partition. One or more of the options <code>-s datafile</code>, <code>-d data</code>, or <code>-n volume_name</code> must be used to request modifications to the disk label. To print disk label contents, see <code>prtvtoc(1M)</code>. The <code>/dev/rdisk/c?[t?]d ?s2</code> file must be the character special file of the device where the new VTOC is to be installed. On IA systems, <code>fdisk(1M)</code> must be run on the drive before <code>fmthard</code>.</p> <p>If you are using an IA system, note that the term “partition” in this page refers to <i>slices</i> within the IA <code>fdisk</code> partition on IA machines. Do not confuse the partitions created by <code>fmthard</code> with the partitions created by <code>fdisk</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>OPTIONS</b>     | <p>The following options apply to <code>fmthard</code>:</p> <p><code>-i</code> This option allows the command to create the desired VTOC table, but prints the information to standard output instead of modifying the VTOC on the disk.</p> <p><code>-d data</code> The <i>data</i> argument of this option is a string representing the information for a particular partition in the current VTOC. The string must be of the format <i>part:tag:flag:start:size</i> where <i>part</i> is the partition number, <i>tag</i> is the ID TAG of the partition, <i>flag</i> is the set of permission flags, <i>start</i> is the starting sector number of the partition, and <i>size</i> is the number of sectors in the partition. See the description of the <i>datafile</i> below for more information on these fields.</p> <p><code>-n volume_name</code> This option is used to give the disk a <i>volume_name</i> up to 8 characters long.</p> <p><code>-s datafile</code> This option is used to populate the VTOC according to a <i>datafile</i> created by the user. If the <i>datafile</i> is “-”, <code>fmthard</code> reads from standard input. The <i>datafile</i> format is described below. This option causes all of the disk partition timestamp fields to be set to zero.</p> <p>Every VTOC generated by <code>fmthard</code> will also have partition 2, by convention, that corresponds to the whole disk. If the input in <i>datafile</i> does not specify an entry for partition 2, a default partition 2 entry will be created automatically in VTOC with the tag <code>V_BACKUP</code> and size equal to the full size of the disk.</p> |

## fmthard(1M)

The *datafile* contains one specification line for each partition, starting with partition 0. Each line is delimited by a new-line character (\n). If the first character of a line is an asterisk (\*), the line is treated as a comment. Each line is composed of entries that are position-dependent, separated by "white space" and having the following format:

```
partition tag flag starting_sector size_in_sectors
```

where the entries have the following values.

|                        |                                                                                                                                                                                                                                                                                                 |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>partition</i>       | The partition number. Currently, for Solaris SPARC, a disk can have up to 8 partitions, 0–7. Even though the <i>partition</i> field has 4 bits, only 3 bits are currently used. For IA, all 4 bits are used to allow slices 0–15. Each Solaris <i>fdisk</i> partition can have up to 16 slices. |
| <i>tag</i>             | The partition tag: a decimal number. The following are reserved codes: 0 (V_UNASSIGNED), 1 (V_BOOT), 2 (V_ROOT), 3 (V_SWAP), 4 (V_USR), 5 (V_BACKUP), 6 (V_STAND), 7 (V_VAR), and 8 (V_HOME).                                                                                                   |
| <i>flag</i>            | The flag allows a partition to be flagged as unmountable or read only, the masks being: V_UNMNT 0x01, and V_RDONLY 0x10. For mountable partitions use 0x00.                                                                                                                                     |
| <i>starting_sector</i> | The sector number (decimal) on which the partition starts.                                                                                                                                                                                                                                      |
| <i>size_in_sectors</i> | The number (decimal) of sectors occupied by the partition.                                                                                                                                                                                                                                      |

Note that you can save the output of a `prtvtoc` command to a file, edit the file, and use it as the *datafile* argument to the `-s` option.

### IA Options

The functionality provided by the following two IA options is also provided by `installboot(1M)`. Because the functionality described here may be removed in future versions of `fmthard`, you should use `installboot` to install boot records. The following options currently apply to `fmthard`:

|                                |                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-p <i>pboot</i></code>   | This option allows the user to override the default partition boot file, <code>/usr/platform/<i>platform-name</i>/lib/fs/ufs/pboot</code> . The partition boot file is platform dependent, where <i>platform-name</i> can be determined using the <code>-i</code> option to <code>uname(1)</code> . |
| <code>-b <i>bootblk</i></code> | This option allows the user to override the default <i>bootblk</i> file, <code>/usr/platform/<i>platform-name</i>/lib/fs/ufs/bootblk</code> . The boot block file is platform dependent, where <i>platform-name</i> can be determined using the <code>-i</code> option to <code>uname(1)</code> .   |

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `uname(1)`, `format(1M)`, `prtvtoc(1M)`, `attributes(5)`

**IA Only** `fdisk(1M)`, `installboot(1M)`

**NOTES** Special care should be exercised when overwriting an existing VTOC, as incorrect entries could result in current data being inaccessible. As a precaution, save the old VTOC.

`fmthard` cannot write a disk label on an unlabeled disk. Use `format(1M)` for this purpose.

## fncheck(1M)

| <b>NAME</b>        | fncheck – check for consistency between FNS data and NIS+ data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |              |         |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------------|--------------|---------|
| <b>SYNOPSIS</b>    | <b>fncheck</b> [-r] [-s] [-u] [-t <i>type</i> ] [ <i>domain_name</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |         |
| <b>DESCRIPTION</b> | <p>fncheck is used for checking for inconsistencies between FNS username or hostname contexts and the contents of the corresponding NIS+ <i>passwd.org_dir</i> or <i>hosts.org_dir</i> tables, respectively, in the NIS+ domain <i>domain_name</i>. If <i>domain_name</i> is omitted, the domain name of the current machine is used. By default (in the absence of the -r and -s options), the following inconsistencies are displayed:</p> <ul style="list-style-type: none"> <li>■ items that appear only in the FNS context but do not appear in the NIS+ table,</li> <li>■ items that appear only in the NIS+ table but do not appear in the FNS context.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-r                    Display only items that appear in the FNS context but do not appear in the corresponding NIS+ table.</p> <p>-s                    Display items that appear in the NIS+ table but do not appear in the corresponding FNS context.</p> <p>-u                    Update the FNS context based on information in the corresponding NIS+ table. If the -r option is used, items that appear only in the FNS context are removed from the FNS context. If the -s option is used, items that appear only in the NIS+ table are added to the FNS context. If neither -r or -s are specified, items are added and removed from the FNS context to make it consistent with the corresponding NIS+ table.</p> <p>-t <i>type</i>            Specify the type of context to check. <i>type</i> can be either <i>hostname</i> or <i>username</i>. If this option is omitted, both <i>hostname</i> and <i>username</i> contexts are checked. If <i>type</i> is <i>hostname</i>, the FNS <i>hostname</i> context is checked against the NIS+ <i>hosts.org_dir</i> table. If <i>type</i> is <i>username</i>, the FNS <i>username</i> context is checked against the NIS+ <i>passwd.org_dir</i> table.</p> |                |                 |              |         |
| <b>USAGE</b>       | Although fncheck can be used to add users and hosts to the username and hostname contexts as new users and hosts are added to NIS+, that is not its intended purpose. fncheck is an expensive operation because it makes complete comparisons of the NIS+ table and the corresponding FNS context. When a user or host is added or removed from NIS+ using <i>admintool</i> (see <i>admintool</i> (1M)), it automatically updates the appropriate FNS contexts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See <i>attributes</i> (5) for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |                 |              |         |

| <b>NAME</b>                  | fncopy – copy FNS contexts, possibly from one naming service to another naming service                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                        |                                                                          |                              |                                                                       |                              |                                                                           |
| <b>SYNOPSIS</b>              | <b>fncopy</b> [-f <i>filename</i> ] [-i <i>old-naming-service</i> ] [-o <i>new-naming-service</i> ]<br><i>old-fns-context new-fns-context</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                        |                                                                          |                              |                                                                       |                              |                                                                           |
| <b>DESCRIPTION</b>           | <p>fncopy copies recursively the FNS context, <i>old-fns-context</i>, and attributes to a new FNS context, <i>new-fns-context</i>. If -i and -o options are specified with the respective naming service, the <i>old-fns-context</i> will be resolved using <i>old-naming-service</i> as the underlying naming service, and <i>new-fns-context</i> will be created using <i>new-naming-service</i> as the underlying naming service. In the absence of -i and -o options, the default naming service will be used (see <code>fnselect(1M)</code>).</p> <p>When the -f option is used, <i>filename</i> names a file containing a list of contexts in the <i>old-fns-context</i> that should be copied to the <i>new-fns-context</i>.</p> <p>If the FNS context <i>new-fns-context</i> already exists in the target naming service, <i>new-naming-service</i>, this command will copy only the contexts and bindings that do not exist in the target naming service. This command will not over-write any of the existing FNS contexts in the target naming service.</p> <p>This command follows links and copies FNS contexts and binding to the <i>new-fns-context</i> namespace.</p> |                        |                                                                          |                              |                                                                       |                              |                                                                           |
| <b>OPTIONS</b>               | <table border="0"> <tr> <td style="vertical-align: top;">-f <i>filename</i></td> <td>Specifies a file name that contains a list of FNS contexts to be copied.</td> </tr> <tr> <td style="vertical-align: top;">-i <i>old-naming-service</i></td> <td>Specifies the source naming service; currently only nis is supported.</td> </tr> <tr> <td style="vertical-align: top;">-o <i>new-naming-service</i></td> <td>Specifies the target naming service; currently only nisplus is supported.</td> </tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | -f <i>filename</i>     | Specifies a file name that contains a list of FNS contexts to be copied. | -i <i>old-naming-service</i> | Specifies the source naming service; currently only nis is supported. | -o <i>new-naming-service</i> | Specifies the target naming service; currently only nisplus is supported. |
| -f <i>filename</i>           | Specifies a file name that contains a list of FNS contexts to be copied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                        |                                                                          |                              |                                                                       |                              |                                                                           |
| -i <i>old-naming-service</i> | Specifies the source naming service; currently only nis is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                        |                                                                          |                              |                                                                       |                              |                                                                           |
| -o <i>new-naming-service</i> | Specifies the target naming service; currently only nisplus is supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                        |                                                                          |                              |                                                                       |                              |                                                                           |

## fnccopy(1M)

**EXAMPLE 1** Using the fnccopy command *(Continued)*

```
eg% fnccopy -i nis -o nisplus -f /etc/ssi-users-list \
```

```
thisorgunit/user org/ssi.eng/user
```

will copy the NIS FNS users' contexts specified in the file /etc/ssi-users-list to NIS+ FNS users' context of the orgunit ssi.eng.

**EXIT STATUS** 0 Operation was successful.

1 Operation failed.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |

| <b>NAME</b>        | fncreate – create an FNS context                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |            |                                                                                                                                  |
| <b>SYNOPSIS</b>    | <b>fncreate</b> -t <i>context_type</i> [-Dosv] [-f <i>input_file</i> ] [-r <i>reference_type</i> ]<br><i>composite_name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |            |                                                                                                                                  |
| <b>DESCRIPTION</b> | <p>fncreate creates an FNS context of type <i>context_type</i>, where a <i>context_type</i> must be one of <i>org</i>, <i>hostname</i>, <i>host</i>, <i>username</i>, <i>user</i>, <i>service</i>, <i>fs</i>, <i>site</i>, <i>nsid</i>, or <i>generic</i>. It takes as the last argument a composite name, <i>composite_name</i>, for the context to be created. In addition to creating the context named, fncreate also creates subcontexts of the named context using FNS Policies of what types of contexts should be bound in those contexts. See <i>fns_policies</i>(5).</p> <p>fncreate discovers which naming service is in use and creates contexts in the appropriate naming service. When FNS is being initially set up, it will by default create contexts for NIS+. This default can be changed by the use of <i>fnselect</i>(1M) to explicitly select a naming service.</p> <p>When using FNS for a NIS+ environment, fncreate creates NIS+ tables and directories in the NIS+ hierarchy. See <i>fns_nis+</i>(5) for more information on the necessary NIS+ credentials and the use of the environment variable <i>NIS_GROUP</i> when using fncreate and other FNS commands.</p> <p>When using FNS for a NIS environment, fncreate creates NIS maps and hence must be executed as superuser on the NIS master of the FNS-related maps. See <i>fns_nis</i>(5) for more information specific to the use of FNS in a NIS environment.</p> <p>When using FNS for an environment that uses <i>/etc</i> files for its naming information, fncreate creates files in the <i>/var/fn</i> directory. See <i>fns_files</i>(5) for more information specific to the use of FNS for files.</p> |            |                                                                                                                                  |
| <b>OPTIONS</b>     | <p>-t <i>context_type</i></p> <p>The following are valid entries for <i>context_type</i>:</p> <table border="0" style="margin-left: 20px;"> <tr> <td style="padding-right: 20px;"><i>org</i></td> <td>Create organization context, and default subcontexts, for an existing NIS+ domain, NIS domain, or <i>/etc</i> files environment.</td> </tr> </table> <p>For NIS+, <i>composite_name</i> is of the form <i>org/domain/</i> where <i>domain</i> is a NIS+ domain. An empty domain name indicates the creation of the organization context for the root NIS+ domain; otherwise, the domain name names the corresponding NIS+ domain. <i>domain</i> can be either the fully-qualified NIS+ domain name — dot (‘.’)-terminated — or the NIS+ domain name named relative to the NIS+ root domain.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <i>org</i> | Create organization context, and default subcontexts, for an existing NIS+ domain, NIS domain, or <i>/etc</i> files environment. |
| <i>org</i>         | Create organization context, and default subcontexts, for an existing NIS+ domain, NIS domain, or <i>/etc</i> files environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |            |                                                                                                                                  |

## fncreate(1M)

For example, the following creates the root organization context and its subcontexts for the NIS+ root domain `Wiz.Com.`:

```
eg% fncreate -t org org//
```

The same thing could have been achieved using the following command:

```
eg% fncreate -t org org/Wiz.COM./
```

Typically, this is the first FNS context created.

To create the organization context for a subdomain of `Wiz.COM.`, execute either of the following commands:

```
eg% fncreate -t org org/sales/
or
```

```
eg% fncreate -t org \
org/sales.Wiz.COM./
```

Note that if the corresponding NIS+ domain does not exist, `fncreate` fails. See `nissetup(1M)` for setting up a NIS+ domain.

A `ctx_dir` directory is created under the directory of the organization named.

For NIS or an `/etc` files environment, *domain* should be `NULL` (empty) because NIS and `/etc` files do not support a hierarchy namespace of domains. For example, the following command creates the organization context for the NIS or `/etc` files environment:

```
eg% fncreate -t org org//
```

For NIS+, NIS, and `/etc` files, creating the organization context also creates the organization's immediate subcontexts `host`, `user`, and `service` and their

## fncreate(1M)

subcontexts. This includes a context for every host entry in the corresponding hosts database of the naming service (that is, `hosts.org_dir` NIS+ table, or `hosts` NIS map, or `/etc/hosts` file), and a context for every user entry in the `passwd` database of the naming service (that is, `passwd.org_dir` NIS+ table, or `passwd` NIS map, or `/etc/passwd` file) unless the option `-o` is specified. Bindings for these subcontexts are recorded under the organization context.

hostname

Create a hostname context in which atomic host names can be bound, and bind the reference of the context to *composite\_name*. If the suffix of *composite\_name* is `host/`, the hostname context created is also bound to the composite name with this suffix replaced by `_host/`, and the reverse (that is, if a composite name with a `_host/` suffix was supplied, a binding would be created for `host/`). Also create a host context for every host entry in the corresponding hosts database of the naming service (`hosts.org_dir` NIS+ table, or `hosts` NIS map, or `/etc/hosts` file), unless either option `-o` or `-f` is specified. The following example creates host contexts for all hosts in the `sales` organization:

```
eg% fncreate -t hostname \
org/sales/host/
```

Typically, a hostname context need not be created explicitly since it is created by default, as a subcontext under `org`.

host

Create a host context for a specific host, and its `service` and `fs` subcontexts, and bind the reference

## fncreate(1M)

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## fncreate(1M)

*composite\_name*. If the suffix of *composite\_name* is *service/*, the service context created is also bound to the composite name with this suffix replaced by *\_service/*, and the reverse. Typically, a service context need not be created explicitly since it is created by default, as a subcontext under *org*, *host*, or *user* contexts.

*fs*

Create a file system context for a user or host, and bind the reference of the context to *composite\_name*. The composite name must be the name of a host or a user, with either *fs/* or *\_fs/* appended to it. If the suffix of *composite\_name* is *fs/*, the file system context created is also bound to the composite name with this suffix replaced by *\_fs/*, and the reverse.

Typically, a file system context need not be created explicitly since it is created by default, as a subcontext of a user or host context.

The file system context of a user is the user's home directory as stored in the *passwd* database of the naming service (that is, in NIS+ table *passwd.org\_dir*, or *passwd* NIS map, or */etc/passwd* file). The file system context of a host is the set of NFS file systems that the host exports.

Use the *fncreate\_fs(1M)* command to create file system contexts for organizations and sites, or to create file system contexts other than the defaults for users and hosts.

*site*

Create a site context in which dot-separated right-to-left site names can be bound, and a service subcontext, and bind the reference

## fncreate(1M)

|                      |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      |                | of the context to <i>composite_name</i> . If the suffix of <i>composite_name</i> is <i>site/</i> , the hostname context created is also bound to the composite name with this suffix replaced by <i>_site/</i> , and the reverse. Typically, a <i>site</i> context is created at the same level as the <i>org</i> context and is used for creating a geographical namespace that complements the organizational namespace of an enterprise.                         |
|                      | <i>nsid</i>    | Create a context in which namespace identifiers can be bound. This context has a flat namespace, in which only atomic names can be bound. An example of such a context is the context to which the name <i>site/east/</i> is bound. This context can have the following bindings:<br><i>site/east/host</i> ,<br><i>site/east/user</i> , and<br><i>site/east/service</i> .                                                                                           |
|                      | <i>generic</i> | Create a generic context in which slash-separated left-to-right names can be bound, and bind the reference of the context to <i>composite_name</i> . The option <i>-r</i> can be used to specify the reference type to be associated with the context. If the <i>-r</i> option is omitted, the reference type used is the reference type of the parent context if the parent context is a generic context; otherwise, the reference type is <i>onc_fn_generic</i> . |
| <i>-f input_file</i> |                | Create a context for every user or host listed in <i>input_file</i> . This option is only applicable when used with the <i>-t username</i> or <i>-t hostname</i> options. The format of the file is an atomic user name or host name per line. This option is used to create contexts for a subset of the <i>users/hosts</i> found in the corresponding <i>passwd</i> or <i>hosts</i> database of the naming service (that is, for NIS+ these are the               |

|                          |                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | passwd.org_dir or hosts.org_dir tables, respectively). If this option is omitted, fcreate creates a context for every user/host found in the corresponding passwd or hosts database.                       |
| -r <i>reference_type</i> | Use <i>reference_type</i> as the reference type of the generic context being created. This option can be used only with the -t generic option.                                                             |
| -D                       | Information about the creation of a context, and corresponding NIS+ directories and tables, or NIS maps, or files entry, is displayed as each context is created.                                          |
| -o                       | Only the context named by <i>composite_name</i> is created; no subcontexts are created. When this option is omitted, subcontexts are created according to the FNS Policies for the type of the new object. |
| -s                       | Create the context and bind it in to supercede any existing binding associated with <i>composite_name</i> . If this option is omitted, fcreate fails if <i>composite_name</i> is already bound.            |
| -v                       | Information about the creation of a context is displayed as each context is created.                                                                                                                       |

**OPERANDS** The following operand is supported:

*composite\_name* An FNS named object.

**EXAMPLES** **EXAMPLE 1** Creating A Host Context In The Root Organization And A User Context In A Sub-Organization

The following examples illustrate creation of a host context in the root organization and a user context in a sub-organization.

Create a context, and subcontexts, for the root organization:

```
eg% fcreate -t org org//
```

It causes the following commands to be invoked automatically:

```
eg% fcreate -t service org//service/
eg% fcreate -t hostname org//host/
eg% fcreate -t username org//user/
```

Create a context, and subcontexts, for host sylvan:

```
eg% fcreate -t host org//host/sylvan/
```

It causes the following commands to be invoked automatically:

```
eg% fcreate -t service org//host/sylvan/service/
eg% fcreate -t fs org//host/sylvan/fs/
```

## fncreate(1M)

**EXAMPLE 1** Creating A Host Context In The Root Organization And A User Context In A Sub-Organization (Continued)

Create a context, and subcontexts, associated with a sub-organization dct:

```
eg% fncreate -t org org/dct/
```

It causes the following commands to be invoked automatically:

```
eg% fncreate -t service org/dct/service/
eg% fncreate -t hostname org/dct/host/
eg% fncreate -t username org/dct/user/
```

Create a context, and subcontexts, for user msmith:

```
eg% fncreate -t user org/dct/user/msmith/
```

It causes the following commands to be invoked automatically:

```
eg% fncreate -t service org/dct/user/msmith/service/
eg% fncreate -t fs org/dct/user/msmith/fs/
```

The following examples create service contexts:

```
eg% fncreate -t service org/dct/service/fax
eg% fncreate -t service org/dct/service/fax/classA
```

**EXIT STATUS**

|   |                           |
|---|---------------------------|
| 0 | Operation was successful. |
| 1 | Operation failed.         |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWfns         |

|                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAME</b>              | fncreate_fs – create FNS file system contexts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>SYNOPSIS</b>          | <pre>fncreate_fs [-r] [-v] -f input_file composite_name fncreate_fs [-r] [-v] composite_name [mount_options] [mount_location...]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b>       | The <code>fncreate_fs</code> command creates or updates the FNS file system context named by <i>composite_name</i> . A description of the context's bindings is provided in <i>input_file</i> if the first form of the command is used, or is given on the command line if the second form is used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>OPTIONS</b>           | <pre>-r          Replace the bindings in the context named by <i>composite_name</i> with only those specified in the input. This is equivalent to destroying the context (and, recursively, its subcontexts), and then running <code>fncreate_fs</code> without this option. This option should be used with care. -v          Verbose. Display information about the contexts being created and modified. -f input_file  Read input from <i>input_file</i>. If <i>input_file</i> is '-' (hyphen), read from standard input instead.</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>OPERANDS</b>          | The following operand is supported:<br><br><i>composite_name</i> An FNS named object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>USAGE</b>             | The <code>fncreate_fs</code> command populates the file system portions of the FNS namespace. The automounter (see <code>automount(1M)</code> ) will then "mount" the FNS namespace under <code>/xfn</code> . The directory with the FNS name <code>org/engineering/fs</code> , for example, can be found on the file system as <code>/xfn/org/engineering/fs</code> .<br><br>The format of the input to <code>fncreate_fs</code> is similar, but not identical, to the format of indirect automount maps. Differences are enumerated in the <b>NOTES</b> section below.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Input File Format</b> | The input file supplies the names and values to be bound in the context of <i>composite_name</i> . Its format is a sequence of lines of the form:<br><br><i>name</i> [ <i>-options</i> ] [ <i>location</i> . . . ] For each such entry, a reference to the <i>location</i> (s) and the corresponding <i>options</i> is bound to the name <i>composite_name/name</i> . The <i>name</i> field may be a simple atomic name, a slash-separated hierarchical name, or '.' (period). If it is '.' then the reference is bound directly to <i>composite_name</i> . The <i>name</i> field must not begin with a slash.<br><br>The <i>location</i> field specifies the host or hosts that serve the files for <i>composite_name/name</i> . In the case of a simple NFS mount, <i>location</i> takes the form:<br><br><i>host</i> : <i>path</i> where <i>host</i> is the name of the host from which to mount the file system, and <i>path</i> is the path name of the directory to mount. |

## fncreate\_fs(1M)

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | <p>The <i>options</i> field is a comma-separated list of the mount options to use when mounting the location bound to <i>composite_name/name</i>. These options also apply to any subcontexts of <i>composite_name/name</i> that do not specify their own mount options. If <i>options</i> is given but <i>location</i> is not, the options apply to subcontexts only.</p> <p>If neither <i>options</i> nor a <i>location</i> is given, then no reference is bound to <i>composite_name/name</i>. Any existing reference is unbound.</p> <p>A single logical line may be continued across multiple input lines by escaping the newline with a '\ ' (backslash). Comments begin with a '#' that is either at the beginning of a line or is prefixed by whitespace, and end at the end of the line.</p>                                                  |
| <b>Command-line Input</b>     | <p>If no <i>input_file</i> is specified on the command line, then the <i>options</i> and <i>location</i> fields given on the command line are bound directly to <i>composite_name</i>. This is equivalent to providing a one-line input file with a '.' in the <i>name</i> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Multiple Locations</b>     | <p>Multiple <i>location</i> fields may be specified for NFS file systems that are exported from multiple, functionally-equivalent locations. If several locations in the list share the same path name, they may be combined using a comma-separated list of host names:</p> <pre>host1, host2, . . . : path</pre> <p>The hosts may be weighted, with the weighting factor appended to the host name as a non-negative integer in parentheses: the lower the number, the more desirable the server. The default weighting factor is 0 (most desirable). In the example:</p> <pre>alpha,bravo,charlie(1),delta(2):/usr/man</pre> <p>hosts alpha and bravo are the most desirable; host delta is the least desirable.</p> <p>See the USAGE section of automount(1M) for additional information on how the automounter interprets the location field.</p> |
| <b>Variable Substitution</b>  | <p>Variable names, prefixed by '\$', may be used with the <i>options</i> or <i>location</i> fields. For example, a <i>location</i> may be given as:</p> <pre>svr1:/export/\$CPU</pre> <p>The automounter will substitute client-specific values for these variables when mounting the corresponding file systems. In the above example, \$CPU is replaced by the output of <code>uname -p</code>; for example, "sparc". See the USAGE section of automount(1M) for more information on how the automounter treats variable substitution.</p>                                                                                                                                                                                                                                                                                                           |
| <b>Alternate Input Format</b> | <p>For additional compatibility with automount maps (see automount(1M)), the following input format is accepted:</p> <pre>name          [options] [location . . .] \<br/>/offset1     [options1] location1 . . . \<br/>/offset2     [options2] location2 . . . \<br/>. . .</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

where each *offset* field is a slash-separated hierarchy. This is interpreted as being equivalent to:

```
name [options] [location . . . ^]
name/offset1 [options1] location1 . . .
name/offset2 [options2] location2 . . .
. . . (the first line being omitted if both options and location are omitted).
```

This format is for compatibility only; it provides no additional functionality. Its use is deprecated.

## EXAMPLES **EXAMPLE 1** Using the `fncreate_fs` Command

The following examples illustrate the use of the `fncreate_fs` command. The call:

```
example% cat input1
src -ro svr1:/export/src
dist -ro svr2,svr3:/export/dist
example% fncreate_fs -f input1 org/engineering/fs
creates a file system context for the engineering organization. It specifies that
org/engineering/fs/src is a read-only NFS mount from server svr1, and that
org/engineering/fs/dist is a read-only NFS mount from either svr2 or svr3.
```

Once this is done, there are several equivalent ways to create the engineering organization's `src/cmd` context. It could be done using the composite name `org/engineering/fs`:

```
example% cat input2
src/cmd svr1:/export/cmd
example% fncreate_fs -f input2 org/engineering/fs
```

Equivalently, it could be done using the composite name `org/engineering/fs/src`:

```
example% cat input3
cmd svr1:/export/cmd
example% fncreate_fs -f input3 org/engineering/fs/src
```

The same results could also be achieved by:

```
example% fncreate_fs org/engineering/fs/src/cmd svr1:/export/cmd
```

Note that `cmd` will also be mounted read-only, since it is a subcontext of `src` and does not have mount options of its own.

In the first example of this section, the `-ro` mount option was specified for each entry in the input file. It could instead have been specified only once:

```
example% cat input4
. -ro
src svr1:/export/src
dist svr2,svr3:/export/dist
example% fncreate_fs -f input4 org/engineering/fs
```

## fncreate\_fs(1M)

### EXAMPLE 1 Using the fncreate\_fs Command (Continued)

The `-ro` option here applies to all bindings in the context `org/engineering/fs` and any of its subcontexts. In particular, it also applies to the `cmd` context from the above examples.

The following will change the NFS server for the `src` context:

```
example% fncreate_fs org/engineering/fs/src svr4:/export/src
```

Had the `-r` option been used, the `cmd` subcontext would have been destroyed as well:

```
example% fncreate_fs -r org/engineering/fs/src svr4:/export/src
```

Only the FNS context is destroyed. The `/export/cmd` directory on `svr1` is not affected.

The file system contexts of users and hosts are not usually created by `fncreate_fs` (see the `NOTES` section below). The defaults set by `fncreate`, however, may be overridden. For example, the call:

```
example% fncreate_fs user/jane/fs svr1:/export/home/jane
sets Jane's file system to be an NFS mount from svr1.
```

**EXIT STATUS** 0 Operation was successful.

1 Operation failed.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWfns         |

**SEE ALSO** `fnbind(1)`, `fnlist(1)`, `fnlookup(1)`, `fnunbind(1)`, `nis+(1)`, `automount(1M)`, `fncreate(1M)`, `fndestroy(1M)`, `attributes(5)`, `fns(5)`, `fns_files(5)`, `fns_nis(5)`, `fns_nis+(5)`, `fns_policies(5)`

**NOTES** The `fncreate_fs` command affects the FNS file system namespace only. It does not have any effect on the servers that export the files and directories from which the namespace is constructed. Destroying an FNS context does not remove any files on any server.

FNS policies specify that file system contexts are bound after the namespace identifier `fs` in composite names (see `fns_policies(5)`). Therefore, `composite_name` must contain an `fs`. The alias `_fs` may be used in place of `fs`.

The context named by the components of `composite_name` preceding `fs` must exist prior to the call to `fncreate_fs`, since `fncreate_fs` creates *only* file system contexts.

Default file system contexts for hosts and users are generally created by the command `fcreate(1M)`. These defaults may be overridden using `fcreate_fs`. Overriding a host's default file system context is unlikely to make sense.

The input file format is similar to the format of indirect automount maps (see `automount(1M)`). The differences are:

- the *name* field may be hierarchical, and may be `'.'`
- there are no included maps or special maps
- there may be entries with neither options nor locations
- the characters `'*'` and `'&'` have no special meaning

The process executing the `fcreate_fs` command may need certain credentials to update information in the underlying naming service. See `fns_nis(5)`, `fns_nis+(5)`, and `fns_files(5)` for more information.

## fncreate\_printer(1M)

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>NAME</b>        | fncreate_printer – create new printers in the FNS namespace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | <b>fncreate_printer</b> [-sv] <i>compositename printername printeraddr</i> [ <i>printeraddr...</i> ]<br><b>fncreate_printer</b> [-sv] [-f <i>filename</i> ] <i>compositename</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DESCRIPTION</b> | <p>fncreate_printer creates a new printer context for an <i>organization</i>, <i>user</i>, <i>host</i>, or <i>site</i> object. <i>compositename</i> is the FNS name of the object. fncreate_printer uses <i>printername</i> to name the new printer and binds it to an FNS reference constructed from the set of <i>printeraddrs</i>. fncreate_printer may also be used to add new <i>printeraddrs</i> for an existing <i>printername</i>.</p> <p>The command also supports creating a set of printers as listed in the file <i>filename</i>.</p> <p>The new printer context is created with the FNS name <code>&lt;compositename&gt;/service/printer/&lt;printername&gt;</code>. If the intermediate <i>service</i> or <i>printer</i> names do not exist, their FNS contexts are also created by this command. Normally, these intermediate contexts would be created by an administrative script that uses fncreate(1M), and is run at the time a new FNS organization is set up. The reference bound to the FNS printer name is of type <code>onc_printers</code> and is constructed from the set of <i>printeraddrs</i>. A <i>printeraddr</i> is of the form <code>&lt;addresstype&gt; = &lt;address&gt;</code>. See <code>printers.conf(4)</code> for the format of <i>printeraddr</i> and also the examples below for currently supported address types and address strings.</p> <p>An FNS printer name is accepted as a valid printer name by <code>lp(1)</code>, <code>lpstat(1)</code>, <code>cancel(1)</code>, <code>lpmove(1M)</code>, <code>lpr(1B)</code>, <code>lpq(1B)</code>, and <code>lprm(1B)</code>.</p> <p>The <i>printername</i> argument may be a slash-separated name. In this case, prior to creating the printer context denoted by the “leaf” name, this command will create printer context(s) for the intermediate node(s) if they do not already exist. See <b>EXAMPLES</b>.</p> <p>fncreate_printer creates entries in the naming service determined by fnselect(1M). See fnselect(1M) for more information on the default naming service and on selecting a naming service. Furthermore, the process executing the fncreate_printer command may require certain credentials to update information in the underlying namespace. See <code>fns_nis+(5)</code>, <code>fns_nis(5)</code>, and <code>fns_files(5)</code> for more information.</p> |
| <b>OPTIONS</b>     | <p>-s                   The new <i>address</i> supersedes an existing address with the same <i>addresstype</i>, if any, for <code>&lt;compositename&gt;/service/printer/&lt;printername&gt;</code>. If this option is omitted, it appends the <i>printeraddr</i> to an existing reference, or creates a new reference using <i>printeraddr</i> for the printer.</p> <p>-v                   Displays information about individual printer contexts as they are created.</p> <p>-f <i>filename</i>        Use <i>filename</i> to obtain a list of printers for which to create contexts. If this option is omitted, <code>/etc/printers.conf</code> is used as the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>NAME</b>        | fnselect – select a specific naming service to use for the FNS Initial Context                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |         |                                                                          |         |                                        |     |                                       |       |                                              |
| <b>SYNOPSIS</b>    | <b>fnselect</b> [-D]<br><b>fnselect</b> <i>naming-service</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |         |                                                                          |         |                                        |     |                                       |       |                                              |
| <b>DESCRIPTION</b> | <i>fnselect</i> is used to set the specified naming service to be used to construct the bindings in the FNS Initial Context. This setting affects the entire machine and affects applications that make subsequent calls to <code>fn_ctx_handle_from_initial(3XFN)</code> . This setting can be changed only by an administrator who has root privilege on the machine.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |                                                                          |         |                                        |     |                                       |       |                                              |
| <b>OPTIONS</b>     | -D        Displays the actual naming service used to generate the FNS Initial Context.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |                                                                          |         |                                        |     |                                       |       |                                              |

| files              | Use /etc files as the target naming service.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |         |                                                                          |         |                                        |     |                                       |       |                                              |
| <b>USAGE</b>       | When the <code>default</code> option is selected, FNS determines the underlying naming service using the following algorithm: <ul style="list-style-type: none"><li>■ First, it checks for NIS+ with FNS installed.</li><li>■ If the result is <code>TRUE</code>, then FNS assumes <code>nisplus</code> as the underlying naming service.</li><li>■ Otherwise, it checks if the system is a NIS client.</li><li>■ If <code>TRUE</code>, FNS assumes <code>nis</code> as the underlying naming service.</li><li>■ Otherwise, FNS assumes <code>/etc files</code>.</li></ul> <p><i>fnselect</i> without any arguments displays the service currently selected for the Initial Context (one of <code>default</code>, <code>nisplus</code>, <code>nis</code>, or <code>files</code>).</p> <p>When the <code>-D</code> option is specified and the current setting is <code>default</code>, <i>fnselect</i> will use the algorithm that is used by FNS and display the actual naming service used for the FNS Initial Context.</p> |         |                                                                          |         |                                        |     |                                       |       |                                              |
| <b>EXAMPLES</b>    | <b>EXAMPLE 1</b> Using The <i>fnselect</i> Command<br>The command<br><pre>example% fnselect nisplus</pre> will select NIS+ as the underlying naming service for the FNS Initial Context.<br>The command                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |         |                                                                          |         |                                        |     |                                       |       |                                              |

**EXAMPLE 1** Using The fselect Command *(Continued)*

example% fselect  
will print the naming service currently being used to generate the FNS Initial Context.

**EXIT STATUS** 0 Operation was successful.

1 Operation failed.

| <b>SYNOPSIS</b>    | <code>/usr/sbin/fnsypd</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                |                        |              |                    |
| <b>DESCRIPTION</b> | <p>The <code>fnsypd</code> daemon is a Remote Procedure Call (RPC) service that accepts requests from NIS clients to update and modify Federated Naming Service (FNS) contexts. This daemon runs on an NIS master server with FNS on top of it. The <code>fnsypd</code> daemon requires the Secure Key Infrastructure (SKI) mechanism for authentication. The SKI mechanism is part of the SUNWski package. If SUNWski is not installed, authentication cannot be performed and users will receive "permission denied" error messages. The SUNWski man pages are located at <code>/opt/SUNWski/man</code>.</p> <p><code>fnsypd</code> enables users and hosts to modify only their respective FNS contexts. Organization, site, hostname and username contexts cannot be modified using <code>fnsypd</code>.</p> |                |                        |              |                    |
| <b>EXIT STATUS</b> | <p>The following exit values are returned:</p> <table><tr><td>0</td><td>Successful completion.</td></tr><tr><td>1</td><td>An error occurred.</td></tr></table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 0              | Successful completion. | 1            | An error occurred. |

| <b>NAME</b>        | format – disk partitioning and maintenance utility                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | <b>format</b> [-f <i>command-file</i> ] [-l <i>log-file</i> ] [-x <i>data-file</i> ] [-d <i>disk-name</i> ]<br>[-t <i>disk-type</i> ] [-p <i>partition-name</i> ] [-s] [-m] [-M] [-e] [ <i>disk-list</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>DESCRIPTION</b> | <p>format enables you to format, label, repair and analyze disks on your system. Unlike previous disk maintenance programs, format runs under SunOS. Because there are limitations to what can be done to the system disk while the system is running, format is also supported within the memory-resident system environment. For most applications, however, running format under SunOS is the more convenient approach.</p> <p>format first uses the disk list defined in <i>data-file</i> if the -x option is used. format then checks for the FORMAT_PATH environment variable, a colon-separated list of filenames and/or directories. In the case of a directory, format searches for a file named format.dat in that directory; a filename should be an absolute pathname, and is used without change. format adds all disk and partition definitions in each specified file to the working set. Multiple identical definitions are silently ignored. If FORMAT_PATH is not set, the path defaults to /etc/format.dat.</p> <p><i>disk-list</i> is a list of disks in the form c?t?d? or /dev/rdisk/c?t?d?s?. With the latter form, shell wildcard specifications are supported. For example, specifying /dev/rdisk/c2* causes format to work on all drives connected to controller c2 only. If no <i>disk-list</i> is specified, format lists all the disks present in the system that can be administered by format.</p> <p>Removable media devices are listed only when users execute format in expert mode (option -e). This feature is provided for backward compatibility. Use rmformat(1) for rewritable removable media devices.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <ul style="list-style-type: none"> <li>-d <i>disk-name</i>                      Specify which disk should be made current upon entry into the program. The disk is specified by its logical name (for instance, -d c0t1d0). This can also be accomplished by specifying a single disk in the disk list.</li> <li>-e                                      Enable SCSI expert menu. Note this option is not recommended for casual use.</li> <li>-f <i>command-file</i>                    Take command input from <i>command-file</i> rather than the standard input. The file must contain commands that appear just as they would if they had been entered from the keyboard. With this option, format does not issue continue? prompts; there is no need to specify y(es) or n(o) answers in the <i>command-file</i>. In non-interactive mode, format does not initially expect the input of a disk selection number. The user must specify the current working disk with the -d <i>disk-name</i></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## format(1M)

|                                |                                                                                                                                                                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                | option when <code>format</code> is invoked, or specify <code>disk</code> and the disk selection number in the <i>command-file</i> .                                                                                                                                                     |
| <code>-l log-file</code>       | Log a transcript of the <code>format</code> session to the indicated <i>log-file</i> , including the standard input, the standard output and the standard error.                                                                                                                        |
| <code>-m</code>                | Enable extended messages. Provides more detailed information in the event of an error.                                                                                                                                                                                                  |
| <code>-M</code>                | Enable extended and diagnostic messages. Provides extensive information on the state of a SCSI device's mode pages, during formatting.                                                                                                                                                  |
| <code>-p partition-name</code> | Specify the partition table for the disk which is current upon entry into the program. The table is specified by its name as defined in the data file. This option can be used only if a disk is being made current, and its type is either specified or available from the disk label. |
| <code>-s</code>                | Silent. Suppress all of the standard output. Error messages are still displayed. This is generally used in conjunction with the <code>-f</code> option.                                                                                                                                 |
| <code>-t disk-type</code>      | Specify the type of disk which is current upon entry into the program. A disk's type is specified by name in the data file. This option can only be used if a disk is being made current as described above.                                                                            |
| <code>-x data-file</code>      | Use the list of disks contained in <i>data-file</i> .                                                                                                                                                                                                                                   |

### USAGE

When you invoke `format` with no options or with the `-e`, `-l`, `-m`, `-M`, or `-s` options, the program displays a numbered list of available disks and prompts you to specify a disk by list number. If the machine has more than 10 disks, press Space to see the next screenful of disks.

You can specify a disk by list number even if the disk is not displayed in the current screenful. For example, if the current screen shows disks 11-20, you can enter 25 to specify the twenty-fifth disk on the list. If you enter a number for a disk that is not currently displayed, `format` prompts you to verify your selection. If you enter a number from the displayed list, `format` silently accepts your selection.

After you specify a disk, `format` displays its main menu. This menu enables you to perform the following tasks:

|         |                                                                                                                                                                                                                  |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| analyze | Run read, write, and compare tests.                                                                                                                                                                              |
| backup  | Search for backup labels.                                                                                                                                                                                        |
| cache   | Enable, disable, and query the state of the write cache and read cache. This menu item only appears when <code>format</code> is invoked with the <code>-e</code> option, and is only supported on SCSI devices.. |

|                              |                                                                              |                                                                                                                                                                                                                                                                                                                                       |
|------------------------------|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | current                                                                      | Display the device name, the disk geometry, and the pathname to the disk device.                                                                                                                                                                                                                                                      |
|                              | defect                                                                       | Retrieve and print defect lists. This option is supported only on SCSI devices. IDE disks perform automatic defect management. Upon using the <code>defect</code> option on an IDE disk, you receive the message:<br><br><code>Controller does not support defect management<br/>or disk supports automatic defect management.</code> |
|                              | disk                                                                         | Choose the disk that will be used in subsequent operations (known as the current disk.)                                                                                                                                                                                                                                               |
|                              | fdisk                                                                        | Run the <code>fdisk(1M)</code> program to create a <code>fdisk</code> partition for Solaris software (IA based systems only).                                                                                                                                                                                                         |
|                              | format                                                                       | Format and verify the current disk. This option is supported only on SCSI devices. IDE disks are pre-formatted by the manufacturer. Upon using the <code>format</code> option on an IDE disk, you receive the message:<br><br><code>Cannot format this drive. Please use your<br/>manufacturer-supplied formatting utility.</code>    |
|                              | inquiry                                                                      | Display the vendor, product name, and revision level of the current drive.                                                                                                                                                                                                                                                            |
|                              | label                                                                        | Write a new label to the current disk.                                                                                                                                                                                                                                                                                                |

| <b>ENVIRONMENT VARIABLES</b> | <code>FORMAT_PATH</code>                                                     | a colon-separated list of filenames and/or directories of disk and partition definitions. If a directory is specified, <code>format</code> searches for the file <code>format.dat</code> in that directory.                                                                                                                           |
| <b>FILES</b>                 | <code>/etc/format.dat</code>                                                 | default data file                                                                                                                                                                                                                                                                                                                     |
| <b>ATTRIBUTES</b>            | See <code>attributes(5)</code> for descriptions of the following attributes: |                                                                                                                                                                                                                                                                                                                                       |

format(1M)

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `fmthard(1M)`, `prtvtoc(1M)`, `rmformat(1)`, `format.dat(4)`, `attributes(5)`, `sd(7D)`

See *Disk Management in System Administration Guide, Volume 1*

**IA Only** `fdisk(1M)`

**WARNINGS** When the `format` function is selected to format the Maxtor 207MB disk, the following message displays:

```
Mode sense page(4) reports rpm value as 0, adjusting it to 3600
```

This is a drive bug that may also occur with older third party drives. The above message is not an error; the drive will still function correctly.

Cylinder 0 contains the partition table (disk label), which can be overwritten if used in a raw disk partition by third party software.

**NOTES** `format` provides a help facility you can use whenever `format` is expecting input. You can request help about what information is expected by simply entering a question mark (?) and `format` prints a brief description of what type of input is needed. If you enter a ? at the menu prompt, a list of available commands is displayed.

For SCSI disks, formatting is done with both Primary and Grown defects list by default. However, if only Primary list is extracted in defect menu before formatting, formatting will be done with Primary list only.

Changing the state of the caches is only supported on SCSI devices, and not all SCSI devices support changing or saving the state of the caches.

| <b>NAME</b>                   | fsck – check and repair file systems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                               |                                                   |                 |                                                                                                                                                                                                                           |  |                                                               |                      |                                                                                                                          |
| <b>SYNOPSIS</b>               | <pre><b>fsck</b> [-F <i>FSType</i>] [-m] [-V] [<i>special...</i>]</pre> <pre><b>fsck</b> [-F <i>FSType</i>] [-n   N   y   Y] [-V] [-o <i>FSType-specific-options</i>]</pre> <pre>          [<i>special...</i>]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                               |                                                   |                 |                                                                                                                                                                                                                           |  |                                                               |                      |                                                                                                                          |
| <b>DESCRIPTION</b>            | <p><code>fsck</code> audits and interactively repairs inconsistent file system conditions. If the file system is inconsistent the default action for each correction is to wait for the user to respond <code>yes</code> or <code>no</code>. If the user does not have write permission <code>fsck</code> defaults to a <code>no</code> action. Some corrective actions will result in loss of data. The amount and severity of data loss may be determined from the diagnostic output.</p> <p><i>FSType-specific-options</i> are options specified in a comma-separated (with no intervening spaces) list of options or keyword-attribute pairs for interpretation by the <i>FSType</i>-specific module of the command.</p> <p><i>special</i> represents the character special device on which the file system resides, for example, <code>/dev/rdisk/c1t0d0s7</code>. Note: the character special device, not the block special device, should be used. <code>fsck</code> will not work on a block device if it is mounted.</p> <p>If no <i>special</i> device is specified <code>fsck</code> checks the file systems listed in <code>/etc/vfstab</code>. Those entries in <code>/etc/vfstab</code> which have a character special device entry in the <code>fsckdev</code> field and have a non-zero numeric entry in the <code>fsckpass</code> field will be checked. Specifying <code>-F FSType</code> limits the file systems to be checked to those of the type indicated.</p> <p>If <i>special</i> is specified, but <code>-F</code> is not, the file system type will be determined by looking for a matching entry in <code>/etc/vfstab</code>. If no entry is found, the default local file system type specified in <code>/etc/default/fs</code> will be used.</p> <p>If a file system type supports parallel checking, for example, <code>ufs</code>, some file systems eligible for checking may be checked in parallel. Consult the file system-specific man page (for example, <code>fsck_ufs(1M)</code>) for more information.</p> |                               |                                                   |                 |                                                                                                                                                                                                                           |  |                                                               |                      |                                                                                                                          |
| <b>OPTIONS</b>                | <p>The following generic options are supported:</p> <table border="0"> <tr> <td style="vertical-align: top;"><code>-F <i>FSType</i></code></td> <td>Specify the file system type on which to operate.</td> </tr> <tr> <td style="vertical-align: top;"><code>-m</code></td> <td>Check but do not repair. This option checks that the file system is suitable for mounting, returning the appropriate exit status. If the file system is ready for mounting, <code>fsck</code> displays a message such as:</td> </tr> <tr> <td></td> <td style="padding-left: 2em;"><code>ufs fsck: sanity check: /dev/rdisk/c0t3d0s1 okay</code></td> </tr> <tr> <td style="vertical-align: top;"><code>-n   -N</code></td> <td>Assume a <code>no</code> response to all questions asked by <code>fsck</code>; do not open the file system for writing.</td> </tr> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <code>-F <i>FSType</i></code> | Specify the file system type on which to operate. | <code>-m</code> | Check but do not repair. This option checks that the file system is suitable for mounting, returning the appropriate exit status. If the file system is ready for mounting, <code>fsck</code> displays a message such as: |  | <code>ufs fsck: sanity check: /dev/rdisk/c0t3d0s1 okay</code> | <code>-n   -N</code> | Assume a <code>no</code> response to all questions asked by <code>fsck</code> ; do not open the file system for writing. |

| b= <i>n</i>                | Use block <i>n</i> as the super block for the file system. Block 32 is always one of the alternate super blocks. Determine the location of other super blocks by running <i>newfs(1M)</i> with the <i>-Nv</i> options specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| c                          | If the file system is in the old (static table) format, convert it to the new (dynamic table) format. If the file system is in the new format, convert it to the old format provided the old format can support the file system configuration. In interactive mode, <i>fsck</i> will list the direction the conversion is to be made and ask whether the conversion should be done. If a negative answer is given, no further operations are done on the file system. In preen mode, the direction of the conversion is listed and done if possible without user interaction. Conversion in preen mode is best used when all the file systems are being converted at once. The format of a file system can be determined from the first line of output from <i>fstyp(1M)</i> . Note: the <i>c</i> option is seldom used and is included only for compatibility with pre-4.1 releases. There is no guarantee that this option will be included in future releases. |
| f                          | Force checking of file systems regardless of the state of their super block clean flag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| p                          | Check and fix the file system non-interactively (“preen”). Exit immediately if there is a problem requiring intervention. This option is required to enable parallel file system checking.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>EXIT STATUS</b>         | 0 file system is okay and does not need checking                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

1 erroneous parameters are specified  
 32 file system is unmounted and needs checking (`fscck -m` only)  
 33 file system is already mounted  
 34 cannot stat device  
 36 uncorrectable errors detected - terminate normally  
 37 a signal was caught during processing  
 39 uncorrectable errors detected - terminate immediately  
 40 for root, same as 0.

**USAGE** See `largefile(5)` for the description of the behavior of `fscck` when encountering files greater than or equal to 2 Gbyte ( $2^{31}$  bytes).

**FILES** `/etc/default/fs` default local file system type. Default values can be set for the following flags in `/etc/default/fs`. For example: `LOCAL=ufs`.

`LOCAL` The default partition for a command if no `FSType` is specified.

`/etc/vfstab` list of default parameters for each file system

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `clri(1M)`, `crash(1M)`, `fscck_cacheufs(1M)`, `fscck_s5fs(1M)`, `fscck_ufs(1M)`, `fsdb_ufs(1M)`, `fsirand(1M)`, `fstyp(1M)`, `mkfs(1M)`, `mkfs_ufs(1M)`, `mountall(1M)`, `newfs(1M)`, `reboot(1M)`, `fs_ufs(4)`, `vfstab(4)`, `attributes(5)`, `largefile(5)`

**WARNINGS** The operating system buffers file system data. Running `fscck` on a mounted file system can cause the operating system's buffers to become out of date with respect to the disk. For this reason, the file system should be *unmounted* when `fscck` is used. If this is not possible, care should be taken that the system is quiescent and that it is rebooted immediately after `fscck` is run. Quite often, however, this will not be sufficient. A panic will probably occur if running `fscck` on a file system modifies the file system.

**NOTES** This command may not be supported for all *FSTypes*.

Running `fscck` on file systems larger than 2 Gb fails if the user chooses to use the block interface to the device:

fsck(1M)

```
fsck /dev/dsk/c?t?d?s?
```

rather than the raw (character special) device:

```
fsck /dev/rdisk/c?t?d?s?
```

**NAME** fscck\_cachefs – check integrity of data cached with CacheFS

**SYNOPSIS** **fscck** -F cachefs [-m | -o | noclean] *cache\_directory*

**DESCRIPTION** The CacheFS version of the `fscck` command checks the integrity of a cache directory. By default it corrects any CacheFS problems it finds. There is no interactive mode. The most likely invocation of `fscck` for CacheFS file systems is at boot time from an entry in the `/etc/vfstab` file (see `vfstab(4)`).

**OPTIONS** Two command line options are available:

-m Check, but do not repair.

-o noclean Force a check on the cache even if there is no reason to suspect there is a problem.

**EXAMPLES** **EXAMPLE 1** An example of the `fscck` command.

The following example forces a check on the cache directory `/cache3`:

```
example% fscck -F cachefs -o noclean /cache3
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `cfsadmin(1M)`, `fscck(1M)`, `mount_cachefs(1M)`, `vfstab(4)`, `attributes(5)`

| <b>NAME</b>          | fsck_pcfs – file system consistency check and interactive repair                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                 |                                                                                                                                                                                                                                                                                                |                      |                                                                                                             |
| <b>SYNOPSIS</b>      | <b>fsck</b> -F pcfs [ <i>generic_options</i> ] <i>special</i><br><b>fsck</b> -F pcfs [ <i>generic_options</i> ] [-o <i>specific_options</i> ] <i>special</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                 |                                                                                                                                                                                                                                                                                                |                      |                                                                                                             |
| <b>DESCRIPTION</b>   | <p>The <code>fsck</code> utility audits and interactively repairs inconsistent conditions on file systems. <i>special</i> represents the character special device on which the file system resides, for example <code>/dev/rdiskette</code>. The character special device, not the block special device, should be used.</p> <p>In the case of correcting serious inconsistencies, by default, <code>fsck</code> asks for confirmation before making a repair and waits for the operator to respond either <code>yes</code> or <code>no</code>. If the operator does not have write permission on the file system, <code>fsck</code> defaults to a <code>-n</code> (no corrections) action. See <code>fsck(1M)</code>.</p> <p>Repairing some file system inconsistencies may result in loss of data. The amount and severity of data loss may be determined from the diagnostic output.</p> <p>When executed with the verify option (<code>-o v</code>), <code>fsck_pcfs</code> automatically scans the entire file system to verify that all of its allocation units are accessible. If it finds any units inaccessible, it updates the file allocation table (FAT) appropriately. It also updates any effected directory entries to reflect the problem. This directory update includes truncating the file at the point in its allocation chain where the file data is no longer accessible. Any remaining accessible allocation units become orphaned.</p> <p>Orphaned chains of accessible allocation units are, with the operator's concurrence, linked back into the file system as files in the root directory. These files are assigned names of the form <code>fileNNNN.chk</code>, where the <i>Ns</i> are digits in the integral range from 0 through 9.</p> <p>After successfully scanning and correcting any errors in the file system, <code>fsck</code> displays a summary of information about the file system. This summary includes the size of the file system in bytes, the number of bytes used in directories and individual files, and the number of available allocation units remaining in the file system.</p> |                 |                                                                                                                                                                                                                                                                                                |                      |                                                                                                             |

fsck\_pcfs(1M)

- v Echo the expanded command line, but do not execute the command. This option may be used to verify and to validate the command line.
- y | -Y Assume a yes response to all questions asked by fsck.
- o *specific\_options* Specify pcfs file system specific options in a comma-separated list, in any combination, with no intervening spaces.
  - v Verify all allocation units are accessible prior to correcting inconsistencies in the metadata.
  - p Check and fix the file system non-interactively (p<sub>r</sub>e<sub>e</sub>n). Exit immediately if there is a problem requiring intervention.
  - w Check writable file systems only.

**FILES** *special* The device which contains the pcfs. The device name for a diskette is specified as /dev/rdiskette0 for the first diskette drive, or /dev/rdiskette1 for a second diskette drive. A hard disk device or high-capacity removable device name must be qualified with a suffix to indicate the proper FDISK partition.

For example, in the names: /dev/rdisk/c0t0d0p0:c and /dev/rdisk/c0t4d0s2:c, the :c suffix indicates the first partition on the disk contains the pcfs.

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Availability        | SUNWesu         |
| Interface Stability | Stable          |

**SEE ALSO** fsck(1M), fstyp(1M), fdisk(1M), mkfs(1M), mkfs\_pcfs(1M), mountall(1M), attributes(5), pcfs(7FS),

**WARNINGS** The operating system buffers file system data. Running fsck on a mounted file system can cause the operating system's buffers to become out of date with respect to the disk. For this reason, the file system should be unmounted when fsck is used. If this is not possible, care should be taken that the system is quiescent and that it is rebooted immediately after fsck is run. Quite often, however, this is not sufficient. A panic will probably occur if running fsck on a file system modifies the file system.

| <b>NAME</b>        | fsck_s5fs – file system consistency check and interactive repair                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYNOPSIS</b>    | <b>fsck</b> -F s5fs [ <i>generic_options</i> ] [ <i>special...</i> ]<br><b>fsck</b> -F s5fs [ <i>generic_options</i> ] [-o <i>specific-options</i> ] [ <i>special...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>DESCRIPTION</b> | <p>fsck audits and interactively repairs inconsistent conditions on file systems. A file system to be checked may be specified by giving the name of the block or character special device or by giving the name of its mount point if a matching entry exists in /etc/vfstab. If no special device is specified, all s5 file systems specified in the vfstab with a fsckdev entry will be checked.</p> <p>In the case of correcting serious inconsistencies, by default, fsck asks for confirmation before making a repair and waits for the operator to respond either <i>yes</i> or <i>no</i>. If the operator does not have write permission on the file system, fsck will default to a <i>-n</i> (no corrections) action. See fsck(1M).</p> <p>Repairing some file system inconsistencies may result in loss of data. The amount and severity of data loss may be determined from the diagnostic output.</p> <p>fsck automatically corrects innocuous inconsistencies such as unreferenced inodes, missing blocks in the free list, blocks appearing in the free list and also in files, or incorrect counts in the superblock automatically. It displays a message for each inconsistency corrected that identifies the nature of the correction on which the file system took place. After successfully correcting a file system, fsck prints the number of files on that file system and the number of used and free blocks.</p> <p>Inconsistencies checked are as follows:</p> <ul style="list-style-type: none"><li>■ Blocks claimed by more than one inode or the free list.</li><li>■ Blocks claimed by an inode or the free list outside the range of the file system.</li><li>■ Incorrect link counts.</li><li>■ Incorrect directory sizes.</li><li>■ Bad inode format.</li><li>■ Blocks not accounted for anywhere.</li><li>■ Directory checks, file pointing to unallocated inode, inode number out of range, absence of <i>'.'</i> and <i>'..'</i> entries in any directory.</li><li>■ Superblock checks: more blocks for inodes than there are in the file system.</li><li>■ Bad free block list format.</li><li>■ Total free block and/or free inode count incorrect.</li></ul> <p>Orphaned files and directories (allocated but unreferenced) are, with the operator's concurrence, reconnected by placing them in the <i>lost+found</i> directory. The name assigned is the inode number. If the <i>lost+found</i> directory does not exist, it is created.</p> |
| <b>OPTIONS</b>     | See generic fsck(1M) for <i>generic_options</i> and details for specifying <i>special</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

- o Specify *s5* file system specific options. These options can be any combination of the following separated by commas (with no intervening spaces):
- f* or *F* Fast check; duplicate blocks and free list check only.
  - l* After all other output is done, print *i-number/pathname* correspondences for damaged files.
  - t scratchfile* If there is insufficient memory and a temporary file is necessary to complete file system checking, use *scratchfile* as the temporary file.
  - T scratchfile* Same as above.
  - s cyl:skip* If it is necessary to rewrite (salvage) the free block list to correct an inconsistency, interleave the blocks such that, to the extent possible within each group of *cyl* consecutive free blocks, the interval between blocks is *skip*. For example, with an interleave of 8:3, in each group of eight consecutive free blocks, the order on the free list would be 1 4 7 2 5 8 3 6. If no *cyl:skip* is given, the value is either taken from the superblock, or, if unspecified (either has a value of 0), 400:7 is used. For obscure historical reasons, interleave specification of "3" and "4" (without colons) are taken to mean 200:5 and 418:7, respectively.
  - S cyl:skip* Same as above, except rewrite the free block list unconditionally.
  - q* Quiet; produce less verbose output.
  - D* Perform more extensive directory checking than normal.
  - p* ("preen") Check and fix the file system non-interactively. Exit immediately if there is a problem requiring intervention.
  - ?* Print usage message.

**FILES** /etc/vfstab list of default parameters for each file system

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Architecture   | IA              |
| Availability   | SUNWs53         |

fsck\_s5fs(1M)

**SEE ALSO** | fsck(1M), attributes(5)

**NOTES** | It is usually faster to check the character special device than the block special device.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>NAME</b>        | fsck_udfs – file system consistency check and interactive repair                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYNOPSIS</b>    | <pre><b>fsck</b> -F udfs [<i>generic_options</i>] [<i>special</i> ...]</pre> <pre><b>fsck</b> -F udfs [<i>generic_options</i>] [-o <i>specific_options</i>] [<i>special</i> ...]</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>DESCRIPTION</b> | <p>fsck audits and interactively repairs inconsistent conditions on file systems. A file system to be checked can be specified by giving the name of the block or character special device or by giving the name of its mount point if a matching entry exists in <code>/etc/vfstab</code>.</p> <p><i>special</i> represents the character special device, for example, <code>/dev/rdisk/c0t2d0s0</code>, on which the file system resides. The character special device, not the block special device should be used. fsck does not work on a mounted block device.</p> <p>If no special device is specified, all udfs file systems specified in the <code>vfstab</code> file with a <code>fsckdev</code> entry are checked. If the <code>-p</code> (<code>preen</code>) option is specified, udfs file systems with an <code>fsckpass</code> number greater than 1 are checked in parallel. See <code>fsck(1M)</code>.</p> <p>In the case of correcting serious inconsistencies, by default, fsck asks for confirmation before making a repair and waits for the operator to respond with either <code>yes</code> or <code>no</code>. If the operator does not have write permission on the file system, fsck defaults to the <code>-n</code> (no corrections) option. See <code>fsck(1M)</code>.</p> <p>Repairing some file system inconsistencies can result in loss of data. The amount and severity of data loss can be determined from the diagnostic output.</p> <p>fsck automatically corrects innocuous inconsistencies. It displays a message for each corrected inconsistency that identifies the nature of the correction which took place on the file system. After successfully correcting a file system, fsck prints the number of files on that file system and the number of used and free blocks.</p> <p>Inconsistencies checked are as follows:</p> <ul style="list-style-type: none"> <li>■ Blocks claimed by more than one file or the free list</li> <li>■ Blocks claimed by a file or the free list outside the range of the file system</li> <li>■ Incorrect link counts in file entries</li> <li>■ Incorrect directory sizes</li> <li>■ Bad file entry format</li> <li>■ Blocks not accounted for anywhere</li> <li>■ Directory checks, file pointing to unallocated file entry and absence of a parent directory entry</li> <li>■ Descriptor checks, more blocks for files than there are in the file system</li> <li>■ Bad free block list format</li> <li>■ Total free block count incorrect</li> </ul> |
| <b>OPTIONS</b>     | The following options are supported:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## fsck\_udfs(1M)

### *generic\_options*

The following *generic\_options* are supported:

-m

Check but do not repair. This option checks to be sure that the file system is suitable for mounting, and returns the appropriate exit status. If the file system is ready for mounting, `fsck` displays a message such as:

```
udfs fsck: sanity check: /dev/rdisk/c0t2d0s0 okay
```

-n | -N

Assume a no response to all questions asked by `fsck`; do not open the file system for writing.

-v

Echo the expanded command line, but do not execute the command. This option can be used to verify and to validate the command line.

-y | -Y

Assume a yes response to all questions asked by `fsck`.

### *-o specific\_options*

Specify `udfs` file system specific options in a comma-separated list with no intervening spaces. The following *specific\_options* are available:

f

Force checking of file systems regardless of the state of their logical volume integrity state.

-p

Check and fix the file system non-interactively (`preen`). Exit immediately if there is a problem that requires intervention. This option is required to enable parallel file system checking.

-w

Check writable file systems only.

**FILES** /etc/vfstab

list of default parameters for each file system

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWudf         |

**SEE ALSO** `crash(1M)`, `fsck(1M)`, `fsdb_udfs(1M)`, `fstyp(1M)`, `mkfs(1M)`, `mkfs_udfs(1M)`, `mountall(1M)`, `reboot(1M)`, `vfstab(4)`, `attributes(5)`,

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WARNINGS</b>    | <p>The operating system buffers file system data. Running <code>fsck</code> on a mounted file system can cause the operating system's buffers to become out of date with respect to the disk. For this reason, use <code>fsck</code> only when the file system is unmounted. If this is not possible, take care that the system is quiescent and that it is rebooted immediately after running <code>fsck</code>. A panic will probably occur if running <code>fsck</code> on a file system that modifies the file system while it is mounted.</p> <p>If an unmount of the file system is not done before the system is shut down, the file system might become corrupted. In this case, a file system check needs to be completed before the next mount operation.</p> |
| <b>DIAGNOSTICS</b> | <p>not writeable<br/>You cannot write to the device.</p> <p>Currently Mounted on<br/>The device is already mounted and cannot run <code>fsck</code>.</p> <p>FILE SYSTEM WAS MODIFIED<br/>File system has been modified to bring it to a consistent state.</p> <p>Can't read allocation extent<br/>Cannot read the block containing allocation extent.</p> <p>Bad tag on alloc extent<br/>Invalid tag detected when expecting an allocation extent.</p> <p>Volume sequence tag error<br/>Invalid tag detected in the volume sequence.</p> <p>Space bitmap tag error<br/>Invalid tag detected in the space bitmap.</p> <p>UNEXPECTED INCONSISTENCY; RUN <code>fsck</code> MANUALLY<br/>Use <code>fsck</code> in interactive mode.</p>                                     |

| <b>NAME</b>        | fsck_ufs – file system consistency check and interactive repair                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SYNOPSIS</b>    | <b>fsck</b> -F ufs [ <i>generic-options</i> ] [ <i>special...</i> ]<br><b>fsck</b> -F ufs [ <i>generic-options</i> ] [-o <i>specific-options</i> ] [ <i>special...</i> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>DESCRIPTION</b> | <p>The <code>fsck</code> utility audits and interactively repairs inconsistent conditions on file systems. A file system to be checked may be specified by giving the name of the block or character <i>special</i> device or by giving the name of its mount point if a matching entry exists in <code>/etc/vfstab</code>.</p> <p>The <i>special</i> parameter represents the character special device, for example, <code>/dev/rdsk/c1t0d0s7</code>, on which the file system resides. The character special device, not the block special device should be used. The <code>fsck</code> utility will not work on a block device if the block device is mounted, unless the file system is error-locked.</p> <p>If no <i>special</i> device is specified, all <code>ufs</code> file systems specified in the <code>vfstab</code> with a <code>fsckdev</code> entry will be checked. If the <code>-p</code> (“preen”) option is specified, <code>ufs</code> file systems with an <code>fsckpass</code> number greater than 1 are checked in parallel. See <code>fsck(1M)</code>.</p> <p>In the case of correcting serious inconsistencies, by default, <code>fsck</code> asks for confirmation before making a repair and waits for the operator to respond either <code>yes</code> or <code>no</code>. If the operator does not have write permission on the file system, <code>fsck</code> will default to a <code>-n</code> (no corrections) action. See <code>fsck(1M)</code>.</p> <p>Repairing some file system inconsistencies may result in loss of data. The amount and severity of data loss may be determined from the diagnostic output.</p> <p>The <code>fsck</code> utility automatically corrects innocuous inconsistencies such as unreferenced inodes, too-large link counts in inodes, missing blocks in the free list, blocks appearing in the free list and also in files, or incorrect counts in the super block. It displays a message for each inconsistency corrected that identifies the nature of the correction on the file system which took place. After successfully correcting a file system, <code>fsck</code> prints the number of files on that file system, the number of used and free blocks, and the percentage of fragmentation.</p> <p>Inconsistencies checked are as follows:</p> <ul style="list-style-type: none"><li>■ Blocks claimed by more than one inode or the free list.</li><li>■ Blocks claimed by an inode or the free list outside the range of the file system.</li><li>■ Incorrect link counts.</li><li>■ Incorrect directory sizes.</li><li>■ Bad inode format.</li><li>■ Blocks not accounted for anywhere.</li><li>■ Directory checks, file pointing to unallocated inode, inode number out of range, and absence of <code>‘.’</code> and <code>‘. .’</code> as the first two entries in each directory.</li></ul> |

- Super Block checks: more blocks for inodes than there are in the file system.
- Bad free block list format.
- Total free block and/or free inode count incorrect.

Orphaned files and directories (allocated but unreferenced) are, with the operator's concurrence, reconnected by placing them in the `lost+found` directory. The name assigned is the inode number. If the `lost+found` directory does not exist, it is created. If there is insufficient space in the `lost+found` directory, its size is increased.

An attempt to mount a `ufs` file system with the `-o nolargefiles` option will fail if the file system has ever contained a large file (a file whose size is greater than or equal to 2 Gbyte). Invoking `fsck` resets the file system state if no large files are present in the file system. A successful mount of the file system after invoking `fsck` indicates the absence of large files in the file system. An unsuccessful mount attempt indicates the presence of at least one large file. See `mount_ufs(1M)`.

## OPTIONS

The *generic-options* consist of the following options:

- |                     |                                                                                                                                                                                                                           |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-m</code>     | Check but do not repair. This option checks that the file system is suitable for mounting, returning the appropriate exit status. If the file system is ready for mounting, <code>fsck</code> displays a message such as: |
|                     | <pre>ufs fsck: sanity check: /dev/rdisk/c0t3d0s1 okay</pre>                                                                                                                                                               |
| <code>-n   N</code> | Assume a no response to all questions asked by <code>fsck</code> ; do not open the file system for writing.                                                                                                               |
| <code>-v</code>     | Echo the expanded command line, but do not execute the command. This option may be used to verify and to validate the command line.                                                                                       |
| <code>-y   Y</code> | Assume a yes response to all questions asked by <code>fsck</code> .                                                                                                                                                       |

See generic `fsck(1M)` for the details for specifying *special*.

- |                                  |                                                                                                                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-o specific-options</code> | Specify <code>ufs</code> file system specific options. These options can be any combination of the following separated by commas (with no intervening spaces).                                                                               |
| <code>b=n</code>                 | Use block <i>n</i> as the super block for the file system. Block 32 is always one of the alternate super blocks. Determine the location of other super blocks by running <code>newfs(1M)</code> with the <code>-Nv</code> options specified. |
| <code>c</code>                   | If the file system is in the old (static table) format, convert it to the new (dynamic table) format. If the file system is in the new format, convert it to the old format                                                                  |

fsck\_ufs(1M)

provided the old format can support the file system configuration. In interactive mode, `fsck` will list the direction the conversion is to be made and ask whether the conversion should be done. If a negative answer is given, no further operations are done on the file system. In preen mode, the direction of the conversion is listed and done if possible without user interaction. Conversion in preen mode is best used when all the file systems are being converted at once. The format of a file system can be determined from the first line of output from `fstyp(1M)`. Note: the `c` option is seldom used and is included only for compatibility with pre-4.1 releases. There is no guarantee that this option will be included in future releases.

- `f` Force checking of file systems regardless of the state of their super block clean flag.
- `p` Check and fix the file system non-interactively ("preen"). Exit immediately if there is a problem requiring intervention. This option is required to enable parallel file system checking.
- `w` Check writable file systems only.

**FILES** `/etc/vfstab` list of default parameters for each file system

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|
| Availability   | SUNWcsu         |

**SEE ALSO** `clri(1M)`, `crash(1M)`, `fsck(1M)`, `fsdb_ufs(1M)`, `fsirand(1M)`, `fstyp(1M)`, `mkfs(1M)`, `mkfs_ufs(1M)`, `mount_ufs(1M)`, `mountall(1M)`, `newfs(1M)`, `reboot(1M)`, `fs_ufs(4)`, `vfstab(4)`, `attributes(5)`, `largefile(5)`

**WARNINGS** The operating system buffers file system data. Running `fsck` on a mounted file system can cause the operating system's buffers to become out of date with respect to the disk. For this reason, the file system should be *unmounted* when `fsck` is used. If this is not possible, care should be taken that the system is quiescent and that it is

rebooted immediately after `fsck` is run. Quite often, however, this will not be sufficient. A panic will probably occur if running `fsck` on a file system modifies the file system.

**NOTES** It is usually faster to check the character special device than the block special device.

Running `fsck` on file systems larger than 2 Gb fails if the user chooses to use the block interface to the device:

```
fsck /dev/dsk/c?t?d?s?
```

rather than the raw (character special) device:

```
fsck /dev/rdisk/c?t?d?s?
```

fsdb(1M)

| <b>NAME</b>        | fsdb – file system debugger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                |                 |              |         |

| <b>SYNOPSIS</b>    | <b>fsdb</b> [-F <i>FSType</i> ] [-V] [-o <i>FSType-specific_options</i> ] <i>special</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |              |         |
| <b>DESCRIPTION</b> | fsdb is a file system debugger that allows for the manual repair of a file system after a crash. <i>special</i> is a special device used to indicate the file system to be debugged. fsdb is intended for experienced users only. <i>FSType</i> is the file system type to be debugged. Since different <i>FSTypes</i> have different structures and hence different debugging capabilities, the manual pages for the <i>FSType</i> -specific fsdb should be consulted for a more detailed description of the debugging capabilities.                                                   |                |                 |              |         |
| <b>OPTIONS</b>     | <p>-F Specify the <i>FSType</i> on which to operate. The <i>FSType</i> should either be specified here or be determinable from /etc/vfstab by matching the <i>special</i> with an entry in the table, or by consulting /etc/default/fs.</p> <p>-V Echo the complete command line, but do not execute the command. The command line is generated by using the options and arguments provided by the user and adding to them information derived from /etc/vfstab. This option may be used to verify and validate the command line.</p> <p>-o Specify <i>FSType</i>-specific options.</p> |                |                 |              |         |
| <b>USAGE</b>       | See largefile(5) for the description of the behavior of fsdb when encountering files greater than or equal to 2 Gbyte ( 2 <sup>31</sup> bytes).                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |
| <b>FILES</b>       | <p>/etc/default/fs default local file system type. Default values can be set for the following flags in /etc/default/fs. For example: LOCAL=ufs</p> <p>LOCAL: The default partition for a command if no <i>FSType</i> is specified.</p> <p>/etc/vfstab list of default parameters for each file system</p>                                                                                                                                                                                                                                                                              |                |                 |              |         |
| <b>ATTRIBUTES</b>  | See attributes(5) for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                |                 |              |         |

| <b>NAME</b>        | fsdb_udfs – udfs file system debugger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | <b>fsdb</b> [-F] udfs [ <i>generic_option</i> ] [-o <i>specific_option</i> ] <i>special</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DESCRIPTION</b> | <p>The <code>fsdb_udfs</code> command is an interactive tool that can be used to patch up a damaged udfs file system. <code>fsdb_udfs</code> has conversions to translate block and i-numbers into their corresponding disk addresses. Mnemonic offsets to access different parts of an inode are also included. Mnemonic offsets greatly simplify the process of correcting control block entries or descending the file system tree.</p> <p><code>fsdb</code> contains several error-checking routines to verify inode and block addresses. These can be disabled if necessary by invoking <code>fsdb</code> with the <code>-o</code> option or by using the <code>o</code> command.</p> <p><code>fsdb</code> reads one block at a time, and therefore works with raw as well as block I/O devices. A buffer management routine is used to retain commonly used blocks of data in order to reduce the number of read system calls. All assignment operations result in an immediate write-through of the corresponding block. In order to modify any portion of the disk, <code>fsdb</code> must be invoked with the <code>-w</code> option.</p> <p>Wherever possible, <code>adb</code>-like syntax has been adopted to promote the use of <code>fsdb</code> through familiarity.</p> |
| <b>OPTIONS</b>     | <p>The following options are supported:</p> <p><code>-o <i>specific_option</i></code> Specify udfs file system specific options in a comma-separated list with no intervening spaces. The following specific options are supported:</p> <ul style="list-style-type: none"> <li><code>o</code> Override some error conditions.</li> <li><code>p=<i>string</i></code> Set prompt to <i>string</i>.</li> <li><code>w</code> Open for write.</li> <li><code>?</code> Display usage.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>USAGE</b>       | <p>Numbers are considered hexadecimal by default. The user has control over how data is to be displayed or accepted. The <code>base</code> command displays or sets the input and output base. Once set, all input defaults to this base and all output displays in this base. The base can be overridden temporarily for input by preceding hexadecimal numbers by <code>0x</code>, preceding decimal numbers with a <code>0t</code>, or octal numbers with a <code>0</code>. Hexadecimal numbers beginning with <code>a-f</code> or <code>A-F</code> must be preceded with a <code>0x</code> to distinguish them from commands.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Disk addressing by `fsdb` is at the byte level. However, `fsdb` offers many commands to convert a desired inode, directory entry, block, and so forth, to a byte address. After the address has been calculated, `fsdb` records the result in the current address (`dot`).

Several global values are maintained by `fsdb`:

- Current base (referred to as `base`)
- Current address (referred to as `dot`)
- Current inode (referred to as `inode`)
- Current count (referred to as `count`)
- Current type (referred to as `type`)

Most commands use the preset value of `dot` in their execution. For example,

```
> 2:inode
```

first sets the value of `dot` (`.`) to 2, colon (`:`), signifies the start of a command, and the `inode` command sets `inode` to 2. A count is specified after a comma (`,`). Once set, count remains at this value until a new command is encountered that resets the value back to 1 (the default).

So, if

```
> 2000,400/X
```

is entered, 400 hex longs are listed from 2000, and when completed, the value of `dot` is  $2000 + 400 * \text{sizeof}(\text{long})$ . If a `RETURN` is then entered, the output routine uses the current values of `dot`, `count`, and `type` and displays 400 more hex longs. An asterisk (`*`) causes the entire block to be displayed. An example showing several commands and the use of `RETURN` would be:

```
> 2:ino; 0:dir?d
or
> 2:ino; 0:db:block?d
```

The two examples are synonymous for getting to the first directory entry of the root of the file system. Once there, subsequently entering a `RETURN`, plus (`+`), or minus (`-`) advances to subsequent entries. Notice that

```
> 2:inode; :ls
or
> :ls /
```

is again synonymous.

## Expressions

The following symbols are recognized by `fsdb`:

|                     |                                                                                                                                                                                                                                                                             |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>RETURN</code> | Update the value of <code>dot</code> by the current value of <i>type</i> and <i>display</i> using the current value of <i>count</i> .                                                                                                                                       |
| <code>#</code>      | Update the value of <code>dot</code> by specifying a numeric expression. Specify numeric expressions using addition, subtraction, multiplication, and division operators ( <code>+</code> , <code>-</code> , <code>*</code> , and <code>%</code> ). Numeric expressions are |

|                |                                                                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | evaluated from left to right and can use parentheses. After evaluation, the value of dot is updated.                                                                                                                                                                                                |
| , <i>count</i> | Update the count indicator. The global value of <i>count</i> is updated to <i>count</i> . The value of <i>count</i> remains until a new command is run. A <i>count</i> specifier of * attempts to show a blocks's worth of information. The default for <i>count</i> is 1.                          |
| ? <i>f</i>     | Display in structured style with format specifier <i>f</i> . See Formatted Output.                                                                                                                                                                                                                  |
| / <i>f</i>     | Display in unstructured style with format specifier <i>f</i> . See Formatted Output.                                                                                                                                                                                                                |
| .              | Display the value of dot.                                                                                                                                                                                                                                                                           |
| + <i>e</i>     | Increment the value of dot by the expression <i>e</i> . The amount actually incremented is dependent on the size of type: <code>dot = dot + e * sizeof (type)</code> The default for <i>e</i> is 1.                                                                                                 |
| - <i>e</i>     | Decrement the value of dot by the expression <i>e</i> . See +.                                                                                                                                                                                                                                      |
| * <i>e</i>     | Multiply the value of dot by the expression <i>e</i> . Multiplication and division don't use <i>type</i> . In the above calculation of dot, consider the <code>sizeof (type)</code> to be 1.                                                                                                        |
| % <i>e</i>     | Divide the value of dot by the expression <i>e</i> . See *.                                                                                                                                                                                                                                         |
| < <i>name</i>  | Restore an address saved in register <i>name</i> . <i>name</i> must be a single letter or digit.                                                                                                                                                                                                    |
| > <i>name</i>  | Save an address in register <i>name</i> . <i>name</i> must be a single letter or digit.                                                                                                                                                                                                             |
| = <i>f</i>     | Display indicator. If <i>f</i> is a legitimate format specifier (see Formatted Output), then the value of dot is displayed using format specifier <i>f</i> . Otherwise, assignment is assumed. See = [s] [e].                                                                                       |
| = [s] [e]      | Change the value of dot using an assignment indicator. The address pointed to by dot has its contents changed to the value of the expression <i>e</i> or to the ASCII representation of the quoted (") string <i>s</i> . This can be useful for changing directory names or ASCII file information. |
| += <i>e</i>    | Change the value of dot using an incremental assignment. The address pointed to by dot has its contents incremented by expression <i>e</i> .                                                                                                                                                        |
| -- <i>e</i>    | Change the value of dot using a decremental assignment. Decrement the contents of the address                                                                                                                                                                                                       |

pointed to by dot by expression *e*.

### Commands

A command must be prefixed by a colon (:). Only enough letters of the command to uniquely distinguish it are needed. Multiple commands can be entered on one line by separating them by a SPACE, TAB, or semicolon (;).

To view a potentially unmounted disk in a reasonable manner, `fsdb` supports the `cd`, `pwd`, `ls`, and `find` commands. The functionality of each of these commands basically matches that of its UNIX counterpart. See `cd(1)`, `pwd(1)`, `ls(1)`, and `find(1)` for details. The `*`, `,`, `?`, and `-` wildcard characters are also supported.

The following commands are supported:

|                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>base[=<i>b</i>]</code>                                     | Display or set the base. All input and output is governed by the current base. Without the <code>= <i>b</i></code> , displays the current base. Otherwise, sets the current base to <i>b</i> . Base is interpreted using the old value of base, so to ensure correctness use the <code>0</code> , <code>0t</code> , or <code>0x</code> prefix when changing the base. The default for base is hexadecimal. |
| <code>block</code>                                               | Convert the value of dot to a block address.                                                                                                                                                                                                                                                                                                                                                               |
| <code>cd [<i>dir</i>]</code>                                     | Change the current directory to directory <i>dir</i> . The current values of inode and dot are also updated. If <i>dir</i> is not specified, changes directories to inode 2, root (/).                                                                                                                                                                                                                     |
| <code>directory</code>                                           | If the current inode is a directory, converts the value of dot to a directory slot offset in that directory, and dot now points to this entry.                                                                                                                                                                                                                                                             |
| <code>file</code>                                                | Set the value of dot as a relative block count from the beginning of the file. The value of dot is updated to the first byte of this block.                                                                                                                                                                                                                                                                |
| <code>find <i>dir</i> [-name <i>n</i>]   [-inum <i>i</i>]</code> | Find files by name or i-number. Recursively searches directory <i>dir</i> and below for file names whose i-number matches <i>i</i> or whose name matches pattern <i>n</i> . Only one of the two options ( <code>-name</code> or <code>-inum</code> ) can be used at one time. The <code>find -print</code> is not necessary or accepted.                                                                   |
| <code>fill=<i>p</i></code>                                       | Fill an area of disk with pattern <i>p</i> . The area of disk is delimited by dot and count.                                                                                                                                                                                                                                                                                                               |
| <code>inode</code>                                               | Convert the value of dot to an inode address. If successful, the current value of                                                                                                                                                                                                                                                                                                                          |

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                           | inode is updated as well as the value of dot. As a convenient shorthand, if <code>:inode</code> appears at the beginning of the line, the value of dot is set to the current inode and that inode is displayed in inode format.                                                                                                                                                                        |
| <code>ls [ -R ] [-l ] pat1 pat2...</code> | List directories or files. If no file is specified, the current directory is assumed. Either or both of the options can be used (but, if used, must be specified before the filename specifiers). Wild card characters are available and multiple arguments are acceptable. The long listing shows only the i-number and the name; use the inode command with <code>?i</code> to get more information. |
| <code>override</code>                     | Toggle the value of override. Some error conditions might be overridden if override is toggled to on.                                                                                                                                                                                                                                                                                                  |
| <code>prompt "p"</code>                   | Change the <code>fsdb</code> prompt to <code>p</code> . <code>p</code> must be enclosed in quotes.                                                                                                                                                                                                                                                                                                     |
| <code>pwd</code>                          | Display the current working directory.                                                                                                                                                                                                                                                                                                                                                                 |
| <code>quit</code>                         | Quit <code>fsdb</code> .                                                                                                                                                                                                                                                                                                                                                                               |
| <code>tag</code>                          | Convert the value of dot and if this is a valid tag, print the volume structure according to the tag.                                                                                                                                                                                                                                                                                                  |
| <code>!</code>                            | Escape to the shell.                                                                                                                                                                                                                                                                                                                                                                                   |

**Inode Commands**

In addition to the above commands, several other commands deal with inode fields and operate directly on the current inode (they still require the colon (:)). They can be used to more easily display or change the particular fields. The value of dot is only used by the `:db` and `:ib` commands. Upon completion of the command, the value of dot is changed so that it points to that particular field. For example,

```
> :ln+=1
increments the link count of the current inode and sets the value of dot to the address of the link count field.
```

The following inode commands are supported:

|                  |               |
|------------------|---------------|
| <code>at</code>  | Access time   |
| <code>bs</code>  | Block size    |
| <code>ct</code>  | Creation time |
| <code>gid</code> | Group id      |
| <code>ln</code>  | Link number   |

## fsdb\_udfs(1M)

|      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| md   | Mode                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| maj  | Major device number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| min  | Minor device number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| nm   | This command actually operates on the directory name field. Once poised at the desired directory entry (using the <code>directory</code> command), this command allows you to change or display the directory name. For example,<br><pre>&gt; 7:dir:nm="foo"</pre> gets the 7th directory entry of the current inode and changes its name to <code>foo</code> . Directory names cannot be made larger than the field allows. If an attempt is made to make a directory name larger than the field allows,, the string is truncated to fit and a warning message is displayed. |
| sz   | File size                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| uid  | User ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| uniq | Unique ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Formatted Output

Formatted output comes in two styles and many format types. The two styles of formatted output are: structured and unstructured. Structured output is used to display inodes, directories, and so forth. Unstructured output displays raw data.

Format specifiers are preceded by the slash (/) or question mark (?) character. *type* is updated as necessary upon completion.

The following format specifiers are preceded by the ? character:

- i Display as inodes in the current base.
- d Display as directories in the current base.

The following format specifiers are preceded by the / character:

- b Display as bytes in the current base.
- c Display as characters.
- o | O Display as octal shorts or longs.
- d | D Display as decimal shorts or longs.
- x | X Display as hexadecimal shorts or longs.

### EXAMPLES

**EXAMPLE 1** Using `fsdb` as a calculator for complex arithmetic

The following command displays 2010 in decimal format, and is an example of using `fsdb` as a calculator for complex arithmetic.

```
> 2000+400%(20+20)=D
```

**EXAMPLE 2** Using fsdb to display an i-number in inode format

The following command displays the i-number 386 in inode format. 386 becomes the current inode.

```
> 386:ino?i
```

**EXAMPLE 3** Using fsdb to change the link count

The following command changes the link count for the current inode to 4.

```
> :ln=4
```

**EXAMPLE 4** Using fsdb to increment the link count

The following command increments the link count by 1.

```
> :ln+=1
```

**EXAMPLE 5** Using fsdb to display the creation time as a hexadecimal long

The following command displays the creation time as a hexadecimal long.

```
> :ct=X
```

**EXAMPLE 6** Using fsdb to display the modification time in time format

The following command displays the modification time in time format.

```
> :mt=t
```

**EXAMPLE 7** Using fsdb to display in ASCII

The following command displays, in ASCII, block 0 of the file associated with the current inode.

```
> 0:file/c
```

**EXAMPLE 8** Using fsdb to display the directory entries for the root inode

The following command displays the first block's directory entries for the root inode of this file system. This command stops prematurely if the EOF is reached.

```
> 2:ino,*?d
```

**EXAMPLE 9** Using fsdb to change the current inode

The following command changes the current inode to that associated with the 5th directory entry (numbered from 0) of the current inode. The first logical block of the file is then displayed in ASCII.

## fsdb\_udfs(1M)

**EXAMPLE 9** Using fsdb to change the current inode (Continued)

```
> 5:dir:inode; 0:file,*/c
```

**EXAMPLE 10** Using fsdb to change the i-number

The following command changes the i-number for the 7th directory slot in the root directory to 3.

```
> 2:inode; 7:dir=3
```

**EXAMPLE 11** Using fsdb to change the name field

The following command changes the *name* field in the directory slot to name.

```
> 7:dir:nm="name"
```

**EXAMPLE 12** Using fsdb to display the a block

The following command displays the 3rd block of the current inode as directory entries.

**EXAMPLE 13** Using fsdb to set the contents of address

The following command sets the contents of address 2050 to 0xffffffff. 0xffffffff can be truncated, depending on the current type.

```
> 2050=0xfffff
```

**EXAMPLE 14** Using fsdb to place an ASCII string at an address

The following command places the ASCII string `this is some text` at address 1c92434.

```
> 1c92434="this is some text"
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE | ATTRIBUTE VALUE |
|----------------|-----------------|

| <b>NAME</b>        | fsdb_ufs – ufs file system debugger                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>SYNOPSIS</b>    | <b>fsdb</b> -F ufs [ <i>generic_options</i> ] [ <i>specific_options</i> ] <i>special</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>DESCRIPTION</b> | <p>The <code>fsdb_ufs</code> command is an interactive tool that can be used to patch up a damaged UFS file system. It has conversions to translate block and i-numbers into their corresponding disk addresses. Also included are mnemonic offsets to access different parts of an inode. These greatly simplify the process of correcting control block entries or descending the file system tree.</p> <p><code>fsdb</code> contains several error-checking routines to verify inode and block addresses. These can be disabled if necessary by invoking <code>fsdb</code> with the <code>-o</code> option or by the use of the <code>o</code> command.</p> <p><code>fsdb</code> reads a block at a time and will therefore work with raw as well as block I/O devices. A buffer management routine is used to retain commonly used blocks of data in order to reduce the number of read system calls. All assignment operations result in an immediate write-through of the corresponding block. Note that in order to modify any portion of the disk, <code>fsdb</code> must be invoked with the <code>w</code> option.</p> <p>Wherever possible, <code>adb</code>-like syntax was adopted to promote the use of <code>fsdb</code> through familiarity.</p> |
| <b>OPTIONS</b>     | <p>The following option is supported:</p> <ul style="list-style-type: none"> <li>-o Specify UFS file system specific options. These options can be any combination of the following separated by commas (with no intervening spaces). The options available are: <ul style="list-style-type: none"> <li>? Display usage</li> <li>o Override some error conditions</li> <li>p='string' set prompt to string</li> <li>w open for write</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>USAGE</b>       | <p>Numbers are considered hexadecimal by default. However, the user has control over how data is to be displayed or accepted. The <code>base</code> command will display or set the input/output base. Once set, all input will default to this base and all output will be shown in this base. The base can be overridden temporarily for input by preceding hexadecimal numbers with <code>'0x'</code>, preceding decimal numbers with <code>'0t'</code>, or octal numbers with <code>'0'</code>. Hexadecimal numbers beginning with <code>a-f</code> or <code>A-F</code> must be preceded with <code>'0x'</code> to distinguish them from commands.</p> <p>Disk addressing by <code>fsdb</code> is at the byte level. However, <code>fsdb</code> offers many commands to convert a desired inode, directory entry, block, superblock and so forth to a byte address. Once the address has been calculated, <code>fsdb</code> will record the result in dot (<code>.</code>).</p> <p>Several global values are maintained by <code>fsdb</code>:</p> <ul style="list-style-type: none"> <li>■ the current base (referred to as <code>base</code>),</li> </ul>                                                                                                   |

- the current address (referred to as `dot`),
- the current inode (referred to as `inode`),
- the current count (referred to as `count`),
- and the current type (referred to as `type`).

Most commands use the preset value of `dot` in their execution. For example,

```
> 2:inode
```

will first set the value of `dot` to 2, `'.'`, will alert the start of a command, and the `inode` command will set `inode` to 2. A count is specified after a `'.'`. Once set, `count` will remain at this value until a new command is encountered which will then reset the value back to 1 (the default). So, if

```
> 2000,400/X
```

is typed, 400 hex longs are listed from 2000, and when completed, the value of `dot` will be  $2000 + 400 * \text{sizeof}(\text{long})$ . If a `RETURN` is then typed, the output routine will use the current values of `dot`, `count`, and `type` and display 400 more hex longs. A `'*'` will cause the entire block to be displayed.

End of fragment, block and file are maintained by `fsdb`. When displaying data as fragments or blocks, an error message will be displayed when the end of fragment or block is reached. When displaying data using the `db`, `ib`, `directory`, or `file` commands an error message is displayed if the end of file is reached. This is mainly needed to avoid passing the end of a directory or file and getting unknown and unwanted results.

An example showing several commands and the use of `RETURN` would be:

```
> 2:ino; 0:dir?d
 or
> 2:ino; 0:db:block?d
```

The two examples are synonymous for getting to the first directory entry of the root of the file system. Once there, any subsequent `RETURN` (or `+`, `-`) will advance to subsequent entries. Note that

```
> 2:inode; :ls
 or
> :ls /
```

is again synonymous.

### Expressions

The symbols recognized by `fsdb` are:

`RETURN`            update the value of `dot` by the current value of `type` and display using the current value of `count`.

|                             |                                                                                                                                                                                                                                                                                                        |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| #                           | numeric expressions may be composed of +, -, *, and % operators (evaluated left to right) and may use parentheses. Once evaluated, the value of <code>dot</code> is updated.                                                                                                                           |
| , <i>count</i>              | count indicator. The global value of <code>count</code> will be updated to <code>count</code> . The value of <code>count</code> will remain until a new command is run. A count specifier of '*' will attempt to show a <i>blocks's</i> worth of information. The default for <code>count</code> is 1. |
| ? <i>f</i>                  | display in structured style with format specifier <i>f</i> . See <code>FormattedOutput</code> .                                                                                                                                                                                                        |
| / <i>f</i>                  | display in unstructured style with format specifier <i>f</i> . See <code>FormattedOutput</code> .                                                                                                                                                                                                      |
| .                           | the value of <code>dot</code> .                                                                                                                                                                                                                                                                        |
| + <i>e</i>                  | increment the value of <code>dot</code> by the expression <i>e</i> . The amount actually incremented is dependent on the size of <code>type</code> :<br><br>$\text{dot} = \text{dot} + e * \text{sizeof}(\text{type})$ <p>The default for <i>e</i> is 1.</p>                                           |
| - <i>e</i>                  | decrement the value of <code>dot</code> by the expression <i>e</i> . See +.                                                                                                                                                                                                                            |
| * <i>e</i>                  | multiply the value of <code>dot</code> by the expression <i>e</i> . Multiplication and division don't use <code>type</code> . In the above calculation of <code>dot</code> , consider the <code>sizeof(type)</code> to be 1.                                                                           |
| % <i>e</i>                  | divide the value of <code>dot</code> by the expression <i>e</i> . See *.                                                                                                                                                                                                                               |
| < <i>name</i>               | restore an address saved in register <i>name</i> . <i>name</i> must be a single letter or digit.                                                                                                                                                                                                       |
| > <i>name</i>               | save an address in register <i>name</i> . <i>name</i> must be a single letter or digit.                                                                                                                                                                                                                |
| = <i>f</i>                  | display indicator. If <i>f</i> is a legitimate format specifier, then the value of <code>dot</code> is displayed using the format specifier <i>f</i> . See <code>FormattedOutput</code> . Otherwise, assignment is assumed. See =.                                                                     |
| = [ <i>s</i> ] [ <i>e</i> ] | assignment indicator. The address pointed to by <code>dot</code> has its contents changed to the value of the expression <i>e</i> or to the ASCII representation of the quoted (") string <i>s</i> . This may be useful for changing directory names or ASCII file information.                        |
| =+ <i>e</i>                 | incremental assignment. The address pointed to by <code>dot</code> has its contents incremented by expression <i>e</i> .                                                                                                                                                                               |
| =- <i>e</i>                 | decremental assignment. The address pointed to by <code>dot</code> has its contents decremented by expression <i>e</i> .                                                                                                                                                                               |

## fsdb\_ufs(1M)

**Commands** | A command must be prefixed by a ':' character. Only enough letters of the command to uniquely distinguish it are needed. Multiple commands may be entered on one line by separating them by a SPACE, TAB or ';'.

In order to view a potentially unmounted disk in a reasonable manner, `fsdb` offers the `cd`, `pwd`, `ls` and `find` commands. The functionality of these commands substantially matches those of its UNIX counterparts. See individual commands for details. The '\*', '?', and '[' wild card characters are available.

|                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>base=b</code>                           | display or set base. As stated above, all input and output is governed by the current base. If the <code>=b</code> is omitted, the current base is displayed. Otherwise, the current base is set to <i>b</i> . Note that this is interpreted using the old value of <code>base</code> , so to ensure correctness use the '0', '0t', or '0x' prefix when changing the <code>base</code> . The default for <code>base</code> is hexadecimal. |
| <code>block</code>                            | convert the value of <code>dot</code> to a block address.                                                                                                                                                                                                                                                                                                                                                                                  |
| <code>cd dir</code>                           | change the current directory to directory <i>dir</i> . The current values of <code>inode</code> and <code>dot</code> are also updated. If no <i>dir</i> is specified, then change directories to <code>inode 2</code> ("/").                                                                                                                                                                                                               |
| <code>cg</code>                               | convert the value of <code>dot</code> to a cylinder group.                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>directory</code>                        | If the current <code>inode</code> is a directory, then the value of <code>dot</code> is converted to a directory slot offset in that directory and <code>dot</code> now points to this entry.                                                                                                                                                                                                                                              |
| <code>file</code>                             | the value of <code>dot</code> is taken as a relative block count from the beginning of the file. The value of <code>dot</code> is updated to the first byte of this block.                                                                                                                                                                                                                                                                 |
| <code>find dir [ -name n ] [ -inum i ]</code> | find files by name or i-number. <code>find</code> recursively searches directory <i>dir</i> and below for filenames whose i-number matches <i>i</i> or whose name matches pattern <i>n</i> . Note that only one of the two options ( <code>-name</code> or <code>-inum</code> ) may be used at one time. Also, the <code>-print</code> is not needed or accepted.                                                                          |
| <code>fill=p</code>                           | fill an area of disk with pattern <i>p</i> . The area of disk is delimited by <code>dot</code> and <code>count</code> .                                                                                                                                                                                                                                                                                                                    |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fragment  | convert the value of <i>dot</i> to a fragment address. The only difference between the <code>fragment</code> command and the <code>block</code> command is the amount that is able to be displayed.                                                                                                                                                                                                                                                                                         |
| inode     | convert the value of <i>dot</i> to an inode address. If successful, the current value of <code>inode</code> will be updated as well as the value of <i>dot</i> . As a convenient shorthand, if <code>'inode'</code> appears at the beginning of the line, the value of <i>dot</i> is set to the current <code>inode</code> and that inode is displayed in inode format.                                                                                                                     |
| log_chk   | run through the valid log entries without printing any information and verify the layout.                                                                                                                                                                                                                                                                                                                                                                                                   |
| log_delta | count the number of deltas into the log, using the value of <i>dot</i> as an offset into the log. No checking is done to make sure that offset is within the head/tail offsets.                                                                                                                                                                                                                                                                                                             |
| log_head  | display the header information about the file system logging. This shows the block allocation for the log and the data structures on the disk.                                                                                                                                                                                                                                                                                                                                              |
| log_otodb | return the physical disk block number, using the value of <i>dot</i> as an offset into the log.                                                                                                                                                                                                                                                                                                                                                                                             |
| log_show  | display all deltas between the beginning of the log (BOL) and the end of the log (EOL).                                                                                                                                                                                                                                                                                                                                                                                                     |
| ls        | <code>[ -R ] [ -l ] pat1 pat2 . . .</code> list directories or files. If no file is specified, the current directory is assumed. Either or both of the options may be used (but, if used, <i>must</i> be specified before the filename specifiers). Also, as stated above, wild card characters are available and multiple arguments may be given. The long listing shows only the i-number and the name; use the <code>inode</code> command with <code>'i'</code> to get more information. |
| override  | toggle the value of <code>override</code> . Some error conditions may be overridden if <code>override</code> is toggled on.                                                                                                                                                                                                                                                                                                                                                                 |
